ORANGE COUNTY CLERK-RECORDER DEPARTMENT

Notice of Determination

BY: _____ DEPUTY

Appendix D

TO:

Office of Planning and Research
For U.S. Mail: P.O. Box 3044
Sacramento, CA 95812-3044
Street Address: 1400 Tenth Street
Sacramento, CA 95814

County Clerk
County of: Orange
Address: 601 N. Ross St.
Santa Ana, CA 92701

FROM:

Public Agency: Irvine Ranch Water District

Address: 15600 Sand Canyon Ave.
Irvine, CA 92618

Contact: Jo Ann Corey

Phone: (949) 453-5326

Lead Agency (if different from above):

Address:

Contact:

Phone:

Subject: Filing of Notice of Determination in compliance with Section 21108 or 21152 of the Public Resources Code.

State Clearinghouse Number (if submitted to State Clearinghouse): 2019080009

Project Title: Syphon Reservoir Improvement Project

Project Location (include county): The proposed project would be built within the IRWD service area at the site of the existing Syphon Reservoir, located in unincorporated County of Orange, California, on the northeast side of Portola Parkway between Bee Canyon Access Road and State Route 133.

Project Description: The proposed project would increase the capacity of the existing recycled water reservoir from approximately 500 acre-feet (AF) to 5,000 AF. The proposed project would replace the existing engineered dam with a new engineered dam, increasing the existing 59-foot dam height to 136 feet and increasing the elevation of the dam crest from the existing 388 feet above mean sea level (amsl) to 466 feet amsl. A new spillway would be included with the new dam to protect the reservoir from overtopping. As part of the new design, the engineered embankment dam would include a seepage control drainage system and a circulation system for the reservoir. The existing strainer and disinfection facilities would be demolished, reconstructed and expanded at the toe of the new dam to provide filtration and disinfection. Additional project features include new onsite access and maintenance roads; wetland and riparian mitigation areas; and potential recreational facilities.

This is to advise that the Irvine Ranch Water District has approved the above described project on (Lead Agency or Responsible Agency)

July 26, 2021 and has made the following determinations regarding the above described projects. (Date)

- 1. The project [] will [x] will not have a significant effect on the environment.
2. [x] An Environmental Impact Report was prepared for this project pursuant to the provisions of CEQA. [] A Negative Declaration was prepared for this project pursuant to the provisions of CEQA
3. Mitigation measures [x] were [] were not made a condition of the approval of the project
4. A mitigation reporting or monitoring plan [x] was [] was not adopted for this project.
5. A statement of Overriding Considerations [] was [x] was not adopted for this project.
6. Findings [x] were [] were not made pursuant to the provisions of CEQA.

CHAPTER 8

Introduction

This Final Environmental Impact Report (EIR) has been prepared in accordance with the California Environmental Quality Act (CEQA) as amended (Public Resources Code Section 21000 et seq.) and CEQA Guidelines (California Administrative Code Section 15000 et seq.). In addition, this Final EIR has been prepared in accordance with the CEQA-Plus requirements of the U.S. Environmental Protection Agency, to fulfill the requirement of potential federal funding partners to comply with the National Environmental Policy Act (NEPA). This Final EIR incorporates, by reference, the Draft EIR prepared by the Irvine Ranch Water District (IRWD) for the Syphon Reservoir Improvement Project (proposed project) (State Clearinghouse No. 2019080009) as it was originally published. Revisions to the Draft EIR are provided in Chapters 10 and 11 of this Final EIR.

8.1 CEQA Requirements

According to the CEQA Guidelines Section 15132, the Final EIR shall consist of the following:

- The Draft EIR or a revision of that draft;
- Comments and recommendations received on the Draft EIR either verbatim or in summary;
- A list of persons, organizations, and public agencies commenting on the Draft EIR;
- The responses of the lead agency to significant environmental points raised in the review and consultation process; and
- Any other information added by the lead agency.

This Final EIR document for the Syphon Reservoir Improvement Project presents:

- The written comments received on the Draft EIR and the list of commenting parties (Chapter 9) along with a response to each comment (Chapter 10); and
- Revisions made to the Draft EIR in response to comments received or otherwise added by IRWD (Chapter 11).

8.2 Public Participation Process

Pursuant to CEQA Guidelines Section 15082, the lead agency is required to send a Notice of Preparation (NOP) stating that an EIR will be prepared to the State Office of Planning and Research (OPR), Responsible and Trustee agencies, and federal agencies involved in funding or approving the project. The NOP must provide sufficient information in order for responsible

agencies to make a meaningful response. At a minimum, the NOP must include a description of the project, location of the project, and probable environmental effects of the project (CEQA Guidelines Section 15082(a)(1)). Within 30 days after receiving the NOP, Responsible and Trustee agencies and OPR shall provide the lead agency with specific detail about the scope and content of the environmental information related to that agency's area of statutory responsibility that should be included in this Draft EIR (CEQA Guidelines Section 15082(b)).

On August 2, 2019, IRWD published the NOP of an EIR for a 45-day review period and circulated it to OPR and local, state, and federal agencies, including Responsible and Trustee agencies, as well as organizations and persons who expressed interest in the proposed project. The NOP comment period extended through September 16, 2019. The NOP provided a general description of the proposed project, a description of the proposed project areas, and an overview of environmental topics that will be evaluated within the EIR. The NOP was made available on the IRWD website. A copy of the NOP and comment letters are included in the Draft EIR in Appendix A. Thirty-five comment letters were received in response to the NOP. As a result of specific public comments received, IRWD engaged the services of HDR to evaluate alternative project scenarios and associated life cycle costs in meeting IRWD's goals for future recycled water storage and distribution management. HDR's evaluation is documented in a Technical Memorandum titled *Technical Memorandum: Evaluation of Syphon Reservoir Expansion in Response to EIR Notice of Preparation Comments* referenced in this EIR as "(HDR, 2020)." A copy of HDR's Technical Memorandum is available from IRWD's District Secretary.

On August 21, 2019, in accordance with CEQA Guidelines Section 15082, IRWD held a public scoping meeting to describe the proposed project, to identify the environmental topics that would be addressed, and to describe the CEQA process for preparation of the EIR. To notify the public of the Scoping Meeting, IRWD published the legal notification in the *Orange County Register* in five languages, mailed a notification to area residents and posted information about the meeting on IRWD's website. IRWD provided an opportunity for attendees to submit written comments on the scope of the environmental evaluation; the written comments received at the scoping meeting are included in the Draft EIR in Appendix A. Verbal comments raised during the scoping meeting included concerns over public safety in a potential inundation zone, property values and flood insurance costs for residences in a potential inundation zone, an increase in traffic, length of the new dam, and impacts to daily operations and safety at nearby schools. These verbal comments were summarized and are included in the scoping comments set forth in the Draft EIR in Appendix A.

Once the Draft EIR was complete, a Notice of Completion (NOC) was submitted to the OPR as required by CEQA (CEQA Guidelines Section 15085), along with copies of the Draft EIR for distribution to public agencies via the State Clearinghouse (CEQA Guidelines Section 15087(f)). At the same time, a Notice of Availability (NOA) of the Draft EIR was posted with the Orange County Clerk (CEQA Guidelines Section 15087(d)). The NOA also was published in the *Orange County Register* (per CEQA Guidelines Section 15087(d)).

The NOA and Draft EIR were available at the following IRWD project website address: <http://www.syphonreservoir.com>. Printed copies of the Draft EIR were available for public review at the following public library and the IRWD office as permitted if/when the restrictions

due to facility closures and the need for social distancing required in response to the COVID-19 pandemic were lifted by the appropriate governmental agencies: Heritage Park Library, 14361 Yale Ave, Irvine CA 92604; and IRWD, 15600 Sand Canyon Avenue, Irvine, California 92618.

The Draft EIR was circulated for a 60-day public review period from March 19, 2021 to May 18, 2021. During this public review period, IRWD held one virtual public meeting via Zoom and telephonically, in accordance with State directives regarding public meetings held during the COVID-19 pandemic, to receive public comments on the environmental analysis in the Draft EIR. The virtual public meeting included a brief presentation providing an overview of the proposed project and findings of the Draft EIR. The virtual meeting was held at 6:00 P.M. on April 21, 2021. Responses to all comments received on the Draft EIR, either in writing or verbally during the public meeting, are addressed in this document, which together with the Draft EIR and changes and corrections to the Draft EIR constitute the Final EIR.

During the public review period, public outreach and notification efforts were conducted to raise awareness about the availability and contents of the Draft EIR and to encourage public participation. Outreach efforts included the following:

- Information was included in an IRWD newsletter that was mailed or emailed to all 128,334 IRWD customer households;
- A Syphon Reservoir Improvement Project overview video, offered in English, Korean and Chinese, was posted to YouTube and targeted to IRWD customers and surrounding residents (the videos received more than 41,000 views in a four-week timeframe);
- Individual postcard mailers were sent to more than 2,000 households;
- More than 100 email notifications were sent to elected officials and stakeholder organizations, including the offer for a briefing;
- Briefings with stakeholders;
- Coordination with the City of Irvine to notice the public meeting and comment period; and
- Social media and website notifications.

Public outreach materials were also developed in English, Chinese and Korean to enhance public awareness. Materials included the following:

- Project Overview brochure;
- Frequently Asked Questions handout;
- Project Overview fact sheet;
- Draft EIR Summary brochure;
- Dam Safety fact sheet; and
- Dam Safety videos.

8.3 Final EIR Certification and Approval

As the lead agency, IRWD has the option to make the Final EIR available for public review prior to considering the project for approval (CEQA Guidelines Section 15089(b)). The Final EIR must be available to commenting agencies at least 10 days prior to consideration for approval.

Prior to considering the proposed project for approval, the IRWD Board of Directors will review and consider the information presented in the Final EIR and may certify that the Final EIR has been adequately prepared in accordance with CEQA. Once the Final EIR is certified, IRWD's Board may proceed to consider project approval (CEQA Guidelines Section 15090, Section 15096(f)). Prior to approving the proposed project, IRWD must make written findings and adopt statements of overriding considerations for each unmitigated significant environmental effect identified in the Final EIR in accordance with Section 15091 of the CEQA Guidelines. There were no unmitigated significant environmental effects identified in the Draft EIR.

8.4 Notice of Determination

Pursuant to Section 15094 of the CEQA Guidelines, IRWD will file a Notice of Determination (NOD) with the Orange County Clerk and State Office of Planning and Research within five working days of certification of the EIR and project approval.

8.5 Mitigation Monitoring and Reporting Program

CEQA requires lead agencies to “adopt a program for monitoring or reporting on the revisions which it has required in the project and the measures it has imposed to mitigate or avoid significant environmental effects” (CEQA Guidelines Section 15097). The mitigation measures and project features described in this Final EIR will be included in the Mitigation Monitoring and Reporting Program (MMRP) for the proposed project and implemented by IRWD. Upon approval of the project, the IRWD Board of Directors will adopt the MMRP.

CHAPTER 9

Public Comments

This chapter contains the comments received during the public review period for the Syphon Reservoir Improvement Project Draft EIR. The commenting persons and/or agencies are listed below in **Table 9-1**. The comments have been bracketed and numbered, and responses to comments are provided in Chapter 10. The responses are labeled to correspond to the comment letters and numbers that appear in the margins of the comment letters.

SyphonEIR@irwd.com

Attn: Ms. Jo Ann Corey
Environmental Compliance Analyst
Irvine Ranch Water District Water Resources & Policy Department
P.O. Box 57000
Irvine, California 92619-7000

Subject: Syphon Reservoir Improvement Project Draft Environmental Impact Report (DEIR) (State Clearinghouse No. 2019080009) located in the County of Orange.

Dear Ms. Corey:

Staff is in receipt of a Notice of Availability of a DEIR for the Syphon Reservoir Improvement Project located northeast of Portola Parkway between Bee Canyon Access Road and SR-133 in the County of Orange. The surrounding land uses to the project site include Crean Lutheran High School Athletics Complex and residential homes in the City of Irvine to the south, Rattlesnake Reservoir to the west, the I-133 to the east, and open space to the north.

The proposed project would replace the existing engineered dam with a new engineered dam, increasing the existing 59-foot dam height to 136 feet and increasing the elevation of the dam crest from the existing 388 feet above mean sea level (amsl) to 466 feet amsl. A spillway would be included with the new dam to protect the reservoir from overtopping. The replacement dam would result in an increase in the reservoir's maximum water surface elevation from the existing 376 feet amsl to 456 feet amsl and increase the reservoir's capacity from approximately the existing 500 acre feet to 5,000 acre feet.

**ENCLOSURE
CITY OF IRVINE COMMENTS**

GENERAL COMMENTS

- 1. Provide a Construction Management Plan and coordinate closely with City staff on the implementation of the plan. 4-2

CH.2 – PROJECT DESCRIPTION

- 2. Confirm whether the proposed trail will be open to the public. Additionally, identify the maintenance responsibility of the trail. 4-3

- 3. Include language that IRWD will coordinate with the City during the design and development of the proposed walking trail. 4-4

- 4. On page ES-3, Objectives, clarify and elaborate on the third bullet point objective “Reduce sewage diversions to OCSD.” 4-5

Is Michelson WRP at operational capacity for sewage treatment because there are no opportunities to pump the tertiary treated effluent to Syphon Reservoir and Rattlesnake Reservoir? Please clarify

- 5. On page 2-25, Table 2-1, Discretionary Permits or Approvals Potentially Required, please note that IRWD may be required by the County of Orange (since the project site is within County of Orange jurisdiction) to have an approved Water Quality Management Plan (WQMP). 4-6

The WQMP depends on whether the project adds or replaces 5,000 square feet or more of impervious surface due to the construction of maintenance access roads or other impervious surface areas pertinent to upgrade or new facilities.

- 6. In Section 2.5, include a robust public outreach plan to ensure adjacent residents’ and property owners are well informed of the project as well as of the pre-construction and construction schedule and activities. 4-7

3.1 - AESTHETICS

- 7. In Figure 3.1-2, include viewpoints of the Stonegate neighborhood and analyze the visual quality, affected views and exposure quality, and visual sensitivity from this viewpoint. 4-8

Ms. Jo Ann Corey
 May 14, 2021
 Page 4

While the document evaluates viewpoints by Stonegate Park and Stonegate Elementary School, there are existing neighborhoods directly north of the park and school, which are closer to the project site, which should be analyzed.

↑
 4-8
 cont.

- 8. On page 3.1-23, Mitigation Measure AES-1, incorporate landscaping and vegetation, similar to the existing vegetation surrounding the project site, to mitigate the appearance of increasing the dam height from 59-feet to 136-feet. Specify the plant and vegetation type that will be used for the project.

↑
 4-9

Currently, it only states that the buildings, structures, and retaining walls shall be designed to have earth tone color palettes that blend with the surrounding landscape and vegetation.

↑

CH. 3.9 – HYDROLOGY AND WATER

- 9. The EIR states that the cost of flood insurance will not increase for property owners adjacent to the reservoir. Flood insurance is dependent on the Flood Maps produced by FEMA. Confirm whether this has been verified with FEMA.

↑
 4-10

- 10. On page 3.9-3 to 4, identify the location of the 7-ft high by 10-foot wide box culvert located north of Portola Parkway, as depicted in Figure 3.9-2.

↑
 4-11

- 11. On page 3.9-13, page 3.9.2, under Groundwater Dewatering Permit for Santa Ana Region, please note that the DEIR-referenced Order No. R8-2007-041 was rescinded and is now superseded by General Waste Discharge Requirements Order No. R8-2019-0061 (Santa Ana RWQCB adoption was December 6, 2019).

↑
 4-12

- 12. On page 3.9-15 - 3.9-16, Orange County Municipal Storm Water Permit (MS4), the DEIR makes references to the applicability of the County of Orange Municipal Separate Storm Sewer System (MS4) permit to the proposed project as a municipal operation.

↑
 4-13

The Syphon project is not a municipal project. Municipal operations in context of the MS4 permit refer to the operations of municipal permittees such as the County or cities. The potential impact from the Syphon project is from stormwater or recycled water discharging to the MS4 system operated by the City of Irvine and to County of Orange flood control drainage facilities located further downstream.

Any stormwater runoff from outside of the reservoir catchment area (as described on P.3.9-3) from surface runoff presumably discharging via bench drains southwest of the dam or any recycled water discharge from the reservoir in the event of an emergency requiring release from the 48-inch IRWD pipe (as described on P. ES-11) would then flow directly to the City of Irvine’s MS4 not that of the

↑
 ↓

Ms. Jo Ann Corey
 May 14, 2021
 Page 5

County of Orange. The MS4 system is comprised of an interconnected storm drain network to include roadway gutter, catch basins, and below ground storm drains.

↑ 4-13
 cont.

13. On page 3.9-31, in the second paragraph of the Water Quality Control Plan or Sustainable Groundwater Management Plan, Construction, correct the reference of the storm drains at Portola Parkway.

4-14

Any storm drains systems located at Portola Parkway would be operated by the City of Irvine not Orange County Flood Control District.

CH. 3.10 – NOISE

14. On page 3.10-19, in Table 3.10-8, arrange the sensitive receptors according to distance (in ascending order) for readability purposes.

4-15

15. On page 3.10-19 and 20, include mitigation measures to show how the project will attenuate noise to an acceptable level that is consistent with the City’s Noise Ordinance.

4-16

In Table 3.10-8, all the proposed construction activities exceed the noise levels for each sensitive receptor. Additionally, the EIR states construction noise levels are estimated to reach a maximum of 89 dBA Leq at the nearest sensitive receptor. A dBA of 89 exceeds the City’s Noise Ordinance standards for Noise Zone 1. The maximum allowed is 70 dBA for only one minute between the hours of 7:00 am to 10:00 pm.

16. On page 3.10-21, this section claims “the City has not established numerical thresholds for construction noise... the proposed project construction activities would comply with the hours allowed by the City... thus, a significant noise impact would not occur during project construction and construction noise impacts would be less than significant.”

4-17

This is an incorrect statement as the City’s Noise Ordinance provides established noise thresholds for any noise measurement, which includes construction activities. Further, all the construction-related noise exceed the noise thresholds for Noise Zone 1 in the City’s Noise Ordinance; therefore, significant noise impacts would occur.

Correct the statement to say that the City establishes numerical thresholds for construction noise. Additionally, include mitigation measures to attenuate the noise to a less than significant impact.

Ms. Jo Ann Corey
 May 14, 2021
 Page 6

17. On page 3.10-21, identify the estimated length of time for each construction related noise level in order to determine if it complies with the City’s Noise Ordinance. If it exceeds the City’s noise standards, propose mitigation measures to attenuate the noise levels.

4-18

Table 3.10-9 states the construction noise levels generated by truck trips range from 57.5 to 72.7 dBA. A dBA over 70 exceeds the noise levels in Noise Zone 1 in the City’s Noise Ordinance. Further, anything between 55-70 dBA is only permissible in Noise Zone 1 depending on length of time.

18. On page 3.10-26 and 3.10-27, Section 3.10-4 - Cumulative Impacts, analyze the potential noise impacts of all three projects (IRWD Syphon Reservoir, Gateway Community Park and Truck Route Roadway Rehabilitation (CIP 311902)) should construction activities occur simultaneously. Additionally, include mitigation measures addressing how IRWD would attenuate the noise levels if it exceeds the City’s noise standards.

4-19

CH. 3.12.2 TRANSPORTATION

19. In Section 3.12.2, Regulatory Framework - City of Irvine, it states there are potential full lane closures. Add language to include “Full lane closures shall be avoided if there is a feasible partial lane closure alternative.”

4-20

20. Add language to state that if any repaving is required for Sand Canyon Ave and Portola Pkwy, fiber-reinforced AC shall be used for repaving.

4-21

21. In Mitigation Measure TRA-1, include language stating that during the span of the project, any proposed non-standard working hours of traffic control staging and/or permanent closures shall require prior review and approval by City staff.

4-22

APPENDIX E: TRAFFIC STUDY

22. On page 3. Study Area Boundary, revise Route 1A and Route 1B to show “north on Sand Canyon Avenue” rather than “south on Sand Canyon Avenue”, similar to how it is referenced on page 21.

4-23

23. On page 20, Construction Period Trip Generation, the last paragraph appears to be from previous edits.

4-24

Delete this paragraph if it is no longer applicable. Otherwise, clarify the number of daily trips from which 30 daily trips were subtracted from to derive 154 daily trips.

24. On page 20, add discussion on the construction timeline.

4-25

Ms. Jo Ann Corey
 May 14, 2021
 Page 7

- 25. In the Site Access Analysis, provide a site plan showing the location of the gate with dimensions from the intersection of Sand Canyon/Portola to demonstrate how the project meets the intent of TDP-14.

4-26
- 26. Note that the City is planning pavement rehabilitation work on Sand Canyon at Portola. Coordinate with City staff to ensure that both agencies are aware of the timing of projects to avoid overlaps between City and IRWD construction projects. Please contact Allison Tran, Associate Engineer, at (949) 724-7547 or atran@cityofirvine.org for more information

4-27
- 27. On pages 59 and 60, incorporate the recommendations from pages 54 and 55. This includes improvements to facilitate bicycle circulation, such as: “BIKES MAY USE FULL LANE” signage, shared arrow advance warning signage, and other suggested methods that provide advance warning to both vehicular drivers and bicyclists. Please coordinate these additional improvements with City Staff.

4-28
- 28. EIR page 3.12-3: Revise Portola Parkway and Irvine Blvd to describe directions of the sidewalks to be on the east and westbound side since Sand Canyon, perpendicular to these two, is also described as north and southbound direction.

4-29
- 29. EIR page 3.12-3: The last sentence in the Portola Parkway paragraph should be revised to state “the only sidewalk on the northbound side is between Sand Canyon and the Crean Lutheran School Sports Complex.”

4-30
- 30. The EIR incorrectly discusses on Pages 3.12-12 and 4-12 that trucks will utilize Portola between Jeffrey and Sand Canyon, Sand Canyon between Irvine Blvd and Portola and Irvine between Jeffrey and Sand Canyon. These segments were not part of the traffic analysis. Revise the EIR so that it is consistent with the traffic study analysis of the truck routes.

4-31
- 31. Figure 2 - Figure 2 shows a proposed walking trail as part of the project. Will this be open to the public and identify the maintenance responsibility of this trail.

Irvine Ranch Water District
Paul Cook, General Manager
15600 Sand Canyon Ave.
Irvine, CA 92618-3100

Dear Mr. Cook:

**RE: City of Newport Beach Support for the Syphon Recycled Water Reservoir Project;
Comments on Draft Environmental Impact Report**

The City of Newport Beach is in support of Irvine Ranch Water District's efforts to increase its recycled water reservoir storage capacity. Recycled water provides many benefits to our community and to the region. It preserves our drinking water supplies and reduces the amount of treated sewage from being discharged into the watershed.

The City and the District have had a long-standing agreement regarding the protection of water quality in the San Diego Creek Watershed. One of the goals and understandings of the agreement was that IRWD would continue to work towards increasing its reservoir storage capacity. Increasing the storage capacity reduces the risk of an emergency situation where IRWD must divert recycled water into the San Diego Creek Watershed (and into Newport Harbor). The improvement and expansion of Syphon Recycled Water Reservoir has been an important project to alleviate this risk and something the City has supported for some time.

The improvement and expansion of the Syphon Recycled Water Reservoir is now undergoing a public review of its Draft Environmental Impact Report. The key features of the project are to replace the dam to the latest safety standards and to raise its height. This will increase the recycled water storage capacity from 500 acre-feet to 5,000 acre-feet. The City of Newport Beach supports the proposed Syphon Reservoir Improvement Project and supports the Draft Environmental Impact Report.

Thank you for the opportunity to comment on the plan and report. If you have any questions, please feel free to contact me at (949) 644-3001 or Mark Vukojevic, Utilities Director at (949) 644-3011.

Sincerely,

Grace Leung, City Manager
City of Newport Beach

 SR 241 PM 27.496

Dear Ms. Corey,

Thank you for including the California Department of Transportation (Caltrans) in the review of the Draft Environmental Impact Report (DEIR) for the Syphon Reservoir Improvement Project in the Irvine Ranch Water District. The mission of Caltrans is to provide a safe and reliable transportation network that serves all people and respects the environment.

The proposed Syphon Reservoir Improvement Project (proposed project) would increase the capacity of the existing recycled water reservoir from approximately 500 acre-feet (AF) to 5,000 AF. The proposed project would replace the existing engineered dam with a new engineered dam, increasing the existing 59-foot dam height to 136 feet and increasing the elevation of the dam crest from the existing 388 feet above mean sea level (amsl) to 466 feet amsl. A spillway would be included with the new dam to protect the reservoir from overtopping. As part of the new design, the engineered embankment dam would include a seepage control drainage system and a circulation system for the reservoir. The existing strainer and disinfection facilities would be demolished, reconstructed, and expanded at the toe of the new dam to provide filtration and disinfection. Additional project features include new onsite access and maintenance roads; wetland and riparian mitigation areas; and a potential recreational facility.

The proposed project would be built within the Irvine Ranch Water District (IRWD) service area at the site of the existing Syphon Reservoir, which is currently a recycled water storage reservoir. Syphon Reservoir is located in the

6-1

 Page 2

unincorporated County of Orange, California, on the northeast side of Portola Parkway between Bee Canyon Access Road, State Route 133 (SR 133), and State Route (SR 241). The majority of the property bounded by these thoroughfares is owned by IRWD, however, both SR 133 and SR 241 are owned and operated by Caltrans. Caltrans is a responsible agency and has the following comments:

Subject: Comments on the Draft Environmental Impact Report for the Syphon Reservoir Improvement Project (SCH #2019080009)

Dear Ms. Corey:

The California Department of Fish and Wildlife (CDFW) has reviewed the above-referenced Draft Environmental Impact Report (DEIR) for the Syphon Reservoir Improvement Project (Project), located in the County of Orange, California. The following statements and comments have been prepared pursuant to CDFW's authority as a Trustee Agency with jurisdiction over natural resources affected by the project (California Environmental Quality Act [CEQA] Guidelines § 15386) and pursuant to our authority as a Responsible Agency under CEQA Guidelines section 15381 over those aspects of the proposed project that come under the purview of the California Endangered Species Act (Fish and Game Code § 2050 *et seq.*) and Fish and Game Code section 1600 *et seq.* CDFW also administers the Natural Community Conservation Planning (NCCP) program. The Irvine Ranch Water District (IRWD) participates in the NCCP program through its role as a Participating Landowner under the County of Orange Central and Coastal Subregion Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP).

The proposed Project would be built within the IRWD service area at the site of the existing Syphon Reservoir, located on the northeast side of Portola Parkway between Bee Canyon Access Road and State Route 133. The project would expand the reservoir's recycled water storage capacity from its current 500 acre-feet capacity to approximately 5,000 acre-feet by replacing the current 59-foot-high earthen engineered dam with a 136-foot-high dam of similar construction. Project implementation will result in permanent impacts to 115.56 acres of natural habitat and temporary impacts to 2.27 acres of natural habitat as described in Table 3.3-3 of the DEIR. This includes permanent impacts to 12.28 acres of riparian and freshwater marsh habitat, up to 57.33 acres of upland communities characterized by a dominance or sub-dominance of coastal sage scrub (CSS) or that include CSS understory, 32.02 acres of habitat dominated by non-native vegetation, and 13.93 acres of open water. The majority of these impacts will occur within the habitat Reserve (Reserve) established by the NCCP/HCP and the area is additionally protected by use restrictions described in the January 4, 2010, Grant Deed that originally conveyed the property to IRWD (IRWD Doc. D0204). Exact acreages of in-Reserve impacts and Grant Deed impacts are not provided in the DEIR. Sensitive plants and wildlife species that were detected during surveys or have a moderate to high potential to occur on site and may be impacted by the Project include: Catalina mariposa lily (*Calochortus catalinae*), the state and federally endangered least Bell's vireo (*Vireo bellii pusillus*), the federally threatened coastal California gnatcatcher (*Poliophtila californica californica*; gnatcatcher), the California fully

7-1

Conserving California's Wildlife Since 1870

protected white-tailed kite (*Elanus leucurus*) and American peregrine falcon (*Falco peregrinus anatum*), and seven California Species of Special Concern (SSC) including yellow warbler (*Setophaga petechia*), yellow-breasted chat (*Icteria virens*), grasshopper sparrow (*Ammodramus savannarum*), Vaux's swift (*Chaetura vauxi*), northern harrier (*Circus hudsonius*), coastal whiptail (*Aspidoscelis tigris stejnegeri*), and San Diego desert woodrat (*Neotoma lepida intermedia*).

7-1
cont.

CDFW submitted comments on the Notice of Preparation (NOP) of a DEIR for the Project in a letter dated August 30, 2019. Comments included: 1) a reference to the ongoing discussions between IRWD, CDFW, and the U.S. Fish and Wildlife Service to develop an agreeable mitigation strategy to offset the anticipated Project impacts to biological resources; 2) a recommendation to limit any potential recreational use of the site to hiking and nature viewing due to the sensitive nature of the biological resources on site; and 3) a recommendation to provide written notification to CDFW for any impacts to rivers, streams, or lakes and to include adequate avoidance, mitigation, and monitoring commitments for impacts to riparian habitats in the final mitigation package for the Project. At the time of the NOP comment submittal, it was anticipated that our agencies would be able to develop an agreeable mitigation strategy in time for inclusion in the DEIR. While we continue to have ongoing meetings and discussions, an agreeable strategy has not been finalized at this time. The recommendations regarding recreational use have been incorporated into the DEIR.

7-2

As described in the 2019 comment letter and the DEIR, we anticipate the final mitigation strategy to ultimately include a combination of use of in-Reserve take credits that were allocated to IRWD as part of their contributions to the development of the NCCP/HCP as a Participating Landowner, off-site acquisition and permanent conservation and management, as well as possible on site or off site restoration with long term funding for management, and restoration of any temporary impacts. CDFW recognizes the progress that IRWD has made in addressing our concerns with the Project's impacts to habitat that was previously used as mitigation for the Transportation Corridor Agencies (TCA) Eastern Transportation Corridor Project and to sensitive species on-site. We appreciate the continued coordination and anticipate reaching an agreeable holistic solution to mitigate Project impacts that includes off-site acquisition and conservation and will ensure the Project remains consistent with the requirements of the NCCP/HCP. Once finalized, we recommend that the details of the final mitigation package, including those components that will minimize and mitigate impacts to any river, stream, or lake, be included in the Final EIR for public review before final certification and Project approval.

In addition to the above recommendation and our continued participation in discussions to develop an agreeable mitigation strategy for Project impacts, CDFW offers the following comments for IRWD's consideration in Project planning and to help avoid and minimize potential project impacts to biological resources.

1. Two species that have been previously observed using the site, American peregrine falcon and white-tailed kite, are listed as fully protected species under Fish and Game Code Section 3511. Given the status of both species, we recommend designing and implementing the Project to ensure complete avoidance if either is detected on site. While it is unlikely either species will utilize the site for nesting, if any nesting individuals are detected during pre-construction surveys or at any time during Project implementation, we recommend immediately notifying CDFW to determine whether additional avoidance measures, beyond what is required in Mitigation Measure BIO-3, are necessary and appropriate. This may include but are not limited to, expansion of the

7-3

Jo Ann Corey
 Irvine Ranch Water District
 May 18, 2021
 Page 3 of 4

- avoidance buffer beyond 500 feet and/or the rescheduling of construction activities to prioritize low disturbance activities during the nesting period.
2. Section 2.5 of the DEIR indicates most construction activities would be limited to 7:00 a.m. to 7:00 p.m. Monday through Friday, and 9:00 am to 6:00 p.m. on Saturday; however, construction outside of these hours may occur if a waiver from the appropriate entity can be secured. Nighttime construction activity requires the use of high intensity lighting, can produce noise levels well beyond the ambient conditions, requires additional human presence on site, and may lead to a decrease in the effectiveness of minimization and avoidance measures due to an inability to detect and avoid wildlife. These disturbances can cause short-term and long-term responses to wildlife including a disruption in foraging behavior and increased predation risk (Beier 2006), disorientation and altered reproduction (Longcore and Rich 2004), spatial displacement and avoidance (George and Crooks 2006, Patten and Burger 2018), and mortality via roadkill and vehicle collisions (Beier 2006). In addition, when the disturbance activity has been ongoing throughout the day and continues into the night, the opportunity for any form of temporal avoidance of the disturbance by wildlife is reduced, increasing the likelihood of a negative response. Given the sensitive nature of the biological resources on site, including those species that are not covered under the NCCP/HCP (e.g., yellow warbler, yellow-breasted chat, grasshopper sparrow, white tailed kite, and Vaux’s swift), and the potential negative impacts that nighttime construction activities may have on these species, we recommend adhering to the proposed construction hours and avoiding any late night or overnight activities (i.e., activities between the hours of 07:00 p.m. to 07:00 a.m.) Activities conducted during the twilight hours immediately before or after sunset should also be limited to those activities that produce minimal noise (i.e., less than 60 decibels) and that do not require heavy reliance on artificial lighting to minimize the potential for impacts during these hours.
 3. As referenced above, it is CDFW’s understanding that the final agreed upon mitigation strategy for the Project may include on-site or off-site restoration and long-term management. In consideration of the Project site’s burn history and the historic observations of cactus wren prior to the 2007 Santiago Fire (DEIR Section 3.3.1 pp. 3.3-22), should on-site restoration be included, we recommend the final restoration plan include targeted augmentation of the few remaining cactus patches left on site as well as additional creation of cacti-dominated vegetation. The restoration, enhancement, and establishment of suitable nesting habitat continues to be recognized as a priority management action for the recovery of cactus wren within the NCCP/HCP Plan Area (Leatherman 2018) and such efforts may encourage future recolonization of the site by the species. In addition to targeted restoration of cactus scrub vegetation, CDFW recommends any understory seeding of forb species within any on-site restoration include Catalina mariposa lily, when appropriate based on soil types. Although impacts to the species are covered under the NCCP/HCP, its inclusion in a restoration seed mix requires minimal additional effort and has the potential to expand the existing population of a species with a California Rare Plant Rank of 4.2 and one that is considered “fairly threatened in California” as determined by the California Native Plant Society.
 4. Section 2.4.1 of the DEIR indicates the downstream slope of the earthen dam will consist of grass to provide for erosion protection during rainfall events. If seeding of the downstream slope is necessary to achieve the desired vegetative cover for erosion protection purposes, then CDFW recommends IRWD consider use of a native forb and

↑ 7-3
cont.

7-4

7-5

7-6
↓

Jo Ann Corey
 Irvine Ranch Water District
 May 18, 2021
 Page 4 of 4

grassland seed mix to provide foraging benefits to sensitive species that utilize the conserved open space surrounding the Project area. Future operations and maintenance of the dam would be covered under the Infrastructure Policies (NCCP/HCP Section 5.9) and would not require further mitigation beyond reseeding of temporary impact areas, as would be necessary absent native vegetation. The use of a native grassland and forb mix is also not expected to increase the potential for nesting by listed species as compared to an annual grassland dominated landscape, nor is it likely to increase the risk of nesting by grassland specialists since many of these species readily nest in habitat dominated by annual grasslands.

7-6
 cont.

We appreciate the opportunity to comment on the DEIR and look forward to the development of an agreeable mitigation plan that appropriately addresses project impacts and ensures project consistency with the NCCP/HCP. If you have any questions or comments regarding this letter, please contact Kyle Rice at (858) 467-4250, or Kyle.Rice@wildlife.ca.gov.

Re: Syphon Reservoir Improvement Project Draft Environmental Impact Report (SCH No. 2019080009)

Dear Ms. Corey:

In a letter dated September 12, 2019 to the Irvine Ranch Water District ("IRWD") in response to the Notice of Preparation ("NOP") of a Draft Environmental Impact Report ("DEIR") for the Syphon Reservoir Improvement Project ("Project"), the Foothill/Eastern Transportation Corridor Agency ("F/ETCA" or "Agency") acknowledged the NOP and requested that the Agency receive all future communication for the Project ("TCA Letter"). The Agency has reviewed the DEIR and has the following comments:

8-1

1. Executive Summary, Table ES-1 (Summary of Impact and Mitigation Measures), Page ES-17

Mitigation Measure BIO-1, as related to Impact 3.3-1, listed on Table ES-1 states as follows: "IRWD has been engaged in close coordination with the Wildlife Agencies (i.e., USFWS and CDFW) since 2018 to develop a multi-faceted mitigation strategy to address impacts to California gnatcatcher, as well as to address the additional mitigation the agencies mandate to compensate for displacement of habitat and land previously set aside for mitigation and subject to the restrictions and requirements imposed under the Mitigation Grant Deed, of which USFWS is a third party beneficiary."

8-2

However, as previously noted in the TCA Letter, pursuant to Section 6 of that certain Grant Deed from The Irvine Water Company LLC to IRWD, dated January 4, 2010 and recorded in the Official Records of Orange County on January 4, 2010 as Instrument No. 2010000000111 ("IRWD Grant Deed"), the F/ETCA is an intended third-party beneficiary of various covenant, conditions and restrictions ("CC&Rs"), to which the Project site is subject to. Please correct the statement above and any other references to indicate that F/ETCA is also a third-party beneficiary of the "Mitigation Grant Deed". The F/ETCA also requests that the Agency be included in all such ongoing coordination efforts.

125 Pacifica, Irvine, CA 92618 • 949.754.3400

TheTollRoads.com

Members: Aliso Viejo • Anaheim • Costa Mesa • County of Orange • Dana Point • Irvine • Laguna Hills • Laguna Niguel • Laguna Woods • Lake Forest
Mission Viejo • Newport Beach • Orange • Rancho Santa Margarita • San Clemente • San Juan Capistrano • Santa Ana • Tustin • Yorba Linda

2. Chapter 2, Page 2-25, Table 2-1 Titled Discretionary Permits or Approvals Potentially Required

As noted in the TCA Letter and above, the Project site is subject to the CC&Rs. Pursuant to Section 7.2 of the IRWD Grant Deed, no termination, amendment, modification or extension of any provision of the CC&Rs can be made without the prior written consent of the F/ETCA. Please correct “Transportation Corridor Agency” to refer to the “Foothill/Eastern” Transportation Corridor Agency” under the agency column of Table 2-1. The F/ETCA is looking forward to receiving IRWD’s proposal regarding the amendment of the IRWD Grant Deed.

8-3

3. Chapter 3, Section 3.3.1 (“Environmental Setting”), Page 3.3-3

Pursuant to that certain Grant Deed from the F/ETCA to The Irvine Company LLC, dated January 4, 2010 and recorded in the Official Records of Orange County on January 4, 2010 as Instrument No. 2010000000110 (“F/ETCA Grant Deed”), the F/ETCA reserved a permanent easement on and across the Project site together with the right of ingress and egress over the property for purposes of trapping, monitoring and related activities. As generally noted in Section 3.3 titled Biological Resources and described in the F/ETCA Grant Deed, the F/ETCA runs a cowbird trapping program. These activities are performed in compliance with multiple Biological Opinions on the effects of the Eastern Transportation Corridor referred to in further detail in the F/ETCA Grant Deed. For the F/ETCA to comply with its ongoing permitting obligations, the Agency will continue to require access to the property at issue.

8-4

4. Chapter 3, Mitigation Measures, Page 3.3-45, Paragraph BIO-1

Please see comment 1 above.

8-5

5. Chapter 3, Mitigation Measures, Pages 3.3-45 and 3.3-46, Paragraphs BIO-2(a) and BIO-3(a)

The F/ETCA recommends that the breeding season listed in BIO-2a (February 15 - July 15) be updated to match the nesting season listed in BIO-3a (February 15 - August 31, or January 15 - July 31 for raptors) and capture a more conservative range for the nesting season.

8-6

6. Appendix C- Biological Resources Technical Report, Section 1.2 Page 5

In Section 1.2, the IRWD again recognizes that it must obtain approval from the F/ETCA and the United States Fish and Wildlife Service (“USFWS”) and provides: “[s]ince 2018, IRWD has been engaged with USFWS and CDFW regarding appropriate options that will satisfy these agencies with regard to mitigation for upland habitat in consideration of the Grant Deed provisions as well as the relevant NCCP/HCP requirements.” (emphasis added) While it seems that the IRWD has

8-7

already approached the USFWS and been engaged with the USFWS regarding appropriate options that would satisfy the agency, the IRWD has yet to begin discussions with the F/ETCA to ensure that the Agency's rights are preserved and required activities can continue.

↑ 8-7
cont.

We request IRWD to continue to provide the Agency with (i) notice of any public meetings or proposed actions by IRWD regarding the Project or the CC&Rs, (ii) notice and copies of any draft amendment or modification of the IRWD Grant Deed or the CC&Rs, and (iii) copies of any draft or final environmental documents related to the Project site.

↑ 8-8

Thank you for the opportunity to comment on the DEIR. If you have any questions or require further information, please do not hesitate to contact me at 949.560-0943 or via email (dspeirs@thetollroads.com) or Virginia Gomez at 949.754-3487 or via email (vgomez@thetollroads.com).

Subject: Irvine Unified School District Comments on Draft Environmental Impact Report (DEIR) for Syphon Reservoir Improvement Project (State Clearinghouse No. 2019080009) **“REVISED”**

Dear Ms. Corey:

The Irvine Unified School District (District) has reviewed the document referenced in our letter dated May 10, 2021 and obtained clarification on our previous comments. As a result, the District has no further comments on the DEIR for the Syphon Reservoir Improvement Project.

9-1

Please accept this **“REVISED”** letter as the District’s official response; this supersedes the District’s letter dated May 10, 2021.

If you have any questions, please contact me at (949) 396-5305 or kelvinokino@iusd.org.

Sincerely,

Kelvin K. Okino

Subject: Syphon Reservoir Improvement Project

Dear Jo Ann Corey,

Thank you for the opportunity to comment on the Notice of Availability of an Environmental Impact Report for the Syphon Reservoir Improvement Project. The County of Orange offers the following comment for your consideration.

10-1

Flood Programs/Floodplain Management & Hydrology Section

1. Per Section Water Quality Control Plan or Sustainable Groundwater Management Plan (p.3-9-31), the document states “Additionally, and as previously discussed, the waste discharge requirements of the NPDES dewatering discharge permit, as well as conditions for discharge into the existing Portola Parkway storm drain, managed by Orange County Flood Control District.” Please revise this sentence since the Portola Parkway storm drain is owned and maintained by the City of Irvine.

10-2

If you have any questions regarding these comments, please contact Alison Camara at (714) 647-3961 or Steven Giang at (714) 667-8816 in OC Development Services.

10-3

Sincerely,

Richard Vuong

COMMENTS RE: Syphon Reservoir Improvement Project Draft EIR dated March 19, 2021

The Syphon Reservoir Improvement Project Draft EIR dated March 19, 2021 is deficient in the following manner:

1. **The EIR fails to establish a need for the expanded reservoir.** A Comment letter submitted at the time of the preparation of the EIR requested that the EIR address this need by projecting the recycled water reservoir needs using 50 gallons per person inside consumption out over a 20 year period. The 50 Gallons per day amount is now being proposed by DWR to go to 45 gallons per day per person and the Freeman proposed legislation is calling for 40 gallons per person per day. The calculations should now address the lower of those numbers. Reduced in house consumption reduces the generation of recycled water and the need to build added winter storage.

In a similar manner the EIR fails to address projected demands and timing of these needs on the recycled system over at least a 20 year period in using dry, normal and wet weather in each case. This will determine the amount of recycled water needed in each type of year.

By comparing the supply against the likely demand it will be possible to project the amount of shortages of supply and storage. The EIR should also analyze the alternatives that would reduce any surplus supplies of recycled water such as increasing the supplies to the OCWD Green Acres project; by sinking water either by injection or surface percolation into the Irvine Sub Groundwater Basin; or by releasing excess supplies into the Santa Ana River

during storm events by using the Green Acres pipeline. These alternatives and others appear to be less costly and reasonably achievable.

↑ 11-2
cont.

The EIR is not clear as to whether the supply of wastewater being converted to recycled water includes that which is currently being discharged and treated by the Orange County Sanitation District (OC San). If included in calculating the supply available the cost to execute this and the impacts of doing so should be included in this EIR. Also the impacts to OC San and the OCWD should be addressed.

11-3

The EIR fails to address the ability of IRVINE LAKE to capture water and store that water during wet years and the ability to purchase and store untreated imported water from MWDSC to supplement the recycled water supply. The District has invested considerably in Storage Programs in Kern County so it can use this water during extreme dry years when MWDSC might otherwise limit imports.

11-4

The EIR fails to calculate and disclose the impacts of increasing recycled water supplies on its ability to pump groundwater within the OCWD groundwater basin. During critically dry periods the BASIN PRODUCTION PERCENTAGE is subject to decreases which currently increases the penalties to be paid for over pumping and makes recycled water less affordable.

11-5

2. The EIR fails to address the impact of placing a significantly larger number of homes in a flood zone if the expanded reservoir should fail in a future event. It is not clear if this possibility would require these homes to purchase FLOOD INSURANCE.

11-6

3. It is unclear if the EIR on table 5-2 is adding the recycled water being generated by the Los Alisos treatment plant to the amount being addressed in this EIR. If this is the case then the cost and impacts of connecting this system should be addressed in the EIR.

11-7

4. The EIR fails to address the cost impacts to the rate payer and tax payer of the projects being contemplated in expanding the reservoir.

11-8

- 5. The EIR fails to address the energy needed to pump water to the expanded reservoir over the use of either imported supplies or Irvine Lake Native water that can be delivered by gravity.**

11-9
- 6. The EIR fails to address the impact to the Irvine Sub Basin and to the landscaping being watered by the added recycled water caused by higher levels of salt than that of MWDSC imported water or IRVINE LAKE**

11-10
- 7. The EIR failed to seriously address the suggestion in my comments to the EIR preparation that providing the OCWD Green Acres Program and the GWRS treatment facility with recycled water would be cheaper than expanding Syphon Reservoir.** Currently Green Acres water is sold for about the same cost as MWDSC Untreated water. IRWD provides water to the Green Acres Project and can sell it there less than the current cost while recovering most of the cost on MWDSC Untreated water thus continuing to fully utilize its recycled water while reducing its energy use and improving the quality of the Irvine Sub Basin. The effect would be to lower the average TDS of the Green Acres Project and to free up supplies to feed the GWRS plant.

11-11
- 8. The EIR failed to address the visual impact of the expanded reservoir.** If built it would tower over a large, recently completed housing area and would become one of the two most prominent features in the Irvine community along with the Bee Canyon Dump.

11-12
- 9. The EIR failed to include a map of the area that would be flooded in the event of a failure of the expanded dam along with an assessment of the monetary damage caused by such a failure.**

11-13
- 10. The EIR failed to demonstrate a cost savings to the rate payers of expending a minimum of \$140 million other than it could satisfy some rather arbitrarily established objectives that were not mandated on the IRWD District.**

11-14

Syphon Reservoir Improvement Project Draft EIR

Public Meeting Comments

April 21, 2021

Verbal Comments Made at Public Meeting

Commenter 1: Claire Na [39:40]

I live near the Syphon Reservoir and was very pleased to learn that you are committed to being a good neighbor and that any potential impacts of the project could be mitigated. I especially appreciate your plan to expand the reservoir because it will protect us against future droughts, and ensure that we have enough water during dry summer seasons.

12-1

Commenter 2: Evan Hsiao [41:00]

We know the water change in the reservoir could increase the probability of fault movement. Have we considered the risks of seismicity for the project?

12-2

Commenter 3: Zihai Li [41:40]

I live in Irvine and I am also president of the Chinese American Mutual Association. Thank you for sharing all the analysis you have done for the Draft Environmental Impact Report. I attended the last meeting when you first started, and there were a lot of concerns about flooding, so I really like the flood research you have done so far to ensure the safety of the project.

12-3

Written Comments Made at Public Meeting

Commenter 4: Zihai Li

Hello my name is Zihai Li and I live in Irvine. I am the founder of “I Love Irvine” Chairwoman of the Chinese American Mutual Assistance Association. Thank you for all the analysis that you are doing to ensure that this is a safe project for our community. Very nice in the work you have done on the Draft Environmental Impact Report.

12-4

Commenter 5: Evan Hsiao

Can the inundation map include the inundation depth contour?

12-5

CHAPTER 10

Responses to Comments

This chapter contains the responses to the comment letters received during the 60-day public review period for the Syphon Reservoir Improvement Project Draft EIR, which are listed in Table 9-1 in Chapter 9. The letters are included in Chapter 9 and have been bracketed and numbered. The responses to comments are provided below and are labeled to correspond to the comment letters and numbers that appear in the margins of the comment letters in Chapter 9.

Where the responses indicate additions or deletions to the text of the Draft EIR, additions are included as underlined text, deletions as ~~stricken text~~. The revisions do not substantially alter the conclusions in the Draft EIR.

IRWD has attempted to respond to all comments. However, it should be noted that some comments seek to raise issues which do not involve environmental impacts and are, therefore, beyond the scope and purpose of the Draft EIR. [*Mani Brothers Real Estate Group v. City of Los Angeles* (2007) 153 Cal.App.4th 1385, 1401: “The focus of CEQA, both procedurally and substantively, is ‘solely ... the potential environmental impacts of a project’”]. Such comments do not warrant or require a response. [*Browning-Ferris Industries v. City Council* (1986) 181 Cal.App.3d 852, 862: The EIR need not respond to each comment made during the review process, but it must specifically respond to the most significant environmental issues raised].

Letter 1: Phong Huynh, Irvine Resident

Response 1-1

The Draft EIR includes a discussion of flood insurance in the Executive Summary on page ES-11 and in Section 3.9, Hydrology and Water Quality on page 3.9-9. As stated in the Draft EIR, “the federal government does not require flood insurance for any properties due to Syphon Reservoir in its current or proposed form” (Draft EIR, page 3.9-9). Therefore, there would be no insurance-related deductibles or rate increases associated with Syphon Reservoir in its current or proposed form. The residential areas downstream of Syphon Reservoir are not within the 100-year flood hazard area mapped by the Federal Emergency Management Agency (FEMA) on its Flood Insurance Rate Maps. The residential areas downstream of Syphon Reservoir are in Zone X, defined by FEMA as an area of minimal flood hazard, which is the lowest possible rating for flood risk (Draft EIR, page 3.9-9).

The 100-year flood (the flood that has a 1 percent-annual-chance of being equaled or exceeded) mapped on FEMA’s Flood Insurance Rate Maps is intended for insurance, floodplain management, and planning efforts. Dam breach inundation zones are not shown on Flood Insurance Rate Maps as areas requiring flood insurance because the probability of failure of a

dam is extremely rare compared to the 1 percent chance of a 100-year flood. This is true of the Syphon Reservoir Improvement Project, which is being designed to avoid dam failure and associated downstream consequences.

Response 1-2

Please refer to Response 1-1 above.

Response 1-3

Currently, the proposed project does not include recreational fishing. As stated in the Draft EIR on page 2-13, the Syphon Reservoir Improvement Project may include passive recreational facilities compatible with the project site. The recreational facilities may include a walking trail along existing access roads at the project site. The appropriateness and location of the proposed walking trail would be determined during final design and would require coordination and approval from regulatory agencies, including U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Wildlife (CDFW).

Response 1-4

The temporary impacts to ambient noise levels during project construction are discussed in the Draft EIR on pages 3.10-17 to 3.10-24. The impacts of construction noise to sensitive receptors such as existing residences and schools would not be significant during project construction.

The temporary impacts to traffic during project construction are discussed in the Draft EIR on pages 3.12-11 to 3.12-13. During construction of the new access road and intersection improvements at the Sand Canyon Avenue/Portola Parkway intersection, IRWD would implement a Traffic Control Plan, to be approved by the City of Irvine, to mitigate potential delays due to temporary lane closures and to ensure detours for bikers and pedestrians traveling along Portola Trail.

Letter 2: Orange County Fire Authority

Response 2-1

The comment is noted for the record.

Letter 3: Scott Turner, Irvine Resident

Response 3-1

Similar to existing conditions, the proposed project would store tertiary-treated recycled water that is produced at IRWD's Michelson Water Recycling Plant (WRP) at Syphon Reservoir (see Draft EIR Figure 1-3). As explained in the Draft EIR on page 2-10 and 2-12, as recycled water enters the Syphon Reservoir from the Michelson WRP, the water would be dechlorinated with sodium bisulfite prior to entering the reservoir for storage. As water is withdrawn from storage, filters would screen out debris (algae, leaves, etc.) that may have entered the reservoir during storage. The proposed onsite disinfection facility would add sodium hypochlorite prior to re-introduction of the water into IRWD's recycled water distribution system.

Letter 4: City of Irvine

Response 4-1

The comment is noted for the record.

Response 4-2

During implementation of intersection improvements at Sand Canyon Avenue and Portola Parkway, IRWD will coordinate with the City of Irvine and secure all necessary approvals and permits.

Response 4-3

The Syphon Reservoir Improvement Project may include passive recreational facilities compatible with the project site. The recreational facilities may include a walking trail along existing access roads at the project site. If implemented, IRWD anticipates that the walking trail would be open to the public. However, the appropriateness and location of the proposed walking trail would be determined during final design and would require coordination and approval from regulatory agencies, including USFWS and CDFW. Access to and maintenance of the walking trail would be the responsibility of IRWD as the land owner.

Response 4-4

As stated above in Response 4-3, the walking trail would be on IRWD property. Access to the trail would be controlled by IRWD, and maintenance would be the responsibility of IRWD.

Response 4-5

As stated in the Executive Summary of the Draft EIR on page ES-3, the proposed project would allow IRWD to maximize the use of recycled water produced at the Michelson WRP rather than discharging it to OCSD or to the ocean for disposal:

While IRWD's existing reservoirs provide storage for recycled water, once the storage reservoirs are full to capacity in winter months, recycled water supplies are either diverted to Orange County Sanitation District (OCSD) or discharged to the ocean. Under such conditions, IRWD is left short of recycled water to meet customer demands and must then purchase costly supplemental imported water from MWD to meet the summer demands of IRWD's recycled water customers. Based on projected demands and supplies, IRWD estimates that it will need approximately an additional 4,500 AF by the year 2030. (Draft EIR, page ES-3)

Response 4-6

The Draft EIR acknowledges the potential applicability of the Drainage Area Management Plan and Water Quality Management Plan on page 3.9-16. During the design phase of the project, IRWD will coordinate with the County of Orange and City of Irvine to secure all necessary approvals and permits.

Response 4-7

IRWD has conducted a robust public outreach plan for the Syphon Reservoir Improvement Project as summarized in Chapter 8 of this Final EIR. Consistent with what IRWD has done with

similar sized construction projects, IRWD would prepare a construction outreach plan for this project once the project has received all appropriate approvals and permits. The construction outreach plan would be implemented prior to and throughout the construction phase of this project. Outreach would include general website updates, targeted resident notifications (door hangers, emails and/or direct mailings), use of IRWD's monthly newsletter, and, as appropriate, use of various social media platforms (Facebook, YouTube, Twitter, etc.). Throughout construction, IRWD staff would be available to the community to answer questions, respond to concerns, and provide project briefings upon request.

Response 4-8

In response to the comment, IRWD has included a second visual assessment from a viewpoint within the Stonegate neighborhood, in addition to Viewpoint B from Stonegate Park that is included in the Draft EIR (see Figure 3.1-5). A new viewpoint and visual simulation have been added from Sherwood Street, which is within the Stonegate neighborhood. The new figures and accompanying text have been added to this Final EIR in Chapter 11.

Response 4-9

Mitigation Measure AES-1 applies to aboveground built structures associated with the proposed project and is not intended to address vegetation or landscaping. With the exception of the dam face, any temporary disturbance of vegetation onsite would be restored in accordance with mitigation measures included in the Draft EIR in Section 3.3, Biological Resources. As stated in the Draft EIR on page 2-5, “[s]imilar to the existing dam, the vegetation on the downstream slope would consist of grass and would provide erosion protection from rainfall runoff.” The intended revegetation of the dam slope that is visible from offsite vantage points is illustrated in the visual simulations included in the Draft EIR in Figure 3.1-4 through 3.1-7. The California Department of Water Resources, Division of Safety of Dams (DSOD) regulates the type of vegetation that can be planted on and around the proposed dam. Although not required to mitigate a significant impact, in response to the comment, IRWD will prepare and coordinate as necessary with other entities, a landscaping plan for the project that would partially screen visibility of the project when walking or driving along Portola Parkway.

Response 4-10

The Draft EIR includes a discussion of flood insurance in the Executive Summary on page ES-11 and in Section 3.9 Hydrology and Water Quality on page 3.9-9. As stated in the Draft EIR, “the federal government does not require flood insurance for any properties due to Syphon Reservoir in its current or proposed form” (Draft EIR, page 3.9-9). The residential areas downstream of Syphon Reservoir are not within the 100-year flood hazard area mapped by FEMA on its Flood Insurance Rate Maps. The residential areas downstream of Syphon Reservoir are in Zone X, defined by FEMA as an area of minimal flood hazard, which is the lowest possible rating for flood risk (Draft EIR, page 3.9-9).

The 100-year flood (the flood that has a 1 percent-annual-chance of being equaled or exceeded) mapped on FEMA's Flood Insurance Rate Maps is intended for insurance, floodplain management, and planning efforts. Dam breach inundation zones are not shown on Flood Insurance Rate Maps as areas requiring flood insurance because the probability of failure of a

dam is extremely rare compared to the 1 percent chance of a 100-year flood. This is true of the Syphon Reservoir Improvement Project, which is being designed to avoid dam failure and associated downstream consequences.

Response 4-11

The box culvert referred to by the commenter is located at the western end of the existing storm drain shown on Figure 3.9-1 (see orange line).

Response 4-12

In response to the comment, the Draft EIR text on page 3.9-13, is revised as follows:

“It is anticipated that if groundwater were to be encountered during the proposed project’s excavation, groundwater would be dewatered and conveyed to proposed onsite settling ponds or discharged to the existing storm drain, if necessary, pursuant to the conditions and requirements in Order Number: R8-2019-006107-044; NPDES Number: CAG918002 (Santa Ana RWQCB 200919).”

The reference for the permit is revised in the Draft EIR on page 3.9-35, as follows:

“~~Santa Ana RWQCB. 2019 n.d. Adopted Order R8-2019-006109-0045~~ General Waste Discharge requirements WDRs for Groundwater Discharges to Surface Waters Resulting from De Minimus Discharges, Groundwater Dewatering Operations, and/or Groundwater cleanup/Remediation Operations at Site within the San Diego Creek/Newport Bay Watershed. Amendment of Order No. R8-2007-0041. Available at https://www.waterboards.ca.gov/santaana/board_decisions/adopted_orders/orders/2019/R8-2019-0061.pdf ~~https://www.waterboards.ca.gov/santaana/board_decisions/adopted_orders/orders/2009/09_045_amendment_of_order_r8_2007_0041_SanDiegoCreek_NewportBayWatershed.pdf~~ Accessed ~~May~~ April 27, 2020.”

Response 4-13

In response to the comment, the following edit to the Draft EIR is made on page 3.9-15 to 3.9-16:

Orange County Municipal Storm Water Permit [MS4]

The Orange County Municipal Storm Water Permit (MS4) applies to the proposed project (Municipal NPDES Permit No. CAS 618030, Order No. R8-2009-0030 - NPDES Waste Discharge Requirements for the County of Orange, Orange County Flood Control District and the Incorporated Cities of Orange County within the Santa Ana Region, Areawide Urban Storm Water Runoff, Orange County). The NPDES municipal general permits issued by the RWQCB establish regulations covering discharge prohibitions, receiving water limitations, municipal operations (~~such as the proposed project~~), new development, construction site controls (construction site runoff), and other regulations to regulate surface water quality (RWQCB 2009). The discharge prohibitions prohibit the discharge of non-stormwater (materials other than stormwater) into storm drain systems and watercourses and includes a tiered

categorization of non-stormwater discharges based on potential for pollutant content that may be discharged upon adequate assurance that the discharge contains no pollutants of concern at concentrations that will impact beneficial uses or cause exceedances of water quality standards. The receiving water limitations provide narrative and numeric water quality standards. The municipal operations regulations include a number of requirements to control and reduce non-stormwater discharges and polluted stormwater to storm drains and watercourses during operation, inspection, and routine repair and maintenance activities of municipal facilities and infrastructure. The requirements include source control, site design, and stormwater treatment requirements, such as minimizing disturbance of natural infiltration areas and the addition of impervious surfaces, controlling and directing runoff, and the use of infiltration and bioretention measures, among other measures. To more efficiently address the requirements, the permittees within the County of Orange, which includes the City of Irvine, developed the Drainage Area Management Plan (DAMP), described below. ~~The MS4 permit applies to the proposed project because (1) the area downgradient (west) of the dam would drain stormwater to the County of Orange.~~

Response 4-14

In response to the comment, the following edit to the Draft EIR is made on page 3.9-31:

Additionally, and as previously discussed, the proposed project would comply with the terms of the NPDES Construction General Permit, the waste discharge requirements of the NPDES dewatering discharge permit, as well as conditions for discharge into the existing Portola Parkway storm drain, ~~managed by Orange County Flood Control District~~. All of these require various measures discussed above in Impact 3.9-1 to prevent degradation of water quality, which would be consistent with the Basin Plan and the Basin 8-1 Alternative. Therefore, impacts relative to the Basin Plan and the alternative sustainable groundwater management plan would be less than significant.

Response 4-15

In response to the comment, for information purposes, Table 3.10-8 was arranged so that the receivers are in the order shown in Figure 3.10-2. The table as shown below has been reorganized to show the receptors based on the distance from the project site in ascending order (from left to right). It should be noted that changes have not been made in ~~strikeout/underline~~ because the construction noise values and have not been revised.

TABLE 3.10-8
ESTIMATE OF CONSTRUCTION NOISE LEVELS (L_{EQ}) AT EXISTING OFF-SITE SENSITIVE RECEIVER LOCATIONS

Construction Phase ^{a, b}	Receiver (Distance in feet from construction activity)

Response 4-16

The Draft EIR concludes on pages 3.10-19 and 3.10-20 that mitigation measures are not required to reduce noise impacts during project construction. The comment notes that noise levels at the closest sensitive receptor (R1, Crean Lutheran Athletic Complex at 55 feet) would potentially experience construction noise levels of 89 dBA Leq, which would exceed the City's Noise Ordinance standards for Noise Zone 1 if the receptor were in the City of Irvine. This sensitive receptor is located northeast of Portola Parkway, and thus is located in the County of Orange and not in the City of Irvine. Therefore, sensitive receptor R1 is not subject to the City of Irvine Noise Ordinance.

In addition, IRWD understands that the City of Irvine Noise Ordinance does not include numerical thresholds for construction activity noise (Draft EIR, page 3.10-21) and includes allowable construction hours, between 7:00 a.m. to 7:00 p.m. Mondays through Fridays, and 9:00 a.m. to 6:00 p.m. on Saturdays. Construction noise is exempt from the City's noise thresholds during these time periods (Municipal Code Section 6.8.205). There is no specific limit on construction noise levels. Construction that would occur outside of these hours would require a waiver from the City, as acknowledged in the Draft EIR on page 3.10-21.

Consistent with many other IRWD projects constructed in the City of Irvine, IRWD would use best management practices and work with the construction crews to minimize noise whenever possible. As noted in Response 4-7 above, IRWD would have a robust construction outreach plan for this project. As a part of this plan, IRWD staff would be available to the community to answer questions, respond to concerns, and provide project briefings, as necessary.

In response to concerns raised in the comments regarding construction noise and to reduce noise levels, IRWD has committed to include the following construction best management practices, incorporated into the project as Project Design Features (PDF) N-1 and N-2, that would provide noise attenuation effects to noise-sensitive receptors in the vicinity of the project site, including those in the City of Irvine:

PDF N-1: Control of Construction Hours. Construction activities occurring as part of the project will be subject to the hours of day limitations that allows for construction activities to occur between 7:00 a.m. and 7:00 p.m. Mondays through Fridays,

and between 9:00 a.m. and 6:00 p.m. on Saturdays. No construction activities shall be permitted outside of these hours or on Sundays and federal holidays unless any required temporary waiver is received.

PDF N-2: Noise Control. IRWD shall incorporate the following measures to ensure that specific noise sources are controlled.

- Construction equipment, fixed or mobile, shall be equipped with properly operating and maintained noise mufflers consistent with manufacturers' standards.
- Construction staging areas shall be located at least 100 feet away from off-site sensitive uses during project construction.
- The project contractor shall place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site, whenever feasible.

As explained in the Draft EIR, the proposed project will not have any significant noise impacts (see the Draft EIR, page 3.10-17 through 3.10-24).

Response 4-17

Please refer to Response 4-16 above. In response to concerns raised in the comments regarding construction noise, IRWD has committed to include construction best management practices, incorporated into the project as Project Design Features (PDF) N-1 and N-2, that would provide noise attenuation effects to noise-sensitive receivers in the vicinity of the project site, including those in the City of Irvine, and reduce noise levels. The Project Design Features (PDF) N-1 and N-2 are described Response 4-16.

Response 4-18

Please refer to Response 4-16 above. In response to the comment, the off-site construction noise modeling analysis was reviewed. It was noted that the noise modeling files overestimated the off-site construction noise levels in Table 3.10-9. The off-site construction traffic noise modeling files in the Draft EIR (see Appendix B of the Noise and Traffic Technical Report, included as Appendix D to the Draft EIR) used daily worker and daily truck trip input values instead of peak hour trip input values, which resulted in construction phase scenarios that used higher truck trip input values than intended. This led to higher noise levels than would reasonably be expected to occur.

Corrections have been made to the analysis for this Final EIR by dividing the daily worker trip values by two, which conservatively assumes that all workers arrive in the same hour and depart in the same hour. The haul truck trip model input values have been corrected in this Final EIR by dividing the daily truck trip values by eight, which reflects haul trucks traveling to and from the project over an eight-hour work period. The corrected off-site construction noise levels are provided in a revised Table 3.10-9, provided below, and a corrected Appendix B to the Noise and Traffic Technical Report is also included in this Final EIR. As shown in the revised Table 3.10-9, off-site construction noise levels would not exceed 70 dBA Leq along any modeled roadway segment. As shown, project construction would generate roadway noise levels ranging from

approximately 52.9 dBA Leq to 64.8 dBA Leq along the various modeled roadway segments. As shown in the City's General Plan Noise Element, roadway noise levels at year 2020 conditions at roadway segments in the vicinity of those modeled for the project exceed the project's noise contribution. As shown in Table F-3 of the City's Noise Element, Irvine Boulevard at Yale Avenue/Jeffery Road and west of Alton Parkway was modeled to be 71.7 and 71.2 dBA CNEL, respectively at 100 feet from the centerline. Sand Canyon Avenue north of Marine Way was modeled to be 68.6 dBA CNEL at 100 feet from the centerline. The Portola Parkway and State Route 133 segments in Table 3.10-9 were not specifically modeled in the General Plan Noise Element. However, these roadways have a similar or greater number of travel lanes as those that were modeled and would be expected to have similar roadway noise levels. In particular, Portola Parkway is expected to have a similar roadway noise level as Sand Canyon Avenue given it has a similar number of travel lanes and that it directly intersects at a "T" intersection with Sand Canyon. Thus, project off-site construction noise levels would be sufficiently low as to not substantially contribute to the General Plan roadway noise levels. No mitigation measures are required, and further analysis is not warranted.

**TABLE 3.10-9
ESTIMATE OF CONSTRUCTION TRAFFIC NOISE LEVELS (L_{EQ}) AT EXISTING OFF-SITE SENSITIVE RECEIVER LOCATIONS**

Construction Phase	Roadway Segment (Distance in feet from construction activity)			
	Portola Pkwy, between SR- 133 and Paragon (60 feet) dBA, Leq	Sand Canyon Ave, between Portola Pkwy and Irvine Blvd (40 feet) dBA, Leq	Irvine Blvd, between San Canyon Ave and Native Spring (55 feet) dBA, Leq	SR-133, between Irvine Blvd and SR- 241 (80 feet) dBA, Leq
Vegetation Clearing Access Routes/Intersection Improvements	70.7 <u>62.2</u>	71.6 <u>63.0</u>	72.0 <u>63.5</u>	71.2 <u>62.7</u>

NOTES:

Construction schedule and truck traffic information provided by the project applicant.
Detailed traffic noise calculations are provided in Revised Appendix D.

SOURCE: ESA 2021

Response 4-19

Construction noise causes localized effects and affects receivers within the immediate vicinity of the project site. The analysis of cumulative impacts in the Draft EIR on pages 3.10-26 and 3.10-27 considers the Gateway Community Park and Truck Route Roadway Rehabilitation project.

Please refer to Response 4-16 above that explains why the Syphon Reservoir Improvement Project would not result in significant noise impacts, and as a result would not contribute to cumulative noise impacts. In addition, please refer to Response 4-16 above for the Project Design Features that would be implemented as part of the Syphon Reservoir Improvement Project and would serve to attenuate noise levels in the event that the proposed project, Gateway Community Park, and the Truck Route Roadway Rehabilitation project are constructed simultaneously.

Response 4-20

On page 3.12-13 of the Draft EIR, Mitigation Measure TRA-1 would require IRWD to implement a Traffic Control Plan that would identify partial and full lane closures. The Traffic Control Plan would be prepared in accordance with the City of Irvine’s traffic control guidelines and would ensure that congestion and traffic delays are not substantially increased as a result of project construction activities.

Response 4-21

The proposed project would add an access road to the Syphon Reservoir site on the north side of the intersection of Sand Canyon Avenue and Portola Parkway, which would necessitate modifications to the signaling of the traffic lights and pedestrian signals, and restriping of traffic lanes, turning lanes, crosswalks and bike lanes. Repaving of Sand Canyon Avenue and Portola Parkway is not anticipated; however, as stated in the Draft EIR on pages 2-15 and 2-25, the intersection modification would be performed in accordance with the City of Irvine’s requirements and approvals.

Response 4-22

Mitigation Measure TRA-1 states that the “Traffic Control Plan shall be prepared in accordance with the City of Irvine’s traffic control guidelines.” As a result, if the City’s guidelines include requirements for standard working hours and lane closures, these shall be incorporated into the Traffic Control Plan.

Response 4-23

In response to the comment, the text description of Route 1A and Route 1B on Page 3 of the Transportation Impact Analysis Report has been revised to be the same as page 21. A Revised Appendix E, Transportation Impact Analysis Report is included with this Final EIR.

- Route 1A – I-5 (from the north), ~~south~~-north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the north) for trucks traveling outbound.
- Route 1B – I-5 (from the south), ~~south~~-north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the south) for trucks traveling outbound

Response 4-24

In response to the comment, the Transportation Impact Analysis Report, included as Revised Appendix E, has been revised on page 20 to provide more clarity about the daily trip generation of the construction phases outside the peak phase as follows:

This level of trip generation is anticipated to occur for approximately two to three months. Trip generation outside of this phase ~~would be reduced with approximately 30 daily to 154 daily trips being generated~~ of construction would vary depending on the level of activity associated with the given phase of construction. Daily trip generation for the other phases of construction range from approximately 30 daily trips to 154 daily trips.

Response 4-25

In response to the comment, information regarding the construction timeline as presented in the Draft EIR has been added to the Timeline section on page 21 of the Transportation Impact Analysis Report, Revised Appendix E, as follows:

Construction of the Project is estimated to require a total of approximately 41 months. The preconstruction activities would begin in the fall of 2022 and would involve approximately 5 months of access road improvements. Preconstruction would be followed by approximately 36 months for construction of the new dam, reservoir, and associated facilities, depending on weather conditions and other variables. Construction is currently anticipated to begin in 2023. The proposed Project is assumed to be operational by end of 2026.

Response 4-26

The site plan for the proposed modifications to the intersection of Sand Canyon Avenue and Portola Parkway has not been developed yet and would be part of the final project design. The Draft EIR includes a general description of the proposed modifications and states that they would be implemented in accordance with the City of Irvine requirements (see Draft EIR page 2-12). As stated in the Transportation Impact Analysis report, the project will meet the intent of TDP-14 for Driveway Lengths by constructing an access road with a gate at least 500 feet away from the intersection, which exceeds the recommendation of a 50-foot driveway based on TDP-14.

Response 4-27

IRWD included the City of Irvine's Truck Route Roadway Rehabilitation Project as Cumulative Project 9 (Draft EIR, page 3-14), which was incorporated into the cumulative impacts' analysis throughout Chapter 3, Environmental Setting, Impact Analysis, and Mitigation Measures. Additionally, during implementation of intersection improvements at Sand Canyon Avenue and Portola Parkway, IRWD will coordinate with the City of Irvine and secure all necessary approvals and permits.

Response 4-28

In response to the comment, the bicycle improvements and coordination recommendations on pages 54 and 55 have been included in the Improvements section of the Transportation Impact Analysis Report, Revised Appendix E. The following paragraph is inserted on page 59 after the first paragraph as follows:

Bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine

requirements. The Project will not affect any planned bicycle facilities in the study area. Minor improvements to facilitate bicycle circulation such as “BIKES MAY USE FULL LANE” signage, shared arrow advance warning signage, and other suggested methods that provide advance warning to both vehicular drivers and bicyclists will be included in the traffic control plans generated for the intersection construction.

Response 4-29

As described in the Draft EIR on page 3.12-3 and as shown in the accompanying Figure 3.12-1, none of the three roadways (Portola Parkway, Irvine Boulevard, Sand Canyon Avenue) travel in a true north/south direction. The descriptions included in the Draft EIR on page 3.12-3 indicate the correct direction of travel (e.g., northeast/southwest or northwest/southeast) for vehicles and pedestrians traveling along these roadways.

Response 4-30

In response to the comment, the text of the Draft EIR on page 3.12-3 is revised as follows:

Notable features along Portola Parkway include bike lanes on both the northbound and southbound sides of the roadway, and a separated sidewalk, known as the Portola Side Path, on the southbound side of the roadway. The only sidewalk on the northbound side is between Sand Canyon and the Crean Lutheran High School Sports Complex. There is no sidewalk on the northbound side.

Response 4-31

The Transportation Impact Analysis Report evaluates truck routes on Sand Canyon Avenue, Irvine Boulevard, I-5, and SR-133, as described for the Study Area Boundary on page 3. In addition, the Transportation Impact Analysis Report also evaluates potential construction-related impacts to intersections at Portola Parkway, Sand Canyon Avenue, Irvine Boulevard, I-5, SR-133, and other roadways such as Trabuco Road and Marine Way, as shown in Figure 2. Accordingly, the text of the Draft EIR on pages 3.12-12 and 4-12 includes a general analysis of average daily trips on roadways in the immediate vicinity of the proposed project and for which truck routes and intersections are analyzed in the Transportation Impact Analysis Report.

Response 4-32

Please refer to Response 4-3 above.

Letter 5: City of Newport Beach

Response 5-1

The comment expressing support for the proposed project is noted for the record.

Letter 6: California Department of Transportation

Response 6-1

The comment is noted for the record.

Response 6-2

The Draft EIR includes a discussion of the potential effects of construction-related traffic to SR-133 on pages 3.12-12 and 3.12-13. The Draft EIR concludes that the proposed project would not have a significant impact on local circulation system performance (including SR-133) from construction-related trips.

Response 6-3

In response to the comment, Figure 3.12-1 has been revised to include freeways/highways and is included in Chapter 11 of this Final EIR.

Response 6-4

The Draft EIR includes a discussion of the evaluation of whether the proposed intersection modification would affect the safety of pedestrians and bicyclists on page 3.12-16. The Draft EIR concludes that the proposed project would reconstruct pedestrian and bicycle facilities at the Sand Canyon Avenue and Portola Parkway intersection, to maintain existing access while following City of Irvine requirements to ensure that no safety hazards are created. Thus, there are no significant impacts to the safety of pedestrians and bicyclists.

Response 6-5

If the proposed project requires work within or near a State right-of-way, IRWD would coordinate with Caltrans in accordance with all laws and regulations and secure encroachment permits if necessary.

Response 6-6

Please refer to Response 6-5 above.

Letter 7: California Department of Fish and Wildlife

Response 7-1

The comment is noted for the record.

Response 7-2

The comment requests that the Final EIR for the proposed project include the final mitigation package. As noted in the comment, IRWD, CDFW and USFWS have had ongoing meetings and discussions regarding mitigation of impacts to wetland and freshwater marsh habitat, coastal sage scrub (CSS), and other habitats within the Reserve for the County of Orange Central and Coastal Subregion Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) since 2018.

Prior to making certain commitments for the final mitigation package for the Syphon Reservoir Improvement Project, IRWD's Board of Directors must first consider whether to certify the Final EIR and approve the Project. Therefore, the final mitigation package cannot be part of the Final EIR. Once the Final EIR is certified and the Project is approved, IRWD would proceed with the commitments required to complete the final mitigation package, which may include property acquisitions. Once IRWD develops a final mitigation package that is acceptable to CDFW, USFWS, and TCA, IRWD will evaluate whether subsequent CEQA documentation is required.

Response 7-3

The Draft EIR notes that the American peregrine falcon and white-tailed kite were observed foraging or flying over the project site by previous studies (Draft EIR, pages 3.3-22, 3.3-38). Neither species is known to nest in the immediate area and the falcon is rarely found nesting in Orange County. Therefore, it is considered extremely unlikely that peregrine falcon might nest on site. Regarding white-tailed kite, the project area contains suitable foraging habitat but the potential for this species to nest on site also is not high, particularly due to the Silverado Fire that burned the project site at the end of October 2020. Currently, there is less tree cover around the reservoir than in 2018, and no coast live oak trees, which kites tend to favor for nest sites. Implementation of proposed mitigation (Mitigation Measure BIO-3) would prevent any impacts to these species, if found to nest on the project site, by prohibiting construction or other disturbance within 500 feet of an active kite or falcon nest. In addition, although not required by Mitigation Measure BIO-3, IRWD will notify CDFW if either species is found to nest on site.

Response 7-4

IRWD is not expecting to conduct nighttime or overnight construction activities as part of normal construction operations for the proposed project. The Draft EIR includes this potential scenario only to cover any urgent or other unforeseen circumstances that could temporarily require construction activities, for limited periods of time, outside of the construction hours permitted by the City of Irvine and County of Orange noise ordinances.

Response 7-5

As noted in the comment, IRWD is anticipating the need to implement on-site habitat restoration as part of the project mitigation strategy. The comment requests that IRWD include augmentation of existing on-site cactus patches as well as seeding of additional cacti-dominated vegetation. Although not required as mitigation, in response to the comment, IRWD will integrate CDFW's request into the final mitigation package.

In addition, the comment requests that any understory seeding of forb species within any on-site restoration also include Catalina mariposa lily, when appropriate based on soil types. As noted in the comment, and in the Draft EIR (page 3.3-21), the Catalina mariposa lily is a Covered Species under the NCCP/HCP. As a result, the Draft EIR concludes that impacts to Catalina mariposa lily are less than significant, and no mitigation is required (Draft EIR, pages 3.3-37 to 3.3-38). IRWD understands that seed for this species is not available "off the shelf." Seed for the Catalina mariposa lily would need to be collected from the on-site population, which would require multiple surveys and collection trips during bloom periods that vary for this bulb each year. Given this relative uncertainty regarding IRWD's ability to ensure seed can be procured, and at a reasonable cost, IRWD will further discuss this recommendation with CDFW as part of its ongoing coordination of the final mitigation package.

Response 7-6

As stated in the Draft EIR on page 2-5, "[s]imilar to the existing dam, the vegetation on the downstream slope would consist of grass and would provide erosion protection from rainfall runoff." The California Department of Water Resources, Division of Safety of Dams (DSOD) regulates the type of vegetation that can be planted on and around the proposed dam. IRWD will

accommodate CDFW's request to consider using native forb and grassland species appropriate for the site to include in the seed mix to the extent such materials will meet the requirements of DSOD.

Response 7-7

The comment is noted for the record.

Letter 8: Foothill/Eastern Transportation Corridor Agency

Response 8-1

The comment is noted for the record.

Response 8-2

The Draft EIR includes an explanation of the Grant Deed and the mitigation project that was implemented on the project site by the Transportation Corridor Agencies (TCA) for the Eastern Transportation Corridor project (see page 3.3-3 and Figure 3.3-1). The Draft EIR states on page 3.3-3:

When IRWD acquired Syphon Reservoir from the Irvine Company (TIC), the Conveyance Agreement included a Grant Deed with use restrictions to protect biological resources within the area that was used for mitigation for the TCA (as shown in Figure 3.3-1)...Since completion of the restoration program in 2000, on-site management of biological resources was limited to annual cowbird trapping (which is required in perpetuity) and few additional studies, including a cactus transplantation and subsequent cactus wren monitoring in the northwest portion of the property.

Implementation of the proposed project is anticipated to require a legal transaction to modify the Grant Deed. IRWD will coordinate with TCA as a third-party beneficiary regarding the proposed final mitigation package for the Project as required (see Letter 7, Response 7-2 above), to modify the Grant Deed.

Response 8-3

In response to the comment, Table 2-1 on page 2-25 of the Draft EIR is modified as follows:

**TABLE 2-1
DISCRETIONARY PERMITS OR APPROVALS POTENTIALLY REQUIRED**

Agency	Permits and Authorizations Required
California Department of Fish and Wildlife (CDFW)	Streambed Alteration Agreement, Fish and Game Code, Section 1602
California Department of Water Resources, Division of Safety of Dams	Dam Safety Inspection and Approval
State Water Resources Control Board; Regional Water Quality Control Board	Compliance with the National Pollutant Discharge Elimination System (NPDES) General Construction Permit, SWPPP Construction Dewatering Permit
State Historic Preservation Officer (SHPO)	National Historic Preservation Act Section 106 compliance
U.S. Fish and Wildlife Service (USFWS); CDFW	NCCP/HCP Compliance (provides Coverage under the Federal Endangered Species Act and Section 2080.1 under California Endangered Species Act)

Agency	Permits and Authorizations Required
Foothill/Eastern Transportation Corridor Agency; USFWS	Mitigation Grant Deed Approval
City of Irvine	Approval <u>Encroachment Permit</u> for Portola Parkway/Sand Canyon Avenue intersection modification

Response 8-4

In accordance with the F/ETCA Grant Deed, the Agency will continue to be granted access to the project site to continue with its cowbird trapping program in compliance with its permitting obligations.

Response 8-5

Please refer to Response 8-2 above.

Response 8-6

The breeding season that is included in Mitigation Measure BIO-2a is specific to the coastal California gnatcatcher. As required by Mitigation Measure BIO-3a, preconstruction nesting surveys for all species, including gnatcatchers, would be required during a broader time period, ranging from February 15 to August 31.

Response 8-7

Please refer to Response 8-2 above. Implementation of the proposed project is anticipated to require actions to modify the Grant Deed. IRWD will coordinate with TCA as a third-party beneficiary regarding the proposed final mitigation package for the Project as required by CDFW and USFWS (see Letter 7, Response 7-2 above), to modify the Grant Deed.

Response 8-8

The comment is noted for the record.

Letter 9: Irvine Unified School District**Response 9-1**

The comment is noted for the record.

Letter 10: Orange County Public Works**Response 10-1**

The comment is noted for the record.

Response 10-2

In response to the comment, the following edit to the Draft EIR is made on page 3.9-31:

Additionally, and as previously discussed, the proposed project would comply with the terms of the NPDES Construction General Permit, the waste discharge requirements of the NPDES dewatering discharge permit, as well as conditions for discharge into the existing Portola Parkway storm drain, ~~managed by Orange~~

~~County Flood Control District~~. All of these require various measures discussed above in Impact 3.9-1 to prevent degradation of water quality, which would be consistent with the Basin Plan and the Basin 8-1 Alternative. Therefore, impacts relative to the Basin Plan and the alternative sustainable groundwater management plan would be less than significant.

Response 10-3

The comment is noted for the record.

Letter 11: Peer Swan

Response 11-1

The Draft EIR includes an explanation of the purpose and need for the proposed project on page 2-3. The purpose of the proposed project is to increase the recycled water storage capacity at Syphon Reservoir in order to meet the seasonal demand of recycled water customers and to enhance IRWD's water supply reliability. Based on projected demands and supplies, IRWD estimates that it will need 4,500 AF of additional recycled water storage capacity by the year 2030 to meet demand. The expansion of Syphon Reservoir's storage capacity from the current 500 AF to approximately 5,000 AF would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water during summer months, and would increase the use of recycled water to maintain community landscaping, as well as agricultural, business and industrial uses.

The comment notes the request made by Director Swan during the NOP comment period, to project IRWD's recycled water needs over 20 years based on certain assumptions for consumption per person. In response to the NOP comments, an evaluation of alternative project scenarios and associated life cycle costs was performed by HDR (HDR 2020). The evaluation of project scenarios and costs are cited in the Draft EIR in Chapter 6, Alternatives Analysis (Draft EIR, page 6-6).

Response 11-2

The Draft EIR includes a discussion of the OCWD Green Acres Project in Chapter 6, Alternatives Analysis, on page 6-6. The Draft EIR includes an explanation of why the Green Acres Project was considered but rejected as a feasible project alternative. The Green Acres Project and the other concepts listed in the comment would not feasibly attain most of the primary objectives for the proposed project.

Response 11-3

As stated in the Draft EIR, the proposed project would store recycled water that is already being produced at IRWD's existing Michelson WRP and is discharged to either Orange County Sanitation District, Orange County Water District, or the ocean when storage facilities are full in winter months (see Draft EIR page 2-3). The purpose of the Draft EIR is to evaluate the potential impacts of the proposed project on the environment. The California Environmental Quality Act (CEQA) does not require that an EIR include an analysis of project costs. Please refer to the

evaluation performed by HDR (HDR 2020) that includes project scenarios and associated life cycle costs, as mentioned above in Response 11-2.

Response 11-4

The Draft EIR mentions the purchase of untreated imported water on page 2-3:

During the dry summer season, when irrigation demands are highest, service area demand for recycled water depletes existing reservoir storage and exceeds the rate at which new recycled water is produced by the WRPs. IRWD must then purchase costly supplemental imported water from Metropolitan Water District of Southern California (MWD) to meet the seasonal demands of IRWD's recycled water customers.

The groundwater storage projects that are suggested by the comment include IRWD's Strand Ranch Integrated Banking Project, Stockdale Integrated Banking Project, and Kern Fan Groundwater Storage Project in Kern County. These projects are not alternatives for the proposed project because they do not provide water on an annual basis in a reliable manner to supplement the recycled water supply or meet annual demand. The objectives for the groundwater storage projects in Kern County are to provide water during certain conditions, such as drought or emergency conditions, and are intended to serve potable water demands rather than recycled water demands of IRWD's customers.

Response 11-5

As stated above, CEQA does not require that an EIR include an analysis of project costs. However, the evaluation performed by HDR (HDR 2020) included an assessment of the cost impact of the ability to pump groundwater. This evaluation was presented to the Board of Directors at the February 5, 2021 Strategic Planning Meeting.

Response 11-6

The Draft EIR includes a discussion of flood insurance in the Executive Summary on page ES-11 and in Section 3.9 Hydrology and Water Quality on page 3.9-9. As stated in the Draft EIR, "the federal government does not require flood insurance for any properties due to Syphon Reservoir in its current or proposed form" (Draft EIR, page 3.9-9). The residential areas downstream of Syphon Reservoir are not within the 100-year flood hazard area mapped by FEMA on its Flood Insurance Rate Maps. The residential areas downstream of Syphon Reservoir are in Zone X, defined by FEMA as an area of minimal flood hazard, which is the lowest possible rating for flood risk (Draft EIR, page 3.9-9).

The 100-year flood (the flood that has a 1 percent-annual-chance of being equaled or exceeded) mapped on FEMA's Flood Insurance Rate Maps is intended for insurance, floodplain management, and planning efforts. Dam breach inundation zones are not shown on Flood Insurance Rate Maps as areas requiring flood insurance because the probability of failure of a dam is extremely rare compared to the 1 percent chance of a 100-year flood. This is true of the Syphon Reservoir Improvement Project, which is being designed to avoid dam failure and associated downstream consequences.

Response 11-7

Table 5-2 of the Draft EIR shows IRWD's recycled water supply and demand for its entire service area, as projected in IRWD's 2015 Urban Water Management Plan. The recycled water supply shown in Table 5-2 includes both the Michelson WRP and the Los Alisos WRP. However, the proposed project would only store recycled water produced at the Michelson WRP, as explained in the Draft EIR on page 2-1. CEQA does not require that an EIR include an analysis of costs.

Response 11-8

The purpose of the Draft EIR is to evaluate the potential impacts of the proposed project on the environment. CEQA does not require that an EIR include an analysis of project costs. Please refer to the evaluation performed by HDR (HDR 2020) that includes project scenarios and associated life cycle costs, as mentioned above in Response 11-2.

Response 11-9

The Draft EIR estimates the amount of energy required to operate the proposed project on page 2-24. The analysis of the proposed project's potential impacts to energy resources compared to imported water is included in the Draft EIR in Chapter 3.5, Energy, on page 3.5-12.

Response 11-10

The Draft EIR includes an analysis of the proposed project's potential impacts to total dissolved solids (TDS) due to greater use of recycled water within IRWD's service area on page 3.9-21 and 3.9-22. The proposed project would result in an increase in the amount of recycled water available to dual-plumbed commercial buildings for toilet flushing and cooling towers, which could affect the TDS concentrations of the recycled water produced at the Michelson WRP. A mass balance analysis was conducted and described in the Draft EIR on page 3.9-22; the proposed project may result in a slight increase in TDS concentrations at the Michelson WRP, anticipated to be no more than 1 to 2 mg/L, which would be considered less than significant impact to water quality.

Response 11-11

The Draft EIR includes a discussion of the OCWD Green Acres Project in Chapter 6, Alternatives Analysis, on page 6-6. The Draft EIR includes an explanation of why the Green Acres Project was considered but rejected as a feasible project alternative. The Green Acres Project would not feasibly attain most of the primary objectives for the proposed project.

The comment cites the comments made by Director Swan during the NOP public review period. In response to the NOP comments, an evaluation of alternative project scenarios and associated life cycle costs was performed by HDR (HDR 2020) and provided to Director Swan. The evaluation of project scenarios and costs are cited in the Draft EIR, Chapter 6, Alternatives Analysis (page 6-6).

Response 11-12

The Draft EIR includes four visual simulations of the expanded reservoir and dam in Section 3.2, Aesthetics. The visual simulations are included in the Draft EIR as Figures 3.1-4 through 3.1-7.

Please also see an additional fifth visual simulation that is being included in the Final EIR in response to a comment made by the City of Irvine (see Letter 4, Response 4-8 above).

Response 11-13

The Draft EIR includes inundation maps in Section 3.9, Hydrology and Water Quality. Figure 3.9-3 shows the inundation area for the existing Syphon Reservoir. Figure 3.9-4 shows the inundation area for both the existing and proposed enlarged Syphon Reservoir. The residential areas downstream of Syphon Reservoir are not within the 100-year flood hazard area mapped by FEMA on its Flood Insurance Rate Maps. The residential areas downstream of Syphon Reservoir are in Zone X, defined by FEMA as an area of minimal flood hazard, which is the lowest possible rating for flood risk (Draft EIR, page 3.9-9).

The 100-year flood (the flood that has a 1 percent-annual-chance of being equaled or exceeded) mapped on FEMA's Flood Insurance Rate Maps is intended for insurance, floodplain management, and planning efforts. Dam breach inundation zones are not shown on Flood Insurance Rate Maps as areas requiring flood insurance because the probability of failure of a dam is extremely rare compared to the 1 percent chance of a 100-year flood. This is true of the Syphon Reservoir Improvement Project, which is being designed to avoid dam failure and associated downstream consequences.

Response 11-14

The purpose of the Draft EIR is to evaluate the potential impacts of the proposed project on the environment. CEQA does not require that an EIR include an analysis of project costs. The objectives of the Syphon Reservoir Improvement Project have been established and informed by substantial technical analyses and reports completed as part of the development of the proposed project and described in the Draft EIR in Section 1.5.3, Syphon Reservoir Studies and Reports (page 1-13). The results of the technical analyses, including the objectives of the project, were presented to the IRWD Board of Directors at multiple meetings and workshops, including the July 7, 2017 Strategic Planning Workshop, at which time the Board approved an authorization to commence the CEQA process and preliminary design in support of CEQA. An updated Syphon Reservoir Expansion analysis was presented at the February 5, 2021 Strategic Planning Workshop, after which the Board approved a budget increase and authorization to advance the design. A financial analysis showing the life cycle cost savings of the Syphon Reservoir Improvement Project was also included in the HDR evaluation (HDR 2020). This HDR evaluation was presented to the Board at the 2021 workshop.

Letter 12: Public Meeting Comment Transcript

Response 12-1

The comment is noted for the record.

Response 12-2

The Draft EIR includes an analysis of potential impacts related to seismic hazards in Section 3.6, Geology and Soils. The Draft EIR concludes that the inactive Central Valley Fault, which is

known to cross the proposed project site, has not experienced movement in the last 1.6 million years and has no potential for future movement (page 3.6-29).

Response 12-3

The comment is noted for the record.

Response 12-4

The comment is noted for the record.

Response 12-5

The modeling and analysis that generated the inundation maps included in the Draft EIR as Figures 3.9-3 and 3.9-4 do not provide the information required to create an inundation depth contour. The Draft EIR includes an explanation of how water depth can vary at each cross section shown on the figures (see Draft EIR pages 3.9-6 and 3.9-27).

This page intentionally left blank

CHAPTER 11

Revisions to the Draft EIR

This chapter presents revisions to the Draft EIR based on comments received during the comment period and District-initiated corrections made by IRWD. The following corrections and changes are made to the Draft EIR, and are incorporated herein as part of the Final EIR. Revised language or new language is underlined. Deleted language is indicated by ~~striketrough~~ text.

Revisions presented in this chapter are corrections and clarifications and do not significantly alter the proposed project, change the Draft EIR's significance conclusions, or result in a conclusion that substantially more adverse environmental impacts will result from the proposed project.

Specifically, CEQA Guidelines Section 15088.5 requires the lead agency to recirculate an EIR only when significant new information is added to the EIR after public notice is given of the availability of the Draft EIR for public review. New information added to an EIR is not significant unless the EIR has changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse, environmental effect of the project or a feasible way to mitigate or avoid such an effect that the project's proponents have declined to implement (CEQA Guidelines Section 15088.5).

In summary, significant new information consists of: (1) disclosure of a new significant impact; (2) disclosure of a substantial increase in the severity of an environmental impact; (3) disclosure of a feasible project alternative or mitigation measure considerably different from the others previously analyzed that would clearly lessen environmental impacts of the project, but the project proponent declines to adopt it; and/or (4) the Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded (CEQA Guidelines Section 15088.5). Recirculation is not required where the new information added to the EIR merely clarifies or amplifies or makes insignificant modifications to an adequate EIR (CEQA Guidelines Section 15088.5).

The changes below present information that clarifies the scope of the proposed project and the analysis of the proposed project's impacts, but the changes do not fundamentally alter the significance conclusions presented in the Draft EIR circulated for public review. The changes present information and analyses in response to comments and merely provide further details on the analyses already provided in the Draft EIR.

Chapter 2, Project Description

Page 2-10

A series of existing and proposed pipelines would be used to transport water to/from IRWD's existing recycled water distribution system to the enlarged reservoir. Recycled water would be delivered to Syphon Reservoir via an existing 36-inch recycled water pipeline and the Eastwood Recycled Water Pump Station, which is located off-site and currently under construction (see Figure 1-3). Currently, the existing 36-inch recycled water pipeline is only used for outlet of recycled water from the reservoir; the project would require bi-directional flow through this pipeline, allowing it to be used for inlet as well as outlet of recycled water, into and out of the enlarged reservoir, respectively. The existing 48-inch discharge pipeline would be used for emergency drainage (as described above under Section 2.4.1), similar to existing conditions. A new, approximately 42-inch, inlet/outlet conduit would be constructed to connect ~~two~~ several proposed inlet/outlet ports along the north-facing reservoir slope to the existing onsite 36-inch inlet/outlet pipeline that ends near the toe of the existing dam. The inlet/outlet ports allow for selective withdrawal of recycled water from the reservoir and provides IRWD with flexibility to select water from different heights in the reservoir based on water quality considerations. The inlet/outlet works will also consist of a masonry block control building located approximately 10-15 feet above the high water elevation of the reservoir at the end of the proposed access road. The control building is anticipated to be approximately 15 feet wide by 48 feet long (approximately 720 square feet), with an approximate height of 16 feet. The control building will house the compressors, instruments, and associated electrical components to remotely operate the inlet/outlet facilities. Pipelines and appurtenant facilities are shown on Figure 2-2 and Figure 2-3. The size and location of proposed pipelines are subject to change with final design. **Figure 2-5** is a diagram (not to scale) showing key features of the proposed dam and their elevation relative to the reservoir storage capacities and water surface.

Page 2-25

**TABLE 2-1
DISCRETIONARY PERMITS OR APPROVALS POTENTIALLY REQUIRED**

Agency	Permits and Authorizations Required
California Department of Fish and Wildlife (CDFW)	Streambed Alteration Agreement, Fish and Game Code, Section 1602
California Department of Water Resources, Division of Safety of Dams	Dam Safety Inspection and Approval
State Water Resources Control Board; Regional Water Quality Control Board	Compliance with the National Pollutant Discharge Elimination System (NPDES) General Construction Permit, SWPPP Construction Dewatering Permit
State Historic Preservation Officer (SHPO)	National Historic Preservation Act Section 106 compliance
U.S. Fish and Wildlife Service (USFWS); CDFW	NCCP/HCP Compliance (provides Coverage under the Federal Endangered Species Act and Section 2080.1 under California Endangered Species Act)

Agency	Permits and Authorizations Required
Foothill/Eastern Transportation Corridor Agency; USFWS	Mitigation Grant Deed Approval
City of Irvine	Approval <u>Encroachment Permit</u> for Portola Parkway/Sand Canyon Avenue intersection modification

Chapter 3, Section 3.1, Aesthetics

Page 3.1-3

Figure 3.1-1 identifies the ~~four~~ five viewpoints chosen to document the visual study area in and around the proposed project. **Figure 3.1-2, and Figure 3.1-3, and Figure 3.1-8** include existing views from those viewpoints.

Page 3.1-3

Figure 3.1-1 has been revised to add a viewpoint from Sherwood Street and Steinway Street in the Stonegate neighborhood.

Page 3.1-8

Figure 3.1-8 has been added to show existing views from Sherwood Street and Steinway Street in the Stonegate neighborhood.

Page 3.1-9

**TABLE 3.1-1
SUMMARY OF VISUAL QUALITY AND SENSITIVITY FINDINGS**

Viewing Location and Representative Photos	Visual Quality	Affected Viewers and Viewer Exposure Conditions	Visual Sensitivity
Viewpoint A (Figure 3.1-2)	Moderate	Moderate (19,000 daily motorists, as well as pedestrians/cyclists, for several minutes per trip)	Moderate
Viewpoint B (Figure 3.1-2)	Moderate	Moderate (approximately 1,000 daily users of the park/school, for 1-3 hours per day)	Moderate
Viewpoint C (Figure 3.1-3)	High	Low (46,700 daily motorists, for several seconds per trip)	Moderate
Viewpoint D (Figure 3.1-3)	Moderate	Moderate (19,000 daily motorists, as well as pedestrians/cyclists, for several minutes per trip)	Moderate
<u>Viewpoint E (Figure 3.1-8)</u>	<u>Moderate</u>	<u>Low (tends to hundreds of daily motorists, as well as pedestrians/cyclists, for several seconds or minutes per trip)</u>	<u>Low-Moderate</u>

Viewpoint E

Viewpoint E (Figure 3.1-8) is looking east to the hills from Sherwood Street and Steinway Street in the Stonegate neighborhood. The foreground view includes houses lining Steinway Street. The middleground provides views of the exiting Syphon Reservoir immediately to the east of Portola Parkway located just across the wall seen in the foreground. The background provides views of the “Lomas de Santiago” (commonly known as Loma Ridge), which is identified as a major ridgeline in Orange County (County of Orange 2005b).

Visual Quality. The visual quality of the area is typical of a residential area that borders open space at the northeastern-most portion of the City of Irvine. While the foreground views are exclusively within the Stonegate community and residential in nature, the hillsides in the middleground and background are unadulterated and provide the visual backdrop of a major ridgeline, Loma Ridge, identified by Orange County. Because the viewpoint is characteristic of typical residential areas within the northeastern portions of the City of Irvine and surrounding area, the existing visual quality is considered moderate (i.e., it is not lacking visual amenities but is not unique compared with the intended visual character of the area).

Affected Viewers and Exposure Conditions. Public views of the project site from this viewpoint are provided to relatively few residents walking and driving/biking along Sherwood Street and Steinway Street, which is an isolated area within the Stonegate neighborhood. The Stonegate neighborhood consists of over 1,000 single family homes and townhomes, however the viewpoint is located off a dead-end street that provides access to approximately 34 residences. There are trees and houses which partially obstruct views from this location. Direct unobstructed views of the proposed project site would be available for brief periods of time (i.e., seconds for vehicle passengers and minutes for pedestrians/cyclists) when motorists and pedestrians/cyclists are passing through the intersection of Sherwood Street and Steinway Street, or traveling along east along the short stretch of Steinway Street. Given that the view of the site is slightly unobstructed and would be observed by tens to hundreds of daily users of Sherwood and Steinway Streets, the viewer exposure is considered low.

Visual Sensitivity Conclusion. Because the view of the site from this area has moderate visual quality and low exposure to public views, it is considered to have low-to-moderate visual sensitivity.

Syphon Reservoir Improvement Project

Figure 3.1-8
Existing Views from Viewpoint E

Page 3.1-16**Visual Assessment**

This visual assessment is based on field observations of the project site and surroundings in addition to a review of topographic maps, aerial, and ground-level photographs of the project area. Additionally, visual simulations were prepared by Fuscoe Engineering, Inc., and ESA, to document the “before and after” visual conditions that could be experienced by implementation of the proposed project (see **Figures 3.1-4 through 3.1-7 and Figure 3.1-9**). To create the visual simulations, photographs were taken from each proposed viewpoint location described in Section 3.1.1 above. Data from each photograph was recorded, such as focal length, date and time of day, lens information, as well as geographic location. A 3D model was created of the proposed enlarged dam, reservoir, and access road using 3D Studio Max software, which was overlaid on each viewpoint photograph in order to demonstrate the visual change that would result from implementation of the proposed project, when viewed from the four public Viewpoints A, B, C, ~~and D,~~ and E. The visual assessment included in this section is based in part on these simulations.

Page 3.1-16

As explained in Section 3.1.1 Environmental Setting, there are several locally designated scenic vistas/viewsapes that encompass the project site:

The Loma Ridge and Santa Ana Mountains, which provide an eastern backdrop to the proposed project as shown in Viewpoints A, ~~and B,~~ and E, are identified as “dominant ridgelines” in the County of Orange; the Santa Ana Mountains is identified as the “signature landmark of Orange County.”

Page 3.1-20

Figure 3.1-9 has been added to show existing views and a visual simulation of the proposed project from Sherwood Street in the Stonegate neighborhood.

Syphon Reservoir Improvement Project

Figure 3.1-9
Existing View and Visual Simulation
of Stonegate Neighborhood from Viewpoint E

Page 3.1-21

The construction sequence would continue at the easternmost portion of the project site and move west as work progresses. While work occurs within the eastern and middle portions of the reservoir, and before excavation of the existing dam face begins, construction activities and large equipment would generally be shielded from view along Portola Parkway (Viewpoint A) and within the Stonegate neighborhood (Viewpoint E) by the walls of the existing dam. Views of construction equipment may be visible from SR 133 (Viewpoint C) during this time, which provide background views of the Santiago Hills, identified as a “major ridgeline of importance.” However, the construction equipment would be temporary and would not shield the background viewscape of the Santiago Hills. As a result, impacts would be less than significant.

When the existing dam is excavated, and as construction of the treatment facilities, new dam, spillway and other appurtenant facilities occur on the western portion of the project site, construction equipment and partially built features may be visible from public vantage points along Portola Parkway (Viewpoint A) and within the Stonegate neighborhood (Viewpoint E) that provide views of the “dominant ridgelines” of Loma Ridge and the larger Santa Ana Mountains in the background. However, the equipment would not have the scale or massing to significantly obstruct or provide contrast to the ridgelines in the background. As a result, impacts would be less than significant.

Page 3.1-21**Operation**

Once constructed, the existing 59-foot dam would be elevated to 136 feet in order to achieve water storage capacity of approximately 5,000 AF. The crest of the dam would be elevated from 388 feet amsl to 477 amsl. Other aboveground structures would include a spillway on the left abutment of the dam, an approximately 720 square foot inlet/outlet works control building behind the dam, and an approximately 6,400 square foot treatment facility at the toe of the dam. Visual simulations of the proposed dam are included in Figure 3.1-4 (from Viewpoint A) and Figure 3.1-5 (Viewpoint B), as well as in Figure 3.1-9 (Viewpoint E). Figure 3.1-6 (Viewpoint C) includes a visual simulation of the proposed maximum water surface elevation in the expanded reservoir. Other permanent contrasting features include pavement installed for the on-site access road and installation of a retaining wall behind the access road, as shown in the visual simulation in Figure 3.1-7 (Viewpoint D). All other aboveground structures, including the inlet/outlet works control building and the treatment facility, would either be obstructed by the dam itself or low in profile and would not affect scenic vistas or viewsapes.

Page 3.1-22

The proposed dam face would extend approximately 77 feet above the existing dam height. The enlarged dam would be the main project component that could obstruct the “dominant ridgelines” of the Loma Ridge or Santa Ana Mountains from public vantage

points within the City of Irvine; all other facilities would be below the dam crest. As shown in Figure 3.1-5, the enlarged dam would barely be visible from Stonegate Park and Stonegate Elementary School (Viewpoint B) due to the intervening vegetation and residences, and would not compromise existing views of the Loma Ridge or Santa Ana Mountains. However, as shown in Figure 3.1-4, the enlarged dam would extend higher than the natural ridgelines seen in the existing condition from the entrance to the Crean Lutheran High School Athletic Complex (Viewpoint A). Additionally, as shown in Figure 3.1-9, the enlarged dam would extend almost as high as the top of the natural ridgelines of Loma Ridge seen in the existing condition. The permanent impact to the viewscape of prominent ridgelines of Loma Ridge and the Santa Ana Mountains within the City of Irvine would be a potentially significant impact. The proposed project includes revegetation of the dam face as a project design feature, which would allow the enlarged dam to blend into the surrounding hillsides, as shown in Figure 3.1-4 and Figure 3.1-9. The types of vegetation used and associated maintenance would conform with DSOD requirements. Additionally, motorists, bicyclists and pedestrians would only experience temporary view obstruction for brief moments of time while passing the project site on Portola Parkway and on Sherwood Street and Steinway Street. And as shown in Figure 3.1-5, the view obstruction is minimized as distance away from the project site is achieved. With implementation of project design features, impacts would be reduced to a less than significant level.

Page 3.1-23 to 3.1-25

Construction

The public vantage points from which views of construction activities could occur are from Portola Parkway and Sand Canyon Avenue, the closest public rights-of-way to the west, and SR-133, the closest public right-of-way to the southeast. Views of construction activities also may be visible from within the Stonegate neighborhood as represented by views from Viewpoint E (Sherwood Street and Steinway Street). The visual sensitivity from Portola Parkway and Sand Canyon Avenue is considered moderate due to moderate visual quality and moderate viewer exposure. The visual sensitivity from the Stonegate neighborhood is considered low-to-moderate due to moderate visual quality and low viewer exposure. The visual sensitivity from SR-133 is considered moderate due to high visual quality and low viewer exposure. Due to the hillsides surrounding the existing reservoir where construction would occur, public views are otherwise limited.

Construction activities associated with the proposed project would result in temporary, short-term, impacts to the visual character and quality of the project area. Construction activities would require the use of construction equipment and materials such as scrapers, dozers, water wagons, rollers, graders, loaders, dozers, and trucks for the construction workers. All work within the existing reservoir footprint would generally be shielded from view along Portola Parkway and the Stonegate neighborhood by the walls of the existing dam. Construction activities associated with the proposed intersection improvements and construction of an on-site access road would be visible for a short duration (from a few seconds to several minutes) from the intersection of Portola Parkway and Sand Canyon

Avenue for the 5-month construction period; as work progresses northeast along the access route and into the project site, views would be shielded by existing topography from public rights-of-way. Views from SR-133 to the construction activities within the existing reservoir would be short in duration (a few seconds) and would not be perceivable to motorists passing by. Construction of the treatment facilities, new dam, spillway and other appurtenant facilities may be visible from public vantage points along Portola Parkway and within the Stonegate neighborhood. However, the majority of these features would be partially obstructed by the Crean Lutheran High School Athletic Complex. Additionally, the equipment would not have the scale or massing to significantly obstruct or provide contrast to the ridgelines in the background. The low contrasting visual elements of construction would be temporary and would not permanently affect the existing visual character and quality of the surrounding area. All impacts from construction-related activities would be less than significant.

Operation

Once constructed, the dam would be raised from its existing height of 59 feet to 136 feet in order to achieve water storage capacity of approximately 5,000 AF. The crest of the dam would be elevated from 388 feet amsl to 477 amsl. Other aboveground structures would include a spillway on the left abutment, an approximately 720 square foot inlet/outlet works control building behind the dam, and a 6,400 square foot treatment facility near the toe of the dam. Visual simulations of the proposed dam are included in Figure 3.1-4 (from Viewpoint A), and Figure 3.1-5 (Viewpoint B), and Figure 3.1-9 (Viewpoint E). Figure 3.1-6 (Viewpoint C) includes a visual simulation of the proposed maximum water surface elevation in the expanded reservoir. Visual simulations of the proposed on-site access road and retaining wall are included in Figure 3.1-7 (Viewpoint D). These figures compare existing views with simulated views after project implementation. The visual simulations show that the proposed new dam, expanded reservoir, and features such as the access road and retaining wall would be fully visible once operational from surrounding public viewpoints. A description of the simulated views in relation to visual character and quality is provided below per the screening criteria of visual obstruction, contrast, and alteration of natural resources.

For Viewpoint A (Figure 3.1-4), the existing visual sensitivity is considered moderate due to moderate visual quality and moderate viewer exposure. With the addition of the proposed dam as shown in the simulation, the ridgelines of the Santa Ana Mountains and Loma Ridge would be eliminated from this vantage point. These ridgelines are considered to have natural land form and open space value and contribute to the area's visual character and quality. No natural landforms would be regraded, altered, or otherwise destroyed as a result of project implementation because the existing dam is an artificial feature. The dam face would be revegetated as a project design feature, which would maintain consistency with the existing natural hillsides. The types of vegetation used and associated maintenance would conform with DSOD requirements. The proposed dam would not provide significant contrast nor alter color of the surrounding landscape. The proposed treatment facilities and the inlet/outlet works control building would be the only facilities installed aboveground other than the dam and associated

spillway. To ensure that all aboveground project structures would not impact the visual character or quality of the project site or surrounding area, Mitigation Measure AES-1 would require design of the aboveground project structures to have color palettes that blend in with the surrounding character of the project site. As a result, the proposed project would not modify the visual quality of the surrounding area. Direct unobstructed views of the proposed dam would be available for brief periods of time (i.e., seconds to several minutes) when approximately 19,000 daily motorist users, as well as pedestrians/cyclists, are passing the site. It is important to note that motorists traveling northwest/southwest on Portola Parkway would not view the site from the angle depicted in the viewpoint; the angle from Viewpoint A looking northwest would mainly be experienced by pedestrians/cyclists, with motorists experiencing a lesser degree of the project site due to the angle of the roadway. Given the lack of temporal frequency of public viewers and the revegetation of the dam face that would be consistent with the surrounding natural hillsides, the existing visual sensitivity of the view from this location would not be compromised. As a result, impacts to the established visual character and quality from this view as a result of project implementation would be less than significant with mitigation.

Page 3.1-26

For Viewpoint E (Figure 3.1-9), the existing visual sensitivity is considered low-to-moderate due to moderate visual quality and low viewer exposure. With the addition of the proposed dam as shown in the simulation, the ridgelines of the Santa Ana Mountains and Loma Ridge would be significantly reduced from this vantage point. These ridgelines are considered to have natural land form and open space value and contribute to the area's visual character and quality. No natural landforms would be regraded, altered, or otherwise destroyed as a result of project implementation because the existing dam is an artificial feature. The dam face would be revegetated as a project design feature, which would maintain consistency with the existing natural hillsides. The types of vegetation used and associated maintenance would conform with DSOD requirements. The proposed dam would not provide significant contrast nor alter color of the surrounding landscape. The proposed treatment facilities would be the only facilities installed aboveground other than the dam, inlet/outlet control building, and associated spillway. To ensure that all aboveground project structures would not impact the visual character or quality of the project site or surrounding area, Mitigation Measure AES-1 would require design of the aboveground project structures to have color palettes that blend in with the surrounding character of the project site. As a result, the proposed project would not modify the visual quality of the surrounding area. Direct unobstructed views of the proposed dam would be available for brief periods of time (i.e., seconds to several minutes) when approximately tens to hundreds of daily motorist users, as well as pedestrians/cyclists, are traveling through the Stonegate neighborhood at Sherwood Street and Steinway Street. Given the lack of temporal frequency of public viewers and the revegetation of the dam face that would be consistent with the surrounding natural hillsides, the existing visual sensitivity of the view from this location would not be significantly compromised. As a result, impacts to the established visual character and

quality from this view as a result of project implementation would be less than significant with mitigation.

Chapter 3, Section 3.9, Hydrology and Water Quality

Page 3.9-13

“It is anticipated that if groundwater were to be encountered during the proposed project’s excavation, groundwater would be dewatered and conveyed to proposed onsite settling ponds or discharged to the existing storm drain, if necessary, pursuant to the conditions and requirements in Order Number: R8-2019-006107-041; NPDES Number: CAG918002 (Santa Ana RWQCB 200919).”

Page 3.9-15 to 3.9-16

Orange County Municipal Storm Water Permit [MS4]

The Orange County Municipal Storm Water Permit (MS4) applies to the proposed project (Municipal NPDES Permit No. CAS 618030, Order No. R8-2009-0030 - NPDES Waste Discharge Requirements for the County of Orange, Orange County Flood Control District and the Incorporated Cities of Orange County within the Santa Ana Region, Areawide Urban Storm Water Runoff, Orange County). The NPDES municipal general permits issued by the RWQCB establish regulations covering discharge prohibitions, receiving water limitations, municipal operations (~~such as the proposed project~~), new development, construction site controls (construction site runoff), and other regulations to regulate surface water quality (RWQCB 2009). The discharge prohibitions prohibit the discharge of non-stormwater (materials other than stormwater) into storm drain systems and watercourses and includes a tiered categorization of non-stormwater discharges based on potential for pollutant content that may be discharged upon adequate assurance that the discharge contains no pollutants of concern at concentrations that will impact beneficial uses or cause exceedances of water quality standards. The receiving water limitations provide narrative and numeric water quality standards. The municipal operations regulations include a number of requirements to control and reduce non-stormwater discharges and polluted stormwater to storm drains and watercourses during operation, inspection, and routine repair and maintenance activities of municipal facilities and infrastructure. The requirements include source control, site design, and stormwater treatment requirements, such as minimizing disturbance of natural infiltration areas and the addition of impervious surfaces, controlling and directing runoff, and the use of infiltration and bioretention measures, among other measures. To more efficiently address the requirements, the permittees within the County of Orange, which includes the City of Irvine, developed the Drainage Area Management Plan (DAMP), described below. ~~The MS4 permit applies to the proposed project because (1) the area downgradient (west) of the dam would drain stormwater to the County of Orange.~~

Page 3.9-31

Additionally, and as previously discussed, the proposed project would comply with the terms of the NPDES Construction General Permit, the waste discharge requirements of the NPDES dewatering discharge permit, as well as conditions for discharge into the existing Portola Parkway storm drain, ~~managed by Orange County Flood Control District~~. All of these require various measures discussed above in Impact 3.9-1 to prevent degradation of water quality, which would be consistent with the Basin Plan and the Basin 8-1 Alternative. Therefore, impacts relative to the Basin Plan and the alternative sustainable groundwater management plan would be less than significant.

Page 3.9-35

“Santa Ana RWQCB. ~~2019 n.d. Adopted Order R8-2019-006109-0045~~ General Waste Discharge requirements WDRs for Groundwater Discharges to Surface Waters Resulting from De Minimus Discharges, Groundwater Dewatering Operations, and/or Groundwater cleanup/Remediation Operations at Site within the San Diego Creek/Newport Bay Watershed. NOTES:

Construction schedule and truck traffic information provided by the project applicant.
Detailed traffic noise calculations are provided in [Revised Appendix D](#).

SOURCE: ESA 2021

Page 3.10-24**Operation**

Operation of the proposed project would not increase the average daily traffic (ADT) volumes along the major thoroughfares within the project vicinity. Additionally, the proposed inlet and outlet pipelines that would supply and drain the reservoir would be located underground and would not result in any operational noise. The inlet/outlet works control building would consist of a masonry block control building to house compressors, instruments, and associated electrical components. These facilities would be located over 1,000 feet from the nearest sensitive receptor and would be blocked by the proposed dam face; as a result, noise would not be generated above ambient conditions at sensitive receptor property lines. The primary pumps used for water distribution are already existing and located off-site. Operation of the proposed project would introduce small pumps located on the site within the proposed treatment facilities. A proposed masonry block wall building would house the storage tanks, metering pumps, and control system. The small pumps located on-site would not generate noise above ambient conditions at sensitive receptor property lines. Therefore, impacts from the operations of the proposed project would be less than significant.

Chapter 3, Section 3.12, TransportationPage 3.12-2

The legend of **Figure 3.12-1** has been revised to include freeways/highways.

Page 3.12-3

Notable features along Portola Parkway include bike lanes on both the northbound and southbound sides of the roadway, and a separated sidewalk, known as the Portola Side Path, on the southbound side of the roadway. The only sidewalk on the northbound side is between Sand Canyon and the Crean Lutheran High School Sports Complex. There is no sidewalk on the northbound side.

- Route 1A – I-5 (from the north), ~~south~~-north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the north) for trucks traveling outbound.
- Route 1B – I-5 (from the south), ~~south~~-north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the south) for trucks traveling outbound

Page 20

This level of trip generation is anticipated to occur for approximately two to three months. Trip generation outside of this phase ~~would be reduced with approximately 30 daily to 154 daily trips being generated~~ of construction would vary depending on the level of activity associated with the given phase of construction. Daily trip generation for the other phases of construction range from approximately 30 daily trips to 154 daily trips.

Page 21

Construction of the Project is estimated to require a total of approximately 41 months. The preconstruction activities would begin in the fall of 2022 and would involve approximately 5 months of access road improvements. Preconstruction would be followed by approximately 36 months for construction of the new dam, reservoir, and associated facilities, depending on weather conditions and other variables. Construction is currently anticipated to begin in 2023. The proposed Project is assumed to be operational by end of 2026.

Page 59

Bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. The Project will not affect any planned bicycle facilities in the study area. Minor improvements to facilitate bicycle circulation such as “BIKES MAY USE FULL LANE” signage, shared arrow advance warning signage, and other suggested methods that provide advance warning to both vehicular drivers and bicyclists will be included in the traffic control plans generated for the intersection construction.

Revised Appendix D
**Noise and Vibration Technical
Report, Sub-Appendix B,
Construction Traffic Noise**

TRAFFIC NOISE ANALYSIS TOOL

Project Name: IRWD Syphon
Analysis Scenario: Vegetation Removal and Access Route
Source of Traffic Volumes: Applicant

Roadway Segment	Ground Type	Distance from Roadway to Receiver (feet)	Speed (mph)			Peak Hour Volume			Peak Hour Noise Level (Leq(h) dBA)
			Auto	MT	HT	Auto	MT	HT	
Potola Pkwy, between SR-133 and Paragon	Hard	60	55	55	55	20	0	20	62.2
Sand Canyon Ave, between Portola Pkwy and Irvine Blvd.	Hard	40	50	50	50	20	0	20	63.0
Irvine Blvd, between San Canyon Ave and Native Spring	Hard	55	60	60	60	20	0	20	63.5
SR-133, between Irvine Blvd and SR-241	Hard	80	65	65	65	20	0	20	62.7

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

TRAFFIC NOISE ANALYSIS TOOL

Project Name: IRWD Syphon
Analysis Scenario: Access Route
Source of Traffic Volumes: Applicant

Roadway Segment	Ground Type	Distance from Roadway to Receiver (feet)	Speed (mph)			Peak Hour Volume			Peak Hour Noise Level (Leq(h) dBA)
			Auto	MT	HT	Auto	MT	HT	
Potola Pkwy, between SR-133 and Paragon	Hard	60	55	55	55	10	0	3	54.8
Sand Canyon Ave, between Portola Pkwy and Irvine Blvd.	Hard	40	50	50	50	10	0	3	55.6
Irvine Blvd, between San Canyon Ave and Native Spring	Hard	55	60	60	60	10	0	3	56.2
SR-133, between Irvine Blvd and SR-241	Hard	80	65	65	65	10	0	3	55.5

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

Roadway Segment	Ground Type	Distance from Roadway to Receiver (feet)	Speed (mph)			Peak Hour Volume			Peak Hour Noise Level (Leq(h) dBA)
			Auto	MT	HT	Auto	MT	HT	
Potola Pkwy, between SR-133 and Paragon	Hard	60	55	55	55	16	0	9	59.0
Sand Canyon Ave, between Portola Pkwy and Irvine Blvd.	Hard	40	50	50	50	16	0	9	59.8
Irvine Blvd, between San Canyon Ave and Native Spring	Hard	55	60	60	60	16	0	9	60.4
SR-133, between Irvine Blvd and SR-241	Hard	80	65	65	65	16	0	9	59.6

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.
 Accuracy of the calculation is within ± 0.1 dB when comparing to TNM results.
 Noise propagation greater than 50 feet is based on the following assumptions:
 For hard ground, the propagation rate is 3 dB per doubling the distance.
 For soft ground, the propagation rate is 4.5 dB per doubling the distance.
 Vehicles are assumed to be on a long straight roadway with cruise speed.
 Roadway grade is less than 1.5%.
 CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

TRAFFIC NOISE ANALYSIS TOOL

Project Name: IRWD Syphon
Analysis Scenario: Demobilization
Source of Traffic Volumes: Applicant

Roadway Segment	Ground Type	Distance from Roadway to Receiver (feet)	Speed (mph)			Peak Hour Volume			Peak Hour Noise Level (Leq(h) dBA)
			Auto	MT	HT	Auto	MT	HT	
Potola Pkwy, between SR-133 and Paragon	Hard	60	55	55	55	15	0	1	52.9
Sand Canyon Ave, between Portola Pkwy and Irvine Blvd.	Hard	40	50	50	50	15	0	1	53.6
Irvine Blvd, between San Canyon Ave and Native Spring	Hard	55	60	60	60	15	0	1	54.4
SR-133, between Irvine Blvd and SR-241	Hard	80	65	65	65	15	0	1	53.8

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

1. Executive Summary

Fehr & Peers has completed a Transportation Impact Analysis (TIA) for construction of the Irvine Ranch Water District (IRWD) Syphon Reservoir Improvement Project (Project) located near the intersection of Sand Canyon Avenue and Portola Parkway in Irvine, California. The Project proposes to increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. Pedestrian and bicycle infrastructure at the intersection will be reconstructed to maintain access like the existing condition while following the City of Irvine requirements.

As part of the TIA, consistent with California Environmental Quality Act (CEQA) requirements, a Vehicle Miles Traveled (VMT) analysis was conducted for the Project. Intersection Level of Service (LOS) was also conducted to determine intersection operations with and without the Project. The study intersections selected represent the intersections where construction traffic is proposed to travel through. Four routes are proposed for the Project.

Findings

On a peak construction activity day, approximately 232 daily trips are estimated, of which 36 trips (27 inbound/9 outbound) would occur during the AM peak hour and 18 trips (0 inbound/18 outbound) would occur during the PM peak hour. For the purpose of the intersection LOS analysis, the trip generation estimates were converted to Passenger Car Equivalent (PCE) trips. PCE reflects the additional effect larger vehicles have on intersection operations based on their larger size. A PCE factor of 1.0 was assumed for worker vehicles and a PCE factor of 3.0 was assumed for all construction trucks, based on the Highway Capacity Manual 6th Edition (HCM) (Transportation Research Board, 2017). As shown in Table 3, on a peak construction activity day, approximately 512 daily PCE trips are estimated, of which 72 PCE trips (45 inbound/27 outbound) would occur during the AM peak hour and 18 PCE trips (0 inbound/18 outbound) would occur during the PM peak hour.

The City of Irvine's *CEQA VMT Impact Analysis Guidelines* identify projects generating fewer than 250 weekday daily trips as requiring no further VMT impact analysis. All phases of construction have a daily trip generation less than 250 trips. Therefore, it can be determined that all the construction phases do not meet the daily trip screening threshold and require no further VMT impact analysis using the *CEQA VMT Impact Analysis Guidelines*.

The LOS analyses resulted in no intersection deficiencies under any of the "plus Project" scenarios. Therefore, no intersection improvements would be required.

2. Introduction

This report presents the analysis and findings of a Transportation Impact Analysis (TIA) prepared for construction of the Irvine Ranch Water District (IRWD) Syphon Reservoir Improvement Project (Project) located near the intersection of Sand Canyon Avenue and Portola Parkway in Irvine, California. This chapter discusses the TIA purpose, analysis locations and methods, scenarios, and report organization.

Study Purpose

The purpose of this study is to evaluate the temporary transportation impacts associated with the Syphon Reservoir Improvement Project. The Project proposes to increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The Project would allow the storage of additional recycled water produced at the Michelson Water Recycling Plant during periods of low demand (winter months) for use during periods of high demand (summer months). The Project would expand the reservoir's storage capacity from the current 500 Acre-Feet (AF) to approximately 5,000 AF and would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water from both Northern California and the Colorado River. The Project would help IRWD to store more drought-proof recycled water during summer months and support the increased use of recycled water for public landscaping, agricultural, business, and industrial uses. Every gallon of recycled water IRWD uses for non-drinking water purposes saves a gallon of drinking water, helping the region's existing and planned future development to better withstand future water shortages. By reducing IRWD's dependence on costly imported water, the Project would allow IRWD to replace an expensive source of water for one that is less expensive and a drought-resilient supply, which increases IRWD's water supply reliability. The proposed Project is assumed to be operational by end of 2026.

The Project would be implemented within the IRWD service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and SR-133 in the County of Orange. The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway. Figure 1 identifies the location of the Project within Irvine.

As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access during Project construction and maintenance/operations access during Project operation. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. Pedestrian and bicycle infrastructure at the intersection would be reconstructed to maintain access like the existing condition while following the City of Irvine requirements. This improvement assumes the northbound

approach at Sand Canyon Avenue and Portola Parkway would be modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach would be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal phasing that gives a green signal for all vehicle movements of one direction followed by a green signal for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations. During construction of the Project, this private roadway would be used by construction trips for ingress and egress of the construction site. Upon completion of the Project, this private roadway would be used by IRWD staff conducting maintenance and inspections as part of typical operations, similar to existing conditions. Trips by IRWD staff to the reservoir are not anticipated to increase as compared to the existing condition and are not considered to have a significant effect on the future intersection operations.

Study Area Boundary

The scope of the traffic analysis, methodology assumptions, and selection of study intersections was developed in consultation with City of Irvine staff and documented in the Scope of Work for Irvine Ranch Water District (IRWD) Syphon Reservoir Construction Transportation Impact Analysis dated June 29, 2020. The approved scope of work is included in Appendix A.

The study intersections selected represent the intersections where construction traffic is proposed to travel through. Four routes are proposed for the Project.

- Route 1A – I-5 (from the north), ~~south~~north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the north) for trucks traveling outbound.
- Route 1B – I-5 (from the south), ~~north~~south on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the south) for trucks traveling outbound.
- Route 2A – SR-133 (from the north), west on Irvine Boulevard, and north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue and east on Irvine Boulevard to SR-133 (to the north) for trucks traveling outbound.
- Route 2B – SR-133 (from the south), west on Irvine Boulevard, and north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue and east on Irvine Boulevard to SR-133 (to the south) for trucks traveling outbound.

As presented in Figure 2, the following intersections have been selected for study:

1. Sand Canyon Avenue & Portola Parkway
2. Sand Canyon Avenue & Irvine Boulevard
3. Sand Canyon Avenue & Trabuco Road
4. Sand Canyon Avenue & I-5 Northbound Ramps
5. Sand Canyon Avenue & Marine Way
6. Sand Canyon Avenue & I-5 Southbound Ramps
7. SR-133 Southbound Ramps & Irvine Boulevard
8. SR-133 Northbound Off-Ramp & Irvine Boulevard

Freeway links were not included in this study as less than 50 peak hour trips would be added to the freeway system.

Note: For the purpose of this study Sand Canyon Avenue is regarded as a north-south roadway

Analysis Methods

The *City of Irvine Traffic Study Guidelines* (City of Irvine, April 2020) were used to identify the analysis methodologies for the Vehicle Miles Traveled (VMT) and intersection Level of Service (LOS) analyses. Many jurisdictions in Southern California have regarded construction-related traffic as causing adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary.

Vehicle Miles Traveled Analysis

On September 27, 2013, Governor Jerry Brown signed Senate Bill (SB) 743 into law and started a process that has fundamentally changed transportation impact analyses conducted as part of California Environmental Quality Act (CEQA) compliance. The Governor's Office of Planning and Research (OPR) was charged with developing new guidelines for evaluating transportation impacts under CEQA using methods that no longer focus on measuring automobile delay and LOS.

OPR issued proposed updates to the CEQA guidelines in support of these goals in November 2017 and a supporting technical advisory in December 2018. The updates establish VMT as the metric for evaluating a project's environmental impacts on the transportation system. Lead agencies, including the City of Irvine, had until July 1, 2020 to implement these new requirements. On June 23, 2020, the City of Irvine adopted the *CEQA VMT Impact Analysis Guidelines* (City of Irvine, April 2020). These guidelines are included as an exhibit in the *City of Irvine Traffic Study Guidelines*.

Neither OPR nor the City of Irvine have provided guidance regarding VMT thresholds for construction related traffic. Nonetheless and per the approved scope of work, a VMT impact analysis was conducted for the Project that follows the adopted *CEQA VMT Impact Analysis Guidelines*.

Intersection Level of Service Analysis

For the signalized intersections within the study area, the transportation analysis was conducted in accordance with *City of Irvine Traffic Study Guidelines* requirements using the Intersection Capacity Utilization (ICU) methodology.

The ICU methodology is considered a standard approach for evaluating signalized intersection operations in Irvine. The ICU method of intersection capacity analysis determines the intersection volume-to-capacity (V/C) ratio and corresponding LOS for the turning movements and intersection characteristics at signalized intersections. "Capacity" represents the maximum volume of vehicles in the critical lanes that have a reasonable expectation of passing through an intersection in one hour under prevailing roadway and traffic

conditions. The ICU method calculates the V/C ratio for each critical movement by dividing volume by capacity. The V/C ratios for each critical movement are summed with an added lost time due to vehicle start-ups and stops to determine the total intersection V/C ratio. Traffic conditions for signalized intersections were evaluated using the Vistro Version 7.0 software.

After the quantitative V/C and delay estimates were completed, the methodologies assign a qualitative letter grade that represents the operations of the intersection. These grades range from level of service (LOS) A (minimal delay) to LOS F (excessive congestion). LOS E represents at-capacity operations. Descriptions of the LOS letter grades for intersections are provided in Table 1.

Analysis Scenarios

The proposed Project is assumed to be operational by end of 2026. The study was directed at analyzing the potential Project generated traffic effect on the local street system under both existing and future year traffic conditions. The following traffic scenarios were developed and analyzed as part of this study:

- Existing Conditions – Due to emergence of COVID-19 in southern California and the decision of local schools to end on-campus classes for the 2019-2020 academic year, existing intersection counts could not be collected in the study area. However, the City of Irvine provided intersection counts from 2018 that were used to estimate 2020 intersection volumes. Per the approved scope of work with the City of Irvine, a growth factor of 2% per year was applied to previously collected counts to develop 2020 intersection volumes for the AM and PM peak hours.
- Existing plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates was added to the Existing Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site was included.
- Short-Term Interim Year Approved Conditions – the future (Short-Term Interim Year Approved) conditions were developed using study area intersection volume growth rates on a per year basis. The per year growth rates were developed based on outputs from the latest versions of the Existing and Short-Term Interim Year Approved Irvine Traffic Analysis Model (ITAM) provided by the City of Irvine. The growth rate was applied to the Existing Conditions intersection volumes to reflect Existing Conditions growth to the Short-Term Interim Year Approved condition of ITAM.
- Short-Term Interim Year Approved plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates was added to the Short-Term Interim Year Approved Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site was included.

TABLE 1
INTERSECTION LEVEL OF SERVICE CRITERIA

Level of Service	Description	ICU Volume to Capacity (V/C) Ratio
A	<p><u>Signalized:</u> Operations with very low delay occurring with favorable progression and/or short cycle length.</p> <p><u>Unsignalized:</u> Little or no delay.</p>	0.000 - 0.600
B	<p><u>Signalized:</u> Operations with low delay occurring with good progression and/or short cycle lengths.</p> <p><u>Unsignalized:</u> Short traffic delays.</p>	0.601 - 0.700
C	<p><u>Signalized:</u> Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.</p> <p><u>Unsignalized:</u> Average traffic delays.</p>	0.701 - 0.800
D	<p><u>Signalized:</u> Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, or high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.</p> <p><u>Unsignalized:</u> Long traffic delays.</p>	0.801 - 0.900
E	<p><u>Signalized:</u> Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.</p> <p><u>Unsignalized:</u> Very long traffic delays.</p>	0.901 - 1.000
F	<p><u>Signalized:</u> Operation with delays unacceptable to most drivers occurring due to over saturation, poor progression, or very long cycle lengths.</p> <p><u>Unsignalized:</u> Extreme traffic delays with intersection capacity exceeded</p>	> 1.000

Sources: *Transportation Research Circular No. 212, Interim Materials on Highway Capacity*, Transportation Research Board, 1980.

- Short-Term Interim Year Pending Conditions – the future (Short-Term Interim Year Pending) conditions were developed using study area intersection volume growth rates on a per year basis. The per year growth rates were developed based on outputs from the latest versions of the Existing and Short-Term Interim Year Pending ITAM provided by the City of Irvine. The growth rate was applied to the Existing Conditions intersection volumes to reflect Existing Conditions growth to the Short-Term Interim Year Pending condition of ITAM.
- Short-Term Interim Year Pending plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates was added to the Short-Term Interim Year Pending Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site was included.

Report Organization

This report is divided into eight chapters as described below:

- Chapter 1 – Executive summary summarizes the findings of the analysis.
- Chapter 2 – Introduction discusses the purpose and organization of the report.
- Chapter 3 – Existing Conditions describes the transportation system in the Project vicinity, including the surrounding roadway network, morning and evening peak period intersection turning movement volumes, existing bicycle, pedestrian, and transit facilities, and intersection operations.
- Chapter 4 – Performance criteria identify the thresholds for impacts and when traffic improvements would be required.
- Chapter 5 – Project characteristics identify the trip generation, distribution, and assignment of the Project traffic.
- Chapter 6 – Existing Plus Project Traffic Conditions addresses the Existing Conditions with the Project and discusses Project effect on intersections.
- Chapter 7 – Short-Term Interim Year Conditions addresses the Short-Term Interim Year without the Project.
- Chapter 8 – Short-Term Interim Year Plus Project Conditions addresses the Short-Term Interim Year Plus Project Conditions, with the Project, and discusses Project effect on intersections.
- Chapter 9 – Special Issues address site access analysis and VMT analysis.
- Chapter 10 – Required improvements address the improvements required of the Project.
- Chapter 11 – Conclusion summarizes the findings of the analysis.

3. Existing Conditions

This chapter describes transportation facilities in the study area including the surrounding roadway network, transit, pedestrian, and bicycle facilities. Existing intersection operations are also described.

Roadway System

The following discusses the roadways that would provide access to the site and are most likely to experience direct traffic effects, if any, from the Project (see Figure 1).

State Route 133 (SR-133) is a north-south freeway that runs between Laguna Beach, California, and Irvine. In the study area, SR-133 provides four general purpose travel lanes in both the northbound and southbound directions.

Interstate 5 (I-5) is a north-south freeway that runs between the Mexico border and the Oregon state line. In the study area, I-5 provides five general purpose travel lanes and one high occupancy vehicle lane in both the northbound and southbound directions.

Marine Way is an east-west roadway through Irvine. In the study area, the roadway generally provides one travel lane in each direction with turn pockets at intersections and driveways. The posted speed limit is 45 mph. No on-street parking is permitted on either side of the road.

Trabuco Road/Great Park Boulevard is an east-west roadway through Irvine. In the study area, the roadway generally provides three travel lanes in each direction with a raised median and turn pockets at intersections. The posted speed limit is 50 mph. No on-street parking is permitted on either side of the road.

Irvine Boulevard is an east-west roadway through Irvine that provides access to SR-133. In the study area, the roadway generally provides three travel lanes in each direction with a raised median and turn pockets at intersections. The posted speed limit is 55 mph. No on-street parking is permitted on either side of the road.

Portola Parkway is an east-west roadway through Irvine. In the study area, the roadway generally provides two travel lanes in each direction with a raised median and turn pockets at intersections. The posted speed limit is 55 mph. No on-street parking is permitted on either side of the road.

Sand Canyon Avenue is a north-south roadway through Irvine that provides access to I-5. In the study area, the roadway generally provides four travel lanes in each direction between Trabuco Road/Great Park

Boulevard and I-5, three travel lanes in each direction between Irvine Boulevard and Trabuco Road/Great Park Boulevard, and two travel lanes in each direction between Portola Parkway and Irvine Boulevard. A raised median and turn pockets are generally provided at intersections. The posted speed limit is 50 mph. No on-street parking is permitted on either side of the road.

Existing Pedestrian and Bicycle Facilities

Pedestrian facilities in the study area include sidewalks, crosswalks, and pedestrian signals. All the roadways in the study areas provide sidewalks or paths on both sides of the street. Sidewalks are not provided along SR-133 or I-5. At the signalized intersections in the study areas, crosswalks and pedestrian push-button actuated signals are provided. Figure 3 presents the following bicycle facilities in the study area, per the *California State Bicycle and Pedestrian Plan* (Caltrans, 2017) 3:

- **Bike paths (Class I)** – Bike paths provide a separate right-of-way and are designated for the exclusive use of people riding bicycles and walking with minimal crossflow traffic. Such paths can be well situated along creeks, canals, and rail lines. Class I Bikeways can also offer opportunities not provided by the road system by serving as both recreational areas and/or desirable commuter routes. Bike paths are provided along the following roadway segments.
 - Sand Canyon Avenue from Portola Parkway to I-5
 - Portola Parkway from Paragon to SR-133
 - Towngate from Hallmark to Crosspointe
 - Cypress Village Trail along I-5
- **Bike lanes (Class II)** – Bike lanes provide designated street space for bicyclists, typically adjacent to the outer vehicle travel lanes. Bike lanes include special lane markings, pavement legends, and signage. Bike lanes may be enhanced with painted buffers between vehicle lanes and/or parking, and green paint at conflict zones (such as driveways or intersections). The following roadway segments have Class II bike lanes.
 - Sand Canyon Avenue from Portola Parkway to I-5
 - Portola Parkway from Paragon to SR-133
 - Spring Meadows from Medallion to Coralwood
 - Irvine Boulevard from Groveland to SR-133
 - Towngate from Hallmark to Crosspointe
 - Trabuco Road/Great Park Boulevard from Keystone to SR-133
 - Roosevelt from Tulip to Sand Canyon Avenue
 - Nightmist from Tulip to Sand Canyon Avenue
 - Marine Way from Sand Canyon to SR-133

- **Bike routes (Class III)** – Bike routes provide enhanced mixed-traffic conditions for bicyclists through signage, striping, and/or traffic calming treatments, and to provide continuity to a bikeway network. Bike routes are typically designated along gaps between bike trails or bike lanes, or along low-volume, low-speed streets. There are no Class III facilities in the study areas.
- **Separated Bikeway (Class IV)** – Separated bikeways, also referred to as cycle tracks or protected bikeways, are bikeways for the exclusive use of bicycles which are physically separated from vehicle traffic. Separated Bikeways were recently adopted by Caltrans in 2015. Types of separation may include, but are not limited to, grade separation, flexible posts, physical barriers, or on-street parking. There are no Class IV facilities in the study areas.

Existing Transit Service

Transit service in the study areas is provided by Orange County Transit Authority (OCTA). OCTA operates Routes 83 and 206 along I-5 in the study area. These routes provide regional service but have no stops in the study area.

Existing Traffic Counts

Due to the COVID-19 pandemic in 2020, travel activity and traffic volumes in the existing year of analysis were substantially decreased throughout the study area and Southern California. It was not possible to collect counts that represented existing traffic conditions. A baseline condition that reflected travel activity and traffic volume prior to the COVID-19 pandemic was developed for the intersection analysis. Historical AM and PM peak hour turning movement counts collected at the study intersection in 2018 provided by the City of Irvine. Each of these counts were grown by 2% per year from their respective count year to the established baseline year of 2020. Peak hour intersection volumes are summarized on Figure 4 along with existing lane configurations and traffic controls. The traffic counts from 2018 are provided in Appendix B.

Existing Operations Analysis

Existing intersection operations were evaluated using the methods described in Chapter 1 for the weekday AM and PM peak hours at the study intersections. The analysis was based on the volumes, lane configurations, and traffic control presented on Figure 4. Detailed intersection LOS calculation worksheets are presented in Appendix C. As shown in Table 2, all signalized study intersections currently operate at LOS C or better in both the AM and PM peak hours.

4. Performance Criteria

The determination of significance for Project impacts is based on applicable policies, regulations, goals, and guidelines defined by the City of Irvine. The proposed impact criteria for this study are presented below.

Vehicle Miles Traveled Impact Thresholds

On June 23, 2020, the City of Irvine adopted the *CEQA VMT Impact Analysis Guidelines*. These guidelines identify the screening criteria, analysis requirements, thresholds, and mitigation options for VMT analysis associated with the operation of new projects in the City of Irvine. The City of Irvine has not provided guidance regarding VMT thresholds for construction related traffic. The screening opportunities and VMT thresholds identified below are documented in the *CEQA VMT Impact Analysis Guidelines* and were utilized as part of the analysis and performance criteria for the Project.

Construction-related traffic is typically considered to cause adverse but not lasting intersection deficiencies because, while sometimes inconvenient, construction-related traffic effects are temporary. However, in an effort to document potential impacts related to the Project, the City of Irvine VMT impact thresholds were applied to the Project.

Screening

If the analysis of environmental impacts related to transportation (i.e., VMT impact analysis) is required for a discretionary project, but if it can be demonstrated that the project meets any one of the following four screening criteria, then no further VMT impact analysis is required:

1. The project results in a net increase of 250 or fewer weekday daily trips.
2. The project is located in a Transit Priority Area¹
3. The project is 100-percent restricted affordable housing units
4. The project is locally serving such as 100,000 square feet or less of retail use, a daycare use or a locally serving public school

¹ A Transit Priority Area (TPA) is defined as within half-mile distance of existing rail transit station or located within half-mile of two or more existing bus routes with a frequency of service interval of 15 minutes or less during morning and evening peak hours.

Thresholds of Significance

The City's identified significance criteria is for the operation of new projects to generate 15 percent less VMT per capita (or per employee) compared to existing conditions, which is consistent with the OPR Technical Advisory recommendations. City staff will periodically update the VMT thresholds based on the latest calibrated and validated City VMT traffic model. Any technical updates to the VMT significance thresholds are subject to the approval of the Transportation Commission at the recommendation of the Director of Public Works and Transportation.

The table below identifies the existing residential VMT per capita and the non-residential VMT per employee, as well as the proposed residential VMT per capita and non-residential VMT per employee significance thresholds, as documented in the *CEQA VMT Impact Analysis Guidelines*. The residential significance threshold is based on the countywide residential VMT divided by the countywide population, while the non-residential significance threshold is based on the countywide commute and other (i.e., customer and client) VMT divided by the number of countywide employees.

Land Use Type	Existing	Significance Threshold* (15 percent reduction)
Residential (VMT per population)	17.5	14.9
Non-Residential (VMT per employee)	48.8	41.5

* Any technical updates to the VMT significance thresholds are subject to the approval of the Transportation Commission at the recommendation of the Director of Public Works and Transportation.

Source: *CEQA VMT Impact Analysis Guidelines* (City of Irvine, April 2020)

If the project VMT rate exceeds the respective threshold, then the project creates a significant impact. When a project results in a significant VMT impact, it must identify the mitigation measures to reduce the impact to a level that meets the City's adopted VMT threshold. All feasible mitigation measures must be incorporated into the project to substantially reduce the impact even if the project cannot meet the adopted VMT threshold.

Signalized Intersections Deficiencies

Construction-related traffic is typically considered to cause adverse but not lasting intersection deficiencies because, while sometimes inconvenient, construction-related traffic effects are temporary. However, in an effort to document potential intersection deficiencies related to the Project, City of Irvine intersection criteria was applied to all signalized intersections. A signalized intersection is considered to be deficient if one of the following criteria is met.

- A location is at acceptable LOS in the baseline condition and the project causes the location to become deficient; or
- A location at unacceptable LOS in the baseline condition and the project causes the location to further deteriorate by two percent or more (i.e. 0.02 v/c ratio change).

According to the *City of Irvine Traffic Study Guidelines*, LOS E shall be considered acceptable for links and intersections in accordance with the City's General Plan Objective B-1. LOS D shall be considered acceptable for all other areas of the City. Based on these criteria, all study intersections will be identified as operating acceptably if they are at or better than LOS D.

For intersection analysis, if an intersection is determined to be deficient based on the criteria above, then the project will be required to improve the intersection, at a minimum, back to the baseline condition.

5. Project Characteristics

Trip Generation

Construction of the Project is estimated to be approximately 41 months, depending on weather conditions and other variables. Construction is currently anticipated to begin in the Fall of 2022. Most construction activities would be limited to 7:00 AM to 7:00 PM Monday through Friday. Construction of the Project would include activities implemented in phases as outlined below.

- Access Routes/Intersection Improvements
- Excavation of Sediment/Existing Dam
- Construction of Dam/Spillway/Reservoir
- Construction of Filtration/Chlor/Dechlor Facilities
- Wetlands/Riparian Installation
- Installation of Recreation Facilities
- Demobilization

Construction Vehicle Type

Haul Trucks

Hauling hours are anticipated to be 7:00 AM to 3:00 PM on weekdays. During the peak trip period, approximately 52 material delivery trucks would enter and exit the site per workday for approximately twelve months. During other times of construction, material deliveries would be expected in the range of 5 to 10 material delivery trucks per day. These trucks are assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Equipment and Delivery Trucks

In addition to haul trucks, the site is also expected to generate equipment and delivery trucks during each phase of construction. These materials would be delivered to the site and stored on-site. These deliveries are expected to occur in a variety of vehicles including small delivery trucks to cement mixer trucks and 18-wheel trucks. Additionally, construction equipment would also have to be delivered to the site. This equipment could include bulldozers, excavators, and other large items of machinery. Most of the heavy equipment is expected to be transported to the site on large trucks such as 18-wheelers or other similar vehicles. These trucks are assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Employee Vehicles

The number of construction workers would vary throughout the construction period. Parking for all construction workers would be provided on-site. Construction workers are assumed to arrive in single occupant vehicles.

Construction Period Trip Generation

Based on the aforementioned information, a construction period trip generation analysis was conducted to estimate daily, morning, and evening peak hour trips of the phase with the highest trip generation potential. As seen in Table 3, the construction of Dam/Spillway/Reservoir phase represents the day with the highest trip generation potential with approximately 116 vehicles.

Construction workers often travel to and from a worksite outside of the typical peak commute hours. Construction hours are anticipated to occur from 7:00 AM to 7:00 PM, with most worker trips and truck trips anticipated to occur outside of the AM and PM peak hours. For the purpose of the analysis, it was assumed that up to 40% of the construction workers would arrive at the construction site during the peak morning commute hour and up to 40% would depart the construction site during the peak evening commute hour. Equipment trucks were assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Table 3 presents a summary of the construction trip generation on a peak day. As shown, on a peak construction activity day, approximately 232 daily trips are estimated, of which 36 trips (27 inbound/9 outbound) would occur during the AM peak hour and 18 trips (0 inbound/18 outbound) would occur during the PM peak hour. For the purpose of the intersection LOS analysis, the trip generation estimates were converted to Passenger Car Equivalent (PCE) trips. PCE reflects the additional effect larger vehicles have on intersection operations based on their larger size. A PCE factor of 1.0 was assumed for worker vehicles and a PCE factor of 3.0 was assumed for all construction trucks, based on the *Highway Capacity Manual 6th Edition (HCM)* (Transportation Research Board, 2017). As shown in Table 3, on a peak construction activity day, approximately 512 daily PCE trips are estimated, of which 72 PCE trips (45 inbound/27 outbound) would occur during the AM peak hour and 18 PCE trips (0 inbound/18 outbound) would occur during the PM peak hour.

This level of trip generation is anticipated to occur for approximately two to three months. Trip generation outside of this phase of construction would vary depending on the level of activity associated with the given phase of construction. Daily trip generation for the other phases of construction range from approximately 30 daily trips to 154 daily trips. ~~would be reduced with approximately 30 daily to 154 daily trips being generated.~~

Trip Distribution and Assignment

Four routes are proposed for the Project.

- Route 1A – I-5 (from the north), north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the north) for trucks traveling outbound.
- Route 1B – I-5 (from the south), north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the south) for trucks traveling outbound.
- Route 2A – SR-133 (from the north), west on Irvine Boulevard, and north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue and east on Irvine Boulevard to SR-133 (to the north) for trucks traveling outbound.
- Route 2B – SR-133 (from the south), west on Irvine Boulevard, and north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue and east on Irvine Boulevard to SR-133 (to the south) for trucks traveling outbound.

Figure 5 shows the distribution and assignment of the four routes studied. Figure 6a – Figure 6d shows the study intersection turning movement volumes of the Project trips for each route.

Timeline

Construction of the Project is estimated to require a total of approximately 41 months. The preconstruction activities would begin in the fall of 2022 and would involve approximately 5 months of access road improvements. Preconstruction would be followed by approximately 36 months for construction of the new dam, reservoir, and associated facilities, depending on weather conditions and other variables. Construction is currently anticipated to begin in 2023. The proposed Project is assumed to be operational by end of 2026.

**TABLE 3
CONSTRUCTION TRIP GENERATION**

Phase	Duration (Months)	Peak Day Activity Under Each Phase			Total Vehicles	Total Daily Vehicle Trips
		Haul Trucks	Equipment and Delivery Trucks	Employee Vehicles		
		Access Routes/Intersection Improvements	5	8		
Excavation of Sediment/ Existing Dam	6.6	0	6	31	37	74
Construction of Dam/Spillway/Reservoir	13.8	52	18	46	116	232
Construction of Filtration/Chlor/Dechlor Facility	12	0	29	48	77	154
Wetlands/Riparian Installation	12	0	5	20	25	50
Installation of Recreation Facilities	3	0	5	10	15	30
Demobilization	1	0	7	15	22	44

Construction of Dam/Spillway/Reservoir Trip Generation							
Trip Type	Daily Trips [a]	Morning Peak Hour Trips			Evening Peak Hour Trips		
		In	Out	Total	In	Out	Total
Haul Truck Trips [b]	104	7	7	14	0	0	0
Delivery and Equipment Truck Trips [b]	36	2	2	4	0	0	0
Construction Worker Trips [c]	92	18	0	18	0	18	18
Phase Total	232	27	9	36	0	18	18

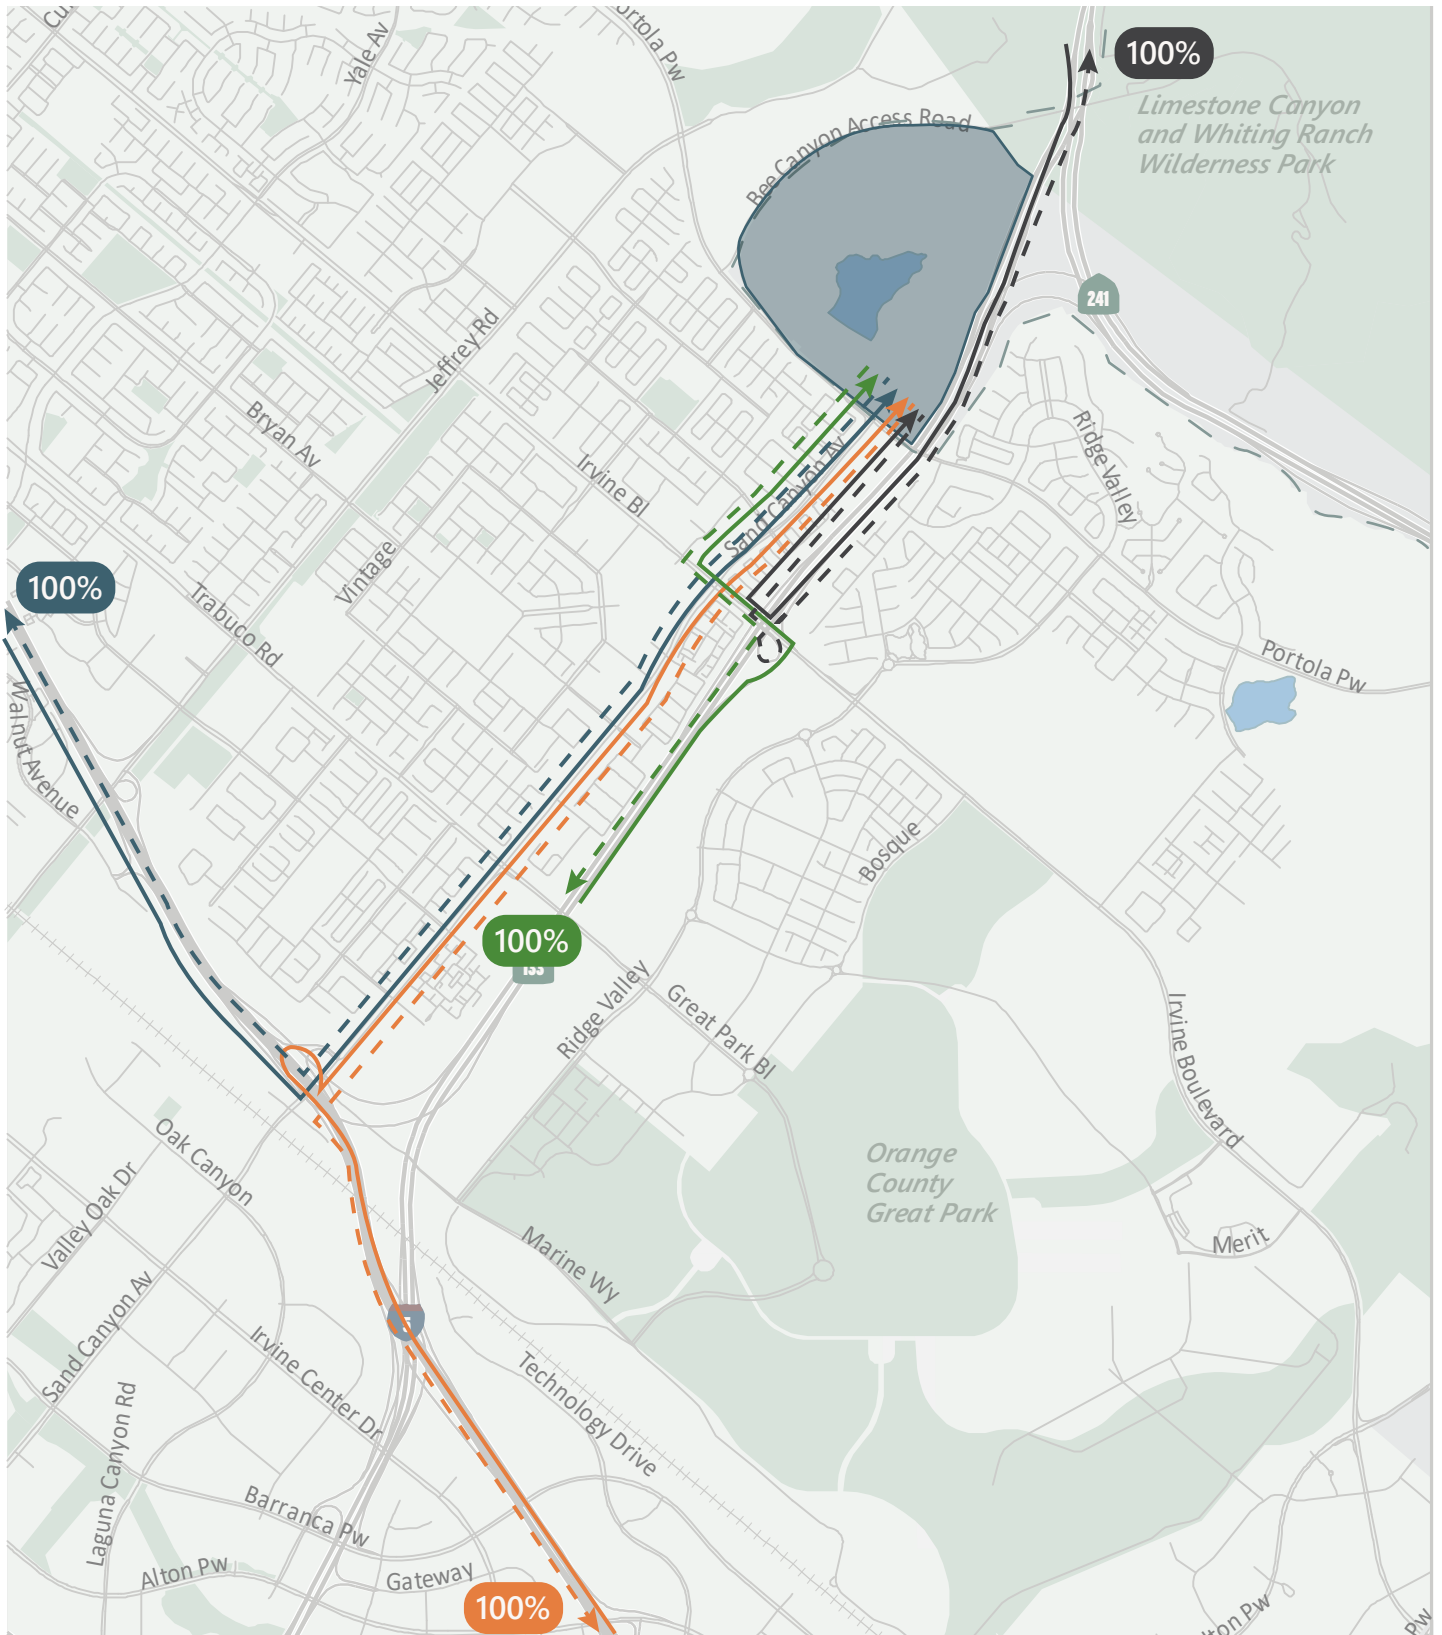

Construction of Dam/Spillway/Reservoir Trip Generation							
Trip Type and Passenger Car Equivalency	Daily Trips [a]	Morning Peak Hour Trips			Evening Peak Hour Trips		
		In	Out	Total	In	Out	Total
Haul Truck Trips PCE: 3.0	312	21	21	42	0	0	0
Delivery and Equipment Truck Trips PCE: 3.0	108	6	6	12	0	0	0
Construction Worker Trips PCE: 1.0	92	18	0	18	0	18	18
PCE Phase Total	512	45	27	72	0	18	18

Notes:

[a] - Daily trips were calculated by counting two trips, one inbound and one outbound trip for each vehicle

[b] - Daily haul and delivery/equipment truck trips were assumed to occur evenly throughout an 8-hour construction day. Therefore, the daily truck trips were divided by 8 hours to calculate morning and evening peak hour truck trips.

[c] - Up to 40% of the construction workers were assumed to arrive during the morning peak hour of adjacent street traffic. A total of up to 40% worker were assumed to depart during the evening peak hour.

6. Existing Plus Project Conditions

This chapter evaluates potential off-site intersection deficiencies under Existing Plus Project conditions.

Traffic Volumes

The Project traffic volumes on Figure 6a through Figure 6d were added to the existing traffic volumes from Figure 4 to estimate the Existing Plus Project traffic volumes for each route, as shown on Figure 7a through Figure 7d.

Intersection Improvements

All Existing Plus Project scenarios intersection lane configurations are assumed to include buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site. This improvement assumes the northbound approach at Sand Canyon Avenue and Portola Parkway is modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach will be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal operation that gives a green phase for all vehicle movements of one direction followed by a green phase for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations.

Intersection Operations

Existing Plus Project intersection operations were evaluated using the methods described in Chapter 1. All the Existing Plus Project analysis results for each route are presented in Table 4, based on the traffic volumes presented on Figure 7a through Figure 7d. As shown, all routes would have each signalized study intersections operate at LOS C or better in both the AM and PM peak hours.

Intersection Deficiencies

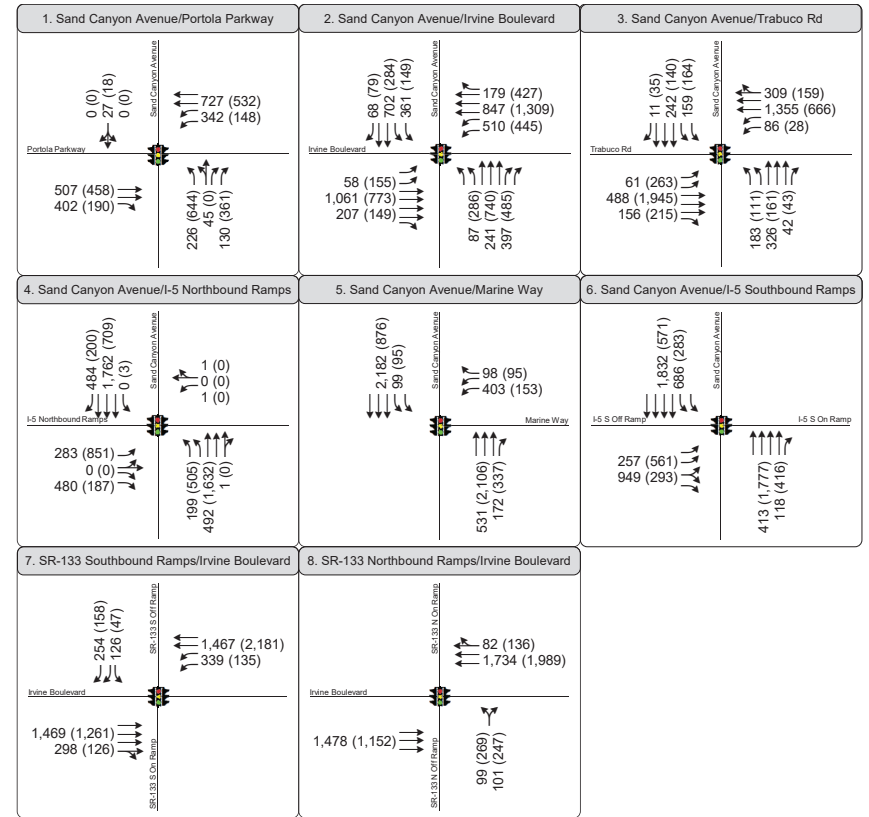

As presented in Table 4, after applying the intersection deficiency criteria, it was determined none of the route options would have a deficient intersection under the Existing Plus Project condition.

Recommended Improvements

There are no intersection deficiencies under Existing Plus Project condition. No intersection improvements are required.

7. Short-Term Interim Year Conditions

This chapter evaluates the Short-Term Interim Year Conditions.

Future Traffic Forecasts

Per the approved scope of work, the Project is required to study the Short-Term Interim Year Approved and Short-Term Interim Year Pending scenarios from ITAM. ITAM forecasts for the base year and both short-term interim year scenarios were provided by the City of Irvine. These scenarios were used to determine growth rates on a per year basis that were applied to the 2020 existing intersection volumes to develop Short-Term Interim Year Approved and Pending intersection volumes. Study intersection volumes Short-Term Interim Year Approved are provided in Figure 8 and study intersection volumes Short-Term Interim Year Pending are provided in Figure 9.

Intersection Improvements

Both Short-Term Interim Year scenarios intersection lane configurations are assumed to include the same lane geometry as the Existing Conditions.

Intersection Operations

Short-Term Interim Year intersection operations were evaluated using the methods described in Chapter 1. The Short-Term Interim Year Approved analysis results are presented in Table 5. As shown, all signalized intersections operate at LOS D or better in both the AM and PM peak hours. The Short-Term Interim Year Pending analysis results are presented in Table 6. As shown, all signalized intersections operate at LOS D or better in both the AM and PM peak hours.

8. Short-Term Interim Year Plus Project Conditions

This chapter evaluates the potential off-site intersection deficiencies under Short-Term Interim Year Plus Project conditions.

Future Traffic Forecasts

The Project traffic volumes from Figure 6a through Figure 6d were added to the Short-Term Interim Year Approved traffic volumes from Figure 8 to estimate the Short-Term Interim Year Approved plus Project traffic volumes, as shown on Figure 10a through Figure 10d.

The Project traffic volumes from Figure 6a through Figure 6d were added to the Short-Term Interim Year Pending traffic volumes from Figure 9 to estimate the Short-Term Interim Year Pending plus Project traffic volumes, as shown on Figure 11a through Figure 11d.

Intersection Improvements

All Short-Term Interim Year Approved plus Project and Short-Term Interim Year Pending plus Project scenarios intersection lane configurations are assumed to include buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site. This improvement assumes the northbound approach at Sand Canyon Avenue and Portola Parkway is modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach will be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal operation that gives a green phase for all vehicle movements of one direction followed by a green phase for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations.

Intersection Operations

Short-Term Interim Year Approved plus Project and Short-Term Interim Year Pending plus Project intersection operations were evaluated using the methods described in Chapter 1. All the Short-Term Interim Year Approved plus Project analysis results for each route are presented in Table 7, based on the traffic volumes presented on Figure 10a through Figure 10d. As shown, all routes would have each signalized study intersections operate at LOS D or better in both the AM and PM peak hours. All the Short-Term

Interim Year Pending plus Project analysis results for each route are presented in Table 8, based on the traffic volumes presented on Figure 11a through Figure 11d. As shown, all routes would have each signalized study intersections operate at LOS D or better in both the AM and PM peak hours.

Intersection Deficiencies

As presented in Table 7, after applying the intersection deficiency criteria, it was determined none of the route options would have a deficient intersection under the Short-Term Interim Year Approved plus Project condition. As presented in Table 8, after applying the intersection deficiency criteria, it was determined none of the route options would have a deficient intersection under the Short-Term Interim Year Pending plus Project condition.

Recommended Improvements

There are no intersection deficiencies under either the Short-Term Interim Year Approved plus Project condition or the Short-Term Interim Year Pending plus Project conditions. No intersection improvements are required.

9. Special Issues

This chapter addresses the site access analysis and VMT analysis for the Project.

Site Access Analysis

As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access during Project construction and maintenance/operations access during Project operation. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. Pedestrian and bicycle infrastructure at the intersection would be reconstructed to maintain access like the existing condition while following the City of Irvine requirements. This improvement assumes the northbound approach at Sand Canyon Avenue and Portola Parkway would be modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach would be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal operation that gives a green phase for all vehicle movements of one direction followed by a green phase for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations. During construction of the Project, this private roadway would be used by construction trips for ingress and egress of the construction site. Upon completion of the Project, this private roadway would be used by IRWD staff conducting maintenance and inspections as part of typical operations, similar to existing conditions. Trips by IRWD staff to the reservoir are not anticipated to increase as compared to the existing condition and are not considered to have a significant effect on the future intersection operations.

An analysis of the *City of Irvine Transportation Design Procedures* (City of Irvine, February 2007) [TDPs] was conducted to address primary access to the Project. The following TDPs were reviewed at request of the City of Irvine per the approved scope of work.

TDP – 1 Turn Lane Pocket Lengths

TDP – 1 identifies recommended lengths of left-turn pockets using a Nomograph for Left-Turn Storage, which uses inputs such as the number of left-turning vehicles, cycle length, and truck percentage. Eastbound left-turn pockets are not proposed at the intersection of Sand Canyon Avenue and Portola Parkway as the Project is planning to only modify the northbound and southbound approaches. Therefore TDP – 1 is not applicable to this Project.

TDP – 14 Driveway Lengths

TDP – 14 identifies recommended lengths for driveways to projects based on the number of peak hour trips entering a project site. The Project will construct a 2-lane private roadway from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site. While plans for this roadway have yet to be submitted, it is estimated that this private roadway will exceed 1,500 feet (ft) from the Sand Canyon Avenue and Portola Parkway intersection to the Project site. Signage indicating the use as a private road will be installed at the intersection and along the roadway. As a private road, access control will be maintained with a gate at least 500 ft away from the intersection. During the construction period this gate will remain open during hours of construction and closed when no construction is occurring. Following construction, the gate will remain closed and only IRWD staff conducting maintenance and inspections as part of typical operations will have access to open the gate. The gate location will provide an area for vehicles to turn around if they do not have access beyond the gate. As peak hour traffic into the Project site is estimated to be 27 vehicles, TDP – 14 recommends a driveway of at least 50 ft. The private road length (greater than 1,500 ft) and distance to the gate (at least 500 ft) exceed the recommendation of 50 feet based on TDP – 14.

TDP – 15 Gate Stacking

TDP – 15 identifies recommendations for vehicle stacking and gate-stacking at project sites. TDP-15 provides recommendations based on different types of land uses for vehicle stacking analysis. As a construction project, none of the examples provided in TDP-15 reflect the Projects' construction management operations or typical conditions of the reservoir following construction. The Project will construct a 2-lane private road with at least 500 ft of distance between the Sand Canyon Avenue and Portola Parkway intersection and a proposed gate. Signage indicating the use as a private road will be installed at the intersection and along the roadway. The proposed gate location will provide an area for vehicles to turn around if they do not have access beyond the gate.

During construction, the gate will remain open during hours of construction and closed when no construction is occurring. With an open gate, the private roadway and internal staging on-site can accommodate vehicle queuing that may be associated with a peak construction activity day.

Following construction, the gate will remain closed and only IRWD staff conducting maintenance and inspections as part of typical operations will have access to open the gate. The trips by IRWD staff will be nominal and are not considered to have a significant effect on the future intersection operations. The proposed gate location and gate operations during typical operations can meet the nominal inbound volume during future operations.

CEQA VMT Impact Analysis

The City of Irvine's *CEQA VMT Impact Analysis Guidelines* identify projects generating fewer than 250 weekday daily trips as requiring no further VMT impact analysis. As identified in Table 3, all phases of construction generate fewer than 250 daily weekday trips. Therefore, it can be determined that all the construction phases do not meet the daily trip screening threshold and require no further VMT impact analysis using the *CEQA VMT Impact Analysis Guidelines*. In addition, many jurisdictions in Southern California have regarded construction-related traffic as causing adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary.

Pedestrian Network Impact Analysis

Disruptions to Existing Facilities

Significance Criteria

The following significance criteria were applied:

A significant impact occurs if a project disrupts existing pedestrian facilities.

Project Impact

Pedestrian infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Interferes with Planned Pedestrian Facilities

Significance Criteria

The following significance criteria were applied to determine if the Project conflicts with planned facilities:

A significant impact occurs if a project interferes with planned pedestrian facilities.

Project Impact

Pedestrian infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. The Project will not affect any planned pedestrian facilities in the study area. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Conflicts with Adopted Pedestrian System Plans, Guidelines, Policies, or Standards

Significance Criteria

A significant impact occurs if a project conflicts or creates inconsistencies with adopted pedestrian system plans, guidelines, policies, or standards.

Project Impact

The Project is consistent with the policies identified in the City of Irvine General Plan Objective B-3: Pedestrian Circulation. The Project will reconstruct pedestrian infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway to maintain existing access while following the City of Irvine requirements. Therefore, it is concluded that the Project impact related to this item is less than significant.

Bicycle Network Impact Analysis

Disruptions to Existing Facilities

Significance Criteria

The following significance criteria were applied:

A significant impact occurs if a project disrupts existing bicycle facilities.

Project Impact

Bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. Minor improvements to facilitate bicycle circulation such as "BIKES MAY USE FULL LANE" signage, shared arrow advance warning signage,

and other suggested methods that provide advance warning to both vehicular drivers and bicyclists will be coordinated with the City of Irvine staff. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Interferes with Planned Bicycle Facilities

Significance Criteria

The following significance criteria were applied to determine if the Project conflicts with planned facilities:

A significant impact occurs if a project interferes with planned bicycle facilities.

Project Impact

Bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. The Project will not affect any planned bicycle facilities in the study area. Minor improvements to facilitate bicycle circulation such as "BIKES MAY USE FULL LANE" signage, shared arrow advance warning signage, and other suggested methods that provide advance warning to both vehicular drivers and bicyclists will be coordinated with the City of Irvine staff. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Conflicts with Adopted Bicycle System Plans, Guidelines, Policies, or Standards

Significance Criteria

A significant impact occurs if a project conflicts or creates inconsistencies with adopted bicycle system plans, guidelines, policies, or standards.

Project Impact

The Project is consistent with the policies identified in the City of Irvine General Plan Objective B-4: Bicycle Circulation. The Project will reconstruct bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway to maintain existing access while following the City of Irvine requirements. Minor improvements to facilitate bicycle circulation such as "BIKES MAY USE FULL LANE" signage, shared arrow advance warning signage, and other suggested methods that provide advance warning to both vehicular

drivers and bicyclists will be coordinated with the City of Irvine staff. Therefore, it is concluded that the Project impact related to this item is less than significant.

Transit System

Disruptions to Existing Transit Service

Significance Criteria

The following significance criteria were applied to determine if the Project is responsible for a disruption of existing transit services or facilities:

A significant impact occurs if a project disrupts existing transit services or facilities.

Project Impact

As noted in the review of existing transit routes, no transit routes currently run through the study area. Therefore, it is concluded that the Project impact related to this item is less than significant.

Interference with Planned Transit Services

Significance Criteria

The following significance criteria were applied:

A significant impact occurs if a project interferes with planned transit services or facilities.

Project Impact

As noted in the review of existing transit routes, no transit routes currently run through the study area. Furthermore, the Project does not propose any changes to existing bus pullout along any of the study roadways. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Conflicts or Creates Inconsistencies with Adopted Transit System Plans, Guidelines, Policies, or Standards

Significance Criteria

The following significance criteria regarding consistency with adopted transit plans, guidelines, policies, or standards were applied:

A significant impact occurs if a project conflicts or creates inconsistencies with adopted transit system plans, guidelines, policies, or standards.

Project Impact

Based on the review of the Project, it can be concluded that the Project does not conflict with these policies or other policies related to transit. The impact is therefore less than significant, and no mitigation is required.

Demand for Public Transit Services Above Capacity

Significance Criteria

The following significance criteria were applied:

A significant impact occurs if the project creates demand for public transit service above the capacity which is provided or planned.

Project Impact

The Project is consistent with the policies identified in the City of Irvine General Plan Objective B-6: Public Transit Circulation. Therefore, it is concluded that the Project impact related to this item is less than significant.

CMP Traffic Impact Analysis

The *2015 Orange County Congestion Management Program* (Orange County Transportation Authority, November 2015) [CMP] guidelines require that projects with the potential to create an impact of more than 3% of LOS E capacity on the CMP highway system links should require a traffic impact analysis. All projects generating 2,400 or more daily trips should require evaluation. If a project will have direct access to a CMP link, the threshold is reduced to 1,600 or more daily trips. A traffic impact analysis is not required if one has already been performed for the Project as part of an earlier development approval which takes the impact on the CMP highway system into account.

The nearest OCTA CMP intersection is Irvine Boulevard and SR-133 Northbound ramps. As documented in Table 3, the Project generates less than 1,600 daily trips on a peak construction activity day. Therefore, a CMP traffic impact analysis is not required.

10. Improvements

As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access during Project construction and maintenance/operations access during Project operation. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. Pedestrian and bicycle infrastructure at the intersection would be reconstructed to maintain access like the existing condition while following the City of Irvine requirements. This improvement assumes the northbound approach at Sand Canyon Avenue and Portola Parkway would be modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach would be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal phasing that gives a green signal for all vehicle movements of one direction followed by a green signal for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations. During construction of the Project, this private roadway would be used by construction trips for ingress and egress of the construction site. Upon completion of the Project, this private roadway would be used by IRWD staff conducting maintenance and inspections as part of typical operations, similar to existing conditions. Trips by IRWD staff to the reservoir are not anticipated to increase as compared to the existing condition and are not considered to have a significant effect on the future intersection operations.

Bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. The Project will not affect any planned bicycle facilities in the study area. Minor improvements to facilitate bicycle circulation such as "BIKES MAY USE FULL LANE" signage, shared arrow advance warning signage, and other suggested methods that provide advance warning to both vehicular drivers and bicyclists will be included in the traffic control plans generated for the intersection construction.

Based on the results of the analysis and in accordance with the adopted Traffic Impact Analysis Guidelines, no significant impacts or intersection deficiencies were identified as part of this Project and therefore no improvements are required.

While no significant impacts were identified as part of this study, the following measures are recommended to alleviate the potential effect of construction traffic:

- Off-site truck staging, if required, shall be provided in a legal area furnished by the contractor. Trucks shall not be permitted to travel along local residential streets.

- To the extent feasible, deliveries and pick-ups of construction materials should be scheduled during non-peak travel periods and coordinated to reduce the potential of trucks waiting to load or unload for protracted periods of time.
- Access shall remain unobstructed for land uses in proximity to the Project site during Project construction.
- Full-time lane or sidewalk closures are not anticipated for the Project. Temporary lane or sidewalk closures, when needed, shall be scheduled to avoid peak commute hours and peak school drop-off and pick-up hours to the extent possible. In the event of a lane or sidewalk closure, a worksite traffic control plan, approved by the City of Irvine, shall be implemented to route traffic or pedestrians around any such lane or sidewalk closures.

11. Conclusion

The purpose of this study is to evaluate the temporary transportation impacts associated with the Syphon Reservoir Improvement Project in Irvine, California. The following summarizes the results of this analysis:

- The Project proposes to increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The Project would be implemented within the IRWD service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and SR-133.
- As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access during Project construction and maintenance/operations access during Project operation.
- The scope of the traffic analysis, methodology assumptions, and selection of study intersections was developed in consultation with City of Irvine staff and documented in the Scope of Work for Irvine Ranch Water District (IRWD) Syphon Reservoir Construction Transportation Impact Analysis dated June 29, 2020.
- The study intersections selected represent the intersections where construction traffic is proposed to travel through. Four routes are proposed for the Project.
- On a peak construction activity day, approximately 232 daily trips are estimated, of which 36 trips (27 inbound/9 outbound) would occur during the AM peak hour and 18 trips (0 inbound/18 outbound) would occur during the PM peak hour. For the purpose of the intersection LOS analysis, the trip generation estimates were converted to PCE which resulted in approximately 512 daily PCE trips are estimated, of which 72 PCE trips (45 inbound/27 outbound) would occur during the AM peak hour and 18 PCE trips (0 inbound/18 outbound) would occur during the PM peak hour on the same peak construction activity day.
- The LOS analyses for all Existing Plus Project routes, Short-Term Interim Year Approved plus Project, and Short-Term Interim Year Pending plus Project that the Project would have no deficiencies at any study intersection. Therefore, no intersection improvements to address intersection deficiencies would be required.
- Based on the daily trip generation on a peak construction activity day, the Project does not meet the daily trip screening threshold and does not require further VMT impact analysis.
- The Project does not have a significant impact on the pedestrian, bicycle, or transit network.

Appendix A:
**Scope of Work for Irvine Ranch Water
District (IRWD) Syphon Reservoir
Construction Transportation Impact
Analysis**

MEMORANDUM

Date: June 29, 2020
To: Justin Equina, City of Irvine
CC: Jennifer Jacobus, PhD, ESA
Jo Ann Corey, Irvine Ranch Water District
From: Spencer Reed, PE and Ethan Yue Sun, PhD
Subject: Scope of Work for Irvine Ranch Water District (IRWD) Syphon Reservoir Construction Transportation Impact Analysis

OC18-0553

Fehr & Peers has been retained by ESA to assist with the transportation impact analysis for construction of the Irvine Ranch Water District (IRWD) Syphon Reservoir Project (Project) located near the intersection of Sand Canyon Avenue and Portola Parkway. Based on the City of Irvine's Traffic Study Guidelines (City of Irvine, August 2004, Updated 2020), this project is required to evaluate the impacts associated with construction of the Project. As the Project is anticipated to generate less than 50 peak hour trips (see trip generation section below), a Limited Scope Traffic Impact Analysis (TIA) will be prepared to evaluate short-term interim-year conditions and satisfy the City's analysis requirements.

The purpose of this memorandum is to document the methodologies and assumptions which will be used in the transportation impact analysis so there is an opportunity to approve the approach prior to preparing the traffic study. This Limited Scope TIA will include the following sections.

I. Executive Summary

This section will provide a summary of the project description and the analysis results. Any mitigations recommended as part of the project will also be included, if necessary.

Spencer Reed

Approved by Development Review

Date

II. Introduction

This section will describe the project, outline the Limited Scope TIA, and include the following sections:

Project Site

The Project proposes to increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The Project would allow the storage of additional recycled water produced at the Michelson WRP during periods of low demand (winter months) for use during periods of high demand (summer months). The Project would expand the reservoir's storage capacity from the current 500 Acre-Feet (AF) to approximately 5,000 AF and would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water from both Northern California and the Colorado River. The Project would help IRWD to store more drought-proof recycled water during summer months and support the increased use of recycled water for public landscaping, agricultural, business and industrial uses. Every gallon of recycled water IRWD uses for non-drinking water purposes saves a gallon of drinking water, helping the region's existing and planned future development to better withstand future water shortages. By reducing IRWD's dependence on costly imported water, the Project would allow IRWD to replace an expensive source of water for one that is less expensive and a drought-resilient supply, which increases IRWD's water supply reliability.

The Project would be implemented within the IRWD service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and SR-133 in the County of Orange. The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway.

As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. During the Project, this private roadway will be used by construction trips for ingress and egress of the construction site. Upon completion of the Project, this private roadway will be used by IRWD staff conducting maintenance and inspections as part of typical

San-San T. Murillo

operations. The trips by IRWD staff will be nominal and are not considered to have a significant effect on the future intersection operations.

Study Area Boundary

The study intersections selected represent the intersections where construction traffic is proposed to travel through. Two route options are proposed for the Project. Route Option 1 will be SR-133, north on Irvine Boulevard, and east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue and south on Irvine Boulevard to SR-133 for trucks traveling outbound. Route Option 2 will be I-5, east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue to I-5 for trucks traveling outbound. As presented in Figure 1, the following intersections have been selected for study:

1. Sand Canyon Avenue & Portola Parkway
2. Sand Canyon Avenue & Irvine Boulevard

8. SR-133 Northbound Off-Ramp & Irvine Boulevard

Data Collection

Due to emergence of COVID-19 in southern California and the decision of local schools to end on-campus classes for the 2019-2020 academic year, it is not recommended to collect existing intersection counts in the study area. However, the City of Irvine has agreed to provide the most recent intersection counts available that can be used to estimate 2020 intersection volumes. As prescribed by the City of Irvine, a growth factor of 2% per year will be applied to previously counts collected to develop 2020 intersection volumes for the AM and PM peak hours.

III. Existing Conditions

Existing Lane Uses

Existing land uses on site will be identified. The existing site is the IRWD syphon reservoir.

Existing Roadways and Intersections

Fehr & Peers will collect the following information in a field visit to the study area:

- Lane & intersection configurations
- Traffic signal locations
- Signal phasing
- Land uses in the study area
- Existing pedestrian and bicycle facilities
- Transit service

IV. Performance Criteria

The performance criteria to determine potential impacts and mitigations will be consistent with the City's criteria, as outlined in the Traffic Study Guidelines. The City's Transportation Design Procedures (TDP) adopted February 2007 will be used as the performance criteria to evaluate the design features of the project access.

V. Proposed Project Impacts

Trip Generation

Construction of the Project is estimated to be approximately 41 months, depending on weather conditions and other variables. Construction is currently anticipated to begin in the Fall of 2022. Most construction activities would be limited to 7:00 AM to 4:00 PM Monday through Friday. Construction of the Project would include activities implemented in phases as outlined below.

- Access Routes/Intersection Improvements
- Excavation of Sediment/Existing Dam
- Construction of Dam/Spillway/Reservoir
- Construction of Filtration/Chlor/Dechlor Facilities
- Wetlands/Riparian Installation
- Installation of Recreation Facilities
- Demobilization

Sun-Sun T. Murillo

Date

Construction Vehicle Type

Haul Trucks

Hauling hours are anticipated to be 7:00 AM to 3:00 PM on weekdays. During the peak trip period, approximately 52 material delivery trucks would enter and exit the site per workday for approximately twelve months. During other times of construction, material deliveries would be expected in the range of 5 to 10 material delivery trucks per day. These trucks are assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Equipment and Delivery Trucks

In addition to haul trucks, the site is also expected to generate equipment and delivery trucks during each phase of construction. These materials would be delivered to the site and stored on-site. These deliveries are expected to occur in a variety of vehicles including small delivery trucks to cement mixer trucks and 18-wheel trucks. Additionally, construction equipment would also have to be delivered to the site. This equipment could include bulldozers, excavators, and other large items of machinery. Most of the heavy equipment is expected to be transported to the site on large trucks such as 18-wheelers or other similar vehicles. These trucks are assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Employee Vehicles

The number of construction workers would vary throughout the construction period. Parking for all construction workers will be provided on-site. Construction workers are assumed to arrive in single occupant vehicles.

Construction Period Trip Generation

Based on the aforementioned information, a construction period trip generation analysis was conducted to estimate daily, morning, and evening peak hour trips of the phase with the highest trip generation potential. As seen in Table 1, the construction of Dam/Spillway/Reservoir phase represents the day with the highest trip generation potential with approximately 116 vehicles.

Construction workers often travel to and from a worksite outside of the typical peak commute hours. Construction hours are anticipated to occur from 7:00 AM to 4:00 PM, with most worker trips and truck trips anticipated to occur outside of the AM and PM peak hours. For the purpose of the analysis, it was assumed that up to 40% of the construction workers would arrive at the construction

Sun-Sun T. Murillo

7/2/20

Approved by Development Review

Date

site during the peak morning commute hour and up to 40% would depart the construction site during the peak evening commute hour. Equipment trucks were assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Table 1 presents a summary of the construction trip generation on a peak day. As shown, on a peak construction activity day, approximately 232 daily trips are estimated, of which 36 trips (27 inbound/9 outbound) would occur during the AM peak hour and 18 trips (0 inbound/18 outbound) would occur during the PM peak hour. This trip generation is anticipated to occur for approximately two to three months. Trip generation outside of this phase would be reduced with approximately 30 daily to 154 daily trips being generated.

Adjustments to Trip Generation

No adjustments to the trip generation shall be made without prior written approval from the City.

Trip Distribution and Assignment

Two route options are proposed for the Project. Route Option 1 will be SR-133, north on Irvine Boulevard, and east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue and south on Irvine Boulevard to SR-133 for trucks traveling outbound. Route Option 2 will be I-5, east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue to I-5 for trucks traveling outbound.

Phasing

The proposed project will be constructed in a single phase and is assumed to be operational by early 2026.

Vehicle Miles Traveled Methodology and Approach

On September 27, 2013, Governor Jerry Brown signed Senate Bill (SB) 743 into law and started a process that will fundamentally change transportation impact analysis conducted as part of California Environmental Quality Act (CEQA) compliance. The Governor's Office of Planning and Research (OPR) was charged with developing new guidelines for evaluating transportation impacts under CEQA using methods that no longer focus on measuring automobile delay and level of service (LOS).

Sun-Sun T. Murillo

7/2/20

OPR issued proposed updates to the CEQA guidelines in support of these goals in November 2017 and a supporting technical advisory in December 2018. The updates establish vehicle miles traveled (VMT) as the metric for evaluating a project's environmental impacts on the transportation system. Lead agencies, including the City of Irvine, have until July 1, 2020 to implement these new requirements. On June 23, 2020, the City of Irvine adopted the CEQA VMT Impact Analysis Guidelines. This project will include a VMT impact analysis section that follows the adopted CEQA VMT Impact Analysis Guidelines.

The City of Irvine's guidelines identify projects generating fewer than 250 daily trips as being screened out of VMT analysis. As identified in Table 1, all phases of construction have a daily trip generation less than 250 trips. Therefore, it can be assumed that all of the construction phases could be screened out of conducting a VMT analysis using the City of Irvine draft guidelines.

Many jurisdictions in Southern California have regarded construction-related traffic as causing adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary. Therefore, due to all phases meeting the daily trip screening threshold of the City of Irvine and the temporary nature of the one phase that exceeds the threshold, this Project can be considered to be exempt from VMT and the traffic study will include a CEQA VMT Impact Analysis section and provide justification on how the project is exempt from VMT analysis.

Intersection Level of Service Analysis Methodology and Approach

The Intersection Capacity Utilization (ICU) methodology will be used to evaluate the intersection level of service (LOS) under the analysis scenarios identified below. The LOS will be reported at the study intersection for the AM and PM peak hours.

In addition, the Project's effect to non-automotive transportation will be evaluated based on the Project's consistency with existing or planned facilities in the study area

The following six scenarios will be analyzed:

- Existing Conditions – estimated intersection counts will be analyzed.
- Existing plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates will be added to the Existing Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site will be included.

Approved by Development Review

Date

- Short-Term Interim Year Approved Baseline Conditions – the future (Short-Term Interim Year) conditions will be developed based on the latest version of the Irvine Traffic Analysis Model (ITAM). Short-Term Interim Year Baseline Approved peak hour traffic volumes will be extracted for the study intersections.
- Short-Term Interim Year Approved Baseline plus Project Conditions – the proposed construction trip generation (in passenger car equivalent) and route assignment estimates will be added to the Short-Term Interim Year Approved Baseline Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site will be included.
- Short-Term Interim Year Pending Baseline Conditions – the future (Short-Term Interim Year) conditions will be developed based on the latest version of ITAM. Short-Term Interim Year Baseline Pending peak hour traffic volumes will be extracted for the study intersections.
- Short-Term Interim Year Pending Baseline plus Project Conditions – the proposed construction trip generation (in passenger car equivalent) and route assignment estimates will be added to the Short-Term Interim Year Pending Baseline Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site will be included.

The following parameters will be used in our operations analysis:

- Manual assignment of project trips added to the estimated intersection count volumes.
- Vistro v7.0 software and ICU methodology to analyze signalized study intersections.
- Volume to capacity (V/C) ratios and the associated LOS will be reported for the signalized Irvine study intersections under the ICU methodology.
- A VMT analysis will be prepared in accordance with adopted Traffic Impact Analysis Guidelines in effect at the time of project approval.
- Per the City of Irvine Traffic Impact Analysis Guidelines, lane capacities of 1,700 per hour per lane for through and turn lanes will be used for all volume/capacity calculations.
- Per the City of Irvine Traffic Impact Analysis Guidelines, lost time of 0.05 added to ICU calculation. Lost time represents the time in which no vehicles can pass through the intersection despite having a green signal (i.e. the delay from the driver in moving the vehicle as the signal changes from red to green)
- Inclusion of proposed private roadway under Plus Project condition

VI. Special Analyses/Issues

Access Analysis

An analysis of the City's Transportation Design Procedures (TDPs) will be conducted for the primary access intersection (Sand Canyon Avenue/Portola) of the IRWD Syphon Reservoir. The TIA will identify the proposed lane geometry at this intersection to reflect this new access. The project is also responsible for restriping and other physical improvements necessary to implement the new access.

The specific TDPs to be evaluated include:

- TDP-1 (Turn lane pocket length) on eastbound Portola Parkway, if an eastbound left-turn lane is proposed
- TDP -14 (Driveway Lengths)
- TDP-15 (Gate Stacking), if applicable.

VII. Required Mitigation Measures

Based on the results and in accordance with the adopted Traffic Impact Analysis Guidelines, physical, operational, and alternative improvements required to mitigate unacceptable impacts due to the proposed project will be identified and analyzed.

VIII. Conclusions

A summary of the six analyzed scenarios, along with estimated effects of the mitigations, will be included in the TIA.

IX. Revisions to the Analysis

After a review and consolidated comments by city staff, Fehr & Peers will prepare one round of revisions to the TIA.

X. Signature

The TIA will be prepared under the supervision of, and signed, stamped, and dated by a registered traffic engineer or a registered professional civil engineer.

**TABLE 1
CONSTRUCTION PERIOD TRIP GENERATION**

Phase	Duration (Months)	Peak Day Activity Under Each Phase			Total Vehicles	Total Daily Vehicle Trips
		Haul Trucks	Equipment and Delivery Trucks	Employee Vehicles		
		Access Routes/Intersecction Improvements	5	8		
Excavation of Sediment/ Existing Dam	6.6	0	6	31	37	74
Construction of Dam/Spillway/Reservoir	13.8	52	18	46	116	232
Construction of Filtration/Chlor/Dechlor Facility	12	0	29	48	77	154
Wetlands/Riparian Installation	12	0	5	20	25	50
Installation of Recreation Facilities	3	0	5	10	15	30
Demobilization	1	0	7	15	22	44

Construction of Dam/Spillway/Reservoir Trip Generation							
Trip Type	Daily Trips [a]	Morning Peak Hour Trips			Evening Peak Hour Trips		
		In	Out	Total	In	Out	Total
Haul Truck Trips [b]	104	7	7	14	0	0	0
Delivery and Equipment Truck Trips [b]	36	2	2	4	0	0	0
Construction Worker Trips [c]	92	18	0	18	0	18	18
Phase Total	232	27	9	36	0	18	18

Notes:

[a] - Daily trips were calculated by counting two trips, one inbound and one outbound trip for each vehicle

[b] - Daily haul and delivery/equipment truck trips were assumed to occur evenly throughout an 8-hour construction day. Therefore, the daily truck trips were divided by 8 hours to calculate morning and evening peak hour truck trips.

[c] - Up to 40% of the construction workers were assumed to arrive during the morning peak hour of adjacent street traffic. A total of up to 40% worker were assumed to depart during the evening peak hour.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.366	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.580	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.496	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.538	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.596	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.600	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.556	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.465	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.418	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.541	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.520	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.396	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.588	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.505	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.538	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.596	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.600	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.556	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.465	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.429	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.541	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.520	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.396	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.588	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.505	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.556	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.602	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.608	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.556	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.465	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.429	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.541	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.525	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.396

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.429	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.546	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.520	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.396	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.580	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.496	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.538	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.596	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.600	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.569	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.491	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.396

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.429	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.546	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.520	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.426	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.681	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.580	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.630	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.700	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.704	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.652	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.544	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.426

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.488	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.635	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.731	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.641	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.610	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.869	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.735	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.456	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.689	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.589	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.630	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.700	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.704	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.652	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.544	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.456

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.499	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.635	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.731	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.641	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.610	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.869	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.735	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.456	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.689	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.589	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.648	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.705	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.712	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.652	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.544	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.456

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.499	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.635	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.731	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.641	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.615	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.869	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.735	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.456	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.681	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.580	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.630	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.700	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.704	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.665	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.544	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.456

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.499	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.640	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.731	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.641	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.610	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.869	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.735	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.456	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.681	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.580	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.630	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.700	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.704	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.665	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.569	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.456

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.499	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.640	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.731	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.641	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.610	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.869	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.735	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.495	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.644	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.618	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.743	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.651	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.619	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.883	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.746	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.470	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.711	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.651	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.723	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.728	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.674	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.562	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.470

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.506	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.644	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.618	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.743	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.651	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.619	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.883	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.746	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.470	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.711	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.670	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.728	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.736	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.674	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.562	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.506	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.644	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.618	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.743	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.651	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.625	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.883	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.746	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.470	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.704	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.600	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.651	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.723	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.728	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.687	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.562	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.506	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.650	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.618	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.743	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.651	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.619	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.883	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.746	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.470	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.704	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.600	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.651	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.723	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.728	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.687	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.587	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.506	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.650	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.618	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.743	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.651	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.619	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.883	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.746	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

SYPHON RESERVOIR IMPROVEMENT PROJECT

Draft Environmental Impact Report
State Clearinghouse Number 2019080009

Prepared for
Irvine Ranch Water District

March 2021

NOTICE OF AVAILABILITY

Draft Environmental Impact Report

Date: March 19, 2021

To: Responsible and Trustee Agencies, Interested Organizations, and Interested Parties

Lead Agency: Irvine Ranch Water District

Project: Syphon Reservoir Improvement Project Draft Environmental Impact Report (State Clearinghouse No. 2019080009)

Review Period: March 19, 2021 to May 18, 2021

This Notice of Availability (NOA) has been prepared to notify responsible and trustee agencies, interested organizations, and interested parties that Irvine Ranch Water District (IRWD), as the Lead Agency pursuant to the California Environmental Quality Act (CEQA), has prepared a Draft Environmental Impact Report (Draft EIR) for the proposed Syphon Reservoir Improvement Project (proposed project) that is available for review and comment. The Draft EIR was prepared to comply with CEQA and the CEQA Guidelines and to provide agencies and the public with information on the potential significant environmental impacts of the proposed project, recommended mitigation measures to reduce or avoid those environmental effects, and the analysis of alternatives to the proposed project. In addition, the Draft EIR was prepared in accordance with the CEQA-Plus requirements of the U.S. Environmental Protection Agency, to fulfill the requirement of potential federal funding partners to comply with the National Environmental Policy Act (NEPA).

Project Location: The proposed project would be implemented within IRWD’s service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and SR-133 in the County of Orange (see **Figure 1**). The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway. The reservoir is located within the Central and Coastal Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) and is included as an operating reservoir allowed within the NCCP/HCP Reserve. Implementation of expanded seasonal storage for recycled water purposes was anticipated and identified as a permitted use in the NCCP/HCP.

Project Description: The proposed project would allow IRWD to increase the storage capacity of the existing recycled water Syphon Reservoir to help IRWD become more self-sufficient by reducing its dependence on costly and less reliable imported water during summer months, and support the increased use of recycled water for public landscaping, agricultural, business and industrial uses in IRWD’s service area. Increased use of recycled water for these non-drinking water purposes would make more drinking water available to the region to better withstand future water shortages.

The proposed project would replace the existing engineered dam with a new engineered dam, increasing the existing 59-foot dam height to 136 feet and increasing the elevation of the dam crest from the existing 388 feet above mean sea level (amsl) to 466 feet amsl. A spillway would be included with the new dam to protect the reservoir from overtopping. The replacement dam would result in an increase in the reservoir's maximum water surface elevation from the existing 376 feet amsl to 456 feet amsl and increase the reservoir's capacity from approximately the existing 500 AF to 5,000 AF. As part of the new design, the engineered embankment dam would include a seepage control drainage system and a circulation/aeration system for the reservoir. The existing strainer and disinfection facilities would be demolished, reconstructed and expanded at the toe of the new engineered dam to provide filtration, chlorination and de-chlorination. Additional project features include new onsite access and maintenance roads; wetland and riparian mitigation areas; and a potential recreational facility (i.e. walking trail). Project features are shown on **Figure 2**.

Environmental Impacts: The Draft EIR evaluates the potential impacts of the proposed project and, for identified potentially significant impacts, the Draft EIR recommends mitigation measures that would reduce the impacts of the proposed project to a less than significant level for the following environmental topics: aesthetics, air quality, biological resources, cultural resources, geology and soils, hazards and hazardous materials, recreation, transportation, tribal cultural resources, and wildfire. Per Section 65962.5 of the Government Code, there are no open active cases for hazardous materials sites within the project site.

Document Availability: The NOA and Draft EIR may be viewed and downloaded from the following IRWD website address: <http://www.syphonreservoir.com>. Printed copies of the Draft EIR may be available for public review at the following public library and the IRWD office as permitted if/when the restrictions due to facility closures and the need for social distancing required in response to COVID-19 are lifted by the appropriate governmental agencies: Heritage Park Library, 14361 Yale Ave, Irvine CA 92604; and IRWD, 15600 Sand Canyon Avenue, Irvine, California 92618.

Public Information Presentation: IRWD will hold one virtual public meeting via Zoom and telephonically to receive public comments on the environmental analysis in the Draft EIR. The virtual public meeting will include a brief presentation providing an overview of the proposed project and findings of the Draft EIR. The virtual meeting will be held at 6:00 P.M. on April 21, 2021. For information on how to access the virtual public meeting, please see below or visit <http://www.syphonreservoir.com>.

Virtual Public Meeting Details

Date:	April 21, 2021
Time:	6:00 PM
Zoom Link:	http://bit.ly/syphoneirmeeting
Telephone Dial-in:	(877) 853 5247 (toll free)
Meeting ID:	898 6243 8353

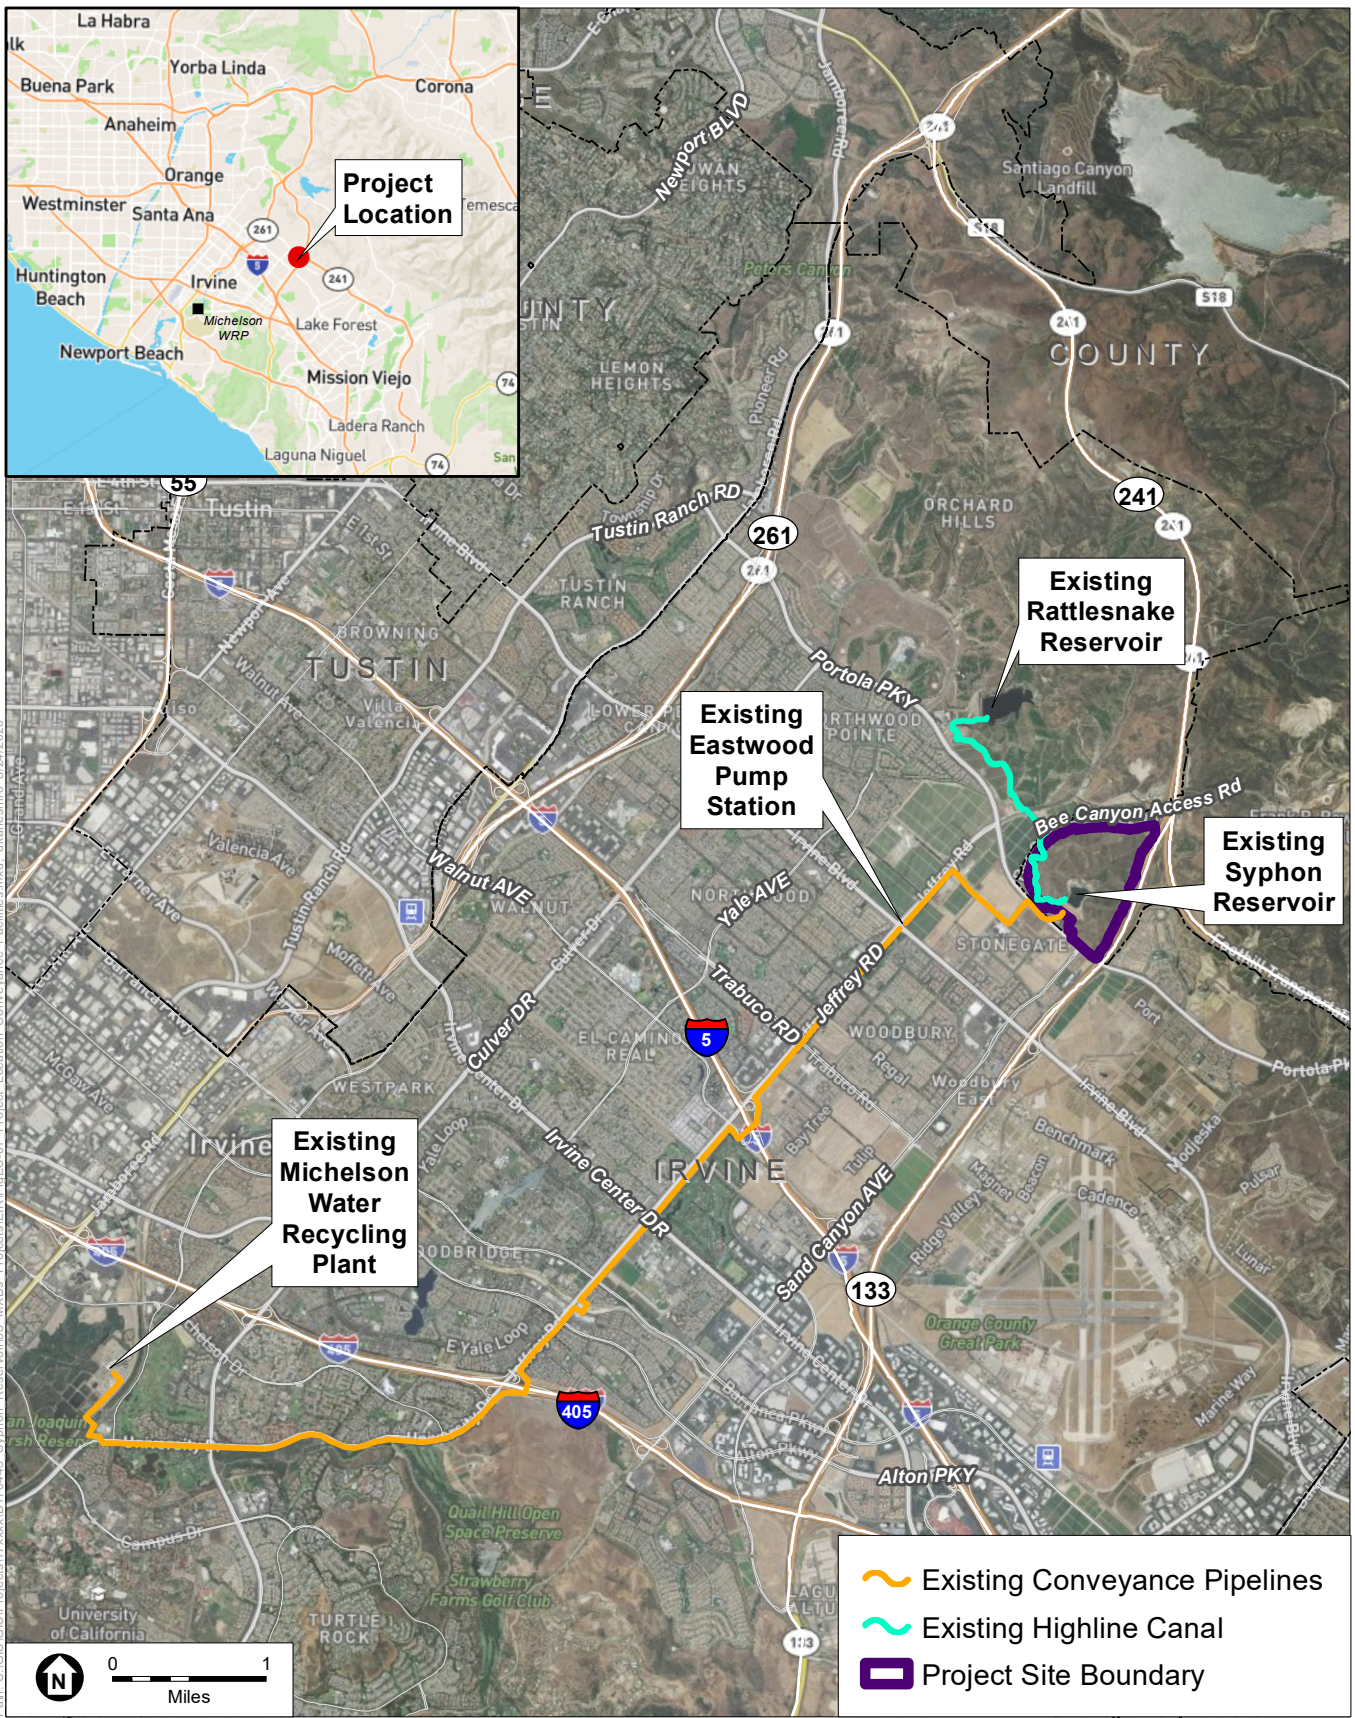

If participating online, please register for the meeting prior to joining by providing your name and email address. For the best experience it is recommended that the public download and install Zoom on your computer before the meeting begins. The free Zoom software can be downloaded in advance, or at the moment you join the meeting at: <https://zoom.us/download>; however, it is not required to install the Zoom

software on your computer to participate and provide comments. When you click on the meeting link provided at registration, a new browser tab or window will open (depending on your browser settings).

If participating by phone, you will not be able to see the visual content presented, but you can listen and participate. When instructed to do so, please press *6 to mute and unmute yourself, and press *9 to raise your hand.

Public Review and Comments: IRWD is soliciting comments from the public regarding the content of the environmental information provided in the Draft EIR. Written comments on the Draft EIR must be received by the IRWD, at the address provided below no later than 4:00 P.M. on May 18, 2021.

EXECUTIVE SUMMARY

ES.1 Introduction

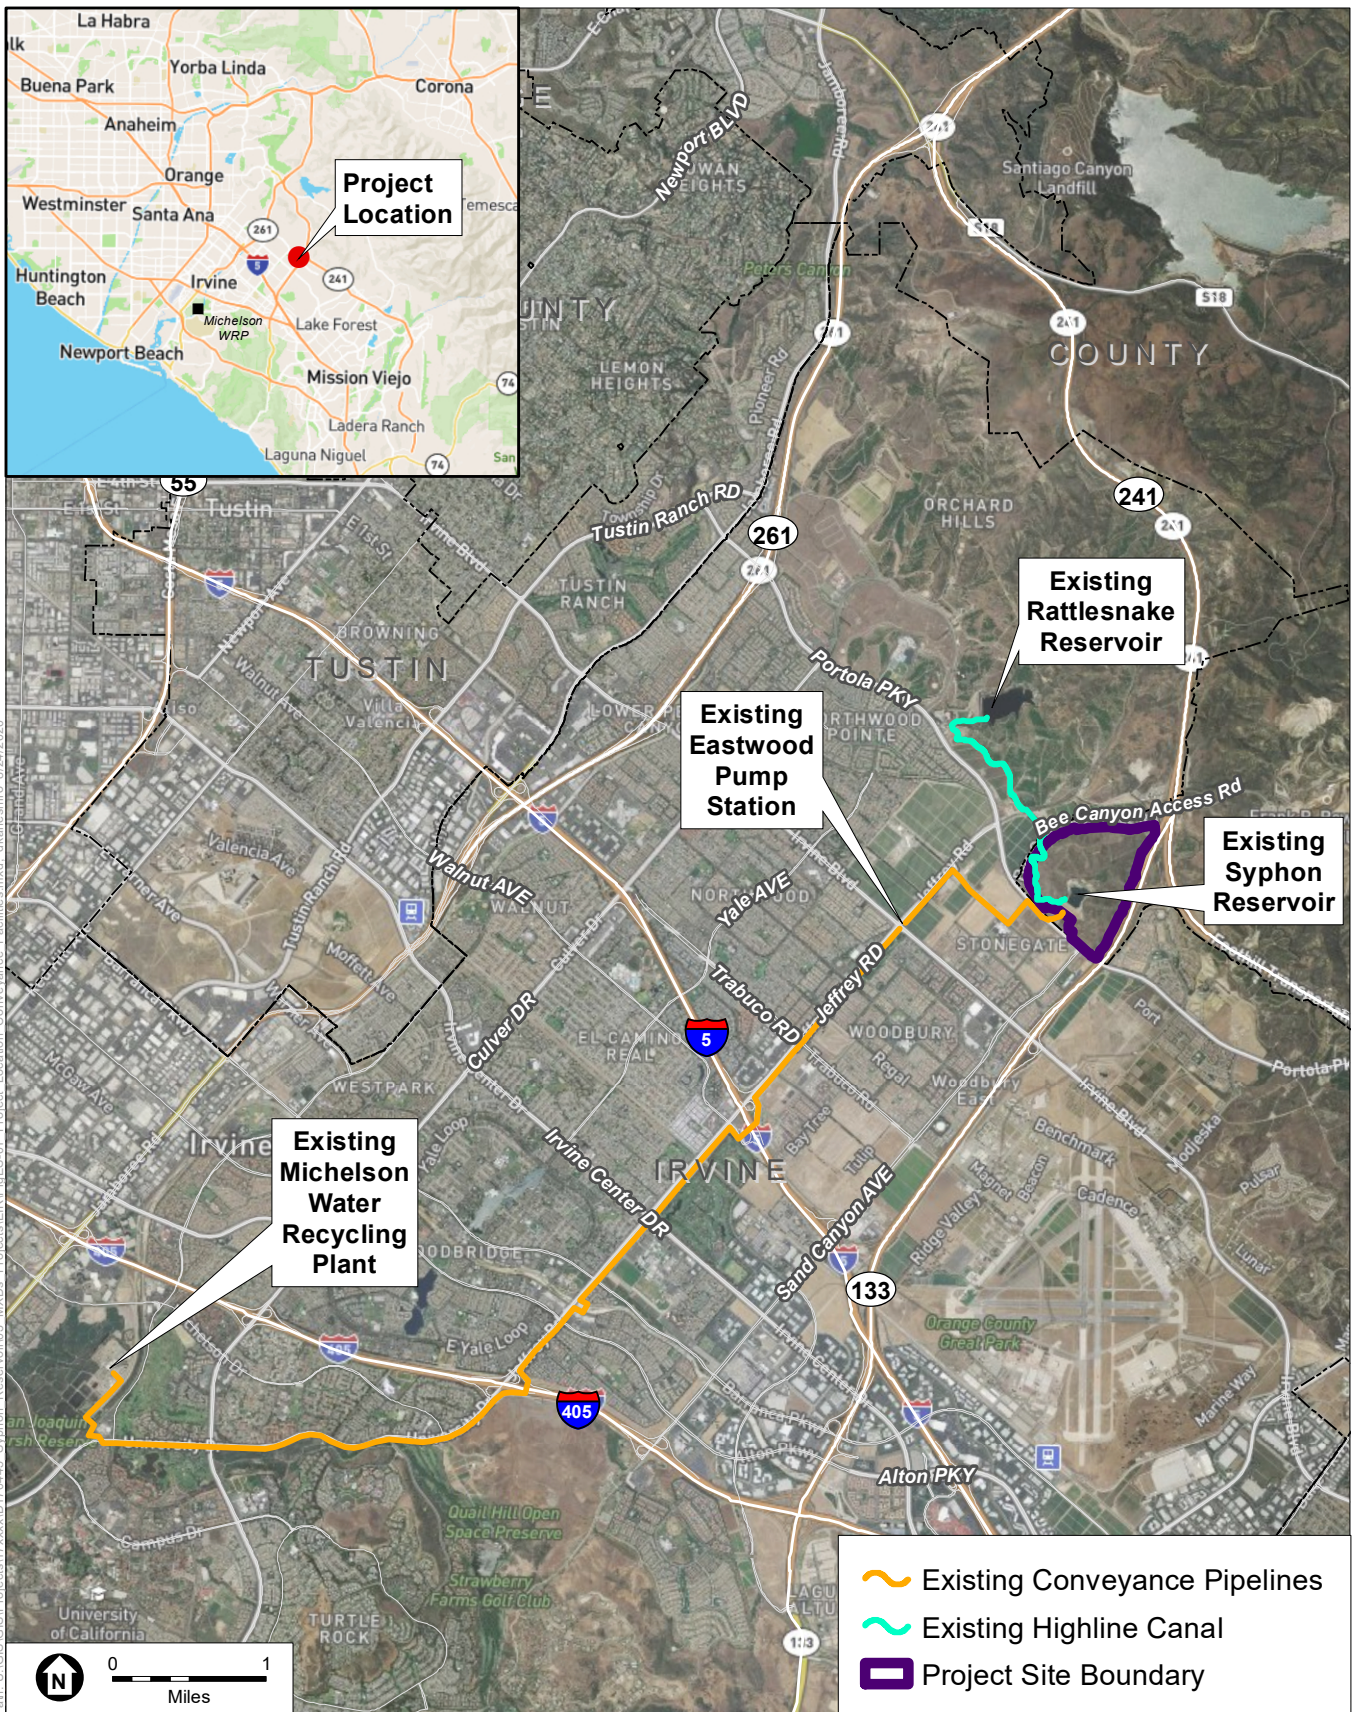

Irvine Ranch Water District (IRWD or District) is proposing to construct the Syphon Reservoir Improvement Project (proposed project). The Syphon Reservoir is an existing recycled water storage reservoir located within IRWD's service area, northeast of Portola Parkway between Bee Canyon Access Road and State Route 133 (SR-133) in the County of Orange. The proposed project would allow IRWD to increase the storage capacity of the existing Syphon Reservoir to help IRWD become more self-sufficient by reducing its dependence on costly and less reliable imported water during summer months, and support the increased use of recycled water for public landscaping, agricultural, business and industrial uses in IRWD's service area. Increased use of recycled water for these non-drinking water purposes would make more drinking water available to the region to better withstand future water shortages.

As the Lead Agency, IRWD has prepared this Draft Environmental Impact Report (Draft EIR) to provide information about the potential environmental effects associated with the proposed project. This Draft EIR has been prepared in compliance with the California Environmental Quality Act (CEQA) of 1970 (as amended), codified at California Public Resources Code (PRC) Sections 21000 et. seq., and the State CEQA Guidelines in the Code of Regulations, Title 14, Division 6, Chapter 3. A project-level analysis, which evaluates the construction and operation of the proposed project at a site-specific level, is included in this Draft EIR. The analysis is consistent with CEQA Guidelines Section 15161 and 15378(a). The proposed project site is shown in **Figure ES-01**. The State Clearinghouse Number is 2019080009.

In addition, this Draft EIR has been prepared in accordance with the CEQA-Plus requirements of the U.S. Environmental Protection Agency, to fulfill the requirement of potential federal funding partners to comply with the National Environmental Policy Act (NEPA).

ES.2 Project Background

IRWD is a local, not-for-profit, independent special district that provides reliable drinking water, sewage collection and treatment, recycled water and urban runoff treatment to the approximately 422,000 residents that are in its 181 square mile-district area in central Orange County, California. IRWD's service area includes the City of Irvine and portions of Costa Mesa, Lake Forest, Newport Beach, Orange, Tustin, and unincorporated areas of Orange County. IRWD provides service to approximately 20 percent of Orange County's total land area and has a diverse water supply that includes local groundwater, recycled water, imported water, and local surface water.

SOURCE: ESRI, 2016; OC LAFCO, 2018

Syphon Reservoir Improvement Project

Figure ES-01
Existing Syphon Reservoir Location and Conveyance Facilities

Approximately 54 percent of IRWD's water supply comes from 26 local groundwater wells in the Orange County Groundwater Basin; approximately 18 percent of IRWD's water supply is imported from the Metropolitan Water District of Southern California (MWD); and roughly 26 percent of IRWD's water demands are met with recycled water.

Recycled water produced by IRWD is stored at Syphon Reservoir, as well as other recycled water storage reservoirs operated by IRWD, including San Joaquin, Rattlesnake, and Sand Canyon Reservoirs. IRWD is an experienced reservoir operator with a strong track record in reservoir and facilities' construction, maintenance, performance, and safety. All of IRWD's reservoirs are state-inspected and meet all requirements for safe use. Additionally, IRWD goes above and beyond the required safety standards by monitoring its dams daily, and inspecting them monthly. IRWD also retains dam safety experts to inspect its dams annually.

While IRWD's existing reservoirs provide storage for recycled water, once the storage reservoirs are full to capacity in winter months, recycled water supplies are either diverted to Orange County Sanitation District (OCSD) or discharged to the ocean. Under such conditions, IRWD is left short of recycled water to meet customer demands and must then purchase costly supplemental imported water from MWD to meet the summer demands of IRWD's recycled water customers. Based on projected demands and supplies, IRWD estimates that it will need approximately an additional 4,500 AF by the year 2030.

The existing Syphon Reservoir was constructed in 1949 and was acquired by IRWD in 2010 from the Irvine Company, which previously used the reservoir to store water for agricultural irrigation. As early as 2011, IRWD began studying the feasibility of expanding the Syphon Reservoir to accommodate additional recycled water storage capacity. In 2012, IRWD prepared the *Syphon Reservoir Expansion Engineering Feasibility Study* and the *Syphon Reservoir Expansion Engineering Feasibility Study, Constructability Analysis* (GEI 2012a; 2012b), which provided baseline geotechnical information for the project site and generalized construction techniques and procedures. The studies evaluated existing site characteristics, geologic conditions, facilities integration, and inundation from any potential dam failure. Additional investigative studies were evaluated in conjunction with the 2012 engineering studies. These studies include the *Syphon Reservoir Water Quality Study*, *Syphon Reservoir Seasonal Storage Requirements*, *Syphon Reservoir System Integration Study*, *Syphon Reservoir Pump Station & Treatment Feasibility Study* (GEI 2012a), and the *Syphon Reservoir Environmental Regulatory Evaluation* (Dudek 2012).

In 2013, IRWD converted the facilities at Syphon Reservoir for interim storage of recycled water produced at IRWD's Michelson Water Recycling Plant (WRP). All recycled water flowing into and out of the Syphon Reservoir for storage is controlled directly by IRWD. The interim facilities included housing for chlorination equipment, storage for sodium bisulfite and sodium hypochlorite, and metering pumps; mechanical strainers; a backwash water supply pump and lift station; reservoir aeration system; and a 48-inch storm drain pipe. IRWD anticipated that the interim facilities could be replaced in the future with larger facilities to handle a higher rate of flow.

In 2016, IRWD conducted a dry lakebed geotechnical exploration to obtain information on the extent and character of sediments that have accumulated in the Syphon Reservoir over time (GEI 2016). The geotechnical investigations provided information on the character of subsurface

materials that had accumulated in the reservoir that could be excavated to provide suitable materials for construction and to increase the capacity of the reservoir (GEI 2016).

In 2018, IRWD began construction of the Eastwood Pump Station to increase operational flexibility in IRWD's recycled water delivery systems and maximize the use of recycled water. In addition, the Eastwood Pump Station would eventually pump recycled water to the proposed expansion of Syphon Reservoir.

In 2019 and 2020, IRWD conducted the Syphon Reservoir Geotechnical Investigations Project, which evaluated geologic and seismic conditions at the existing Syphon Dam and Reservoir. Results of the geotechnical investigations are used to inform the evaluation of project-related impacts in this Draft EIR and would be used for the design of the proposed project. The Syphon Reservoir Geotechnical Investigations Project included a fault study that confirmed the Central Valley Fault is a regional U-shape fault with two main splays that extend northeast to southwest under the existing Syphon Dam. The fault splays are concealed by the lake bottom sediments, alluvium, and slopewash/colluvium soils in the reservoir and in the drainage. The fault study concluded that the Central Valley Fault has not moved within Quaternary time (the last 1.6 million years) and has no potential for future movement. Faults that have no suggestion of Quaternary activity are considered inactive (AECOM 2020).

ES.3 Objectives

The primary objective of the proposed project is to allow for an increase in IRWD's seasonal recycled water storage capacity. In implementing the proposed project, IRWD would:

- Improve local water supply reliability by reducing the need to purchase costly imported water from MWD by storing additional recycled water during low demand periods for use when needed during high demand periods;
- Ensure the new engineered dam and reservoir meet or exceed the current safety and design requirements established by the California Department of Water Resources (DWR), Division of Safety of Dams (DSOD), which is the governing state agency associated with this project;
- Reduce diversions of sewage to OCSD;
- Maximize the use of recycled water produced by IRWD for the benefit of IRWD customers; and
- Reduce recycled water discharges to the ocean.

IRWD's current dam safety program falls under the jurisdiction of the DSOD. The intent of the Syphon Reservoir Improvement Project would be to not only meet the requirements of DSOD, but to exceed those requirements by considering the current state of practice of Risk-Informed Decision-Making (RIDM) during design and construction. The overarching goal of this approach would be to construct an expanded Syphon Reservoir that would comply not only with state requirements but would also leverage the significant benefits that a risk-informed dam safety approach can provide in protecting dam facilities and the public. Agencies, owners and regulators from around the world (including all US federal dam owners and regulators such as the Bureau of Reclamation, the US Army Corps of Engineers, and the Federal Energy Regulatory Commission) use RIDM and associated risk management strategies to assess and manage risks for dams,

including making decisions about the safety of their facilities and necessary actions to reduce risk. The risk-informed design approach for the Syphon Reservoir Improvement Project will result in a dam design that avoids failures and associated consequences to downstream communities consistent with IRWD's priority of public safety.

ES.4 Project Description

The proposed project would replace the existing engineered dam with a new engineered dam, increasing the existing 59-foot dam height to 136 feet and increasing the elevation of the dam crest from the existing 388 feet above mean sea level (amsl) to 466 feet amsl. A spillway would be included with the new dam to protect the reservoir from overtopping. The existing dam includes a spillway that has never been used during its 62-year history, including during IRWD's ownership and operation of Syphon Reservoir (GEI 2012a). The new engineered dam would result in an increase in the reservoir's maximum water surface elevation from the existing 376 feet amsl to 456 feet amsl and increase the reservoir's approximate capacity from the existing 500 AF to 5,000 AF. As part of the new design, the engineered embankment dam would include a seepage control drainage system and a circulation/aeration system for the reservoir. The existing strainer and disinfection facilities would be demolished, reconstructed and expanded at the toe of the new dam to provide filtration, chlorination and de-chlorination. Additional project features include new onsite access and maintenance roads; wetland and riparian mitigation areas; and potential recreational facilities. Project features are shown on **Figure ES-02**.

Similar to existing operations, all recycled water flowing into and out of the Syphon Reservoir for storage would be controlled directly by IRWD. The delivery of recycled water to and from Syphon Reservoir would be accomplished by the addition of pumps within the offsite Eastwood Recycled Water Pump Station. The Eastwood pump station structure is currently under construction to enhance IRWD's recycled water delivery systems. The pump station can accommodate the Syphon Reservoir Improvement Project with the installation of additional pump equipment. Installation of the equipment would be coordinated as a separate "equipping project" in parallel to the construction of the proposed project. As shown in Figure ES-01, existing offsite conveyance facilities would be used to deliver tertiary-treated recycled water from the Michelson WRP to the Eastwood Recycled Water Pump Station, and then to Syphon Reservoir via an existing 36-inch recycled water pipeline. The existing Highline Canal would be abandoned in place and no longer used to deliver water from Rattlesnake Reservoir to Syphon Reservoir. Under normal operating conditions, all flow out of Syphon Reservoir would be conveyed back to the Eastwood Recycled Water Pump Station through the same 36-inch recycled water pipeline, for connection to IRWD's recycled water distribution system (see Figure ES-01).

During the design phase, IRWD intends to establish an independent Technical Advisory Group (TAG) comprised of nationally recognized industry experts, which may include the disciplines of dam geology/site characterization, seismic analysis, hydrology/hydraulics, dam construction, potential failure mode analysis and RIDM. The purpose of the TAG is to provide an independent assessment of the design development including, but not limited to, review of design criteria, design details, technical approach, and other aspects of the design engineer's work to confirm that the project design is in full compliance with or exceeds governing standards and requirements.

Syphon Reservoir Improvement Project

Figure ES-02
Proposed Project Facilities

ES.5 Project Alternatives

An EIR must describe a range of reasonable alternatives to the proposed or alternative project locations that could feasibly attain most of the basic project objectives and would avoid or substantially lessen any of the significant environmental impacts of the proposed project. The alternatives analysis must include the “No Project Alternative” as a point of comparison. The No Project Alternative includes existing conditions and reasonably foreseeable future conditions that would exist if the proposed project were not approved (CEQA Guidelines Section 15126.6). The following alternatives are discussed further in Chapter 6, Alternatives Analysis.

No Project Alternative

Under the No Project Alternative, IRWD would not demolish the existing Syphon Dam and Syphon Reservoir and would not build a new dam and reservoir with a capacity of approximately 5,000 AF and associated infrastructure. The existing 500 AF reservoir would continue to be operated by IRWD, with excess sewage continuing to be sent to OCS D for disposal. IRWD would continue to purchase costly imported water from MWD to meet recycled water customer demands. The benefits of the proposed project, which include maximizing the use of recycled water produced by IRWD for the benefit of IRWD customers, would not occur. The No Project Alternative would avoid all of the mitigated environmental impacts associated with the proposed project but would meet none of the project objectives.

Sand Canyon Reservoir Alternative

The Sand Canyon Reservoir Alternative would involve enlarging the existing reservoir at Sand Canyon. The Sand Canyon Reservoir currently has a 768 AF storage capacity (IRWD 2020a), and an early feasibility study indicated that raising the dam 28 feet above its existing elevation would increase the reservoir storage capacity to approximately 3,000 AF. Site constraints include quality and quantity of the onsite borrow and embankment materials and costs associated with property acquisitions (Woodward-Clyde 1992). Existing pipelines and pump stations would be sized appropriately for the expansion, and no additional pipelines or pump stations would be required (Woodward-Clyde 1992).

The Sand Canyon Reservoir Alternative would result in greater impacts, when compared to the proposed project, to air quality and noise during construction due to sensitive receptors located approximately 80 feet from construction activities. Temporary increases in noise levels and construction health risk impacts would be greater than the proposed project, resulting in potentially significant impacts. Additionally, the Sand Canyon Reservoir Alternative may eliminate portions of adjacent recreational facilities, requiring a relocation of recreational facilities which could have an adverse physical effect on the environment. As a result, the Sand Canyon Reservoir Alternative would result in greater environmental impacts when compared to the proposed project. The Sand Canyon Reservoir Alternative would not fully achieve all of the project objectives. Most notably, with the Sand Canyon Reservoir Alternative storage capacity capped at 3,000 AF, IRWD would need to purchase additional costly, imported supplies to offset

approximately 2,000 AF of recycled water that could not be stored when compared to the proposed project

Upper Rattlesnake Reservoir Alternative

The Upper Rattlesnake Reservoir Alternative would involve expansion of storage capacity at the existing Rattlesnake Dam complex. Rattlesnake Reservoir currently has a capacity of up to 1,480 AF of recycled water storage (IRWD 2020b). This alternative would involve construction of a new dam and upper reservoir that would be 3,000 feet upstream of the existing Rattlesnake Dam and would provide approximately 6,000 AF of recycled water storage. Water would flow from the new Upper Rattlesnake Reservoir downstream to the existing Rattlesnake Reservoir (Woodward-Clyde 1996). In addition, the expanded reservoir would require 5,500 linear feet of new pipeline and a new 1,200 horsepower pump station.

The Upper Rattlesnake Reservoir Alternative would result in greater impacts, when compared to the proposed project, to air quality and noise during construction due to proximity of pipelines to adjacent sensitive receptors. Temporary increases in noise levels and construction health risk impacts would be greater than the proposed project, resulting in potentially significant impacts. Additionally, the Upper Rattlesnake Reservoir Alternative would involve installation of a new separate reservoir, not an expansion of an existing reservoir, which would result in greater impacts to aesthetic resources in surrounding Irvine communities. As a result, the Upper Rattlesnake Reservoir Alternative would result in greater environmental impacts when compared to the proposed project. The Upper Rattlesnake Reservoir Alternative would fully achieve all of the project objectives due to reservoir capacity, resulting in maximization of recycled water produced by IRWD and elimination of the need to purchase expensive imported water, among other objectives.

Reduced Project Alternative

The Reduced Project Alternative would result in expansion of Syphon Reservoir but not at the capacity proposed under the project. Instead of raising the existing 59-foot dam height to 136 feet as proposed for the project, the Reduced Project Alternative would raise the existing dam to 98 feet. The Reduced Project Alternative would provide approximately 2,500 AF of recycled water storage, or about half of the proposed project's capacity. The Reduced Project Alternative would involve similar activities as the project, such as excavation of large amounts of onsite sediment, import of dam embankment material, construction of a spillway, treatment facility, access roads, and recreation trails.

The Reduced Project Alternative would generally result in similar environmental impacts to the proposed project. The extent of earth moving activities would be the same for the project and the Reduced Project Alternative, with the main difference being the height of the dam. Because the proposed project does not result in any significant and unavoidable impacts, the Reduced Project Alternative does not avoid or substantially lessen significant environmental effects. The Reduced Project Alternative would not fully achieve all of the project objectives.

Alternatives Rejected from Further Consideration

An EIR should identify any alternatives considered but rejected as infeasible by the lead agency during the scoping process and briefly explain the reasons for the exclusion (CEQA Guidelines Section 15126.6(c)). Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid any significant environmental effects. Additional alternatives that were considered but rejected from further consideration by IRWD include expansion of existing reservoirs such as Peter's Canyon and San Joaquin reservoirs; construction of a new reservoir at Round Canyon; use of above ground storage tanks for recycled water storage; implementation of a new ocean outfall to dispose of recycled water; and expansion of the Orange County Water District Green Acres Project. These alternatives did not meet the project objectives, were found to result in significant environmental impacts, were not cost-effective, or were otherwise determined to be infeasible. The alternatives rejected from further consideration are discussed in this Draft EIR in Chapter 6.2.1, *Alternatives Considered but Rejected*.

In response to the Notice of Preparation (NOP) for this EIR, IRWD received comments regarding certain alternative project scenarios and associated life cycle costs. As a result of specific public comments received, IRWD engaged the services of HDR to evaluate alternative project scenarios and associated life cycle costs in meeting IRWD's goals for future recycled water storage and distribution management. HDR's evaluation is documented in a Technical Memorandum titled *Evaluation of Syphon Reservoir Expansion in Response to EIR Notice of Preparation Comments* referenced in this EIR as "(HDR 2020)." A copy of HDR's Technical Memorandum is available from IRWD's District Secretary.

Environmentally Superior Alternative

One of the primary purposes of the alternatives analysis is to identify project alternatives that may avoid or substantially lessen significant project impacts (CEQA Guidelines Section 15126.6). The proposed project would not result in any significant impacts as documented in the analyses provided in Chapters 3, 4, and 5 of this Draft EIR. CEQA requires that a Draft EIR shall assess the No Project Alternative. A comparison of the proposed project to the No Project Alternative presents a tradeoff between achieving project objectives and impacting the environment. The No Project Alternative would avoid all the environmental impacts of the proposed project but would not meet any of the project objectives. The No Project Alternative also would forego any environmental benefits to the IRWD service area, such as improving local water supply reliability.

CEQA requires that an EIR identify the environmentally superior alternative of a project other than the No Project Alternative (CEQA Guidelines Section 15126.6(e)(2)). The Sand Canyon Reservoir Alternative and the Upper Rattlesnake Reservoir Alternative would result in greater environmental impacts due to proximity to sensitive receptors, when compared to the proposed project. The Reduced Project Alternative would generally result in similar environmental impacts to the proposed project without fully achieving its objectives. Overall, none of the alternatives would avoid any impacts or mitigation measures associated with the proposed project. Only the

Upper Rattlesnake Reservoir Alternative would fully achieve all of the project objectives, but with much greater environmental impacts than the proposed project.

ES.6 Areas of Controversy

Pursuant to CEQA Guidelines Section 15123(b)(2), a lead agency is required to include areas of controversy raised by agencies and the public in the EIR summary. Areas of controversy have been identified for the proposed project, based on comments made during the 45-day public review period in response to information published in the NOP.

During the NOP public review period and during the August 21, 2019, community meeting held for the proposed project, concerns were raised regarding potential adverse impacts to environmental resources, as well as potential impacts to nearby residents in the communities of Stonegate Village, Stonegate East, Woodbury, and Woodbury East. Oral comments recorded during the public scoping meeting consisted of concerns about potential project impacts including the following: inundation and flooding, earthquake risks, increased traffic on Sand Canyon Avenue, and safety and operational impacts on the Crean Lutheran High School Athletic Complex and Stonegate Elementary School. In addition, IRWD received comments on the need to consider alternatives to the project, and public involvement with emergency evacuation planning.

Comment letters received from the public included concerns related to environmental resources impacts that have been addressed in Chapter 3 of this Draft EIR. The greatest area of known controversy from an environmental perspective is safety of downstream communities and schools due to potential flooding and inundation in the unlikely event of a dam failure. Those concerns are the reason why great efforts have been made by IRWD to analyze site conditions for dam safety, to design the proposed project to meet or exceed dam safety requirements to avoid failures and consequences to downstream communities, and to conduct public outreach workshops with the local community.

As discussed in this Draft EIR, Section 3.6.3, *Geology and Soils*, the design and operation requirements for dams are established and regulated by the California Department of Water Resources, Division of Safety of Dams (DSOD), which requires specific rigorous design standards, risk analysis, and site-specific geotechnical investigations to inform the design. The existing Syphon Reservoir meets the DSOD requirements for safe use, and for the proposed project, IRWD would exceed these current requirements by implementing state-of-the-art Risk-Informed Decision-Making (RIDM) processes that further improve dam safety and substantially reduce the risk of dam failure. The design of the proposed project would first be peer-reviewed through a rigorous process overseen by a TAG, an independent technical advisory group comprised of a panel of respected reservoir experts. Upon approval, the design would then be submitted to DSOD for their review and approval.

As discussed in this Draft EIR, Section 3.9.3, *Hydrology and Water Quality*, under Impact 3.9-4, the new proposed dam would be constructed to withstand a variety of site conditions to maintain capacity for the purpose of water storage with improved stability. The proposed design would

include withstanding damage from earth displacements or a seiche caused by a seismic event, while maintaining stability of the dam structure to prevent breaching or overtopping. A monitoring system would be installed to continuously monitor the stability of the dam. New proposed dam instrumentation would also be implemented to identify situations that may require intervention, such as a controlled emergency release of water from the reservoir. In the event of an emergency, IRWD would draw down the reservoir through an existing 48-inch pipeline that discharges the recycled water to the existing storm drain, located in Portola Parkway.

As discussed in this Draft EIR, Section 3.9.3, *Hydrology and Water Quality*, under Impact 3.9-4, DSOD requirements include requiring IRWD to update and recirculate the Emergency Action Plan for Syphon Reservoir to account for the increased size of the new reservoir. This process would facilitate input from public safety agencies and local stakeholders, including approval from the City of Irvine, the City of Tustin Police Departments, Orange County Sheriff, and Orange County Fire Authority. The Emergency Action Plan would establish updated emergency notification processes and procedures and identify the responding agencies, to mitigate risks to downstream communities. The updated inundation map for areas downstream of the reservoir and dam, which is included as Figure 3.9-4 in Section 3.9.3, *Hydrology and Water Quality*, would be included in the Emergency Action Plan and would assist public safety agencies in planning for emergency response.

Concerns regarding biological resource protection were received during the comment period, including requests to offset project impacts with various mitigation measures, NCCP/HCP and sensitive biological resources protection, compliance with the existing Grant Deed at the project site, and wetland and riparian habitats. These topics are addressed in Section 3.3.12, *Biological Resources*. Concerns were also raised about the proposed project's location on a liquefaction and landslide overlap zone, and the project's close proximity to the Puente Hills Fault. These topics are addressed in Section 3.6.3, *Geology and Soils*.

Other comments not related to environmental issues include concerns about impacts to private property values and flood insurance rates in nearby communities, as well as concerns about the necessity for the proposed project in the proposed location, impacts to businesses, and water pricing. As explained in Section 3.9, *Hydrology and Water Quality*, the federal government does not require flood insurance for any properties due to Syphon Reservoir in its current or proposed form. As explained above and in Chapter 6, *Alternatives Analysis*, IRWD has considered alternative project locations. CEQA requires lead agencies to consider environmental effects associated with project approvals, but it does not require a financial impact analysis regarding either the cost of the project itself or potential impacts to property values for any parcels or communities adjacent to the project site. Rather, CEQA requires an analysis of consistency with land use classifications that are established by local jurisdictions, such as the City of Irvine, through General Plans and zoning ordinances. This Draft EIR includes an analysis of land use consistency at the project site in Section 3.02, *Effects Found Not to be Significant*.

IRWD understands the natural concern that local property owners have for property values adjacent to the project site. The proposed project would not develop any permanent built facilities that would conflict with or change the land use of the project site, which would continue to be

used as a water storage facility similar to existing conditions. The proposed enlargement of the existing dam would not modify or change the intended use of the project site. Views would not be significantly affected from neighboring communities (see Draft EIR, Section 3.1 *Aesthetics*), and long-term operational noise and traffic would be similar to existing conditions once project construction is complete (see Draft EIR, Section 3.10 *Noise* and Section 3.12 *Transportation*).

ES.7 Summary of Impacts

Table ES-1, at the end of this chapter, presents a summary of the impacts and mitigation measures identified for the proposed project. The complete impact statements and mitigation measures are presented in Chapter 3 of this Draft EIR. The level of significance for each impact was determined using significance criteria (thresholds) developed for each category of impacts; these criteria are presented in the appropriate sections of Chapter 3. Significant impacts are those adverse environmental impacts that meet or exceed the significance thresholds; less than significant impacts would not exceed the thresholds. **Table ES-1** indicates the measures that will be implemented to avoid, minimize, or otherwise reduce significant impacts to a less than significant level.

The CEQA Guidelines require that an EIR discuss the significant environmental effects of the proposed project (Section 15126.2(a)), which is summarized in **Table ES-1** and provided in Chapters 3 and 4 of the Draft EIR. The CEQA Guidelines also require that an EIR discuss the significant environmental effects which cannot be avoided (Section 15126.2(c)); significant irreversible environmental changes which would be caused by the proposed project should it be implemented (Section 15126.2(d)); and growth-inducing impacts of the proposed project (Section 15126.2(e)). These are discussed below.

Significant Unavoidable Environmental Effects

As required by CEQA Guidelines Section 15126.2(c), an EIR must describe any significant impacts that cannot be avoided, including those impacts that can be mitigated but not reduced to a less than significant level. Where there are impacts that cannot be alleviated without imposing an alternative design, their implications and the reasons the project is being proposed, notwithstanding their effect, should be described. The proposed project would not result in any significant impacts as documented in the analyses provided in Chapters 3, 4, and 5 of this Draft EIR.

Significant Irreversible Environmental Changes

Section 15126.2(d) of the CEQA Guidelines require that an EIR analyze the extent to which a project's primary and secondary effects would affect the environment and commit nonrenewable resources to uses that future generations would not be able to reverse. "Significant irreversible environmental changes" include the use of nonrenewable natural resources during the initial and continued phases of the project, should this use result in the unavailability of these resources in the future. Also, irreversible damage can result from environmental accidents associated with the

project. Irretrievable commitments of these resources are required to be evaluated in an EIR to ensure that such consumption is justified.

Construction and operation activities for the proposed project would require the commitment of renewable and non-renewable sources. Proposed project implementation would necessitate the consumption of resources including, but not limited to: building materials (such as concrete), fuel and operational materials/resources, energy resources, and transportation of persons and goods to and from the proposed project site. Construction activities would specifically require the use of concrete and asphalt, and would require the consumption of fossil fuels, including gasoline and oil, in order to provide power to construction vehicles and equipment. The recycled water currently diverted to OCS D for disposal would be stored and reused under the proposed project. Therefore, the proposed project would result in a benefit to the reuse of water versus discharging treated wastewater to the ocean. The use of nonrenewable resources for the implementation of the proposed project is justified and would not result in the unavailability of such resources.

Growth-Inducing Impacts

Section 15126.2(e) of the CEQA Guidelines require that an EIR discuss the potential growth-inducing impacts of a proposed project. A project can have direct and/or indirect growth-inducement potential. Direct growth inducement would result if a project involves construction of new housing. A project can have indirect growth-inducement potential if it establishes substantial new permanent employment opportunities (e.g., commercial, industrial, or governmental enterprises) or if it involves a construction effort with substantial short-term employment opportunities that indirectly stimulates the need for additional housing and services to support the new employment demand. Similarly, under CEQA, a project would indirectly induce growth if it removes an obstacle to additional growth and development, such as removing a constraint on a required public service.

As explained in this Draft EIR, Chapter 5, *Growth Inducement*, implementation of the proposed project would not have a direct growth inducement effect, as it does not propose development of new housing that would attract additional population to the area. Further, implementation of the proposed project would not result in substantial permanent employment that could indirectly induce population growth. Although construction activities would create some short-term construction employment opportunities over the approximately 36-month duration of construction, the amount of opportunities created would not require persons outside of the Orange County work force. Further, no new permanent employees would be required to operate the proposed dam and reservoir.

The proposed project would expand recycled water infrastructure to store and use recycled water that is already produced by IRWD. The proposed project would support planned population growth within IRWD's service area by providing recycled water to meet the current and planned demand for irrigation of public landscaping such as street medians, parks and golf courses, agricultural irrigation, office building uses such as toilet flushing and cooling towers. The proposed project would not create a new recycled water supply that would induce future growth. Rather, the proposed project would accommodate the population growth already planned by local

and regional jurisdictions, such that water infrastructure reliability would not be an impediment to already-planned growth. As a result, the proposed project neither supports nor encourages growth within the IRWD service area to a greater degree than presently estimated by the City of Irvine, County of Orange, and Southern California Association of Governments, as the land use agencies with jurisdiction over the proposed project area. The proposed project would not remove any obstacles to growth and would not indirectly have a significant impact on growth inducement. As a result, impacts to growth inducement would be less than significant.

ES.8 Organization of the Draft EIR

This Draft EIR has been organized into the following chapters:

ES. Executive Summary. This chapter summarizes the contents of the Draft EIR.

Chapter 1, Introduction and Project Background. This chapter discusses the CEQA process, explains the purpose of the Draft EIR, and summarizes the background studies and processes that influenced the development of the proposed project.

Chapter 2, Project Description. This chapter provides an overview of the proposed project, describes the need for and objectives of the proposed project, explains planning for construction, operation, and management of the proposed project, and presents a preliminary list of the agencies and entities, in addition to IRWD, that would use this EIR in their consideration of specific permits and other discretionary approvals for the proposed project.

Chapter 3, Environmental Setting, Impacts, and Mitigation Measures. This chapter describes the environmental setting and identifies the direct, indirect, and cumulative impacts of the proposed project for each of the following environmental topics: Aesthetics; Air Quality; Biological Resources; Cultural Resources; Geology and Soils; Greenhouse Gas Emissions; Energy; Hazards and Hazardous Materials; Hydrology and Water Quality; Noise; Recreation; Transportation; Tribal Cultural Resources; and Wildfire. For the assessment of cumulative impacts, this chapter includes a list of past, current, and probable future projects to be considered together with the proposed project. Measures to mitigate the impacts of the proposed project are presented for each environmental topic where potential significant impacts have been identified. Potential hazards from flooding associated with the construction and operation of the proposed project, including dam safety issues, are discussed in Section 3.9, *Hydrology and Water Quality*.

Chapter 4, CEQA-Plus Considerations: This chapter summarizes the proposed project's compliance with CEQA-Plus requirements of the U.S. Environmental Protection Agency, to fulfill the requirement of potential federal funding partners to comply with NEPA.

Chapter 5, Growth Inducement. This chapter analyzes whether the proposed project would induce growth.

Chapter 6, Alternatives Analysis. According to CEQA, an EIR must describe a reasonable range of alternatives to a proposed project that would feasibly attain most of the basic project objectives and would avoid or substantially lessen any of the proposed project's significant environmental effects. This chapter presents an overview of the alternatives development process,

describes the alternatives to the proposed project that were considered, and describes potential impacts of feasible alternatives relative to those of the proposed project.

Chapter 7, Report Preparers. This chapter identifies the parties involved in preparing this Draft EIR, including persons and organizations consulted.

Appendices: The appendices include materials related to the NOP and scoping process (**Appendix A**), as well as technical studies that support the impact analyses, such as an Air Quality and Greenhouse Gas Emissions Technical Report (**Appendix B**), Biological Resources Technical Report (**Appendix C**), Noise and Vibration Technical Report (**Appendix D**), Traffic Study (**Appendix E**), and the Tribal Cultural Resources Consultation (**Appendix F**).

**TABLE ES-1
SUMMARY OF IMPACTS AND MITIGATION MEASURES**

Potential Impact	Mitigation Measure	Significant Determination
Aesthetics		
Impact 3.1-1: The proposed project could have a substantial adverse effect on a scenic vista or other scenic viewscapes.	Mitigation Measure AES-1: Aboveground buildings/structures/retaining walls shall be designed to have earth-tone color palettes that blend in with the surrounding landscape and vegetation.	Less than Significant Impact with Mitigation.
Impact 3.1-2: The proposed project would not substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.	None required	No Impact
Impact 3.1-3: The proposed project could substantially degrade the existing visual character or quality of the site and its surroundings (Public views are those that are experienced from publicly accessible vantage point).	Implement Mitigation Measure AES-1	Less than Significant Impact with Mitigation
Impact 3.1-4: The proposed project could create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.	Mitigation Measure AES-2: All new permanent exterior lighting associated with the proposed project shall be shielded and directed downward to avoid light spill onto neighboring parcels and visibility from surrounding public vantage points.	Less than Significant Impact with Mitigation
Impact 3.1-5: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative short-term and long-term impacts to aesthetics.	Implement Mitigation Measures AES-1 and AES-2	Less than Significant Impact with Mitigation
Air Quality		
Impact 3.2-1: The proposed project could conflict with or obstruct implementation of the applicable air quality plan.	Mitigation Measure AIR-1: IRWD shall require the construction contractor to implement construction equipment features for equipment operating at the project site during certain construction phases. Construction features will include the following: The proposed project shall utilize off-road diesel-powered construction equipment that meet or exceed CARB and USEPA Tier 4 off-road emissions standards for	Less than Significant Impact with Mitigation

Potential Impact	Mitigation Measure	Significant Determination
	standard construction equipment rated at 50 horsepower (hp) or greater during project construction. Such equipment will be outfitted with BACT devices including a CARB certified Level 3 Diesel Particulate Filter or equivalent. At a minimum, this measure shall apply during implementation of the following construction sub-phases: upstream excavation and foundation treatment, dam excavation and foundation treatment, installation of embankment to the bottom of the blanket drain, and installation of the chimney/remaining embankment.	
Impact 3.2-2: The proposed project could result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.	Implement Mitigation Measure AIR-1	Less than Significant Impact with Mitigation
Impact 3.2-3: The proposed project could expose sensitive receptors to substantial pollutant concentrations.	Implement Mitigation Measure AIR-1	Less than Significant Impact with Mitigation
Impact 3.2-4: The proposed project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.	None required	Less than Significant Impact
Impact 3.2-5: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative short-term and long-term impacts to air quality.	Implement Mitigation Measure AIR-1	Less than Significant Impact with Mitigation
Biological Resources		
Impact 3.3-1: The proposed project could have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife (CDFW) or U.S. Fish and Wildlife Service (USFWS).	BIO-1: IRWD has been engaged in close coordination with the Wildlife Agencies (i.e., USFWS and CDFW) since 2018 to develop a multi-faceted mitigation strategy to address impacts to California gnatcatcher, as well as to address the additional mitigation the agencies mandate to compensate for displacement of habitat and land previously set aside for mitigation and subject to the restrictions and requirements imposed under the Mitigation Grant Deed, of which USFWS is a	Less than Significant Impact with Mitigation

Potential Impact	Mitigation Measure	Significant Determination
	<p>third party beneficiary. To date, IRWD has researched numerous off-site lands with high value habitat and biological resources, and initiated negotiations with landowners for possible acquisition. IRWD shall implement one, or a combination, of the following measures to mitigate permanent impacts to special-status wildlife species:</p> <ol style="list-style-type: none"> a. Use of Incidental Take Credits for participating landowners (within the Reserve, or outside of the Reserve) to offset permanent impacts to coastal sage scrub (e.g., California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/non-native herbaceous cover, and non-native herbaceous cover/California sagebrush scrub) at a 1:1 impact-to-mitigation ratio. b. On- and/or off-site creation, restoration, and/or enhancement containing natural communities suitable for special-status species or comparable, as determined acceptable by the USFWS and CDFW. c. Off-site land acquisition, preservation, creation, restoration, and/or enhancement containing natural communities suitable for special-status species or comparable, as determined acceptable by the USFWS and CDFW. d. Areas where temporary impacts occur would be returned to pre-project conditions (i.e., pre-project elevation contours and revegetated with native upland scrub species) within one-year after construction is completed, and will be monitored for three years, or until a qualified biologist determines that the project site has returned to pre-project conditions. A revegetation plan would be prepared to re-seed/re-plant the area with local species, and would include performance standards, success criteria, maintenance, and future monitoring. 	

Potential Impact	Mitigation Measure	Significant Determination
	<p>BIO-2: In accordance with the NCCP/HCP, certain construction-related mitigation measures are required to minimize impacts to the coastal California gnatcatcher and other coastal sage scrub species. The removal of coastal sage scrub communities will be conducted in compliance with the NCCP/HCP's Construction Related Minimization Measures:</p> <ul style="list-style-type: none"> a. To the maximum extent practicable, no grading of coastal sage scrub habitat that is occupied by nesting gnatcatchers will occur during the breeding season (February 15 through July 15). b. Prior to the commencement of grading operations or other activities involving significant soil disturbance, all areas of coastal sage scrub habitat to be avoided under the provisions of the NCCP/HCP shall be identified with temporary fencing or other markers clearly visible to construction personnel. Additionally, prior to the commencement of grading operations or other activities involving disturbance of coastal sage scrub, a survey will be conducted to locate gnatcatchers and cactus wrens within 100 feet of the outer extent of projected soil disturbance activities and the locations of any such species shall be clearly marked and identified on the construction/grading plans. c. A monitoring biologist, acceptable to USFWS/CDFW, will be on-site during any clearing of coastal sage scrub. IRWD will advise USFWS/CDFW at least seven calendar days (and preferably fourteen calendar days) prior to the clearing of any habitat occupied by Identified Species¹ to allow USFWS/CDFW to work with the monitoring biologist in connection with bird flushing/capture activities. The monitoring biologist will flush Identified Species (avian or 	

¹ NCCP/HCP Identified Species that occur, or have potential to occur, on-site include the following: coastal California gnatcatcher, coastal cactus wren, orange-throated whiptail, coastal western whiptail, red-diamond rattlesnake, coast horned lizard, northern harrier, sharp-shinned hawk, prairie falcon, American peregrine falcon, red-shouldered hawk, southern California rufous-crowned sparrow, San Diego desert woodrat, gray fox, and coyote.

Potential Impact	Mitigation Measure	Significant Determination
	<p>other mobile Identified Species) from occupied habitat areas immediately prior to brush-clearing and earth-moving activities. If birds cannot be flushed, they will be captured in mist nets, if feasible, and relocated to areas of the site to be protected or to the NCCP/HCP Reserve System. It will be the responsibility of the monitoring biologist to assure that Identified bird species will not be directly impacted by brush-clearing and earth-moving equipment in a manner that also allows for construction activities on a timely basis.</p> <p>d. Following the completion of initial grading/earth moving activities, all areas of coastal sage scrub habitat to be avoided by construction equipment and personnel will be marked with temporary fencing and other appropriate markers clearly visible to construction personnel. No construction access, parking, or storage of equipment or materials will be permitted within such marked areas.</p> <p>e. In areas bordering the NCCP Reserve System or Special Linkage/Special Management areas containing significant coastal sage scrub identified in the NCCP/HCP for protection, vehicle/equipment transportation routes and staging areas will be restricted to a minimum number during construction consistent with project construction requirements. Waste dirt or rubble will not be deposited on adjacent coastal sage scrub identified in the NCCP/HCP for protection. Pre-construction meetings involving the monitoring biologist, construction supervisors, and equipment operators will be conducted and documented to ensure maximum practicable adherence to these measures.</p> <p>f. Coastal sage scrub identified in the NCCP/HCP for protection and located within the likely dust drift radius of construction areas shall be periodically sprayed with water to reduce</p>	

Potential Impact	Mitigation Measure	Significant Determination
	<p>accumulated dust on the leaves as recommended by the monitoring biologist.</p> <p>BIO-3: Impacts to nesting birds would be avoided by conducting all clearing and grubbing outside of the bird nesting season (i.e., work should occur September 1 to February 14, or July 1 to January 14 for raptors). If clearing and grubbing cannot avoid the bird nesting season, the following measures would be implemented:</p> <ol style="list-style-type: none"> a. Prior to work during the bird nesting season (February 15 to August 31, or January 15 to June 31 for raptors), a qualified biologist should conduct a pre-construction survey of all suitable habitat for the presence of nesting birds no more than 7 days prior to construction and/or maintenance activities. The results of the pre-construction survey would be valid for 7 days; if vegetation removal activities do not commence within 7 days following the survey, a new pre-construction nesting bird survey should be conducted before these activities begin again. If no active nests are found, then no further mitigation is required. b. If any active nests are found during a pre-construction nesting bird survey, a buffer of 300 feet (500 feet for raptors), or as determined appropriate by the qualified biologist (based on species-specific tolerances and site-specific conditions) in consultation with IRWD, would be delineated, flagged, and avoided until the nesting cycle is complete (i.e., the qualified biologist determines that the young have fledged or the nest has failed). The qualified biologist may also recommend other measures to minimize disturbances to the nest, which may include, but are not limited to, erection of sound barriers (e.g., noise blankets), erection of visual barriers (e.g., hay bales), or full-time monitoring by a qualified biologist. 	

Potential Impact	Mitigation Measure	Significant Determination
	<p>BIO-4: With the creation of on-site riparian and wetland habitat areas, as part of the proposed project, there will be no net loss of woody riparian habitat for least Bell's vireo and no net loss of any wetland habitat. Nevertheless, there will be a temporary loss of these habitats until construction is completed and riparian habitat can be reestablished that the species can use again. IRWD is engaged with the Wildlife Agencies and is collaboratively developing a comprehensive program to address temporal impacts to least Bell's vireo and other riparian-associated special-status wildlife species (e.g., yellow warbler, yellow-breasted chat). IRWD shall implement the following measure to compensate for temporal impacts to least Bell's vireo and associated riparian special-status wildlife species (e.g., yellow warbler, yellow-breasted chat):</p> <ul style="list-style-type: none"> a. Off-site land acquisition and preservation, and/or creation, restoration, and/or enhancement, of areas containing habitat suitable for least Bell's vireo and associated riparian special-status wildlife species (e.g., yellow warbler, yellow-breasted chat) to compensate for temporal loss in an amount or at a ratio determined acceptable by the USFWS and CDFW. Any private lands acquired and/or restored for this mitigation would be permanently preserved and dedicated for habitat conservation. <p>BIO-5: IRWD shall implement the following measure to mitigate indirect impacts to special-status wildlife species:</p> <ul style="list-style-type: none"> a. Educational signage shall be posted at the entrances of the proposed walking trail to inform the public about the sensitive biological resources in the area and local wildlife in the area (e.g., rattlesnakes, coyotes). Signage would also be posted periodically along the proposed trail to remind public to keep on the trail and out of sensitive habitat areas. 	

Potential Impact	Mitigation Measure	Significant Determination
	<ul style="list-style-type: none"> b. The proposed trail shall only be open during daylight hours (e.g., dawn to dusk). c. A Resource Management Plan (RMP) shall be prepared to outline long-term maintenance and management responsibilities for the preservation of the biological resources on-site (e.g., invasive species management, monitoring access issues, off-trail use, erosion, trash). The RMP should also provide guidance to ensure that all operations and maintenance activities performed on-site must also comply with all applicable requirements of the NCCP/HCP and the preservation of the biological resources on-site. The RMP would also outline monitoring requirements for species populations for federal and state-listed species (i.e., least Bell's vireo and California gnatcatcher). 	
<p>Impact 3.3-2: The proposed project could have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or USFWS.</p>	<p>BIO-6: IRWD shall implement one, or a combination, of the following measures to mitigate impacts to sensitive natural communities:</p> <ul style="list-style-type: none"> a. Use of Incidental Take Credits for NCCP/HCP participating landowners (within the Reserve, or outside of the Reserve) to offset permanent impacts to coastal sage scrub (e.g., California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/non-native herbaceous cover, and non-native herbaceous cover/California sagebrush scrub) at a 1:1 impact-to-mitigation ratio. b. On- and/or off-site land acquisition and preservation, and/or creation, restoration, and/or enhancement of sensitive natural communities comparable or equivalent to a 1:1 impact-to-mitigation ratio, or as determined acceptable by the USFWS and CDFW. c. Areas where temporary impacts occur to sensitive natural communities (e.g., California 	<p>Less than Significant Impact with Mitigation.</p>

Potential Impact	Mitigation Measure	Significant Determination
	<p>sagebrush scrub) would be returned to pre-project conditions (i.e., pre-project elevation contours and revegetation initiated) within one-year after the construction is completed, and will be monitored for three years, or until a qualified biologist determines that affected natural communities have been restored to equivalent or better condition as compared to pre-project conditions. A revegetation plan would be prepared to re-seed/re-plant the area with locally indigenous native species, and would include performance standards, success criteria, maintenance, and future monitoring.</p> <p>BIO-7: IRWD shall negotiate and execute a Lake or Streambed Alteration Agreement under Section 1602 of the California Fish and Game Code with CDFW.</p>	
<p>Impact 3.3-3: The proposed project would not have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.</p>	<p>None required</p>	<p>Less than Significant Impact</p>
<p>Impact 3.3--4: The proposed project could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.</p>	<p>Implement Mitigation Measure BIO-3</p>	<p>Less than Significant Impact with Mitigation</p>
<p>Impact 3.3-5: The proposed project could conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.</p>	<p>Implement Mitigation Measures BIO-1, BIO-2, BIO-3, BIO-4, BIO-5, and BIO-6</p>	<p>Less than Significant Impact with Mitigation</p>
<p>Impact 3.3-6: The proposed project could conflict with provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional, or state habitat conservation plan.</p>	<p>Implement Mitigation Measures BIO-1, BIO-2, and BIO-3</p>	<p>Less than Significant Impact with Mitigation</p>

Potential Impact	Mitigation Measure	Significant Determination
<p>Impact 3.3-7: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to biological resources.</p>	<p>Implement Mitigation Measures BIO-1 through BIO-7</p>	<p>Less than Significant Impact with Mitigation</p>
Cultural Resources		
<p>Impact 3.4-1: The proposed project could cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5.</p>	<p>CR-1: Avoidance of Unevaluated Resources. Two resources (CA-ORA-1237 and the Latrine Site) are considered historical resources for purposes of this project. Both resources occur within close proximity to proposed project activities. Prior to work in the vicinity of the resources (i.e., within 100 feet), Environmentally Sensitive Areas consisting of protective fencing or flagging shall be established around the boundary of each resource, including a 50-foot buffer. The establishment of the Environmentally Sensitive Areas and installation of required fencing or flagging shall be carried out under the supervision of a Qualified Archaeologist, defined as an archaeologist meeting the Secretary of the Interior’s standards for archaeology (USDI 2008), or an archaeologist working under the direction of the Qualified Archaeologist. Environmentally Sensitive Areas should be clearly marked in the field and on design plans with exclusion markers to ensure avoidance during project-related ground disturbance. The protective fencing or flagging should not identify the Environmentally Sensitive Areas as cultural resource areas to discourage unauthorized disturbance or collection of artifacts. Ground disturbing activities in the vicinity of the Environmentally Sensitive Areas should be monitored, as described in Mitigation Measure CR-3.</p> <p>CR-2: Worker Sensitivity Training. Prior to the start of construction activities, all construction personnel should be trained to identify the types of cultural resources that may be encountered during project implementation. These include both prehistoric and historic period archaeological resources. In addition to cultural resources recognition, the training should convey procedures to follow in the event of a potential</p>	<p>Less than Significant Impact with Mitigation</p>

Potential Impact	Mitigation Measure	Significant Determination
	<p>cultural resources discovery, including notification procedures. The training should be provided by the Qualified Archaeologist or an archaeologist working under their supervision.</p> <p>CR-3: Construction Monitoring. An archaeological monitor (working under the direct supervision of the Qualified Archaeologist) shall observe all ground-disturbing activities, including but not limited to brush clearance, vegetation removal, grubbing, grading, and excavation, in undisturbed areas of the project site. In addition, the Qualified Archaeologist, in coordination with IRWD, may reduce or discontinue monitoring if it is determined that the possibility of encountering buried archaeological deposits is low based on observations of soil stratigraphy or other factors. Archaeological monitoring shall be conducted by an archaeologist familiar with the types of archaeological resources that could be encountered within the project site. The archaeological monitor, in consultation with IRWD, shall be empowered to halt or redirect ground-disturbing activities away from the vicinity of a discovery until the Qualified Archaeologist has evaluated the discovery, consulted with IRWD, and determined appropriate treatment (as prescribed in CR-4). The archaeological monitor shall keep daily logs detailing the types of activities and soils observed, and any discoveries. After monitoring has been completed, the Qualified Archaeologist shall prepare a monitoring report that details the results of monitoring. The report shall be submitted to IRWD and any Native American groups who request a copy. The Qualified Archaeologist shall submit a copy of the final report to the California Historic Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC).</p> <p>In addition, prior to the commencement of earthwork activities, IRWD shall provide written notification to the Native American representatives from the Gabrieleno Band of Mission Indians - Kizh Nation indicating the date and time of the commencement of earthwork activities. The representatives from the Gabrieleno</p>	

Potential Impact	Mitigation Measure	Significant Determination
	<p>Band of Mission Indians - Kizh Nation (“tribal representative”) shall be provided reasonable access to the project site in a manner that does not interfere with the earthwork activities. Tribal representatives, at their own expense, and in a manner that does not interfere with earthwork activities, shall be allowed to monitor subsurface ground-disturbing construction activities. The monitoring may consist of either direct observation of the earthwork activities or the examination of the excavated soils prior to disposal for evidence of cultural resources. If any cultural resources are identified during the monitoring and evidence is presented that the discovery proves to be potentially significant under CEQA, as determined by IRWD’s consulting Qualified Archaeologist, additional measures such as data recovery excavation, avoidance of the area of the find, documentation, testing, data recovery, reburial, archival review and/or transfer to the appropriate museum or educational institution, or other appropriate actions may be warranted as recommended by IRWD’s consulting Qualified Archeologist in consultation with the tribal representative.</p> <p>CR-4: Protocols for Unanticipated Discoveries. If cultural resources are encountered during project implementation, all activity within 50 feet of the find should cease until the find can be evaluated by the Qualified Archaeologist. If the Qualified Archaeologist determines that the resources may be significant, he or she will notify IRWD and together with IRWD, shall develop an appropriate treatment plan for the resource. IRWD should consult with the Native American monitor or other appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature. Under CEQA, preservation in place is the preferred manner of mitigating impacts to archaeological sites. However, if avoidance is infeasible, other appropriate measures will be instituted, which could include, among other options, detailed documentation, or data</p>	

Potential Impact	Mitigation Measure	Significant Determination
	recovery excavation. Work may proceed on other parts of the project area while mitigation for cultural resources is being carried out.	
Impact 3.4-2: The proposed project could cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5..	Implement Mitigation Measures CR-1 through CR-4	Less than Significant Impact with Mitigation
Impact 3.4-3: The proposed project would not disturb human remains, including those interred outside of formal cemeteries.	None required	Less than Significant Impact
Impact 3.4-4: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to cultural resources.	Implement Mitigation Measures CR-1 through CR-4	Less than Significant Impact with Mitigation
Energy		
Impact 3.5-1: The proposed project would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.	None required	Less than Significant Impact
Impact 3.5-2: The proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.	None required	Less than Significant Impact
Impact 3.5-3: Concurrent construction and operation of the project and related projects in the geographic scope would not result in cumulative impacts to energy.	None required	Less than Significant Impact
Geology and Soils		
Impact 3.6-1a: The proposed project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault zone.	None required	Less than Significant Impact

Potential Impact	Mitigation Measure	Significant Determination
Impact 3.6-1b: The proposed project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic groundshaking.	None required	Less than Significant Impact
Impact 3.6-1c: The proposed project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction.	None required	Less than Significant Impact
Impact 3.6-2: The proposed project would not result in substantial soil erosion or the loss of topsoil.	None required	Less than Significant Impact
Impact 3.6-3: The proposed project would not be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.	None required	Less than Significant Impact
Impact 3.6-4: The proposed project would not be located on expansive soil creating substantial direct or indirect risks to life or property.	None required	Less than Significant Impact
Impact 3.6-5: The proposed project would not have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.	None required	No Impact
Impact 3.6-6: The proposed project could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	<p>GEO-1: Appoint a Qualified Paleontologist. A qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards (SVP 2010) (Qualified Paleontologist) shall be retained prior to the start of ground disturbing activities. The Qualified Paleontologist shall provide technical and compliance oversight of all work as it relates to paleontological resources, shall attend the project kick-off meeting and project progress meetings on a regular basis, and shall report to the site in the event potential paleontological resources are encountered.</p> <p>GEO-2: Worker Sensitivity Training. The Qualified Paleontologist shall conduct construction worker</p>	Less than Significant Impact with Mitigation

Potential Impact	Mitigation Measure	Significant Determination
	<p>paleontological resources sensitivity training prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.). This can occur in coordination with Cultural Resources Worker Sensitivity Training (Mitigation Measure CR-1). In the event construction crews are phased, additional trainings shall be conducted for new construction personnel. The training session shall focus on the recognition of the types of paleontological resources that could be encountered within the project site and the procedures to be followed if they are found. Documentation shall be retained demonstrating that all construction personnel attended the training.</p> <p>GEO-3: Paleontological Monitoring. Paleontological resources monitoring shall be conducted for ground disturbing activities occurring in previously undisturbed sediments with high paleontological sensitivity, including any areas containing the Silverado Formation or Sespe/Vaqueros Formation, very old Quaternary Alluvium, and deeper layers of younger Quaternary Alluvium (which overly sensitive older Quaternary Alluvium). Ground disturbing activities include vegetation removal, grading, excavation, pavement removal, roadway improvements, or other similar activities within these sensitive formations. For undisturbed sediments mapped as the Silverado Formation, Sespe/Vaqueros Formation, or very old Quaternary Alluvium, monitoring of all ground disturbance is initially required. A depth of 5 feet bgs is established as the depth at which high sensitivity and paleontological monitoring should begin in the younger Quaternary Alluvium. The Qualified Paleontologist shall evaluate ground disturbing activities on an intermittent basis and consult with IRWD on whether the depth or frequency of required monitoring should be revised or may cease.</p> <p>Paleontological resources monitoring shall be performed by a qualified paleontological monitor (meeting the standards of the SVP 2010) under the direction of the Qualified Paleontologist, and in conjunction with IRWD. Monitors shall have the</p>	

Potential Impact	Mitigation Measure	Significant Determination
	<p>authority to temporarily halt or divert work away from exposed fossils in order to recover the fossil specimens. Any significant fossils collected during project-related excavations shall be salvaged and prepared to the point of identification following the standards of the SVP (2010). Monitors shall prepare daily logs detailing the types of activities and soils observed, and any discoveries. The Qualified Paleontologist shall prepare a final monitoring and mitigation report to document the results of the monitoring effort. Any salvaged fossils shall be offered for donation to an accredited repository with a scientific interest in the materials. If no accredited repository accepts the donation, then the fossils may be donated to a local museum, historical society, school, or other institution for educational purposes.</p> <p>GEO-4: Fossil Discovery. If personnel or workers discover any potential fossils during project implementation, regardless of the depth of work or location, work at the discovery location shall cease in a 50-foot radius of the discovery until the Qualified Paleontologist has assessed the discovery, consulted with IRWD, and made recommendations as to the appropriate treatment. If the find is deemed significant, the qualified paleontologist shall salvage the resource following the standards of the SVP (2010). Any salvaged fossils shall be offered for donation to an accredited repository with a scientific interest in the materials. If no accredited repository accepts the donation, then the fossils may be donated to a local museum, historical society, school, or other institution for educational purposes.</p>	
<p>Impact 3.6-7: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to geology, soils, and paleontological resources.</p>	<p>Implement Mitigation Measures GEO-1 through GEO-4</p>	<p>Less than Significant Impact with Mitigation</p>

Potential Impact	Mitigation Measure	Significant Determination
Greenhouse Gas Emissions		
Impact 3.7-1: The proposed project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.	None required	Less than Significant Impact
Impact 3.7-2: The proposed project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.	None required	Less than Significant Impact
Impact 3.7-3: Concurrent construction and operation of the proposed project and related projects in the geographic scope would not result in cumulative impacts regarding greenhouse gas emissions.	None required	Less than Significant Impact
Hazards and Hazardous Materials		
Impact 3.8-1: The proposed project would not create a significant hazard to the public or the environment through the routine transport, use, disposal, or the accidental release of hazardous materials.	None required	Less than Significant Impact
Impact 3.8-2: The proposed project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.	None required	Less than Significant Impact
Impact 3.8-3: The proposed project would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would not create a significant hazard to the public or the environment.	None required	No Impact
Impact 3.8-4: The proposed project is not located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport; the proposed project would not result in a safety hazard or excessive noise for people residing or working in the project area.	None required	No Impact

Potential Impact	Mitigation Measure	Significant Determination
Impact 3.8-5: The proposed project could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.	Implement Mitigation Measure TRA-1	Less than Significant Impact with Mitigation
Impact 3.8-6: The proposed project could expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.	Implement Mitigation Measure WDF-1	Less than Significant Impact with Mitigation
Impact 3.8-7: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative short-term and long-term impacts to hazards, hazardous materials, and wildfires.	Implement Mitigation Measures TRA-1 and WDF-1	Less than Significant Impact with Mitigation
Hydrology and Water Quality		
Impact 3.9-1: The proposed project would not violate water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.	None required	Less than Significant Impact
Impact 3.9-2: The proposed project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.	None required	Less than Significant Impact
Impact 3.9-3: The proposed project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation onsite or offsite; or substantially increase the rate or amount of surface runoff in a manner which would result in flooding onsite or offsite; or create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide	None required	Less than Significant Impact

Potential Impact	Mitigation Measure	Significant Determination
substantial additional sources of polluted runoff; or impede or redirect flood flows.		
Impact 3.9-4: The proposed project would not result in a flood hazard, tsunami, or seiche, and risk release of pollutants due to project inundation.	None required	Less than Significant Impact
Impact 3.9-5: The proposed project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.	None required	Less than Significant Impact
Impact 3.9-6: Concurrent construction and operation of the proposed project and related projects in the geographic scope would not result in cumulative impacts to hydrology and water quality.	None required	Less than Significant Impact
Noise		
Impact 3.10-1: The proposed project would not generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	None required	Less than Significant Impact
Impact 3.10-2: The proposed project would not generate excessive groundborne vibration or groundborne noise levels.	None required	Less than Significant Impact
Impact 3.10-3: The proposed project would not expose people residing or working in the project area to excessive noise levels within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport.	None required	No Impact
Impact 3.10-4: Concurrent construction and operation of the proposed project and related projects in the geographic scope would not result in cumulative impacts to noise and vibration.	None required	Less than Significant Impact

Potential Impact	Mitigation Measure	Significant Determination
Recreation		
Impact 3.11-1: The proposed project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	None required	Less than Significant Impact
Impact 3.11-2: The proposed project could include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.	Implement Mitigation Measures BIO-1 through BIO-6 and CR-1 through CR-4	Less than Significant Impact with Mitigation
Impact 3.11-3: Concurrent construction and operation of the proposed project and related projects in the geographic scope would not result in cumulative impacts to recreation.	None required	Less than Significant Impact
Transportation		
Impact 3.12-1: The proposed project could conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.	TRA-1: Traffic Control Plan. Prior to the start of construction, IRWD shall require the construction contractor to prepare and have approved a Traffic Control Plan. The Traffic Control Plan will show all signage, striping, delineated detours, flagging operations, and any other devices that will be used during installation of the improvements at the intersection of Sand Canyon Avenue and Portola Parkway to guide motorists, bicyclists, and pedestrians safely through the construction area and allow for adequate access and circulation to the satisfaction of the City of Irvine, as applicable. The Traffic Control Plan shall be prepared in accordance with the City of Irvine's traffic control guidelines and will be prepared to ensure that emergency access will not be restricted. Additionally, the Traffic Control Plan will ensure that congestion and traffic delays are not substantially increased as a result of the construction activities. Further, the Traffic Control Plan will include detours or alternative routes for bicyclists using on-street bicycle lanes as well as for pedestrians using adjacent sidewalks.	Less than Significant Impact with Mitigation

Potential Impact	Mitigation Measure	Significant Determination
	<p>IRWD shall also notify local emergency responders of any planned partial or full lane closures required for project construction. Emergency responders include fire departments, police departments, and ambulances that have jurisdiction within the project area. Written notification and disclosure of lane closure location must be provided at least 30 days prior to the planned closure to allow emergency response providers adequate time to prepare for lane closures.</p>	
<p>Impact 3.12-2: The proposed project would not conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).</p>	<p>None required</p>	<p>Less than Significant Impact</p>
<p>Impact 3.12-3: The proposed project would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).</p>	<p>None required</p>	<p>Less than Significant Impact</p>
<p>Impact 3.12-4: The proposed project could result in inadequate emergency access.</p>	<p>Implement Mitigation Measure TRA-1</p>	<p>Less than Significant Impact with Mitigation</p>
<p>Impact 3.12 5: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to transportation.</p>	<p>Implement Mitigation Measure TRA-1</p>	<p>Less than Significant Impact with Mitigation</p>
<p>Tribal Cultural Resources</p>		
<p>Impact 3.13-1a: The proposed project could cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k).</p>	<p>Implement Mitigation Measures CR-3 and CR-4</p>	<p>Less than Significant Impact with Mitigation</p>

Potential Impact	Mitigation Measure	Significant Determination
<p>Impact 3.13-1b: The Proposed Project could cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe that is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.</p>	Implement Mitigation Measures CR-3 and CR-4	Less than Significant Impact with Mitigation
<p>Impact 3.13-2: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to tribal cultural resources.</p>	Implement Mitigation Measures CR-3 and CR-4	Less than Significant Impact with Mitigation
Wildfire		
<p>Impact 3.14-1: The proposed project could substantially impair an adopted emergency response plan or emergency evacuation plan.</p>	Implement Mitigation Measure TRA-1	Less than Significant Impact with Mitigation
<p>Impact 3.14-2: The proposed project could, due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.</p>	WDF-1: Fire Hazard Reduction Measures. During project implementation, IRWD shall require all spark arrestors on construction and maintenance equipment to be in good working order. Contractors shall require all vehicles and crews to have access to functional fire extinguishers at all times.	Less than Significant Impact with Mitigation
<p>Impact 3.14-3: The proposed project could require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.</p>	Implement Mitigation Measure WDF-1	Less than Significant Impact with Mitigation

Potential Impact	Mitigation Measure	Significant Determination
<p>Impact 3.14-4: The proposed project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.</p>	None required	Less than Significant Impact
<p>Impact 3.14-5: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to wildfire.</p>	Implement Mitigation Measure WDF-1	Less than Significant Impact with Mitigation

CHAPTER 1

Introduction and Project Background

1.1 Introduction

Irvine Ranch Water District (IRWD or District) is proposing to construct the Syphon Reservoir Improvement Project (proposed project). The Syphon Reservoir is an existing recycled water storage reservoir located within IRWD's service area, northeast of Portola Parkway between Bee Canyon Access Road and State Route 133 (SR-133) in the County of Orange (**Figure 1-1**). The proposed project would increase the storage capacity of the existing Syphon Reservoir to serve the community's seasonal and future recycled water needs. As a part of the reservoir expansion, the existing engineered dam would be replaced with a new engineered dam that would meet or exceed the current safety and design requirements established by the California Department of Water Resources (DWR), Division of Safety of Dams (DSOD). The project design would avoid failures and consequences to downstream communities. The proposed project would increase the reservoir capacity from approximately 500 acre-feet (AF) to 5,000 AF.

1.2 Purpose of the Draft EIR

IRWD is the Lead Agency pursuant to the California Environmental Quality Act (CEQA), and has prepared this Draft Environmental Impact Report (EIR) in compliance with CEQA of 1970 (as amended), codified at California Public Resources Code Sections 21000 et. seq., and the State CEQA Guidelines in the Code of Regulations, Title 14, Division 6, Chapter 3. The purpose of the Draft EIR is to provide the public and pertinent agencies with information about the potential effects on the local and regional environment associated with construction and operation of the proposed project. This Draft EIR describes the environmental impacts of the proposed project and suggests mitigation measures where necessary to avoid or reduce any significant impacts. The impact analyses are based on a variety of sources, including publicly available documents, agency consultation, technical studies and field surveys.

In addition, this Draft EIR has been prepared in accordance with the CEQA-Plus requirements of the U.S. Environmental Protection Agency, to fulfill the requirement of potential federal funding partners to comply with the National Environmental Policy Act (NEPA).

IRWD intends to use this EIR to consider implementation of the proposed project. IRWD's Board of Directors, as the decision-making body for the Lead Agency, shall consider and certify prior to approving the proposed project that the Draft EIR has been completed in compliance with CEQA, and that the EIR reflects its independent judgment and analysis (CEQA Guidelines Section 15090(a)).

Syphon Reservoir Improvement Project

Figure 1-1
Project location

1.3 Draft EIR Organization

This Draft EIR has been organized into the following chapters:

- **Executive Summary.** This chapter summarizes the contents of the Draft EIR.
- **Chapter 1, Introduction and Project Background.** This chapter discusses the CEQA process, explains the purpose of the Draft EIR, and summarizes the background studies and processes that influenced the development of the proposed project.
- **Chapter 2, Project Description.** This chapter provides an overview of the proposed project, describes the need for and objectives of the proposed project, explains planning for construction, operation, and management of the proposed project, and presents a preliminary list of the agencies and entities, in addition to IRWD, that would use this EIR in their consideration of specific permits and other discretionary approvals for the proposed project.
- **Chapter 3, Environmental Setting, Impacts, and Mitigation Measures.** This chapter describes the environmental setting and identifies the direct, indirect, and cumulative impacts of the proposed project for each of the following environmental topics: Aesthetics; Air Quality; Biological Resources; Cultural Resources; Geology and Soils; Greenhouse Gas Emissions; Energy; Hazards and Hazardous Materials; Hydrology and Water Quality; Noise; Recreation; Transportation; Tribal Cultural Resources; and Wildfire. For the assessment of cumulative impacts, this chapter includes a list of past, current, and probable future projects to be considered together with the proposed project. Measures to mitigate the impacts of the proposed project are presented for each environmental topics where potential significant impacts have been identified. Potential hazards from flooding associated with the construction and operation of the proposed project, including dam safety issues, are discussed in Section 3.9, *Hydrology and Water Quality*.
- **Chapter 4, CEQA-Plus Considerations:** This chapter summarizes the proposed project's compliance with CEQA-Plus requirements of the U.S. Environmental Protection Agency, to fulfill the requirement of potential federal funding partners to comply with NEPA.
- **Chapter 5, Growth Inducement.** This chapter describes the potential for the proposed project to induce growth.
- **Chapter 6, Alternatives Analysis.** According to CEQA, an EIR must describe a reasonable range of alternatives to a proposed project that would feasibly attain most of the basic project objectives and would avoid or substantially lessen any of the proposed project's significant environmental effects. This chapter presents an overview of the alternatives development process, describes the alternatives to the proposed project that were considered, and describes potential impacts of feasible alternatives relative to those of the proposed project.
- **Chapter 7, Report Preparers.** This chapter identifies the parties involved in preparing this Draft EIR, including persons and organizations consulted.
- **Appendices:** The appendices include materials related to the NOP and scoping process (**Appendix A**), as well as technical studies that support the impact analyses, such as an Air Quality and Greenhouse Gas Emissions Technical Report (**Appendix B**), Biological Resources Technical Report (**Appendix C**), Noise and Vibration Technical Report (**Appendix D**), Traffic Study (**Appendix E**), and the Tribal Cultural Resources Consultation (**Appendix F**).

1.4 CEQA Environmental Review Process

1.4.1 CEQA Process Overview

The basic purposes of CEQA are to (1) inform decision makers and the public about the potential, significant adverse environmental effects of proposed governmental decisions and activities, (2) identify the ways those environmental effects can be avoided or significantly reduced, (3) prevent significant, avoidable and adverse environmental effects by requiring changes in projects through the use of alternatives or mitigation measures when feasible, and (4) disclose to the public the reasons why an implementing agency may approve a project even if significant unavoidable environmental effects are involved.

An EIR uses a multidisciplinary approach, applying social and natural sciences to make a qualitative and quantitative analysis of all the foreseeable environmental impacts that a proposed project would exert on the surrounding area. As stated in *CEQA Guidelines* section 15151:

An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible.

This Draft EIR has been prepared to comply with CEQA and the CEQA Guidelines and is to be used by local regulators and the public in their review of the potential significant adverse environmental impacts of the proposed project and alternatives, and mitigation measures that would minimize or avoid those potential environmental effects. IRWD will consider the information presented in this Draft EIR, along with other factors, prior to considering and making any final decisions regarding the proposed project.

CEQA-Plus Requirements

As noted above, this Draft EIR has been prepared in accordance with the CEQA-Plus requirements of the U.S. Environmental Protection Agency (USEPA) to fulfill the requirement of potential federal funding partners to comply with NEPA. The CEQA-Plus requirements are intended to supplement CEQA and the CEQA Guidelines with specific requirements for environmental documents. They are not intended to supersede or replace CEQA Guidelines.

Prior to the approval of a federal funding agreement, federal consultation with agencies such as the U.S. Fish and Wildlife Service and the State Historic Preservation Office must be completed. As such, to support federal consultations, this Draft EIR demonstrates compliance with the federal Endangered Species Act (FESA) and Section 106 of the National Historic Preservation Act, and includes a Clean Air Act conformity analysis (if in a nonattainment area or an attainment area subject to a maintenance plan). In addition, this Draft EIR also demonstrates compliance with federal laws and cross-cutter regulations, including the Clean Water Act, Farmland Protection Policy Act, Migratory Bird Treaty Act, Flood Plain Management Act, Wild and Scenic Rivers Act, and Coastal Zone Management Act. Chapter 4 of this Draft EIR addresses all federal laws and regulations in fulfillment of CEQA-Plus requirements.

1.4.2 Notice of Preparation and Public Scoping

Pursuant to CEQA Guidelines Section 15082, the lead agency is required to send a Notice of Preparation (NOP) stating that an EIR will be prepared to the State Office of Planning and Research (OPR), Responsible and Trustee agencies, and federal agencies involved in funding or approving the project. The NOP must provide sufficient information in order for responsible agencies to make a meaningful response. At a minimum, the NOP must include a description of the project, location of the project, and probable environmental effects of the project (CEQA Guidelines Section 15082(a)(1)). Within 30 days after receiving the NOP, Responsible and Trustee agencies and OPR shall provide the lead agency with specific detail about the scope and content of the environmental information related to that agency's area of statutory responsibility that should be included in this Draft EIR (CEQA Guidelines Section 15082(b)).

On August 2, 2019, IRWD published a Notice of Preparation (NOP) of an EIR for a 45-day review period and circulated it to OPR and local, state, and federal agencies, including Responsible and Trustee agencies, as well as organizations and persons who expressed interest in the proposed project. The NOP comment period extended through September 16, 2019. The NOP provided a general description of the proposed project, a description of the proposed project areas, and an overview of environmental topics that will be evaluated within the EIR. The NOP was made available on the IRWD website. A copy of the NOP and comment letters are included in this Draft EIR in **Appendix A**. Thirty-five comment letters were received in response to the NOP. As a result of specific public comments received, IRWD engaged the services of HDR to evaluate alternative project scenarios and associated life cycle costs in meeting IRWD's goals for future recycled water storage and distribution management. HDR's evaluation is documented in a Technical Memorandum titled *Technical Memorandum: Evaluation of Syphon Reservoir Expansion in Response to EIR Notice of Preparation Comments* referenced in this EIR as "(HDR, 2020)." A copy of HDR's Technical Memorandum is available from IRWD's District Secretary.

On August 21, 2019, in accordance with CEQA Guidelines Section 15082, IRWD held a public scoping meeting to describe the proposed project, to identify the environmental topics that would be addressed, and to describe the CEQA process for the EIR. To notify the public of the Scoping Meeting, IRWD published the legal notification in the *Orange County Register* in five languages, mailed a notification to area residents and posted information about the meeting on IRWD's website. The District provided an opportunity for attendees to submit written comments on the scope of the environmental evaluation; the written comments received at the scoping meeting are included in Appendix A. Verbal comments raised during the scoping meeting included concerns over public safety in a potential inundation zone, property values and flood insurance costs for residences in a potential inundation zone, an increase in traffic, length of the new dam, and impacts to daily operations and safety at nearby schools. These verbal comments were summarized and are included in the scoping comments set forth in Appendix A.

1.4.3 Draft EIR

This Draft EIR has been prepared pursuant to the requirements of CEQA Guidelines Section 15126. This Draft EIR provides an analysis of reasonably foreseeable impacts associated with the

construction, operation, and maintenance of the proposed project. The environmental baseline for determining potential impacts is the date of publication of the NOP for the proposed project unless otherwise indicated (CEQA Guidelines Section 15125(a)). The baseline setting for each environmental topic assessed in this Draft EIR describes the existing conditions as of the publication of the NOP. The impact analysis is based on changes to existing conditions that would result due to implementation of the proposed project.

In accordance with the CEQA Guidelines Section 15126, Chapter 3 of this Draft EIR describes the proposed project site and the existing baseline environmental setting, identifies potential short-term, long-term, and cumulative adverse environmental impacts associated with project implementation, and identifies mitigation measures for potentially significant adverse impacts. Significance criteria are defined at the beginning of each impact analysis section for each environmental topic analyzed in this Draft EIR. In addition, Chapter 5 of this Draft EIR analyzes potential growth-inducing impacts, and Chapter 6 of this Draft EIR provides an analysis of alternatives to the project.

1.4.4 Draft EIR Public Review

In accordance with Section 15105 of the CEQA Guidelines, this Draft EIR has been submitted to the OPR State Clearinghouse for review by state agencies. In addition, this Draft EIR has been circulated to federal, state, and local agencies and interested parties who may wish to review and provide comments on its contents. A minimum 45-day public review period is required for a Draft EIR submitted to the OPR State Clearinghouse; however, IRWD is making the Draft EIR available for public review and comment for a 60-day review period from March 19, 2021 to May 18, 2021. Please submit all comments to:

Irvine Ranch Water District
Water Resources & Policy Department
15600 Sand Canyon Avenue
P.O. Box 57000
Irvine, California 92619-7000
Attn: Jo Ann Corey, Environmental Compliance Specialist
SyphonEIR@irwd.com

IRWD will hold one virtual public meeting via Zoom and telephonically to receive public comments on the environmental analysis in the Draft EIR. The virtual public meeting will include a brief presentation providing an overview of the proposed project and findings of the Draft EIR. After the presentation, oral comments will be accepted. Written comments also may be submitted anytime during the 60-day review period. The virtual public meeting will be held on April 21, 2021, at 6:00 p.m. For information on how to access the virtual public meeting, please visit <http://www.syphonreservoir.com>.

1.4.5 Final EIR Publication and Certification

Once this Draft EIR public review period has ended, IRWD will prepare written responses to all timely submitted comments. The Final EIR will be comprised of this Draft EIR, responses to comments received on this Draft EIR, and any changes or corrections to this Draft EIR that are made as part of the responses to comments. As the Lead Agency, IRWD will make the Final EIR

available for public review prior to it considering any final decision regarding approval of the proposed project (CEQA Guidelines Section 15089(b)). The Final EIR must be available to commenting agencies at least 10 days prior to certification (CEQA Guidelines Section 15088(b)).

Prior to considering the proposed project for approval, IRWD will review and consider the information presented in the Final EIR and will certify that the Final EIR has been adequately prepared in accordance with CEQA. Once the Final EIR is certified, the IRWD Board of Directors may proceed to consider any final decisions regarding the proposed project (CEQA Guidelines Sections 15090, 15096(f)). Prior to approving the proposed project, IRWD must make written Findings in accordance with Section 15091 of the CEQA Guidelines. In addition, IRWD must adopt a Statement of Overriding Considerations (SOC) concerning each significant environmental effect identified in the Final EIR (if any) that cannot be fully mitigated to a less than significant level. If one is needed, then the SOC will be included in the record of the proposed project's approval and mentioned in the Notice of Determination (NOD) following CEQA Guidelines Section 15093(c). Pursuant to CEQA Guidelines Section 15094, IRWD will file an NOD with the State Clearinghouse and County Clerk within five working days, if the proposed project is approved.

1.4.6 Mitigation Monitoring and Reporting Program

CEQA Guidelines Section 15097 requires lead agencies to “adopt a reporting or monitoring project for the changes made to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment.” The mitigation measures, if any, adopted as part of the Final EIR will be included in a Mitigation Monitoring and Reporting Program (MMRP) and implemented by IRWD.

1.5 Project Background

1.5.1 District Overview

Established in 1961 as a California Water District under the provisions of the State of California Water Code, IRWD is a local, not-for-profit, independent special district serving residents and businesses in central Orange County, California. IRWD provides drinking water, reliable sewage collection and treatment, recycled water and urban runoff treatment to approximately 422,000 residents. As an independent public agency, IRWD is governed by a five-member publicly elected Board of Directors, who live in the community and are responsible for the District's policies and decision-making. Day-to-day operations are supervised by the General Manager and District staff. IRWD's service area is located in central Orange County and encompasses 181 square miles extending from the Pacific Coast to the foothills (**Figure 1-2**). IRWD's service area includes the City of Irvine and portions of Costa Mesa, Lake Forest, Newport Beach, Orange, Tustin, and unincorporated areas of Orange County. IRWD is bordered to the west by the cities of Orange, Tustin, Santa Ana, Costa Mesa, and unincorporated Orange County areas; to the north by unincorporated Orange County; to the east by Lake Forest, Mission Viejo, and unincorporated Orange County areas; and to the south by Newport Beach, Laguna Beach, and the Pacific Ocean. IRWD provides service to approximately 20 percent of Orange County's total land area.

SOURCE: ESRI, 2019.

Syphon Reservoir Improvement Project

Figure 1-2
Irvine Ranch Water District - Service Area

IRWD has a diverse water supply that includes local groundwater, recycled water, imported water, and local surface water. Approximately 54 percent of the IRWD water supply comes from 26 local groundwater wells in the Orange County Groundwater Basin; approximately 18 percent of the District's water supply is imported from the Metropolitan Water District of Southern California (MWD); and roughly 26 percent of the District's water demands are met with recycled water. IRWD produces recycled water at its Michelson Water Recycling Plant (WRP) located in the City of Irvine and at its Los Alisos WRP located in the City of Lake Forest. Recycled water is provided to customers primarily for irrigation of public landscaping such as street medians, parks and golf courses as well as agricultural irrigation. It is also used in industrial processes such as mixing concrete, office building uses such as toilet flushing and cooling towers, as well as for firefighting.

When recycled water production exceeds seasonal demands, recycled water is stored at Syphon Reservoir, as well as other recycled water storage reservoirs operated by IRWD, including San Joaquin, Rattlesnake, and Sand Canyon Reservoirs. IRWD is an experienced reservoir operator with a strong track record in reservoir and facilities' construction, maintenance, performance, and safety. All of IRWD's reservoirs are state-inspected and meet all requirements for safe use. Additionally, IRWD goes above and beyond the required safety standards by monitoring its dams daily, and inspecting them monthly. IRWD also retains dam safety experts to inspect its dams annually.

Although IRWD's existing recycled water reservoirs provide storage for recycled water, once the storage reservoirs are filled to capacity in winter months, recycled water supplies are either diverted to Orange County Sanitation District (OCSD) or discharged to the ocean. During the dry season, service area demands for recycled water depletes existing reservoir storage and exceeds the rate at which new recycled water is produced by the WRPs. IRWD must then purchase supplemental imported water from MWD to meet the summer demands of IRWD's recycled water customers. Based on projected demands and supplies, IRWD estimates that it will need an additional 4,500 AF of recycled water seasonal storage capacity by the year 2030.

1.5.2 Existing Syphon Reservoir Facility Operations

The existing Syphon Reservoir was constructed in 1949 and was acquired by IRWD in 2010 from the Irvine Company, which previously used the reservoir to store water for agricultural irrigation. The existing reservoir is located within unincorporated Orange County within the City of Irvine's sphere of influence.¹ The reservoir is located within the Central and Coastal Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) and is included as an operating reservoir allowed within the NCCP/HCP Reserve. As early as 2011, IRWD began studying the feasibility of expanding the Syphon Reservoir to accommodate additional recycled water storage capacity. In 2013, IRWD converted the facilities at Syphon Reservoir for interim storage of recycled water produced at IRWD's Michelson WRP, by adding strainer and disinfection facilities. IRWD also enhanced the pipeline capacity by replacing the existing pipes connecting

¹ A sphere of influence is a planning boundary that designates an agency's probable future boundary and service area. Spheres of influence ensure the provision of efficient services while discouraging urban sprawl and the premature conversion of land uses such as agricultural and open space.

the reservoir to IRWD's existing system and the associated storm drain with new, larger diameter pipes (**Figure 1-3**).

The existing engineered dam is comprised of compacted on-site geologic materials, approximately 59 feet high, with a crest² length of 843 feet and width of 10 to 12. The surface area of the existing reservoir is approximately 28 acres when filled to capacity, and the current capacity of the reservoir below the existing spillway crest is approximately 535 AF. The 2011 topography survey of the dam indicates its crest to be at an elevation of 387.7 feet above mean sea level (amsl).

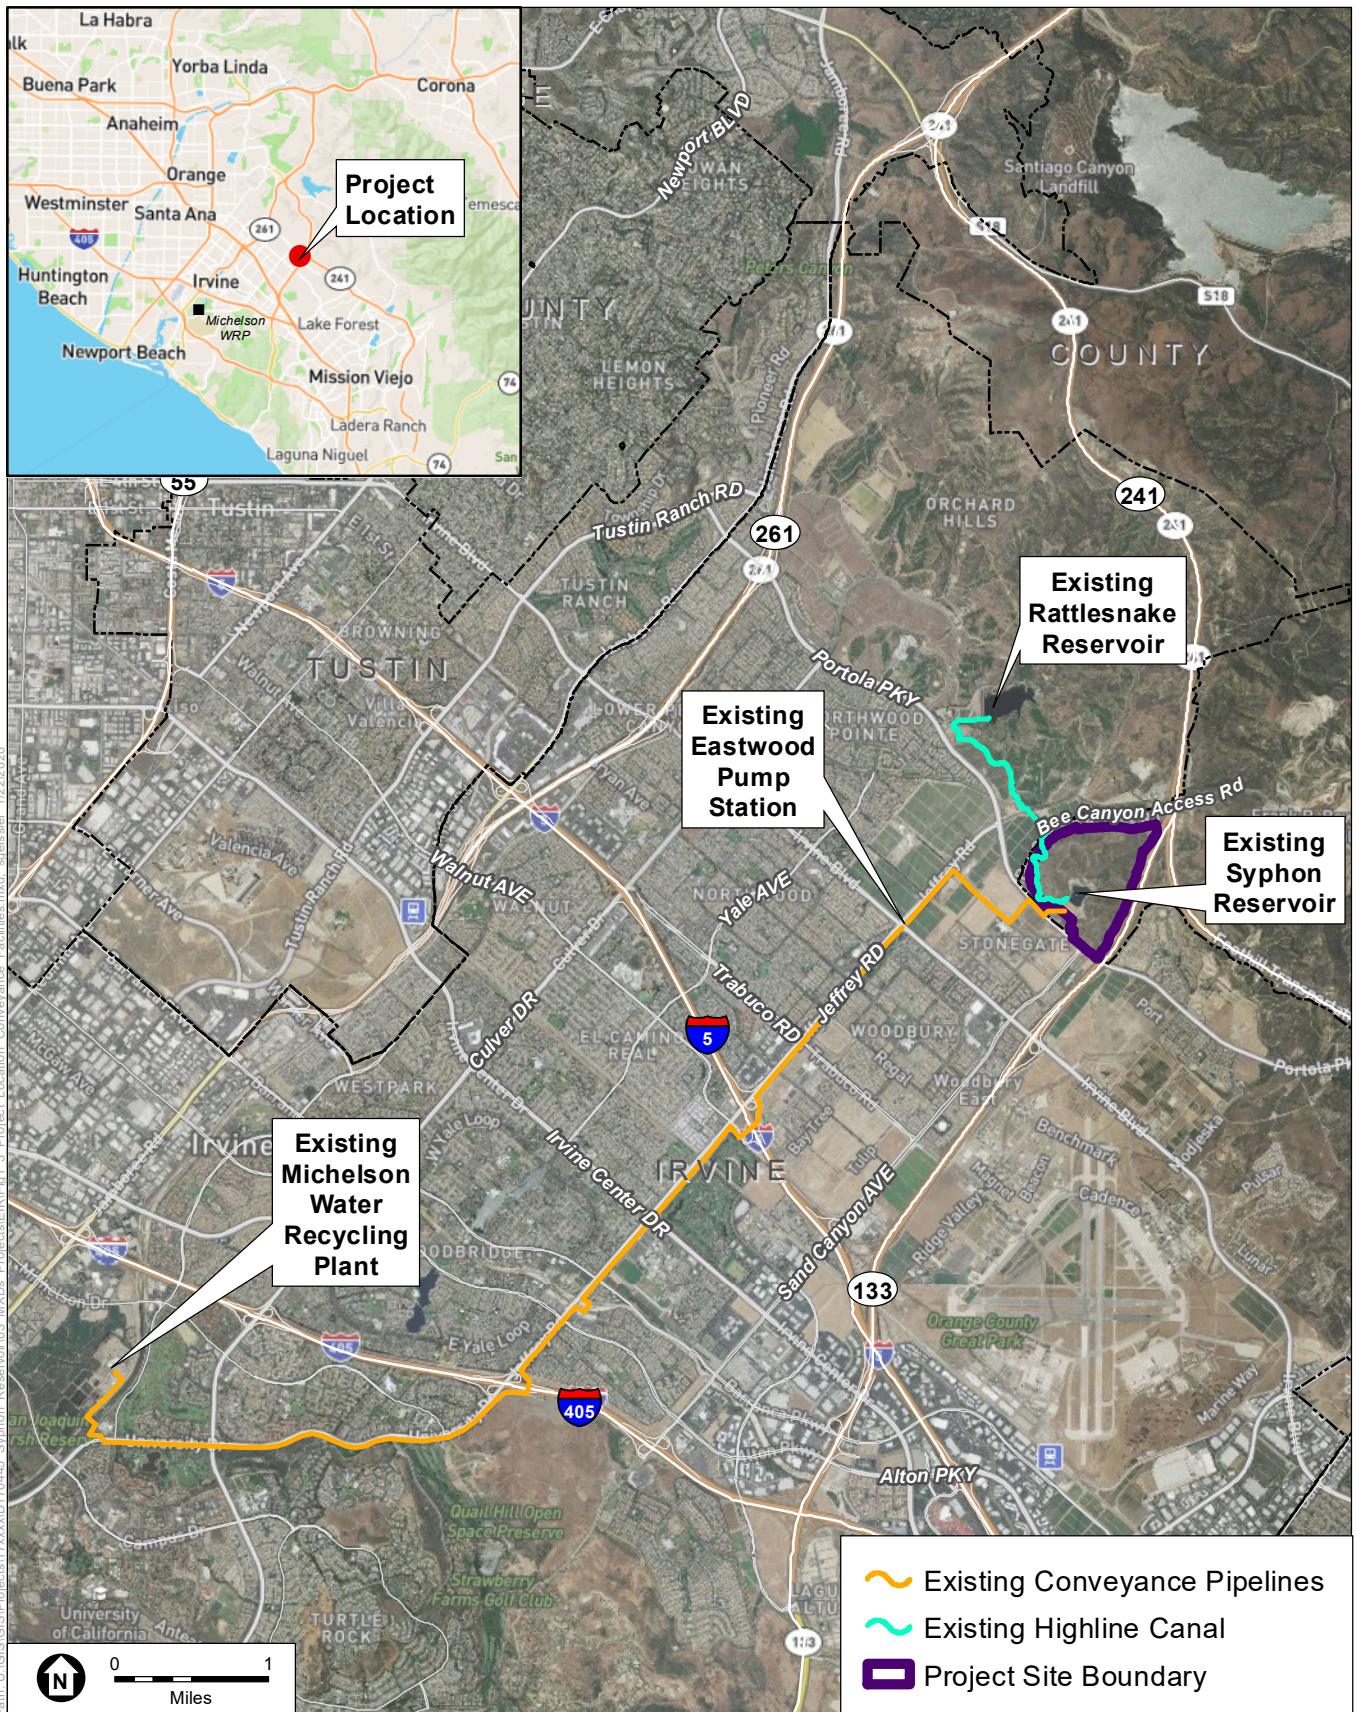

The existing dam spillway was constructed as a 12-foot-wide, broad-crested weir, located at the left abutment of the dam with a crest at 380 feet amsl (**Figure 1-4**). The existing spillway structure is designed to prevent overtopping by conveying recycled water to the existing storm drain in Portola Parkway. However, IRWD directly controls the flow of water into and out of Syphon Reservoir and can lower the water surface to allow for storage of the minor amounts of runoff that result from storm events. The reservoir does not receive water from rivers or streams. Since 2010 when IRWD purchased the reservoir, the spillway has never been used. The reservoir includes a small watershed that is approximately 205 acres and is not capable of generating significant amounts of runoff that need to be managed through the use of the spillway. In addition, an existing storm drain discharges storm water from SR-133 properties into the Syphon Reservoir (GEI 2012a). The spillway sidewalls and floor are constructed from gunite,³ reinforced with steel wire mesh adjacent to the embankment dam crest. The spillway discharge channel consists of an unpaved access road and earthen drainage ditch along the southernmost areas of the dam on the left abutment.

The existing Highline Canal is used to fill Syphon Reservoir via gravity flows from IRWD's Rattlesnake Reservoir. Flows from the Highline Canal enter the site at Bee Canyon Access Road. Branching off from the existing Highline Canal, a gunite-lined channel leads to an existing 30-inch reinforced concrete pipe covered with embankment fill (Figure 1-3). The pipeline emerges on the left side of the dam, where flows continue into an open channel (GEI 2012a).

Under normal operating conditions, all flow out of the reservoir is conveyed through a series of underground pipes that lead to the strainer and disinfection facilities and then to an existing 36-inch recycled water pipeline that connects to IRWD's recycled water system for distribution to customers. Alternatively, the existing reservoir can be drawn down through an existing 48-inch pipeline that discharges to the existing storm drain, located in Portola Parkway (see Figure 1-4).

² The elevation of the uppermost surface of a dam, usually a road or walkway, excluding any parapet wall, railing, curb, etc. On embankment dams, the crest of the dam is the top of the embankment, not including camber, crown, or roadway surfacing (U.S Department of the Interior, Bureau of Reclamation 2019).

³ A mixture of cement, sand, and water applied through a pressure hose, producing a dense hard layer of concrete used in building for lining tunnels and structural repairs.

Existing Project Site and Vicinity

1.5.3 Syphon Reservoir Studies and Reports

Multiple studies have been conducted at the project site to support the use of the reservoir to store and distribute recycled water. In 2012, IRWD prepared the *Syphon Reservoir Expansion Engineering Feasibility Study* and the *Syphon Reservoir Expansion Engineering Feasibility Study, Constructability Analysis* (GEI 2012a; 2012b), which provided baseline geotechnical information for the project site and generalized construction techniques and procedures. The studies evaluated existing site characteristics, geologic conditions, facilities integration, and inundation from any potential dam failure. Additional investigative studies were evaluated in conjunction with the 2012 engineering studies. These studies include the *Syphon Reservoir Water Quality Study*, the *Syphon Reservoir Seasonal Storage Requirements*, the *Syphon Reservoir System Integration Study*, the *Syphon Reservoir Pump Station & Treatment Feasibility Study* (GEI 2012a), and the *Syphon Reservoir Environmental Regulatory Evaluation* (Dudek 2012).

In 2013, IRWD prepared an Initial Study and subsequent Addendum for the Syphon Reservoir Interim Facilities Project (IRWD 2013a; 2013b). The Initial Study described potentially significant impacts on biological resources, cultural resources, hazards and hazardous materials, and noise. Mitigation measures were identified for these environmental topics to reduce impacts to less than significant levels. IRWD determined that the Interim Facilities Project would not have a significant effect on the environment and adopted a Mitigated Negative Declaration.

The Syphon Reservoir Interim Facilities Project was constructed at the base of the existing Syphon Reservoir to allow IRWD to operate the reservoir for recycled water use. The interim facilities included housing for chlorination equipment, storage for sodium hypochlorite, and metering pumps; mechanical strainers; a backwash water supply pump and lift station; reservoir aeration system; and a 48-inch storm drain pipe. The Syphon Reservoir Interim Facilities Project anticipated the facilities could be replaced in the future with larger facilities to handle a higher rate of flow.

In 2016, IRWD conducted a dry lakebed geotechnical exploration to obtain information on the extent and character of sediments that have accumulated in the Syphon Reservoir over time (GEI 2016). The geotechnical investigations provided information on the character of subsurface materials that had accumulated in the reservoir that could be excavated to provide suitable materials for construction and to increase the capacity of the reservoir (GEI 2016).

In 2018, IRWD prepared an Initial Study for the Eastwood Recycled Water Pump Station (IRWD 2018). The Eastwood Pump Station is being constructed to support IRWD's recycled water services, including pumping recycled water to Syphon Reservoir, and provide a high degree of operational flexibility. The Initial Study described potentially significant impacts on cultural resources, hazards and hazardous materials, and noise. Mitigation measures were identified for these environmental topics to reduce impacts to less than significant levels. IRWD determined that the Eastwood Recycled Water Pump Station would not have a significant effect on the environment and adopted a Mitigated Negative Declaration.

In 2019, IRWD prepared an Initial Study for the Syphon Reservoir Geotechnical Investigations Project (IRWD 2019). The Initial Study described potentially significant impacts on biological resources, cultural resources, geology and soils, hazards and hazardous materials, and wildfire.

Mitigation measures were identified for these environmental topics to reduce impacts to less than significant levels. IRWD determined that the Syphon Reservoir Geotechnical Investigations Project would not have a significant effect on the environment and adopted a Mitigated Negative Declaration. In August 2019, IRWD began the geotechnical investigations as outlined in the Geotechnical Investigations Work Plan developed by HDR (2019) for the project. The Syphon Reservoir Geotechnical Investigations Project evaluated geologic and seismic conditions at the existing dam embankment, spillway, outlet, and borrow sites. Results of the geotechnical investigations are used to inform the evaluation of project-related impacts in this Draft EIR and would be used for the design of the proposed project.

The Syphon Reservoir Geotechnical Investigations Project included a fault study that confirmed the Central Valley Fault is a regional U-shape fault with two main splays that extend northeast to southwest under the existing Syphon Dam. The fault splays are concealed by the lake bottom sediments, alluvium, and slopewash/colluvium soils in the reservoir and in the drainage. The fault study concluded that the Central Valley Fault has not moved within Quaternary time (the last 1.6 million years) and has no potential for future movement. Based on the DSOD criteria, this fault is considered inactive (AECOM 2020).

CHAPTER 2

Project Description

2.1 Overview and Project Location

Irvine Ranch Water District is proposing to implement the Syphon Reservoir Improvement Project (proposed project). The Syphon Reservoir is an existing recycled water storage reservoir in IRWD's service area. IRWD is limited in its ability to supply recycled water to its customers year-round with its existing recycled water storage capacity. The proposed project would increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam, while meeting or exceeding the current safety and design requirements. The proposed project would allow the storage of additional recycled water produced at IRWD's Michelson WRP during periods of low demand (winter months) for use during periods of high demand (summer months). The proposed project would expand the reservoir's storage capacity from the current 500 AF to approximately 5,000 AF and would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water from both Northern California and the Colorado River. The proposed project would help IRWD to store more drought-proof recycled water during the winter months for use during the summer months and maximize the use of recycled water for public landscaping, agricultural, business and industrial uses. Every gallon of recycled water IRWD uses for non-drinking water purposes saves a gallon of drinking water, helping the region's existing and planned future development to better withstand future water shortages. By reducing IRWD's dependence on costly imported water, the proposed project would allow IRWD to replace an expensive source of water for one that is both less expensive and a drought-resilient supply, which increases IRWD's water supply reliability.

The proposed project would be implemented within IRWD's service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and SR-133 in the County of Orange (**Figure 2-1**). The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway. The ground surrounding the reservoir is hilly with ridgelines and terraced slopes. Ground surface elevations at the site range from about 675 feet above mean sea level (amsl) in the northeast corner of the project site to about 319 feet amsl at Portola Parkway immediately downstream of the existing reservoir. The reservoir is located within the Central and Coastal Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) and is included as an operating reservoir allowed within the NCCP/HCP Reserve. Implementation of expanded seasonal storage for recycled water purposes was anticipated and identified as a permitted use in the NCCP/HCP.

Existing (Google Earth, 2018)

Proposed (Fusco, 2020)

D:770445.00

Syphon Reservoir Improvement Project

Figure 2-1
Existing and Proposed Syphon Reservoir

2.2 Project Purpose and Need

The purpose of the proposed project is to increase the recycled water storage capacity at Syphon Reservoir in order to meet the seasonal demand of recycled water customers and to enhance IRWD's water supply reliability. Water recycling is an essential component of IRWD's water supply portfolio, as any demand met with recycled water reduces the demand for high-quality drinking water. The expansion of Syphon Reservoir would assist in meeting projected demands within the service area by allowing the storage of additional recycled water produced at the Michelson WRP during periods of low demand (winter months) for use during periods of high demand (summer months). Although IRWD's existing recycled water reservoirs provide some storage for recycled water, once the storage reservoirs are filled to capacity in winter months, recycled water supplies are either diverted to Orange County Sanitation District (OCSD), Orange County Water District or discharged to the ocean. During the dry summer season, when irrigation demands are highest, service area demand for recycled water depletes existing reservoir storage and exceeds the rate at which new recycled water is produced by the WRPs. IRWD must then purchase supplemental imported water from Metropolitan Water District of Southern California (MWD) to meet the seasonal demands of IRWD's recycled water customers. Based on projected demands and supplies, IRWD estimates that it will need 4,500 AF of additional recycled water storage capacity by the year 2030 to meet demand. The expansion of Syphon Reservoir's storage capacity from the current 500 AF to approximately 5,000 AF would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water during summer months, and would increase the use of recycled water to maintain community landscaping, as well as agricultural, business and industrial uses. IRWD produces up to 28 million gallons of recycled water every day at its WRPs. Every gallon of recycled water IRWD uses for these non-drinking water purposes saves a gallon of drinking water. The proposed project would prepare IRWD for the future by storing more drought-proof water, helping the region better withstand future water shortages. By expanding water recycling infrastructure, the proposed project would be consistent with California Water Code Section 13512, which states, "[i]t is the intention of the Legislature that the state undertake all possible steps to encourage development of water recycling facilities so that recycled water may be made available to help meet the growing water requirements of the state."

2.3 Project Objectives

The primary objective of the proposed project is to allow for an increase in IRWD's seasonal recycled water storage capacity. In implementing the proposed project, IRWD would:

- Improve local water supply reliability by reducing the need to purchase costly imported water from MWD by storing additional recycled water during low demand periods for use when needed during high demand periods;
- Ensure the new engineered dam and reservoir meet or exceed the current safety and design requirements established by the California Department of Water Resources (DWR), Division of Safety of Dams (DSOD), which is the governing state agency associated with this project;
- Reduce diversions of sewage to OCSD;
- Maximize the use of recycled water produced by IRWD for the benefit of IRWD customers; and
- Reduce recycled water discharges to the ocean.

IRWD's current dam safety program falls under the jurisdiction of the DSOD. The intent of the Syphon Reservoir Improvement Project would be to not only meet the requirements of DSOD, but to exceed those requirements by considering the current state of practice of Risk-Informed Decision-Making (RIDM) during design and construction. The overarching goal of this approach would be to construct an expanded Syphon Reservoir that would comply not only with state requirements but would also leverage the significant benefits that a risk-informed dam safety approach can provide in protecting dam facilities and the public. Agencies, owners and regulators from around the world (including all US federal dam owners and regulators such as the Bureau of Reclamation, the US Army Corps of Engineers, and the Federal Energy Regulatory Commission) use RIDM and associated risk management strategies to assess and manage risks for dams, including making decisions about the safety of their facilities and necessary actions to reduce risk. The risk-informed design approach for the Syphon Reservoir Improvement Project would result in a dam design that avoids failures and associated consequences to downstream communities consistent with IRWD's priority of public safety.

2.4 Project Description

The proposed project primarily involves the expansion of three on-site facilities: Syphon Reservoir Dam, Syphon Reservoir, and Syphon Reservoir Treatment Facilities. Other operational design features would include an internal seepage control system within the new engineered dam; a circulation/aeration system for the reservoir; new onsite access and maintenance roads; wetland and riparian mitigation areas; and potential recreational facilities. These project facilities and components are described further below. It should be noted that sizes, dimensions, and locations of the various project components and configurations as further described herein, are based on feasibility-level evaluations and are subject to change with final design.

The delivery of recycled water to and from Syphon Reservoir would be accomplished with existing offsite facilities. Modifications to offsite facilities would be limited to the addition of pumps within the existing structures as further described below. As shown in Figure 1-3, existing offsite conveyance facilities would be used to deliver tertiary-treated recycled water from the Michelson WRP to the Eastwood Recycled Water Pump Station, and then to Syphon Reservoir via an existing 36-inch recycled water pipeline. The Eastwood Recycled Water Pump Station is a multi-zone pump station that pumps recycled water from IRWD's Zone A to Zone B through one set of pumps, and Zone A to Zone C through a separate set of pumps. The pump station structure is currently under construction. When completed, the Eastwood Recycled Water Pump Station can accommodate the Syphon Reservoir Improvement Project with additional pump equipment. Installation of the additional pump equipment would be coordinated as a separate "equipping project" in parallel to the construction of the proposed Syphon Reservoir improvements. The existing Highline Canal would be abandoned in place and no longer used to deliver water to Syphon Reservoir from IRWD's Rattlesnake Reservoir. Under normal operating conditions, all flow out of Syphon Reservoir would be conveyed back to Eastwood Recycled Water Pump Station through the same 36-inch recycled water pipeline, for connection to IRWD's recycled water distribution system (refer to Figure 1-3).

2.4.1 Dam Replacement

The proposed project would replace the existing engineered dam with a new engineered dam, increasing the existing 59-foot dam height to 136 feet and increasing the elevation of the dam crest from the existing 388 feet amsl to 466 feet amsl. The new dam would be an earthfill embankment. The embankment slopes would provide adequate stability including for seismic loading conditions. The freeboard of the dam is 10 feet, the difference between the dam crest elevation (466 feet amsl) and spillway crest elevation (456 feet amsl).

The crest of the new dam would be approximately 20 feet wide and approximately 1,300 feet long. **Figure 2-2** shows the preliminary footprint of the proposed dam, which would be constructed primarily from on-site materials, although the importation of some specialty materials is anticipated. Onsite materials would be obtained from excavation of the existing earthen embankment dam and spillway, excavation below the new dam footprint and borrow excavations within the existing and proposed reservoir area. The proposed project would require an estimated 2.3 million cubic yards of fill, of which approximately 2.2 million cubic yards would be available onsite. Approximately 0.1 million (100,000) cubic yards of material would be imported from offsite sources, including rock, gravel and other materials required to construct portions of the dam.

Slope protection for the new dam would consist of rip-rap on the upstream slope and vegetation on the downstream slope. The rip-rap on the upstream slope would provide erosion protection from wave action resulting from water in the reservoir. Similar to the existing dam, the vegetation on the downstream slope would consist of grass and would provide erosion protection from rainfall runoff.

The existing dam includes a spillway that has never been used during its 62-year history, including during IRWD's ownership and operation of Syphon Reservoir (GEI 2012a, page 4-18). Similar to the existing dam, it is a requirement of DSOD that a spillway be included with the new dam to protect the reservoir from overtopping. The new proposed spillway would be designed to meet or exceed the current safety and design requirements established by the DSOD. The elevation of the spillway crest would be approximately 456 feet amsl, providing 10 feet of freeboard relative to the dam crest at 466 feet amsl and thus ensuring that overtopping of the dam would not occur. In addition, IRWD would operate the reservoir with additional freeboard below the spillway to capture the volume of water generated by the probable maximum flood (PMF) and 100-year storm events to ensure the water surface elevation remains safely below the spillway crest elevation at all times. Furthermore, IRWD's current and future operating procedures include monitoring the local weather forecasts, and in the event of a major storm event, IRWD will lower the reservoir's water surface by distributing the stored water throughout IRWD's recycled water system, or sending a controlled flow to the existing storm drain in advance of the predicted storm event.

SOURCE: ESA, 2020; ESRI, 2020.

Syphon Reservoir Improvement Project

Figure 2-2
Proposed Project Facilities

The conceptual design of the spillway is shown on **Figure 2-3** and consists of a 22-foot-wide by approximately 220-foot-long channel cut into the left abutment of the dam. The new spillway would be constructed and lined with reinforced concrete to prevent erosion of the abutment and embankment materials. Flows through the spillway would discharge into a channel lined with grouted rip-rap (concrete grout placed in void spaces between rip-rap pieces), and then would enter a partially below-grade retention basin designed to dissipate the energy of the flow. Water would exit the retention basin via a new 48-inch conduit connecting to the existing 48-inch discharge pipeline that would route flows to the existing storm drain box culvert, located in Portola Parkway. A baffled concrete energy dissipation structure and short rip-rap lined channel are located at the end of the 48-inch discharge pipeline to reduce flow velocities to safe levels for entry into the box culvert.

The spillway system would be designed to accommodate inflow to the reservoir during precipitation events, including the PMF and 100-year storm events. During such events, stormwater runoff could add up to approximately 257 AF of water to the reservoir and raise the water surface elevation by approximately 2 to 3 feet. The proposed spillway would be designed to pass 280 cubic feet per second (cfs), although during precipitation events, IRWD would maintain reservoir levels well below the spillway crest to create sufficient storage space for stormwater runoff to enter the reservoir and avoid the need for outflow through the spillway. The spillway would convey flow into a concrete energy dissipation basin and into a 48-inch pipeline connected to the existing Portola Parkway storm drain culvert. The existing storm drain capacity is capable of receiving and safely conveying the storm event flows.

2.4.2 Reservoir Enlargement

The replacement dam would result in an increase in the reservoir's maximum water surface elevation from 376 feet amsl to 456 feet amsl and increase the reservoir's capacity from approximately 500 AF to 5,000 AF. As shown in Figure 2-1 and Figure 2-2, the proposed project would expand the reservoir's shoreline and inundate up to approximately 82 acres upstream of the dam that currently support upland and wetland vegetation communities, some of which are within the NCCP/HCP Reserve area and deed restricted lands. The existing reservoir ground surface would be excavated non-uniformly to obtain approximately 2.2 million cubic yards of material to construct the new engineered dam.

As part of the new design, the engineered embankment dam would include a seepage control drainage system consisting of a steeply inclined chimney drain and a gently sloping blanket drain constructed on the downstream side of the dam. The purpose of the drainage system is to safely route seepage through the dam. This prevents erosion in the embankment area and ensures slope stability. Each drain component would be approximately 5 feet thick and would be positioned within the dam structure as shown in **Figure 2-4**. The blanket drain would discharge to a piped-collection system near the toe of the dam.

Siphon Reservoir Improvement Project

Figure 2-4
Proposed Cross Section of New Dam

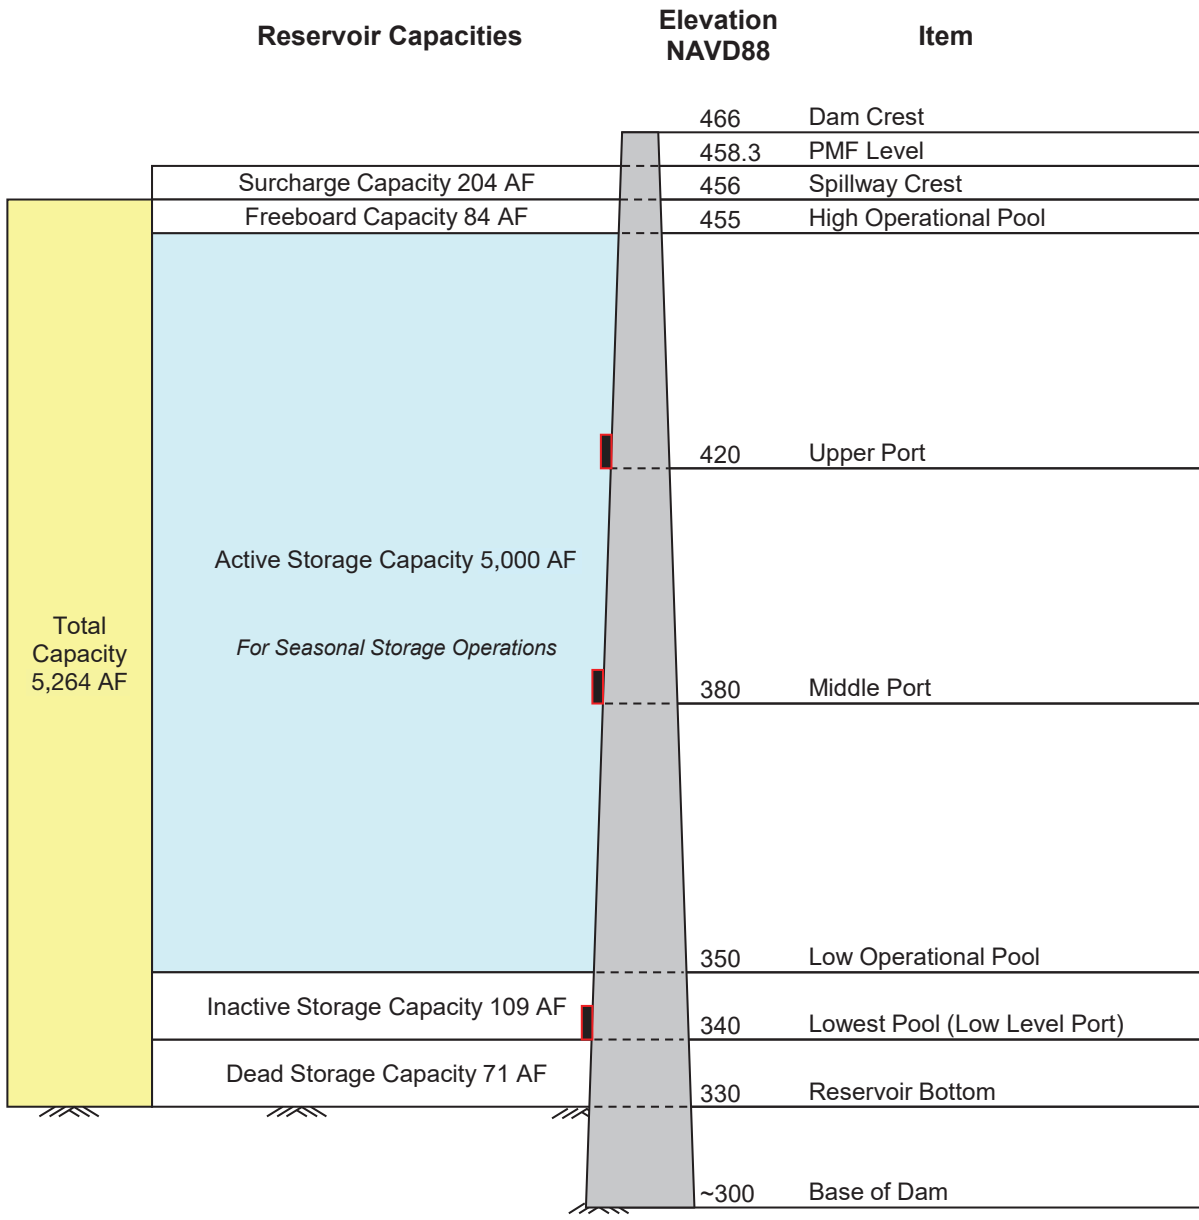

A series of existing and proposed pipelines would be used to transport water to/from IRWD's existing recycled water distribution system to the enlarged reservoir. Recycled water would be delivered to Syphon Reservoir via an existing 36-inch recycled water pipeline and the Eastwood Recycled Water Pump Station, which is located off-site and currently under construction (see Figure 1-3). Currently, the existing 36-inch recycled water pipeline is only used for outlet of recycled water from the reservoir; the project would require bi-directional flow through this pipeline, allowing it to be used for inlet as well as outlet of recycled water, into and out of the enlarged reservoir, respectively. The existing 48-inch discharge pipeline would be used for emergency drainage (as described above under Section 2.4.1), similar to existing conditions. A new, approximately 42-inch, inlet/outlet conduit would be constructed to connect two proposed inlet/outlet ports along the north-facing reservoir slope to the existing onsite 36-inch inlet/outlet pipeline that ends near the toe of the existing dam. The inlet/outlet ports allow for selective withdrawal of recycled water from the reservoir and provides IRWD with flexibility to select water from different heights in the reservoir based on water quality considerations. Pipelines and appurtenant facilities are shown on Figure 2-2 and Figure 2-3. The size and location of proposed pipelines are subject to change with final design. **Figure 2-5** is a diagram (not to scale) showing key features of the proposed dam and their elevation relative to the reservoir storage capacities and water surface.

Similar to the existing reservoir, the proposed project would be provided with a water circulation/aeration system to maintain water quality within the reservoir. The benchmarks for acceptable water quality include maintaining sufficient dissolved oxygen concentrations to prevent excessive odors and internal nutrient recycling, minimizing algal biomass, and minimizing the need for chemical treatment. The water circulation/aeration system would be detailed during final design, and would likely consist of a compressed air distribution system or surface mixer/aeration system.

2.4.3 Treatment Facilities

The existing strainer and disinfection facilities would be demolished, reconstructed and expanded at the toe of the new dam to provide filtration, chlorination and de-chlorination. The potential locations of the treatment facilities, which would be determined during detailed design, are depicted in Figure 2-2 and Figure 2-3. The layout would consist of an enclosed masonry building. The footprint of the proposed treatment facilities would be determined during the detailed design, but is anticipated to be approximately 40 feet by 160 feet. The purpose of the treatment facilities would be to de-chlorinate the recycled water as it enters the reservoir, filter the recycled water as it leaves the reservoir to remove algae and leaves, and chlorinate the recycled water as it leaves the reservoir to provide a chlorine residual as the water is delivered through IRWD's recycled water distribution system.

As recycled water enters the reservoir from the Michelson WRP, the water would be de-chlorinated with sodium bisulfite prior to entering the reservoir for storage. Approximately 11,000 gallons of sodium bisulfite would be stored onsite and metering pumps would be used to facilitate the de-chlorination process. Sodium bisulfite would be stored within two tanks inside a building adjacent to the filtration facility. A masonry block wall building would house the storage tanks, metering pumps, and control system. Spill containment pads would be integrated into the facility.

Notes:
AF = acre-feet

Actual capacities will depend on final grading of the reservoir area.

D:\70445.00 - IRWD Syphon Reservoir Recycled Water Storage\05 Graphics-GIS-Modeling

SOURCE: GEI Consultants, Inc., 2012a

Syphon Reservoir Improvement Project

Figure 2-5
Proposed Dam Elevations and Reservoir Capacities

As water is withdrawn from storage, the filters would screen out debris (algae, leaves, etc.) that may have entered the reservoir during storage. The filters would come equipped with a backwash system and associated pump station that is used to clean the filters. The spent filter backwash water would drain to a new pump station that would pump the spent backwash water back into Syphon Reservoir.

The disinfection facility would add sodium hypochlorite prior to re-introduction into IRWD's recycled water distribution system. The hypochlorite system would pump metered sodium hypochlorite to achieve an approximate 5-part-per-million chlorine residual in the recycled water. Approximately 17,000 gallons of sodium hypochlorite would be stored onsite and metering pumps would be used to facilitate the chlorination process. Sodium hypochlorite would be stored within two tanks inside the same building as the dechlorination system.

2.4.4 Access and Maintenance Roads

The primary access point for construction traffic and future IRWD operation and maintenance is anticipated to be from the intersection at Portola Parkway and Sand Canyon Avenue. The current intersection consists of a "tee" intersection, where Sand Canyon Avenue ends at the intersection with Portola Parkway. The existing intersection includes traffic signals that allow two left-hand turn lanes and one right-hand turn lane onto Portola Parkway, as well as associated cross walks. As part of the proposed project, the intersection and associated traffic lights would be modified to allow construction and future IRWD operations access through the intersection, into the District's property. Construction vehicles and IRWD vehicles would also leave the site through the same intersection. Cross walks and associated pedestrian signals would also be modified to allow safe pedestrian crossing in both directions. The modification of the intersection, traffic signals, and crosswalks would be performed in accordance with City of Irvine requirements.

An unpaved road currently exists on the District's property in the vicinity of the intersection at Portola Parkway and Sand Canyon Avenue, which was used to access and maintain the existing Highline Canal. The Highline Canal in this area has since been abandoned. As part of the proposed project, this dirt road would be utilized and improved to allow two lanes (one in each direction) for ingress and egress for the construction and IRWD operation traffic. As part of the access road improvements, it is anticipated that excavation into the existing slope and construction of a retaining wall may be necessary to allow trucks to make the left turn onto the existing Highline Canal road after passing through the intersection. Figure 2-2 depicts the anticipated access road location.

Potential secondary construction access may be considered through existing IRWD maintenance roads off of Bee Canyon Access Road. If used, these roads would be considered as one-way access points and limited to specific construction activities as further determined during the detailed design phase.

2.4.5 On-Site Freshwater Wetland, Riparian and Upland Habitat Replacement Areas

The displacement of the existing woody riparian and freshwater marsh communities resulting from expansion of the current facility would be offset on site at a 1:1 ratio, at minimum. At least 12.3 acres of riparian/wetland habitat consisting of native woody riparian vegetation and

freshwater marsh habitat is proposed to be established onsite to replace habitat displaced by construction. Both freshwater marsh and woody riparian vegetation are proposed to be placed within a large patch at the northeast end of the proposed reservoir. Also, much of the woody riparian replacement habitat would be situated within a strip that would extend around the proposed reservoir at the same elevation as the planned water surface elevation when the reservoir is full as shown in **Figure 2-6**. A shallow trough would be constructed around the reservoir perimeter (excluding the dam face), which would support native trees and shrubs (e.g., willows, mulefat, etc.) forming a belt of riparian vegetation around the upper edge of the artificial lake. The trough would be formed with fine clayey material to reduce permeability and help retain water when the reservoir is periodically drained.

In addition to reserving a strip around the edge of the expanded reservoir for woody riparian habitat, an approximately 6- to 8-acre wetland area would also be established within a flat area extending northeast of the expanded reservoir (Figure 2-6). Like the perimeter trough for riparian habitat creation, this wetland area would be situated at an elevation just below the maximum water surface elevation of the reservoir. The underlying material in this area would consist of slowly permeable fine soil with very high clay content to retain water for extended periods when the reservoir is drained down. Freshwater marsh vegetation consisting primarily of tules (native cattail and bulrush species) would be planted or seeded in the area subject to periodic inundation. However, based on preliminary coordination with the wildlife agencies, additional woody riparian habitat and less freshwater marsh vegetation may be established in this flat area in order to increase habitat for State and federally Endangered least Bell's vireo on-site.

Significant grading would be necessary that would cut into the existing hill northeast of the future lake edge in order to create sufficient space for wetland and riparian habitat restoration in this area. This additional grading would occur in an area that is dominated by ruderal (weedy) vegetation and non-native grassland that provides relatively low wildlife habitat value. Once grading is completed, the graded slope would be seeded, planted and maintained to establish native coastal sage scrub habitat where none currently exists.

2.4.6 Recreational Facilities

During project design, IRWD would consider passive recreational facilities compatible with the project site. Recreational facilities could include a walking trail along existing access roads at the project site. As shown on Figure 2-2, this proposed walking trail could be located in the south and west portions of the project site, beginning at the new permanent access road at Portola Parkway and Sand Canyon Avenue and traveling along that route, across the dam crest, and following the alignment of the existing Highline Canal, which would be abandoned with implementation of the proposed project. Offsite recreational facilities are not part of this project and would be analyzed under separate environmental review if/when future offsite recreational facilities are established. Final design would determine the appropriateness and location of the proposed walking trail on existing access roads and any other optional recreational facilities. Coordination and approval from regulatory agencies, including U.S. Fish and Wildlife Service and California Department of Fish and Wildlife, would be required for onsite recreational components.

Syphon Reservoir Improvement Project

Figure 2-6
Riparian and Upland Habitat Areas

2.4.7 Additional Geotechnical Investigations

As stated in Section 1.5.3, IRWD previously completed a comprehensive geotechnical investigation of the site from which the resulting data would be used during final design to develop the detailed construction documents. During the design phase, additional geotechnical investigations may need to be performed. If additional investigations are deemed necessary, the investigations may include the performance of exploratory test pits, soil borings, packer testing, and/or non-intrusive geologic investigations and observations. The additional geotechnical investigations, if needed, would remain within the proposed limits of disturbance defined by the project and would be mitigated as part of the overall project.

2.4.8 Technical Advisory Group

During the design phase, IRWD intends to establish an independent Technical Advisory Group (TAG) comprised of nationally recognized industry experts, which may include the disciplines of dam geology/site characterization, seismic analysis, hydrology/hydraulics, dam construction, potential failure mode analysis and RIDM. The purpose of the TAG is to provide an independent assessment of the design development including, but not limited to, review of design criteria, design details, technical approach, and other aspects of the design engineer's work to confirm that the project design is in full compliance with or exceeds governing standards and requirements.

2.5 Project Construction

Construction of the proposed project is estimated to require a total of 41 months. The preconstruction activities would begin in the fall of 2022 and would involve approximately 5 months of access road improvements. Preconstruction would be followed by approximately 36 months for construction of the new dam, reservoir, and associated facilities, depending on weather conditions and other variables. Construction is currently anticipated to begin in 2023. Most construction activities would be limited to 7:00 a.m. to 7:00 p.m. Monday through Friday and 9:00 am to 6:00 p.m. on Saturday. If construction work is conducted outside of these hours, IRWD would secure a variance/waiver from the appropriate entity. Construction of the proposed project would include activities implemented in phases as outlined below, which may involve overlap.

2.5.1 Preconstruction Activities and Intersection Modification

Before active construction activities are initiated onsite, all water within the reservoir would be drained and appropriate vegetation cleared outside of the bird nesting season. In addition, the proposed access road would be constructed starting at the intersection of Portola Parkway and Sand Canyon Avenue. As part of the proposed project, the intersection of Portola Parkway and Sand Canyon Avenue and associated traffic lights would be modified to allow access for construction vehicles and future IRWD operation and maintenance vehicles through the intersection, into the District's property. Cross walks and associated pedestrian signals would also be modified to allow safe pedestrian crossing in both directions. The modification of the intersection, traffic signals, and crosswalks would be performed in accordance with City of Irvine requirements.

A dirt or paved road would be graded from the new intersection at Portola Parkway and Sand Canyon Avenue for ingress and egress for the construction and IRWD operation traffic. As part of the access road improvements, it is anticipated that excavation into the existing slope and construction of a retaining wall may be necessary to allow trucks to make the left turn onto the existing Highline Canal road after passing through the intersection. Construction of the new access road would be completed within approximately 5 months and would require approximately 10 construction workers. A maximum of up to 42 daily trips would be required for haul trucks, equipment delivery, and employee vehicles throughout the duration of preconstruction activities.

2.5.2 Construction Mobilization, Site Preparation and Staging Areas

Construction mobilization would involve initial mobilization of contractors, construction office trailers and equipment to the site, as well as initial site preparation. Stockpile and staging areas, runoff settling basins, as well as temporary construction access roads would be cleared and developed. The preliminary locations of these construction-related features are shown in **Figure 2-7** and are subject to change during final project design. Initial construction areas proposed for work also would be cleared. Ingress and egress areas would be delineated, fenced, or marked so that the surrounding habitat and riparian areas would not be impacted, to the extent possible.

The proposed stockpile/staging areas would hold reusable excavation materials, sediments, and topsoil, as well as material imported from offsite sources such as rock and gravel and would be located primarily within the proposed reservoir inundation area to avoid disturbance to surrounding conservation lands in the NCCP/HCP. The proposed stockpile/staging areas could also be used for excavating borrow materials once stockpiles are removed. Some stockpile/staging areas could be outside the reservoir expansion area and could hold materials to be used beyond the inundation area. These stockpile/staging locations would primarily be sited in areas that would later be used for upland restoration.

The construction access roads, shown in Figure 2-7, would be arterial roads used for the duration of the project construction period and have been designed to be primarily within the limits of disturbance for the reservoir enlargement and the new dam. As the site is developed, and borrow excavation areas are developed, utilized, and exhausted, the location of the roads may change and additional roads would be constructed. In addition, some of the construction access roads may transition to permanent maintenance and access roads.

The runoff settling basins would be constructed onsite to capture sediment and runoff during construction, including nuisance flow, flows from the storm drain conduit below SR-133, and flows from dewatering operations. The basins also could be used as a water source for dust control and soil moisture conditioning.

SOURCE: ESA, 2020; ESRI, 2020.

Syphon Reservoir Improvement Project

Figure 2-7
Proposed Onsite Access, Staging, and Stockpiling

Temporary office facilities (likely consisting of multiple temporary trailers) would be established near the toe of the dam (see Figure 2-7), which would be used by the contractor for the duration of construction. This location could also provide some level of site security as a controlled access since all vehicles entering and leaving the site would pass this point. Additional mobilization of equipment to distinct areas onsite may occur on an ongoing basis, for each construction phase described below, based on the particular activity occurring onsite.

2.5.3 Excavation of Material/Existing Dam and Dewatering

Approximately 2.4 million cubic yards of material would be excavated from within the project site for use in construction of the proposed project components. These materials include topsoil, lake bottom sediments, alluvium, colluvium, slopewash, formational materials, as well as the existing dam. The majority of materials would be obtained from borrow excavations made within the enlarged reservoir inundation area; these reservoir area excavations also would contribute significantly to the capacity of the expanded reservoir. Each material type is briefly explained below, including suitability for each as embankment fill for the proposed new dam.

Lake bottom materials are present beneath the existing reservoir with sediment thickness ranging from zero at the edge of the reservoir (when full) to a maximum of 20 feet adjacent to the dam. Average sediment thickness is estimated at approximately 5 feet (AECOM 2020 & GEI 2012a). Lake bottom materials would not likely be suitable for use as embankment fill material. Alluvium is present at the project site in the valley bottom areas, near and below the existing dam. Alluvium is comprised of interlayered silt, sand, and clay with trace amounts of gravel and cobbles. Alluvium is not adequate foundational material for the proposed dam but would be suitable material for use as embankment fill in the proposed new dam. Mixtures of slopewash and colluvium are present on the hillsides above the valley bottom on the project site. The slopewash and colluvium thickness vary across the site from about 1 foot along the hillsides to about 35 feet in the valley bottom (AECOM 2020). These soils are comprised of interlayered silt, sand, and clay, typically with trace amounts of gravel. The slopewash and colluvium are suitable materials for use as embankment fill in the proposed dam. The formational materials underlying the project site are the Vaqueros/Sespe Formation and Silverado Formation. These formational materials are considered excellent foundation for an embankment dam and would be a good source of material for use as embankment fill as well.

The proposed embankment dam would be founded on the Vaqueros/Sespe and Silverado Formational materials. The estimated extent of excavations to provide a suitable foundation for the proposed embankment dam are shown on profile and cross-sectional views of the proposed new dam in Figure 2-3. The formational materials are expected to provide a foundation with high shear strength, low compressibility, and low permeability. Construction would consist of compaction of the upper layers of the foundation with heavy equipment prior to placement of embankment materials and treatment of the fault zone as discussed below. Special measures to improve the foundation materials may be included if their need is determined during the design phase.

A conceptual grading plan for the proposed reservoir area is shown in Figure 2-6 and Figure 2-7. This reservoir grading plan would achieve approximate balance between the volume of material

needed for embankment fill construction, and the excavated volume of fill that would be produced from all onsite sources. Implementation of the grading plan would result in the excavation of topsoil, lake bottom materials, alluvium, colluvium, slopewash, and highly weathered formational materials as described below.

Lake bottom materials overlie the alluvium on the upstream side of the existing dam. These lake bottom materials would be removed from below the footprint of the proposed dam, as well as from the entire reservoir area. The alluvium below the proposed dam footprint would be removed due to the potential for liquefaction of loose sandy layers in the alluvium during seismic loading. Removal of the alluvium necessitates removal of the existing dam. The excavation depth of the alluvium in the valley bottom is anticipated to be up to about 35 feet. The existing dam would be excavated down to elevation 330 feet amsl. Both the alluvium and existing dam materials would be reused for construction of the proposed new embankment dam.

Topsoil, colluvium, slopewash, and highly weathered formational materials (if present) on the left and right abutments would also be removed below the footprint of the proposed new embankment dam. The depth of excavations to remove these materials is expected to range from less than 1 foot along the hillsides to about 35 feet in the valley bottom. All of these materials, except topsoil, could be reused for construction of the proposed embankment dam.

An ancient fault onsite that separates the Vaqueros/Sespe and Silverado Formations would likely be exposed following excavation of the alluvium. This fault is inactive, which was confirmed by the Syphon Reservoir Geotechnical Investigations Project (see Chapter 1), and has a negligible potential for future displacement. It is anticipated that treatment of the fault zone would include localized over-excavation of the fault zone and replacement with compacted embankment fill.

During excavation activities, saturated materials and shallow groundwater would be encountered. Groundwater depth at the downstream toe of the existing dam is approximately three feet below ground surface. Groundwater relief trenches for dewatering would be installed in materials and into the alluvium as needed during excavation. The area downstream of the toe of the dam would also be dewatered.

The borrow excavation could be accomplished with large excavators and articulated trucks. This equipment is well suited to the wet and soft nature of materials in the excavated zones and stockpile areas. Excavation productions by excavator and trucks may range between 2,500 and 5,000 cubic yards per 8-hour day.

The processing of all excavated material would be done in the stockpile areas. Processing and drying of saturated materials would be accomplished using various methods, including use of discs and tractors to expose the material to sun and wind, and mixing drier and wetter borrow materials together. Wet materials transported to stockpile areas could be spread with a dozer, such as a low ground pressure bulldozer.

Depending on weather conditions, the excavation phase of the proposed project would be completed within approximately 7 to 9 months. A maximum of 74 daily trips would be required

for haul trucks, equipment delivery, and employee vehicles throughout the duration of excavation activities.

2.5.4 Construction of New Dam, Spillway and Reservoir

The proposed new engineered dam would be an earthfill embankment constructed primarily from onsite materials. The majority of materials for the embankment fill would be obtained from borrow excavations made in the reservoir area, as described above in Section 2.5.3.

Approximately 2.2 million cubic yards of compacted material would be reused onsite for construction of the new engineered dam. Approximately 0.1 million cubic yards of material would be imported from offsite sources, including the rock, gravel and other materials required for the construction of portions of the dam, including riprap. A portion of the topsoil obtained during borrow excavation could be used on the downstream slope of the new dam to support the proposed vegetation for downstream slope protection. However, topsoil would not be suitable for embankment fill. Lake bottom sediments would also not be suitable for embankment fill.

Once all sediment has been appropriately excavated, stockpiled, and processed, the new proposed embankment dam would be installed. First, the new, approximately 42-inch inlet/outlet, conduit would be installed below the proposed new dam as outlined in Figure 2-3, at elevation 330 feet amsl. The new proposed pipeline would be approximately 700 feet in length and would connect the two proposed upstream inlet/outlet ports along the north-facing reservoir slope to the existing 36-inch inlet/outlet pipeline at the toe of the dam.

The dam embankment fill materials would be placed in thin horizontal layers and compacted with heavy equipment to create a material with the required strength and compressibility characteristics. The downstream embankment material would be placed and compacted below the existing dam area, including toe backfill. The embankment construction would continue, up to the bottom of the blanket drain, between 330 to 340 feet amsl (see Figure 2-4).

The blanket drain would then be installed, using drain aggregate material. The blanket drain and associated embankment would be installed simultaneously between approximately 330 feet amsl to 340 feet amsl. The proposed dam embankment and chimney drain would continue to be constructed above elevation 340 feet amsl. Depending on weather conditions, approximately 12 months of work would be required to construct the embankment above elevation 340 feet amsl, up to the dam crest. The rate of rise in the lower portion of the dam would be approximately one foot per 8-hour day, with production lessening in the upper portion of the dam especially near the crest. Riprap would be installed at approximate 10-foot increments along the top of the upstream embankment. Riprap may be stockpiled or delivered directly to placement areas as needed. Approximately 1,695 cubic yards of concrete would be required for construction of the proposed inlet/outlet encasement, port structures, and other associated facilities.

Construction of the proposed embankment may be done with scrapers, or a large excavator and articulated trucks. The embankment would be spread with bulldozers and compacted with sheepsfoot and vibratory rollers, depending on the materials. Support equipment would include graders and water wagons.

Continuous on-site inspection by certified geotechnical staff would occur during the contractor's placement of the embankment dam materials to ensure compliance with design criteria and requirements. DSOD would also have staff present periodically during construction to ensure the dam is being constructed in compliance with its requirements.

Monuments would be established on the dam crest to monitor settlements and lateral movements. Open wells and/or piezometers would be installed to monitor piezometric levels (groundwater pressures) in the embankment and foundation. A seepage collection system would be installed at a low point at the downstream toe of the dam to monitor embankment seepage.

The proposed new spillway would be constructed and lined with reinforced concrete to prevent erosion of the abutment and embankment materials. Approximately 164 cubic yards of concrete would be required for this phase. The spillway would be constructed once the construction of the dam embankment is near completion (overlap may occur).

Construction of the proposed dam, spillway and expanded reservoir would be completed within approximately 14 months, depending on weather conditions. Up to approximately 232 daily trips would be required for haul trucks, equipment delivery, and employee vehicles throughout the duration of construction activities.

2.5.5 Construction of Treatment Facilities

The existing filtration and disinfection facilities would be demolished during construction of the new embankment dam and rebuilt and enlarged in one of the optional locations as part of the proposed project. Construction of the proposed new treatment facilities would occur once construction of the new dam embankment is largely complete and would require site preparation and grading, followed by installation of buried and exposed piping, mechanical, electrical/control, and structural facilities. Construction of the proposed new treatment facilities would last approximately 12 months, depending on weather conditions, and would require a crew of up to 16 construction workers. Up to 104 total truck trips, vehicle deliveries and employee trips would be required per day. Construction equipment would include a front-end loader, backhoe, bobtail dump truck, transit mix concrete truck, vibratory walk-behind compactor and water truck. If water is encountered during excavation or trenching it would be dewatered and discharged to the existing Portola Parkway storm drain under a permit from the Regional Water Quality Control Board. Trench width would vary depending upon the size (diameter) of the pipeline but would generally be between 2 to 6 feet. Excavated soils would be placed back within the trench and spread over the site in other disturbed areas. No off-site trucking of soils would be necessary. Approximately 500 cubic yards of concrete would be required for these facilities, including for the concrete pad and masonry buildings.

2.5.6 Construction of Wetland, Riparian, and Upland Areas

Approximately 12.3 acres of riparian/wetland onsite habitat would be established at the eastern end and around the perimeter of the reservoir. These areas would be graded and contoured at the same time excavation and grading occurs as described under Section 2.5.3. A shallow trough would be constructed around the reservoir perimeter and would be formed with fine clayey

material to reduce permeability and help retain water when the reservoir is periodically drained. After installation of the trough, irrigation would be installed through a series of pipelines that are around the perimeter of the reservoir, which connect to the reservoir water source. Subsequent planting and seeding of native trees and shrubs would form a belt of riparian vegetation around the upper edge of the reservoir. Additionally, up to 10.47 acres of onsite coastal sage scrub would be planted on the graded slope to the northeast of the riparian and wetland habitat area. Installation of the wetlands/riparian area would require up to 50 vehicle and equipment trips over the course of 12 months. Required equipment would include a skid steer loader, pick-up trucks, ATVs, and a water wagon.

2.5.7 Installation of Recreation Facility

A proposed recreation facility may consist of a walking trail installed on existing onsite roads and access points as shown on Figure 2-2. For example, the existing Highline Canal could be backfilled for installation of the proposed walking trail. Construction of a trail would occur through grading and compacting of native material. No existing vegetation would be impacted by the installation of the trail along existing roads or the Highline Canal. A potential on-site trail extension may be installed east from the existing Highline Canal and would be located on ridges or other relative gradual-sloped terrain. Up to 10 workers would be required to install the onsite trail over the course of 3 months. Up to approximately 30 total daily vehicle trips would be required to construct the trail, and equipment would include graders, pick-up trucks, and water trucks.

2.5.8 Site Restoration/Demobilization

Site restoration/demobilization would involve removal of all equipment, debris and personnel from the site. Site restoration would occur over the course of one month and would require up to 44 daily vehicle trips. Required equipment would include an excavator, rubber-tired loaders, a tool carrier, pick-up trucks, and a water truck.

2.5.9 Site Access, Workers, and Equipment Usage

As stated previously, the main access point to the project site would be from the intersection of Sand Canyon Avenue and Portola Parkway. The majority of materials for the embankment fill would be obtained from borrow excavations made in the reservoir area (Figure 2-7). Approximately 2.2 million cubic yards of compacted material would be reused onsite for construction of the new engineered dam. Approximately 0.1 million (100,000) cubic yards of material would be imported from offsite sources, including the rock, gravel and other materials required for the construction of portions of the dam, including riprap. This material is expected to be imported from local quarries in Corona, CA (e.g., Hanson Aggregates quarry approximately 28 miles away) or San Juan Capistrano, CA (e.g., Ortega Rock quarry approximately 26 miles away). It is not anticipated that any materials would need to be exported from the site; however, if this were necessary, local landfills that accept soils or local construction sites that need soils would be used. There are two haul route options that could be used for material delivery. Haul route Option 1 would be SR-133, north on Irvine Boulevard, and east on Sand Canyon Avenue for trucks traveling inbound, and westbound on Sand Canyon Avenue and south on Irvine

Boulevard to SR-133 for trucks traveling outbound. Haul route Option 2 would be from Interstate Highway 5 (I-5) and then east on Sand Canyon Avenue for trucks traveling inbound, and westbound on Sand Canyon Avenue to I-5 for trucks traveling outbound.

The peak daily trip activity would occur during construction of the dam, expanded reservoir and spillway. In this phase, up to approximately 66 haul trips, 3 delivery trucks, and 46 employee vehicles would access the site each day, for a total of up to approximately 232 haul trucks per day for approximately 3 to 4 months. During other phases of construction, haul trucks and material deliveries would be expected in the range of 3 to 24 trucks per day, and approximately 10 to 31 construction workers would be onsite per day.

Construction of the proposed project would involve the use of a variety of heavy construction machinery onsite. The majority of equipment and vehicles would be associated with the intensive earthwork and the structural and paving phases of construction. Large construction equipment such as backhoes, compactors, cranes, excavators, scrapers, haul trucks, pavers, and rollers would be used during the construction phase of the proposed project.

2.6 Operation and Maintenance

Once operational, all project components would operate and be monitored via IRWD's Supervisory Control and Data Acquisition (SCADA) system. Reservoir level sensors would be installed to monitor water levels in the reservoir. In addition, instrumentation and monitoring systems would be installed to continuously monitor the stability of the dam and to identify situations that may require intervention, such as a controlled emergency release of water from the reservoir. Instrumentation and monitoring will be determined during final design and may include, but are not limited to, survey monuments, inclinometer, seepage weirs, piezometers, reservoir level sensor, strong-motion accelerographs, and a weather station.

Similar to the current reservoir, operation of the proposed project would not require daily onsite staffing but, rather, would require only periodic maintenance. Water levels at Syphon Reservoir would fluctuate seasonally; water would be stored in winter when recycled water supply exceeds demand, and the reservoir would be drawn down in summer when recycled water demand exceeds supply. The estimated minimum operating capacity of the reservoir would be about 180 AF to maintain water quality. However, IRWD would develop an operating plan for Syphon Reservoir, updated each year to set targets for the volume of water to be contained in the reservoir on a daily, monthly, annual, or seasonal basis. Reservoir operations would vary with time, and would need to consider a wide variety of factors, such as: seasonal storage needs, water quality considerations, impound requirements based on rainfall projections, and operational compatibility with the IRWD recycled water system.

As mentioned previously in Section 2.4.1, during precipitation events, IRWD would maintain reservoir levels well below the spillway crest to create sufficient space for stormwater runoff to enter the reservoir and avoid use of the spillway. The annual operating plan would identify a maximum water surface elevation that would ensure overtopping of reservoir and spillway would not occur due to stormwater inflow, wave action, or overfilling of the reservoir from IRWD's

recycled water system. Reservoir operations would be adjusted by IRWD during the year based on changes in projected demands, and other factors as needed.

Under normal operating conditions, all flow in or out of the reservoir would be conveyed through the existing 36-inch inlet/outlet pipeline. In the event of an emergency, IRWD would draw down the reservoir through the existing 48-inch pipeline that discharges the recycled water to the existing storm drain, located in Portola Parkway.

The proposed new treatment facilities would require monthly or bi-monthly chemical deliveries of sodium bisulfite and sodium hypochlorite, similar to existing conditions. IRWD Operations and Maintenance staff would continue to conduct routine safety and security checks of the site, similar to existing conditions.

Maintenance of the proposed wetland/riparian areas would be required for up to 5 years after construction is complete to ensure success of the vegetated areas. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. The wetland/riparian areas would be irrigated as needed using the series of pipelines installed around the perimeter of the reservoir that connect to the reservoir water source. More information about maintenance of the wetland/riparian areas can be found in Section 3.3 Biological Resources.

If IRWD includes a recreational walking trail as part of the proposed project, hours of operation may be restricted to daily or seasonal use.

2.6.1 Energy Use

The proposed project facilities would be supplied with electrical power from Southern California Edison (SCE). The District's electricity usage to operate Syphon Reservoir and associated facilities was approximately 217,272 kilowatt hours (kWh) in 2018. The proposed project would use up to 1,300,000 kWh annually to operate the proposed project facilities.

2.7 Project Permits and Approvals

Table 2-1 presents a preliminary list of the agencies and entities that would use this Draft EIR in their consideration of specific permits and other discretionary approvals that may apply to the project. This Draft EIR is intended to provide those agencies with information required in CEQA Guidelines Section 15124, including, “(A) A list of the agencies that are expected to use the EIR in their decision making, and (B) A list of permits and other approvals required to implement the project” to support their decision-making processes. Additionally, discretionary approval may be needed from federal agencies to meet federal funding requirements. For more information on federal cross-cutter regulations and requirements please see Chapter 4, *CEQA Plus Considerations*.

**TABLE 2-1
DISCRETIONARY PERMITS OR APPROVALS POTENTIALLY REQUIRED**

Agency	Permits and Authorizations Required
California Department of Fish and Wildlife (CDFW)	Streambed Alteration Agreement, Fish and Game Code, Section 1602
California Department of Water Resources, Division of Safety of Dams	Dam Safety Inspection and Approval
State Water Resources Control Board; Regional Water Quality Control Board	Compliance with the National Pollutant Discharge Elimination System (NPDES) General Construction Permit, SWPPP Construction Dewatering Permit
State Historic Preservation Officer (SHPO)	National Historic Preservation Act Section 106 compliance
U.S. Fish and Wildlife Service (USFWS); CDFW	NCCP/HCP Compliance (provides Coverage under the Federal Endangered Species Act and Section 2080.1 under California Endangered Species Act)
Transportation Corridor Agency; USFWS	Mitigation Grant Deed Approval
City of Irvine	Approval for Portola Parkway/Sand Canyon Avenue intersection modification

CHAPTER 3

Environmental Setting, Impact Analysis, and Mitigation Measures

3.0 Introduction to the Analysis

In compliance with CEQA Guidelines Sections 15125 and 15126, Chapter 3 of this Draft EIR provides an analysis of the significant environmental effects of the Syphon Reservoir Improvement Project (proposed project) with respect to existing baseline conditions. The following environmental topics are assessed in detail in this chapter in accordance with CEQA Guidelines Appendix G:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards and Hazardous Materials
- Hydrology and Water Quality
- Noise
- Recreation
- Transportation
- Tribal Cultural Resources
- Wildfire

The CEQA Guidelines Section 15128 requires that an EIR “contain a statement briefly indicating the reasons that various possible significant effects of a project were determined not to be significant and therefore were not discussed in detail in the EIR.” The following environmental topics from CEQA Guidelines Appendix G are not discussed in detail in this Draft EIR because no significant impacts could occur as a result of implementation of the proposed project:

- Agriculture and Forestry Resources
- Land Use and Planning
- Mineral Resources
- Population and Housing
- Public Services
- Utilities and Service Systems

The effects found not to be significant associated with these environmental topics are explained further below in Section 3.0.2, *Effects Found Not to Be Significant*.

3.0.1 Format of the Environmental Analysis

This Draft EIR provides analysis of impacts for those environmental topics where it was determined in the NOP, or through subsequent analysis, that the proposed project would result in “potentially significant impacts.” Sections 3.1 through 3.14 discuss the environmental impacts that may result with approval and implementation of the proposed project. The format of the environmental analysis for each environmental topic included in Sections 3.1 through 3.14 includes an environmental setting, regulatory framework summary, impact analysis and mitigation measures (if required), and references.

“Significant effect” is defined by the CEQA Guidelines Section 15382 as “a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.”

Determining the severity of project impacts is fundamental to achieving the objectives of CEQA. The level of significance for each impact examined in this Draft EIR was determined by considering the predicted magnitude of the impact to baseline environmental conditions against the applicable threshold. Thresholds were developed using criteria from the CEQA Guidelines and Appendix G Checklist; state, federal, and local schemes; local/regional plans and ordinances; accepted practice; consultation with recognized experts; and other professional opinions.

The assessment of each issue area begins with any relevant baseline setting information that is needed to provide context for the impact analysis that follows. Extraneous setting information that does not shed light on the impact analysis is not included in this Draft EIR.

The impact analysis includes any necessary description of methodologies used and the “significance thresholds,” which are those criteria adopted by the State, County, City, or other agencies, universally recognized, or developed specifically for this analysis to determine whether potential effects are significant. Each effect under consideration for an issue area is separately listed with the discussion of the effect and its significance following. Each potentially significant impact includes a numbered impact statement and significance determination.

Following each environmental effect discussion is a list of mitigation measures (if required) and the residual effects or level of significance remaining after the implementation of the measures. In those cases, where the mitigation measure for an impact could have a significant environmental impact in another issue area, this impact is discussed as a residual effect.

Environmental Setting and Baseline

In accordance with CEQA Guidelines Section 15125(a), the environmental setting contains a description of the regional and local physical environmental conditions in the project vicinity at the time of the publication of the NOP. This environmental setting constitutes the baseline physical

condition against which the implementation of the proposed project is assessed in order to determine whether an environmental impact would occur (CEQA Guidelines Section 15126.2(a)).

Regulatory Framework

Where the project site and/or surrounding area falls within the jurisdiction of federal, state, and local regulatory agencies, the proposed project would be subject to the laws, rules, regulations, and policies of those agencies. These regulations are intended to guide development, reduce adverse effects on sensitive resources, and/or offer general guidance on the protection of such resources. The regulatory framework section summarizes the applicable laws, rules, regulations, and policies for the proposed project. These rules may also set the standards, in the form of significance criteria or thresholds of significance as discussed below, by which the potential impacts of the proposed project are evaluated.

Impact Analysis and Mitigation Measures

Significance Criteria and Methodology

This section presents the significance criteria against which potential impacts are evaluated. As defined by CEQA Guidelines Section 15064.7(a), thresholds of significance are an identifiable quantitative, qualitative, or performance standard for the assessment of a particular environmental impact. Significance criteria are included for each environmental topic.

Impact Analysis

This section provides an analysis of the potential environmental impacts that could result from implementation of the proposed project. This Draft EIR addresses the direct, indirect, and cumulative impacts associated with implementation of the proposed project, including short-term and long-term impacts.

The level of significance for each environmental impact examined in this Draft EIR was determined by considering the predicted magnitude of the impact in relation to baseline environmental setting and the applicable regulatory requirements, measured against the significance criterion. Based on the significance criterion, the significance of each potential environmental impact is determined according to the following categories:

- **Significant and Unavoidable:** A significant and unavoidable impact is a substantial adverse effect on the environment that cannot be reduced to below a significance threshold given reasonably available and feasible mitigation measures. A project with significant and unavoidable impacts could still proceed, but IRWD would be required to prepare a Statement of Overriding Considerations, pursuant to CEQA Guidelines Section 15093, explaining why the District would proceed with the project in spite of the potential for a significant environmental impact.
- **Less-than-Significant Impact with Mitigation:** A potentially significant impact occurs if the proposed project could result in a potentially substantial adverse change in the physical conditions of the environmental topic being evaluated. If such a determination is made, reasonably available and feasible mitigation measures must be considered if they would avoid or substantially reduce the significant impact. An impact that can be reduced to below the

significance threshold with such mitigation measures is considered less than significant with mitigation. Such an impact requires findings to be made under Section 15091 of the CEQA Guidelines.

- **Less-than-Significant Impact:** A less-than-significant impact is an impact that may be adverse, but does not exceed the significance threshold and does not require mitigation measures. However, mitigation measures that could further lessen the environmental effect may be suggested if readily available and easily achievable.
- **No Impact:** A no impact determination would occur if the project would not result in a substantive change to the environmental topic that is being evaluated.
- **Beneficial Impact:** An effect that would enhance existing environmental conditions or reduce existing environmental problems or hazards.

Mitigation Measures and Significance Determination

Mitigation measures are recommended for any identified potentially significant impacts as a result of the proposed project. The significance determination provides the level of significance after the implementation of recommended mitigation measures, if applicable, based on the categories described above.

References

References used for the analysis of each environmental topic addressed in this Draft EIR are included at the end of each subsection.

3.0.2 Effects Found Not to Be Significant

Agriculture and Forestry Resources

The proposed project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use.

The California Department of Conservation (CDC) Farmland Map for Orange County identified the project site as “Other Land,” which includes low density rural developments, brush, timber, wetland, and riparian areas not suitable for livestock grazing, confined livestock, poultry or aquatic facilities, strip mines, borrow pits, and water bodies smaller than 40 acres. Further, there is no Prime Farmland, Unique Farmland, or Farmland of Statewide Importance located within the project vicinity (CDC 2020a). The project would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use. There would be no impact.

The proposed project would not conflict with existing zoning for agricultural use, or a Williamson Act contract.

A Williamson Act contract requires private landowners to voluntarily restrict their land to agriculture and compatible open-space uses. The project site does not include land enrolled in a Williamson Act contract (CDC 2004). However, the project site is zoned as General Agriculture

by the County of Orange (2015). According to the Orange County Zoning Code (Section 7-9-55.1), the General Agricultural District “is established to provide for agriculture, outdoor recreational uses, and those low-intensity uses which have a predominately open space character” such as the existing Syphon Reservoir. The proposed project would enlarge the Syphon Reservoir and maintain the use of the project site for water storage similar to existing conditions, and would not result in conflicts with the General Agricultural zoning designation. There would be no impact.

The proposed project would not conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104 (g)).

As stated above, the project site is currently zoned as General Agriculture. The proposed project does not include lands that are zoned as forest land or timberland. The proposed project does not involve any changes to current General Plan land use or zoning designations for forest land, or timberland. Therefore, the proposed project would not conflict with existing zoning of forest land or cause rezoning of forest land, timberland, or timberland zoned for Timberland Production. There would be no impact.

The proposed project would not result in the loss of forest land or conversion of forest land to non-forest use.

The project site and surrounding areas contain no forest land. Thus, implementation of the proposed project would result in no impacts related to the loss or conversion of forest land to non-forest use.

The proposed project would not involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

As stated above, the proposed project would not convert Farmland to non-agricultural use or forest land to non-forest use. No other adverse impacts to the existing environment would occur from implementation of the proposed project activities that could result in conversion of farmland to non-agricultural use or forest land to non-forest use.

Land Use and Planning

The proposed project would not physically divide an established community.

The physical division of an established community typically results from the construction of a feature, such as an interstate highway or railroad tracks, or removal of a means of access, such as a local road or bridge that would impact mobility within an existing community or between a community and outlying area. Given that the proposed project would not construct any physical structures that would impact mobility within the surrounding community or remove a means of access, the proposed project would result in no impact to the physical division of an established community.

The proposed project would not cause significant environmental impact due to conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.

The proposed project is located in unincorporated Orange County and within the City of Irvine's sphere of influence, which means that City of Irvine General Plan zoning ordinances apply to the project site. The California Government Code (CGC) Section 53091 specifies that water supply facilities such as those associated with the proposed project, are exempt from building and zoning ordinances. Specifically, CGC Section 53091 states in part:

- (d) Building ordinances of a county or city shall not apply to the location or construction of facilities for the production, generation, storage, treatment, or transmission of water, wastewater, or electrical energy by a local agency.*
- (e) Zoning ordinances of a county or city shall not apply to the location or construction of facilities for the production, generation, storage, treatment, or transmission of water.*

The proposed project is considered a water storage facility. Per CGC Section 53091, building ordinances and zoning ordinances of local cities or counties do not apply to the location or construction of facilities for the storage of water. Therefore, the building ordinances and zoning ordinances of the County of Orange and City of Irvine, including the Orange County General Plan and the City of Irvine General Plan and its policies, that have been adopted for purposes of mitigating an environmental effect do not apply to the proposed project.

Even so, the proposed project would not conflict with the Orange County General Plan, Orange County Zoning Code, the City of Irvine General Plan, or the City of Irvine Zoning Ordinance. The project site, where the existing Syphon Reservoir is located, is currently designated as Open Space Reserve in the Orange County General Plan and is zoned as General Agriculture (County of Orange 2015; County of Orange 2016). As stated above under Agriculture and Forestry Resources, the proposed project would not conflict with the Orange County Zoning Code. The project site's land use is designated as Water Bodies, Preservation, and NCCP Reserve, and zoned as 1.4 Preservation Area and 1.6 Water Bodies in the City of Irvine General Plan (City of Irvine 2015). The proposed project would not develop any permanent built facilities that would change the land use of the project site, which would continue to be used as a water storage facility similar to existing conditions. Additionally, the project would remain consistent with the City of Irvine Preservation Area land use, which identifies land that contains visually significant ridgelines and biotic communities, and the Water Bodies land use, which contain public or private reservoirs that provide the City with water resources, since these resources and uses would be preserved with expansion of the reservoir under the proposed project. The proposed project is a permitted use within the Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP), and impacts related to conflicts of provisions with the NCCP are discussed in Section 3.3, Biological Resources of this Draft EIR. As such, the proposed project would not conflict with the Orange County General Plan or the City of Irvine General Plan or the respective zoning codes. There would be no impact.

Mineral Resources

The proposed project would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.

According to USGS' Mineral Resources Data System (USGS 2020), the project area is not identified as a known mineral resource area and does not have a history of mineral extraction uses. In addition, according to the State of California Department of Conservation, Division of Oil, Gas, and Geothermal Resources, no oil wells exist on the project site (CDC 2020b). The proposed project would not result in the loss of availability of a known mineral resource. There would be no impact.

The proposed project would not result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.

The County of Orange General Plan does not identify the project area as a mineral resource zone (County of Orange 2005). Therefore, the implementation of the proposed project would not result in the loss of a locally important mineral resource recovery site. There would be no impact.

Population and Housing

The proposed project would not induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).

Implementation of the proposed project would not have a direct growth inducement effect, as it does not propose development of new housing that would attract additional population to the area. Further, implementation of the proposed project would not result in substantial permanent employment that could indirectly induce population growth. Although construction activities would create some short-term construction employment opportunities over the approximately 3-year duration of construction, the amount of opportunities created would not require persons outside of the Orange County workforce. Further, no new permanent employees would be required to operate the proposed dam and reservoir. The proposed project would not directly induce substantial unplanned population growth; there would be no impact.

Please refer to Chapter 5, Growth Inducement of this Draft EIR for a discussion of the potential for the proposed project to indirectly induce substantial unplanned population growth.

The proposed project would not displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

There are no existing residences within the project area, and no residences would be condemned or displaced by the proposed project. Therefore, the proposed project would not displace people or housing necessitating the construction of replacement housing elsewhere. There would be no impact.

Public Services

The proposed project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service rations, response times or other performance objectives for any of the following public services:

Fire Protection.

The proposed project would be implemented in the County of Orange. The Orange County Fire Authority (OCFA) provides fire protection and emergency services in the vicinity of the project site (Orange County Fire Authority 2020). The nearest station to the project site is Station 55 located approximately 1.3 miles northwest of the project site at 4955 Portola Parkway in Irvine. The proposed project would not change existing demand for fire protection services because construction activities would not result in a permanent increase of employees or population to the project area. The proposed project would not substantially increase the need for new fire department staff or new facilities.

Police Protection.

The Orange County Sheriff's Department (OCSD) provides police protection services to the project site (Orange County Sheriff's Department 2020). The Irvine Police Department (IPD) also provides services to the project area (City of Irvine 2020). The nearest OCSD station is located 4.7 miles east of the project area at 20202 Windrow Drive in Lake Forest. The nearest IPD police station is located 5.6 miles southwest of the project area at 1 Civic Center Plaza in Irvine. The proposed project does not include new homes or businesses that would require any additional services or extended response times for police protection services beyond those required with the existing on-site uses. Therefore, the OCSD and IPD would not be required to expand or construct new police stations to serve the proposed project.

Schools.

The project area lies within the Irvine Unified School District (IUSD) (IUSD 2020). The student generation rates or enrollment numbers within IUSD would not be affected or altered by the proposed project. As such, the proposed project would not require new or expanded school facilities.

Parks.

The proposed project would not result in the construction of new public parks, or require the alteration of existing public parks. The project area is located adjacent to the privately-owned Crean Lutheran High School Athletic Complex. IRWD would notify Crean Lutheran High School prior to implementation of construction activities. The project would not require new parks in order to maintain service ratios.

Other Public Facilities.

The proposed project would not require or impact other additional public facilities. No impacts would occur because new public facilities would not be needed.

Utilities and Service Systems

The proposed project would not require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.

The proposed project would result in an expanded water storage facility that includes treatment facilities and discharge facilities to the existing Portola Parkway storm drain; however, the impacts associated with constructing and operating the proposed project is evaluated throughout this Draft EIR. Similar to existing conditions, the proposed project would capture onsite stormwater runoff in the reservoir and would be designed to ensure the existing SR-133 storm drain that discharges to the project site remains functional. The proposed project also includes an inlet/outlet pipeline that would be used to drain the reservoir in the event of a dam safety emergency to the existing storm drain, located in Portola Parkway. The proposed project may require the use of potable water during construction and operation, but no new water treatment facilities, electric power, natural gas, or telecommunication facilities would be required to support proposed infrastructure. Additionally, implementation of the proposed project would not require the relocation of any of the existing aforementioned infrastructure. As a result, no impact would occur.

The proposed project would not have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry, and multiple dry years.

The proposed project would increase storage of recycled water, which would be beneficially used within IRWD's service area instead of potable water, reducing dependency on costly, imported water and maintaining operational efficiency at IRWD's water recycling plants. No new water supplies or entitlements would be required to serve the project itself. No permanent water supply would be required to serve the project. Therefore, no impacts would occur related to water supplies.

The proposed project would not result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.

The proposed project would result in the generation of wastewater associated with the temporary use of portable toilets during construction. During project implementation, IRWD or the contractor may have portable toilet facilities available onsite temporarily for use by construction workers. Once construction of the proposed project is complete, such portable facilities would be removed and the wastewater properly handled and disposed in accordance with all applicable laws and regulations. Therefore, the proposed project does not require a wastewater treatment provider to serve the project during construction.

Once operational, the proposed project includes increased conveyance and storage of recycled water at Syphon Reservoir. The proposed project would store recycled water that currently is being produced at the Michelson WRP but not being put to beneficial use. The implementation of the proposed project would not affect the capacity of IRWD's existing Michelson WRP or require expansion of the facility. IRWD has adequate capacity to serve the project's projected demand. There would be no impact.

The proposed project would not generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals.

Implementation of the proposed project will result in construction debris from demolition of the existing dam and construction and contouring of the new reservoir bottom. While the majority of soils and other materials would be reused onsite to the extent practicable, construction-related debris would require disposal at regional landfills serving the project area. There are three permitted Class III landfills in Orange County available to accept waste. The Frank R. Bowerman landfill is located adjacent to the project site and has a remaining capacity through the year 2053 (County of Orange Waste and Recycling 2020). If the tonnage daily limit of 11,500 tons per day is reached at that landfill, waste would be diverted to either the Olinda Landfill or the Prima Deshecha Landfill, both located in Orange County. As a result, the proposed project would be served by landfills with sufficient permitted capacity to accommodate the project's solid waste disposal needs. There would be no impact.

The proposed project would comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

Implementation of the proposed project would result in nominal solid waste as discussed above. Statewide policies regarding solid waste have become progressively more stringent, reflecting Assembly Bill 939, which requires local government to develop waste reduction and recycling policies and meet mandated solid waste reduction targets. For the solid waste anticipated to be produced by the proposed project, IRWD would be required to comply with all laws and regulations related to the disposal and recycling of waste and for disposal of any hazardous materials resulting from demolition of the dam and the strainer and disinfection facilities (see Section 3.8, Hazards and Hazardous Materials for more information). There would be no impact.

3.0.3 Cumulative Impact Methodology

As indicated above, in addition to direct and indirect impacts associated with implementation of the proposed project, this Draft EIR also includes an assessment of cumulative impacts for each environmental topic evaluated in Chapter 3. The cumulative effects of implementing the proposed project in combination with other past, present, and reasonably foreseeable future projects within and around the project site are considered. The analysis of cumulative impacts considers whether other projects could cause related environmental impacts similar to the environmental impacts anticipated to occur due to the proposed project.

CEQA Guidelines Section 15130 requires that an EIR shall discuss cumulative impacts of a project when the project's incremental effect is "cumulatively considerable." "Cumulative impacts" are defined as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts" [CEQA Guidelines, Section 15355; see also Public Resources Code, Section 21083(b)]. Stated another way, "a cumulative impact consists of an impact which is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts" [CEQA

Guidelines, Section 15130(a)(1)]. The definition of cumulatively considerable is provided in Section 15065(a)(3):

Cumulatively considerable means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.

According to Section 15130(b) of the CEQA Guidelines:

[t]he discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. The discussion should be guided by standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute rather than the attributes of other projects which do not contribute to the cumulative impact.

For the purposes of this Draft EIR, the proposed project would contribute to a cumulatively considerable and, therefore, significant cumulative impact if:

- The cumulative effects of other past, current, and probable future projects without the proposed project are not significant and the proposed project's incremental impact is substantial enough, when added to the cumulative effects, to result in a significant impact.
- The cumulative effects of other past, current, and probable future projects without the proposed project are already significant and the proposed project would result in a cumulatively considerable contribution to the already significant effect. The standards used to determine whether the contribution is cumulatively considerable include the existing baseline environmental conditions and whether the proposed project would cause a substantial increase in impacts or otherwise exceed an established threshold of significance.

Geographic Scope of Cumulative Impacts

The geographic area affected by the proposed project and the proposed project's potential to contribute to cumulative impacts varies based on the environmental topic being analyzed. Generally, the geographic area associated with the environmental effects of the proposed project, as described further in this Chapter 3, define the boundaries of the area used for compiling the list of past, present, and reasonably foreseeable future related projects considered in the cumulative impact analysis. Table 3-1 presents the geographic areas analyzed to determine if the proposed project's contribution to a particular impact would be cumulatively considerable and, therefore, significant.

Temporal Scope of Cumulative Impacts

The cumulative projects considered in this analysis include those that have recently been completed, are currently under construction, or are reasonably foreseeable (e.g., for which an application has been submitted). A project's schedule is relevant to the consideration of cumulative short-term construction-related impacts and long-term operational impacts. For future cumulative projects, implementation schedules are often broadly estimated and can be subject to change. However, for purposes of evaluating both short-term and long-term cumulative impacts of the proposed project, this analysis assumes future cumulative projects would be implemented concurrently with the proposed project.

Method of Analysis

CEQA Guidelines Section 15130 provides that the following approaches can be used to adequately address cumulative impacts:

- **Regional Growth Projections Method** — A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency.
- **List Method** — A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the lead agency.

For this Draft EIR, the list method is used primarily. Consistent with CEQA, a two-step approach was used to analyze cumulative impacts. The first step was to determine whether the combined effects from the proposed project and related projects would be cumulatively significant. This was done by adding the proposed project's incremental impact to the anticipated impacts of other probable future projects and/or reasonably foreseeable development. Where the combined effect of the projects and/or projected development was determined to result in a significant cumulative effect, the second step was to evaluate whether the proposed project's incremental contribution to the combined significant cumulative impact would be cumulatively considerable, as required by CEQA Guidelines Section 15130(a).

CEQA Guidelines Section 15064(h)(4) states that:

... [t]he mere existence of significant cumulative impacts caused by other projects alone shall not constitute substantial evidence that the proposed project's incremental effects are cumulatively considerable.

Therefore, it is not necessarily true that, even where cumulative impacts are significant, any level of incremental contribution must be deemed cumulatively considerable by the lead agency. If the proposed project's individual impact is less than significant, however, its contribution to a significant cumulative impact could also be deemed cumulatively considerable, depending on the nature of the impact and the existing environmental setting. If, for example, a project is located in an air basin determined to be in extreme or severe nonattainment for a particular criteria pollutant, a project's relatively small contribution of the same pollutant could be found to be cumulatively considerable. Thus, depending on the circumstances, an impact that is less than significant when considered individually may still be cumulatively considerable in light of the impact caused by all projects considered in the analysis.

List of Related Projects

Cumulative effects could result when considering the effects of the proposed project in combination with the effects of other related projects in the area. For this Draft EIR analysis, other past, present, and reasonably foreseeable future related projects have been identified. **Table 3-1** lists projects in the proposed project vicinity that are included in the analysis of cumulative impacts. **Figure 3-1** graphically displays the location of the cumulative projects.

**TABLE 3-1
RELATED PROJECTS FOR CUMULATIVE ANALYSIS**

Project No.	Lead Agency	Name	Location	Project Type	Project Description	Status
1	The County of Orange	Peters Canyon Regional Park General Development Plan and Resource Management Plan	Tustin, CA and Orange, CA	Development and Management Plan	The purpose of the GDP/RMP is to provide a comprehensive, long-term development and management plan to provide safe, educational, and enjoyable public access and recreation while preserving the natural and cultural resource values of the park. The GDP is the master plan for the park and identifies proposed uses, trailheads, staging area locations, and other improvements as well as the general operations and management of the park facility.	GDP/RMP approved by County Board of Supervisors, September 2019
2	The County of Orange, Orange County Parks	2014 Irvine Ranch Open Space Donation Interim Recreation and Resource Management Plan	Orange, CA	Development and Management Plan	Recreational improvements and general park maintenance for East Orange I and II and Mountain Park. These are intended to improve and expand permitted recreational uses including hiking, mountain biking, and horseback riding.	Complete 2019
3	City of Irvine	Gateway Community Park / City of Irvine Master Parks Plan	Irvine, CA	Park Master Plan	Conceptual planning for development of a new community park in the land zoned for Open Space adjacent to the western boundary of the Syphon Reservoir site (City of Irvine 2017). The site is currently used for agricultural purposes. Conceptual planning and community outreach for the Gateway Community Park planning process has been ongoing since the year 2003 and the current goal is for completion in 2021 (City of Irvine 2019). Plans include the potential development of a 70-acre park beginning at the terminus of the Jeffrey Open Space Trail which may include a community center, gymnasium, hiking trails, an 18-hole disc golf course, a dog park, picnic areas, and other amenities. If hiking trails are included as part of the finals concept, the trails could connect to other Open Space trails located north of the project site.	Construction projected to be completed in 2021
4	City of Irvine	Eastwood Village	Irvine, CA	Residential	The project consists of 1,798 total single-family homes, 587 are under construction, and 1,211 have been completed	Under construction
5	City of Irvine	Northwood Town Center Gas Station Renovation	Irvine, CA	Commercial	The project would consist of the demolition and reconstruction of an existing gas station to add a convenience store, new gas pump canopy and car wash	Approved

Project No.	Lead Agency	Name	Location	Project Type	Project Description	Status
6	City of Irvine	Orchard Hills	Irvine, CA	Residential	The project consists of 4,088 units, of which, 396 are under review and 750 have yet to be approved.	Under construction
7	City of Irvine	Planning Area 6	Irvine, CA	Residential	The project consists of 4,602 units, 438 apartment units, and 622 condominiums are under construction, 86 single-family homes have been completed	Under construction
8	City of Irvine	Spectrum Montessori	Irvine, CA	Conditional Use Permit	The project consists of a Conditional Use Permit request to establish a child care center on a 1.41-acre site at 910 Tomato Springs Road. The center is proposed to serve up to 204 children, with 20 full-time teachers.	Under construction
9	City of Irvine, Public Works	Truck Route Roadway Rehabilitation (CIP 311902)	Irvine, CA	Capital Improvement Project	<p>The project would rehabilitate and preserve the pavement on arterial streets impacted by trash truck traffic going to and from the Frank Bowerman Landfill (County Landfill). The project is funded by County funds paid to the City as part of the Frank Bowerman Landfill Extension Agreement between the City and the Landfill.</p> <p>The project would occur on sections of Sand Canyon and Portola Parkway as these arterial streets contain the most trash truck traffic to and from the County Landfill.</p>	Project is in design; civil engineering consultant will prepare plans and specification for the rehabilitation work
10	City of Irvine, Public Works	18-19 Athletic Court Resurfacing (CIP 361909)	Irvine, CA	Capital Improvement Project	<p>The project consists of athletic court hardscape resurfacing and top finishing and Northwood, Las Lomas, Bill Barber, Homestead, Cypress, Stonegate, and other locations deemed necessary.</p> <p>The project will extend the useful life of the playing surface and provide a more even surface for public use and enjoyment.</p>	Construction began December 2019; projected to be completed December 2020
11	City of Irvine, Public Works	FY 19-20 Slurry Seal and Local Street Rehabilitation	Irvine, CA	Capital Improvement Project	This project consists of an annual slurry seal and local street rehabilitation. Fiscal Year 2019-2020 will be in the Spectrum Business Park area, UCI Area, and a portion of Portola Springs. Slurry seal will be applied to the majority of streets in these areas to preserve the pavement and slow deterioration. Street segments that are very deteriorated will be rehabilitated with a 2-inch asphalt grind and overlay.	Construction to begin March 2020; projected to be completed by November 2020

Project No.	Lead Agency	Name	Location	Project Type	Project Description	Status
12	City of Irvine Public Works	Ventura Spur/ SR-133 Bicycle-Pedestrian Bridge (CIP 321701)	Irvine, CA	Capital Improvement Project	The project consists of a separated Class 1 bicycle-pedestrian bridge that spans over State Route 133 between the communities of Woodbury East (at Emberglow/Sable) and Great Park Neighborhoods. This project is identified in the City's Bicycle Transportation Plan and is a Developer obligation for Irvine Company and Five Point Communities. Preliminary Design Plans, Categorical Exemptions, and PEER/EP are approved by Caltrans.	Final design in progress; construction projected to be completed June 2022
13	City of Irvine Public Works	Adaptive Traffic Signal Control System (CIP 331907)	Irvine, CA	Capital Improvement Project	The project consists of piloting an adaptive signal control system to address changing traffic patterns and volumes.	Construction in progress; projected completion in July 2020
14	City of Irvine Public Works	Great Park (Trabuco)/ SR- 133 Interchange (CIP 316020)	Irvine, CA	Capital Improvement Project	The project consist of construction of a freeway interchange to access SR-133 at Great Park (Trabuco Road).	Final design projected to be complete December 2021 with construction projected to be complete 2025
15	City of Irvine Public Works	Trabuco Center Expansion Design (CIP 361719)	Irvine, CA	Capital Improvement Project	The project consists of consulting architectural and engineering services to evaluate options for potential expansion of the Trabuco Center.	Preliminary design to be completed April 2020; projected construction from August to December 2020
16	City of Irvine Public Works	Streetscape Rehabilitation (CIP 351701)	Irvine, CA	Capital Improvement Project	The project consists rehabilitation of landscaping and irrigation systems within citywide streetscapes. Improvements are proposed to irrigation systems with a focus on reducing inefficiencies and water run off by installing master valves, flow sensors, drip emitters, and new nozzle technology. The focus of this CIP is on rehabilitation of streetscape landscaping citywide for the conversion of domestic/ potable water meters to a recycled water meter system.	Public Works is currently coordinating with IRWD to define scope of work and identify project locations
17	IRWD	Zone A to Rattlesnake Pump Station	Irvine, CA	Water Supply Project	The project involves replacing the existing Rattlesnake Reservoir pump station with a new pump station and appurtenant facilities. The project includes demolition and replacement of the pump, installation of electric motor-driven pumps, and other facility improvements.	Construction in progress; construction projected to be completed 2023.

Project No.	Lead Agency	Name	Location	Project Type	Project Description	Status
18	IRWD	Eastwood Recycled Water Pump Stations	Irvine. CA	Water Supply Project	The Eastwood Recycled Water Pump Station is an existing multi-zone pump station that pumps recycled water from IRWD's Zone A to Zone B through one set of pumps, and Zone A to Zone C through a separate set of pumps. The pump station structure is currently under construction to accommodate the Syphon Reservoir Improvement Project with the exception of the additional pump equipment. Installation of the equipment would be coordinated as a separate "equipping project" in parallel to the construction of the proposed Syphon Reservoir improvements.	Under construction
19	IRWD	Zone 1 Reservoir	Irvine. CA	Water Supply Project	The project involves installing a second, smaller reservoir at Sand Canyon Avenue and Elysian to increase water storage capacity and create a necessary backup supply of drinking water that will ensure uninterrupted service to Irvine residents.	Completed 2020
20	Orange County Water District	Mid-Basin Injection Project	Orange County Groundwater Basin	Groundwater Project	The project involves the installation of five new groundwater wells, with a total recharge capacity of 8 million gallons per day (MGD). The project is provided water from OCWD's Groundwater Replenishment System (GWRS). The project wells have the capacity to inject water with a TDS concentration of 48 mg/L near IRWD's Dyer Road Well Field.	Wells installed in 2020
21	Orange County Water District	Groundwater Replenishment System (GWRS) Final Improvement Project	Orange County Groundwater Basin	Groundwater Project	Groundwater producers from the Orange County Aquifer are cost-effectively limited to pump not more than a specified Basin Pumping Percentage (BPP) of their demand that overlies the groundwater basin. The project will increase the amount of groundwater recharge from 100 MGD to 130 MGD. This increased recharge is expected to increase IRWD's BPP from about 70% to 75%. This will result in IRWD pumping more groundwater that will be offset with a corresponding reduction in imported water. Because the TDS of groundwater is significantly less than the TDS of imported water, the BPP increase is expected to reduce the TDS concentration of Michelson WRP's outflow.	Operation anticipated in 2023

Project No.	Lead Agency	Name	Location	Project Type	Project Description	Status
22	IRWD	MWRP Biosolids Project	Irvine, CA	Recycled Water and Biosolids Project	IRWD's biosolids facility at the Michelson WRP will produce a centrate that is pre-treated and then discharged to the MWRP headworks. The facility is expected to provide about 1.24 MGD of centrate to the MWRP headworks and result in a 1.8% increase in TDS when operating at 28 MGD. The biosolids facility came on-line in 2020 for production testing and is expected to be fully operational before the Syphon Reservoir Improvement Project is operational.	Operation started in 2020

3.1 Aesthetics

This section addresses the aesthetic and visual impacts associated with construction and operation of the proposed project. This section includes: a description of existing visual resources and aesthetic conditions at the project site; a summary of applicable regulations related to aesthetics; and an evaluation of potential impacts on visual resources, including scenic vistas, and on the visual character and quality of the project site, including cumulative impacts.

3.1.1 Environmental Setting

Definitions Related to Visual Resources

Visual or aesthetic resources are generally defined as both the natural and built features of the landscape that contribute to the public viewer's experience and appreciation of the environment.¹ Depending on the extent to which a project's presence would alter the perceived visual character and quality of the environment, a visual or aesthetic impact may occur. Key terms that are used to describe aesthetic views include:

Visual character is a general description of the visual attributes of a particular land use setting as defined by local municipalities and other land use agencies. The purpose of defining the visual character of an area is to provide the context within which the visual quality of a particular site or locale is most likely to be perceived by the viewing public. For urban areas, visual character is typically described on the neighborhood level or in terms of areas with common land use, intensity of development, socioeconomic conditions, and/or landscaping and urban design features. For natural and open space settings, visual character is most commonly described in terms of areas with common landscape attributes (such as landform, vegetation, water features, etc.).

Visual quality is defined as the overall visual impression or attractiveness of a site or locale as determined by its aesthetic qualities (such as color, variety, vividness, coherence, uniqueness, harmony, and pattern). For the aesthetic analysis, the visual quality of a site or locale is defined according to three levels:

- **Low.** The location is lacking in natural or cultural visual resource amenities typical of the region. A site with low visual quality will have aesthetic elements that are perceptibly uncharacteristic of the surrounding area.
- **Moderate.** The location is typical or characteristic of the region's natural or cultural visual amenities. A site with moderate visual quality maintains the visual character of the surrounding area, with aesthetic elements that do not stand out as either contributing to or detracting from the visual character of an area.
- **High.** The location has visual resources that are unique or exemplary of the region's natural or cultural scenic amenities. A site with high visual quality is likely to stand out as particularly appealing and makes a notable positive contribution to the visual character of an area.

¹ CEQA Guidelines, Appendix G, Environmental Checklist Form defines public views as those that are experienced from a publicly accessible vantage point.

The identification of public viewer types describes the type of potentially affected viewers within the visual study area (defined below). Land uses that derive value from the quality of their settings are potentially sensitive to changes in visual conditions.

Viewer Exposure addresses the variables that affect the viewing conditions of a site. Viewer exposure considers some or all of the following factors: landscape visibility (the ability to see the landscape); viewing distance (i.e., the proximity of viewers to the project); viewing angle (whether the project would be viewed from a superior, inferior, or level line of sight); extent of visibility (whether the line of sight is open and panoramic to the project area or restricted by terrain, vegetation, and/or structures); and duration of view.

Visual Sensitivity is the overall measure of a site's susceptibility to adverse visual changes. Visual sensitivity is rated as high, moderate, or low and is determined based on the combined factors of visual quality, viewer types, how many viewers, and viewer exposure to the Project. Higher visual sensitivity is associated with sites with a higher visual quality and with a greater potential for changes to degrade or detract from the visual character of a public view.

Light originates from human activity from the following two primary sources): light emanating from building interiors that passes through windows, and light originating from exterior sources (e.g., street lighting, building illumination, security lighting, parking lot lighting, landscape lighting, and signage). These sources of light can be a nuisance to adjacent residential areas, diminish the view of the clear night sky, and if uncontrolled, can cause disturbances for motorists traveling in the area. Land uses such as residences and hotels are considered light sensitive, since occupants have expectations of privacy during evening hours and may be subject to disturbances by bright light sources. Light spill is typically defined as the presence of unwanted light on properties adjacent to the property being illuminated.

Glare is caused by the reflection of sunlight or artificial light by highly polished surfaces such as window glass or reflective materials and, to a lesser degree, from broad expanses of light-colored surfaces or vehicle headlights. Perceived glare is the unwanted and potentially objectionable sensation as observed by a person as they look directly into the light source of a luminaire. Daytime glare generation in urban areas is typically associated with buildings with exterior facades largely or entirely comprised of highly reflective glass. Glare can also be produced during evening and nighttime hours by the reflection of artificial light sources, such as automobile headlights. Glare generation is typically related to either moving vehicles or sun angles, although glare resulting from reflected sunlight can occur regularly at certain times of the year. Glare-sensitive uses include residences and transportation corridors.

Regional Setting

The proposed project site is located in the central-eastern portion of Orange County. Orange County encompasses approximately 798 square miles stretching from the Pacific Ocean to the Santa Ana Mountains. The natural setting of Orange County provides a diverse combination of mountains, hills, flatlands, and shoreline. Orange County consists of an alluvial plain surrounded by Santa Ana Mountains to the east that rise approximately 5,600 feet above mean sea level

(amsl), the Puente and Chino Hills to the north, and the San Joaquin Hills to the south (Orange County 2020). The project site is situated in the Santiago Hills portion of the Santa Ana Mountains, within a shallow valley commonly referred to as Syphon Canyon.

The major roadway corridors in the Project vicinity include Portola Parkway, Sand Canyon Avenue, State Route (SR-) 133, and SR-241.

Visual Study Area

The proposed project site is located in unincorporated Orange County northeast of the City of Irvine. Site reconnaissance of the project area was performed in 2020 to identify the visual study area and take representative photographs of existing visual conditions of the project site and adjacent areas. The visual study area includes the existing Syphon Reservoir site, surrounding hillsides, and the residential neighborhood of Stonegate, located southwest of the existing Syphon Reservoir, in the City of Irvine. **Figure 3.1-1** identifies the four viewpoints chosen to document the visual study area in and around the proposed project. **Figure 3.1-2** and **Figure 3.1-3** include existing views from those viewpoints.

The project site includes the existing Syphon Reservoir Dam, Syphon Reservoir, and Syphon Reservoir Strainer and Disinfection Facilities. The topography surrounding the reservoir is hilly with ridgelines and terraced slopes. Ground surface elevations at the site range from about 675 feet amsl in the northeast corner of the project site to about 319 feet amsl at Portola Parkway immediately downstream of the existing reservoir. The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. The residential neighborhood of Stonegate is located on the southwest side of Portola Parkway.

Scenic Vistas and Aesthetic Resources

Scenic vistas and views provide expansive views of distant landforms and aesthetic features from public vantage points, including areas designated as official scenic vistas along roadway corridors or otherwise designated by local jurisdictions. The County of Orange identifies “viewscape corridors” in the Scenic Highway Plan which provide scenic views from the coastal and mountain roadways in the county (County of Orange 2005a). The closest viewscape corridor to the project site is Santiago Canyon Road, located approximately 3 miles northeast of the project site. The City of Irvine designates certain scenic highways for their characterization of urban or rural/nature as well as “major views” that provide outstanding views of the local area. The City of Irvine identifies the intersection of Sand Canyon Avenue looking northeast at Portola Parkway, which is located adjacent to the project site, as a “major view” (City of Irvine 2015a). Another “major view” is identified at the intersection of Jeffrey Road looking northeast at Irvine Boulevard, approximately 1 mile from the project site (City of Irvine 2015a).

Views of mountains, hills, flatlands, coastal areas, open space and conservation areas are considered important scenic resources within the County of Orange and the City of Irvine (County of Orange 2005b; City of Irvine 2015). The Santa Ana Mountains provide dominant ridgelines for surrounding areas within Orange County. The twin-peaked Saddleback Mountain within the Santa Ana Mountains is the “signature landmark of Orange County” (County of

Orange 2005b). This scenic resource offers a variety of visual opportunities to the area. Saddleback Mountain is located approximately 11 miles east of the proposed project site within the Cleveland National Forest. Closer to the project site in the hillsides west of the Cleveland National Forest are the “Lomas de Santiago” (commonly known as Loma Ridge) which is identified as a major ridgeline in Orange County (County of Orange 2005b). These scenic resources together provide the visual backdrop of the proposed project site looking east. Looking west from the proposed project site, the San Joaquin Hills are identified as a major ridgeline of importance in the Orange County General Plan (County of Orange 2005b).

Orange County is further defined by a series of linear open spaces that establish a “visual sense of community identity” within the county. According to the Orange County General Plan, open space corridors can include features such as “a series of ridgelines” (County of Orange 2005b) which are present in the Loma Ridge and Santa Ana Mountains in the background of the project site. The foothills abutting the Cleveland National Forest boundary “possess outstanding scenic qualities and significant watershed and wildlife habitat for mountain lion, deer, hawks, and eagles” (County of Orange 2005b). Other open space corridors “may include private recreation facilities such a golf courses or recreational lakes” (County of Orange 2005b).

Visual Character

The project site is within undeveloped open space located directly adjacent to urbanized land in the City of Irvine. The slopes of the mountains and hillsides surrounding the project site provide contrast to the generally flat topography of the developed City of Irvine located to the south and west, which is designated as Medium Density residential in the area southwest of Portola Parkway. Much of the residential area surrounding the project consists of low-rise residential units that preserve the scenic views of the hillsides to the east and northeast of the project site. Views east and north of the project site are towards the diverse topography and hillsides of the Sana Ana Mountains and larger Cleveland National Forest.

Public views of the project site are available to motorists traveling along roadways adjacent to the project including Portola Parkway, Bee Canyon Access Road, SR-133, SR-241, and Sand Canyon Avenue. Views of the project site could also be experienced by pedestrians and bicyclists traveling on public paths along Portola Parkway. The adjacent residential community of Stonegate in the City of Irvine offers brief views of the project area in the range of 600 to 4,000 feet from the project site. Portola Parkway has an average daily traffic load of approximately 19,000 vehicles in the project area between Sand Canyon Avenue and Jeffrey Road (OCTA 2019). Sand Canyon Avenue has an average daily traffic load of approximately 16,000 vehicles in the project area between Irvine Boulevard and Portola Parkway (OCTA 2019). SR-133 has a daily traffic load of 46,700 at the junction of SR-241 (Caltrans 2018).

Visual Quality and Sensitivity

The overall visual sensitivity of the project site from public views is described in terms of its visual quality, potentially affected viewers, and exposure conditions (i.e., landscape visibility, viewing angle, extent of visibility, and duration of view). **Table 3.1-1** summarizes the aforementioned attributes in regard to each analyzed viewpoint.

**TABLE 3.1-1
 SUMMARY OF VISUAL QUALITY AND SENSITIVITY FINDINGS**

Viewing Location and Representative Photos	Visual Quality	Affected Viewers and Viewer Exposure Conditions	Visual Sensitivity
Viewpoint A (Figure 3.1-2)	Moderate	Moderate (19,000 daily motorists, as well as pedestrians/cyclists, for several minutes per trip)	Moderate
Viewpoint B (Figure 3.1-2)	Moderate	Moderate (approximately 1,000 daily users of the park/school, for 1-3 hours per day)	Moderate
Viewpoint C (Figure 3.1-3)	High	Low (46,700 daily motorists, for several seconds per trip)	Moderate
Viewpoint D (Figure 3.1-3)	Moderate	Moderate (19,000 daily motorists, as well as pedestrians/cyclists, for several minutes per trip)	Moderate

Viewpoint A

Viewpoint A (Figure 3.1-2) is looking northeast to the project site from public right-of-way Portola Parkway and the outer limits of the Stonegate residential community. This viewpoint is lower in elevation than the project site. The foreground view includes Portola Parkway and the middleground provides views of the Crean Lutheran High School Athletic Complex and the existing Syphon Reservoir. The background provides views of local hillsides leading up to the Santa Ana Mountains including Loma Ridge.

Visual Quality. The visual quality of the area is typical of a residential area that borders open space at the northeastern-most portion of the City of Irvine. While the hillsides leading up to the Santa Ana Mountains and views of Loma Ridge are seen in the background from this viewpoint, the extent of the visibility is somewhat hindered by the existing Syphon Reservoir. Nevertheless, the existing limit of the Syphon Reservoir is below the natural ridgelines. Further, the existing vegetated dam face blends in with the surrounding hillsides. Because the viewpoint is characteristic of typical residential areas within the northeastern portions of the City of Irvine and surrounding area, the existing visual quality is considered moderate (i.e., it is not lacking visual amenities but is not unique compared with the intended visual character of the area).

Affected Viewers and Exposure Conditions. Public views of the project site are provided to approximately 19,000 motorists and pedestrians/cyclists traveling northwest and southeast along Portola Parkway. Views of the Project site would be largely experienced from residents traveling to and from their homes and recreationalists using the bike/walking pathway on the western side of the roadway. It is important to note that motorists traveling northwest/southwest on Portola Parkway would not view the site from the angle depicted in the viewpoint; the angle from Viewpoint A looking northwest would mainly be experienced by pedestrians/cyclists, with motorists experiencing a lesser degree of the project site due to the angle of the roadway. There

are relatively few trees or other features that obstruct views of the project site. Direct unobstructed views of the project site would be available for brief periods of time (i.e., seconds to several minutes) when motorists or pedestrians/cyclists are passing the site. Given that the view of the site is relatively clear and unobstructed and would be observed briefly by 19,000 daily users of Portola Parkway, the viewer exposure is considered moderate.

Visual Sensitivity Conclusion. Because the view of the site from this area has moderate visual quality and moderate exposure to public views, it is considered to have moderate visual sensitivity.

Viewpoint B

Viewpoint B (Figure 3.1-2) is looking east to the project site from Stonegate Park, which is a public park in the City of Irvine. Stonegate Elementary School is located adjacent to the park. This viewpoint is below the elevation of the project site. The foreground view includes a field within Stonegate Elementary School and the middleground includes a blacktop, trees, and some single-story buildings associated with the school. The background includes views of the ridgelines of the Santa Ana Mountains. The existing Syphon Reservoir is not visible from this vantage point.

Visual Quality. The visual quality of the area is typical of a residential area and associated recreational and educational facilities within the City of Irvine. While the hillsides leading up to the Santa Ana Mountains are seen in the background from this viewpoint, the extent of the visibility is somewhat hindered by the dense vegetation associated with the Stonegate neighborhood and elementary school. Nevertheless, the natural ridgelines of the local mountains are visible in the distance. Because viewpoint is characteristic of typical residential areas within the City of Irvine, especially those at the northeastern portion of the city, the existing visual quality is considered moderate (i.e., it is not lacking visual amenities but is not unique compared with the intended visual character of the area).

Affected Viewers and Exposure Conditions. Views of the project site from this location would be experienced by users of the public park, as well as children recreating in the fields of Stonegate Elementary School. The Stonegate neighborhood consists of over 1,000 single family homes and townhomes, with 7 parks available within the community, one of which is Stonegate. While the park is open to the public, it is more widely utilized by the residents of the Stonegate neighborhood. The Stonegate Elementary School had 1,066 annual students as of 2019 (IUSD 2020). Use of the school and park would involve longer durations than residents traveling along public rights-of-ways, since residents/students recreating at the location would spend longer than a couple minutes passing through (and up to 1-3 hours). Given that the view of the site is low and would be observed by over 1,000 daily but prolonged users of Stonegate park and elementary school, the viewer exposure is considered moderate.

Visual Sensitivity Conclusion. Because the view of the site from this area has moderate visual quality and moderate exposure, it is considered to have moderate visual sensitivity.

Viewpoint C

Viewpoint C (Figure 3.1-3) is looking southwest to the project site from public right-of-way SR-133, which passes through the project area in a southwestern direction. The viewpoint is elevated above the project site. The foreground view includes SR-133, the middle ground includes views of the project site and the vegetation surrounding the project site, while the background includes views of the City of Irvine and distant views of the San Joaquin Hills.

Visual Quality. The visual quality of the middleground area is typical of the low-lying hillsides that border the City of Irvine to the northeast. The visual quality experienced in the background is unique in that it is elevated above the valley floor and provides expansive views of Orange County, including the San Joaquin Hills, which are identified as resources of importance in the City of Irvine General Plan, and a major ridgeline in the Orange County General Plan. There are only a few right-of-ways similar to SR-133 that afford these expansive views within Orange County. Given that the visual resources experienced from Viewpoint C are unique or exemplary of the region's natural scenic amenities, the visual quality is considered high (i.e., it is considered unique when compared to the typical residential nature of Orange County).

Affected Viewers and Exposure Conditions. Public views of the project site are provided to approximately 46,700 motorists traveling southwest along SR-133. Direct views of the project site would be available for merely a number of seconds as motorists are traveling at high speeds along the transportation corridor. Given that the view of the project site, while clear, could only be viewed by motorists for several seconds, the viewer exposure is considered low.

Visual Sensitivity Conclusion. Because the view of the site from this area has high visual quality and low exposure, it is considered to have moderate visual sensitivity.

Viewpoint D

Viewpoint D (Figure 3.1-3) is looking northeast to the hills from the intersection of public right-of-way Portola Parkway and Sand Canyon Avenue. The foreground view includes the intersection of Portola Parkway and Sand Canyon Avenue. The middleground provides views of the low-lying hills immediately adjacent and to the east of Portola Parkway, which are identified by the City of Irvine as a "major view." The background provides views of local hillsides leading up to the Santa Ana Mountains.

Visual Quality. The visual quality of the area is typical of a residential area that borders open space at the northeastern-most portion of the City of Irvine. While the foreground views are exclusively roadways and associated stoplights, the hillsides in the middleground and background are unadulterated and contribute to the "major view" as defined by the City of Irvine. Because the viewpoint is characteristic of typical residential areas within the northeastern portions of the City of Irvine and surrounding area, the existing visual quality is considered moderate (i.e., it is not lacking visual amenities but is not unique compared with the intended visual character of the area).

Affected Viewers and Exposure Conditions. Public views of the project site are provided to approximately 19,000 motorists and pedestrians/cyclists traveling along Portola Parkway and along Sand Canyon Avenue. Motorists and pedestrians/cyclists traveling northeast on Sand

Canyon Avenue from regional connector freeways increasingly experience this view as they travel east. There are relatively few trees or other features that obstruct views from this location. Direct unobstructed views of the proposed access road would be available for brief periods of time (i.e., seconds to several minutes) when motorists and pedestrians/cyclists are passing through the intersection or queuing at the stop light on Sand Canyon Avenue waiting to turn left or right along Portola Parkway. Given that the view of the site is relatively clear and unobstructed and would be observed briefly by 19,000 daily users of Portola Parkway, the viewer exposure is considered moderate.

Visual Sensitivity Conclusion. Because the view of the site from this area has moderate visual quality and moderate exposure to public views, it is considered to have moderate visual sensitivity.

Light and Glare

The existing site consists largely of the existing Syphon Reservoir Dam. The existing facilities do not contain any major light sources. However, when filled during the winter months with recycled water, the reservoir can act as a source of glare for traffic southbound on SR-133. Existing light and glare in the immediate area is produced from motor vehicles travelling along Portola Parkway and SR-133. Residential receptors (single family homes) and the Crean Lutheran High School Sports Complex are located immediately south and west of the project site and emit small amounts of human-generated lighting emanating from building interiors and small amounts of outside lighting. There are no other uses located near or adjacent to the project site that generate glare such as solar panels or other large bodies of water.

3.1.2 Regulatory Framework

Federal

National Scenic Byway Program

The National Scenic Byways program is part of the U.S. Department of Transportation, Federal Highway Administration. The program was established under the Intermodal Surface Transportation Efficiency Act of 1991 and was reauthorized in 1998 under the Transportation Equity Act for the 21st Century. Under the program, the U.S. Secretary of Transportation recognizes certain roads as National Scenic Byways or All-American Roads based on their archaeological, cultural, historic, natural, recreational, and scenic qualities. The only National Scenic Byway located within Southern California is the Arroyo Seco Historic Parkway–Route 110 in Los Angeles County (Federal Highway Administration 2020). This National Scenic Byway is located 35 miles from the proposed project site.

State

California State Scenic Highway Program

The State Scenic Highway Program, created by the California Legislature in 1963, was established to preserve and protect scenic highway corridors from change that would diminish the aesthetic value of lands adjacent to the highways. A highway is designated under this program when a local jurisdiction adopts a scenic corridor protection program, applies to the California Department of Transportation (Caltrans) for scenic highway approval, and receives notification from Caltrans that the highway has been designated as a scenic highway. When a city or county nominates an eligible scenic highway for official designation, it defines the scenic corridor, which is land generally adjacent and visible to a motorist on the highway (Caltrans 2020). The nearest officially designated state scenic highway is a segment of SR-91, which is approximately 10.5 miles northwest of the project area. (Caltrans 2019).

Local

County of Orange

General Plan, Resources Element

The County of Orange General Plan, Resources Element, contains a comprehensive strategy for the development, management, preservation and conservation of resources that are necessary to meet Orange County's existing and future demands. This strategy entails a framework of resources goals, policies, and programs. The General Plan identifies Landforms as a natural resource and discusses the aesthetic value of the diverse combination of mountains, hills, flatlands, and shoreline within the County of Orange. Additionally, the General Plan discusses policies in use to maintain scenic views such as sign restriction zoning and the Scenic Highway Component of the Transportation Element.

The Resources Element also discusses the value of Open Space within the County of Orange and how that relates to the aesthetic quality of the County. The value of open space to Orange County includes shaping the overall urban form, providing outdoor recreation opportunities, enhancing and protecting scenic vistas, ensuring public health and safety, preserving valuable natural resources, and providing areas for the managed production of resources.

The following are relevant policies, goals and objectives related to aesthetic resources identified in the General Plan, Resources Element:

Natural Resources Component, Policy 5: To protect the unique variety of significant landforms in Orange County through environmental review procedures and community and corridor planning activities.

Open Space, Goal 1: Retain the character and natural beauty of the environment through the preservation, conservation, and maintenance of open space.

Open Space, Objective 1.1: To designate open space areas that preserve, conserve, maintain, and enhance the significant natural resources and physical features of unincorporated Orange County.

Open Space, Policy 1.1: To guide and regulate development of the unincorporated areas of the County to ensure that the character and natural beauty of Orange County is retained.

General Plan, Transportation Element

The County of Orange General Plan, Transportation Element, contains a Scenic Highway Plan, which designates “landscape corridors” and “viewscape corridors” within the county. As discussed in Section 3.1.1 above, the closest viewscape corridor to the project site is Santiago Canyon Road, approximately three miles northeast of the project site. The Transportation Element defines the goals, objectives, and policies pertaining to the implementation of the Scenic Highways Plan. The following are relevant policies, goals and objectives related to aesthetic resources identified in the General Plan, Transportation Element:

Scenic Highway Plan, Goal 1: Preserve and enhance unique or special aesthetic and visual resources through sensitive highway design and the regulation of development within the scenic corridor.

Scenic Highway Plan, Objective 1.1: Protect and enhance the County's beauty, amenities and quality of life within the unincorporated areas.

City of Irvine

General Plan, Conservation and Open Space Element

The City Irvine General Plan, Conservation Open Space Element, includes goals and policies to achieve the overarching goal of maintaining and preserving the environmental systems as a major feature in the City. Open space includes wildlife habitats, natural resource preserves, as well as parklands and areas of scenic value. As discussed above in Section 3.1.1, the General Plan identifies natural resources of importance to the City of Irvine namely the Santiago Hills, Northern Flatlands, Central Flatlands, and San Joaquin Hills. The following goals and policies from the Open Space Element are relevant to the proposed project and are as follows:

Policy L-5(b): Include standards or criteria for the identification and preservation of visually significant natural features (i.e., skylines, major ridgelines, prominent rock outcroppings, ridges, and oak woodlands) in future development proposals.

Policy L-5(c): Ensure development in the hillside areas retains the character and aesthetic value of the natural landform through use of the Hillside Development Ordinance.

General Plan, Land Use Element

The City Irvine General Plan, Land Use Element, includes goals and policies to achieve the overarching goal of promoting land use patterns which maintain safe residential neighborhoods, bolster economic prosperity, preserve open space, and enhance the overall quality of life in Irvine. The following goals and policies from the Land Use Element are relevant to the proposed project and are as follows:

Policy A-1(a): Develop identifiable City edges, pathways, entry points, and landmarks, and conserve visual resources along the scenic corridors which characterize Irvine.

Policy A-3(b): Ensure development in the hillside areas retains the character and aesthetic value of the natural landform through use of the Hillside Development Ordinance.

3.1.3 Impact Analysis and Mitigation Measures

Significance Criteria

This Draft EIR assumes implementation of the Proposed Project would have a significant impact related to aesthetics based on the *CEQA Guidelines* Appendix G and adapted to the Project by IRWD as lead agency if it would do the following:

1. Have a substantial adverse effect on a scenic vista or other scenic viewscapes.
2. Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.
3. In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?
4. Create a new source of substantial light or glare which would adversely affect sensitive day or nighttime views in the area.
5. Result in cumulatively considerable impacts to aesthetics.

Methodology

Visual Quality

Impacts to visual quality are generally assessed by estimating the amount of visual change introduced by project components, the degree to which visual changes may be visible to surrounding viewer groups, and the general sensitivity of viewer groups to landscape alterations. Visual changes are usually measured by three factors: (1) the amount of visual contrast that project components create (changes to form, line, color, texture, and scale in the landscape); (2) the amount of view obstruction that occurs (loss of view, duration/timing); and (3) the degradation of specific natural resources (e.g., removal of scenic trees):

- (1) Visual contrast could be significant if project activities involve regraded landforms, alteration or elimination of ridgelines, and changes introduced by the project that result in landscape colors, textures, and scale of visual components that are inconsistent with a Project site's surroundings.
- (2) View obstruction could be considered significant if the project would obstruct foreground (0 to 0.25 mile) or middleground (0.25 to 3 miles) views of the viewed area seen from sensitive public viewpoints.² View obstruction is contextualized in the temporal framework, for instance how long the view of the project feature would be visible by motorists, pedestrians and bicyclists traveling on the surrounding public roadways.
- (3) The project's impacts could be considered significant if the project severely alters or displaces specific natural resources composed of striking landform features, aesthetic water bodies, mature stands of native/cultural trees (e.g., historic hedgerows), or historic structures.

² Public views are those that are experienced from publicly accessible vantage points.

Visual impacts would be considered significant overall if any one of the three measures of significance is identified. These criteria were used to assist in estimating the extent and scale of landscape alterations due to Project implementation.

Visual Assessment

This visual assessment is based on field observations of the project site and surroundings in addition to a review of topographic maps, aerial, and ground-level photographs of the project area. Additionally, visual simulations were prepared by Fuscoe Engineering, Inc., and ESA, to document the “before and after” visual conditions that could be experienced by implementation of the proposed project (see **Figures 3.1-4 through 3.1-7**). To create the visual simulations, photographs were taken from each proposed viewpoint location described in Section 3.1.1 above. Data from each photograph was recorded, such as focal length, date and time of day, lens information, as well as geographic location. A 3D model was created of the proposed enlarged dam, reservoir, and access road using 3D Studio Max software, which was overlaid on each viewpoint photograph in order to demonstrate the visual change that would result from implementation of the proposed project, when viewed from the four public Viewpoints A, B, C, and D. The visual assessment included in this section is based in part on these simulations.

Impact Analysis

Scenic Vistas

Impact 3.1-1: The proposed project could have a substantial adverse effect on a scenic vista or other scenic viewscapes.

As explained in Section 3.1.1 Environmental Setting, there are several locally designated scenic vistas/viewscapes that encompass the project site:

- The Loma Ridge and Santa Ana Mountains, which provide an eastern backdrop to the proposed project as shown in Viewpoints A and B, are identified as “dominant ridgelines” in the County of Orange; the Santa Ana Mountains is identified as the “signature landmark of Orange County.”
- The San Joaquin Hills, which can be seen in the distant background of the proposed project site and vicinity as shown in Viewpoint C, are identified as a “major ridgeline of importance” in the County of Orange.
- The intersection of Sand Canyon Avenue and Portola Parkway looking northeast as shown in Viewpoint D is designated as a “major view” within the City of Irvine.

The intersection of Jeffrey Road looking northeast at Irvine Boulevard is designated as a “major view” within the City of Irvine. Views from this location towards the project site are largely obstructed by trees and residences in the middleground, and this viewscape is not discussed further.

Santiago Canyon Road, located approximately 3 miles northeast of the project site, is identified by the County of Orange as a viewscape corridor. Views west from Santiago Canyon Road are blocked by low-lying hills, and therefore views of the project site are not available from this vantage point. As such, this viewscape is not discussed further.

Construction

Construction of the proposed project would require temporary construction activities within the project site. Construction equipment would include backhoes, excavators, scrapers, dozers, water wagons and trucks, rollers, graders, loaders, dozers, and trucks for the construction workers and equipment hauling. Construction would initiate with intersection improvements and construction of an on-site access road at the intersection of Sand Canyon Avenue and Portola Parkway (Viewpoint D), which is identified as a “major view” in the City of Irvine. During construction, the access road would consist of native dirt or potentially road base and would not provide unusual contrast with the native hillsides which provide the backdrop for the “major view.” Construction at this location would be temporary, approximately 5 months, and would not affect the scale or quality of the view of the local hillsides from this location. Impacts to the “major view” at the intersection of Sand Canyon Avenue and Portola Parkway would be less than significant.

The construction sequence would continue at the easternmost portion of the project site and move west as work progresses. While work occurs within the eastern and middle portions of the reservoir, and before excavation of the existing dam face begins, construction activities and large equipment would generally be shielded from view along Portola Parkway (Viewpoint A) by the walls of the existing dam. Views of construction equipment may be visible from SR-133 (Viewpoint C) during this time, which provide background views of the Santiago Hills, identified as a “major ridgeline of importance.” However, the construction equipment would be temporary and would not shield the background viewscape of the Santiago Hills. As a result, impacts would be less than significant.

When the existing dam is excavated, and as construction of the treatment facilities, new dam, spillway and other appurtenant facilities occur on the western portion of the project site, construction equipment and partially built features may be visible from public vantage points along Portola Parkway (Viewpoint A) that provide views of the “dominant ridgelines” of Loma Ridge and the larger Santa Ana Mountains in the background. However, the equipment would not have the scale or massing to significantly obstruct or provide contrast to the ridgelines in the background. As a result, impacts would be less than significant.

Operation

Once constructed, the existing 59-foot dam would be elevated to 136 feet in order to achieve water storage capacity of approximately 5,000 AF. The crest of the dam would be elevated from 388 feet amsl to 477 amsl. Other aboveground structures would include a spillway on the left abutment of the dam and an approximately 6,400 square foot treatment facility at the toe of the dam. Visual simulations of the proposed dam are included in Figure 3.1-4 (from Viewpoint A) and Figure 3.1-5 (Viewpoint B). Figure 3.1-6 (Viewpoint C) includes a visual simulation of the proposed maximum water surface elevation in the expanded reservoir. Other permanent contrasting features include pavement installed for the on-site access road and installation of a retaining wall behind the access road, as shown in the visual simulation in Figure 3.1-7 (Viewpoint D).

As shown in Figure 3.1-7, the access road north of the intersection of Sand Canyon Avenue and Portola Parkway would be paved after completion of construction, and a retaining wall would be installed, which would introduce permanent features into a native landscape that is identified by the City of Irvine as a “major view.” While views of the paved access road would not be pronounced like other aboveground structures, the retaining wall would be a new permanent feature that could contribute to a degradation of the “major view” from this location. As a result, the impact would be considered a potentially significant impact to scenic views identified in the City of Irvine General Plan. **Mitigation Measure AES-1** would require design of the aboveground project structures, including retaining walls, to have color palettes that blend in with the surrounding character of the project site. As shown in Figure 3.1-7 which demonstrates implementation of the mitigation measure, the retaining wall would blend in with the surrounding vegetation. With implementation of the mitigation measure, the impact to the “major view” at the intersection of Sand Canyon Avenue and Portola Parkway would be reduced to a less than significant level.

The proposed dam face would extend approximately 77 feet above the existing dam height. The enlarged dam would be the main project component that could obstruct the “dominant ridgelines” of the Loma Ridge or Santa Ana Mountains from public vantage points within the City of Irvine; all other facilities would be below the dam crest. As shown in Figure 3.1-5, the enlarged dam would barely be visible from Stonegate Park and Stonegate Elementary School (Viewpoint B) due to the intervening vegetation and residences, and would not compromise existing views of the Loma Ridge or Santa Ana Mountains. However, as shown in Figure 3.1-4, the enlarged dam would extend higher than the natural ridgelines seen in the existing condition from the entrance to the Crean Lutheran High School Athletic Complex (Viewpoint A). The permanent impact to the viewscape of prominent ridgelines of Loma Ridge and the Santa Ana Mountains within the City of Irvine would be a potentially significant impact. The proposed project includes revegetation of the dam face as a project design feature, which would allow the enlarged dam to blend into the surrounding hillsides, as shown in Figure 3.1-4. The types of vegetation used and associated maintenance would conform with DSOD requirements. Additionally, motorists, bicyclists and pedestrians would only experience temporary view obstruction for brief moments of time while passing the project site on Portola Parkway. And as shown in Figure 3.1-5, the view obstruction is minimized as distance away from the project site is achieved. With implementation of project design features, impacts would be reduced to a less than significant level.

The proposed expanded reservoir would provide an increase in approximately 4,500 AF of water storage at the project site. As shown from Figure 3.1-6, the water surface elevation would be significantly higher than under existing conditions. Nevertheless, background views of the Santiago Hills, identified as a “major ridgeline of importance,” would be maintained. Furthermore, the increase in water within the reservoir provides an aesthetic benefit to the overall viewscape. As a result, impacts would be less than significant.

Mitigation Measures

AES-1: Aboveground buildings/structures/retaining walls shall be designed to have earth-tone color palettes that blend in with the surrounding landscape and vegetation.

Significance Determination

Less than Significant Impact with Mitigation

Scenic Highway

Impact 3.1-2: The proposed project would not substantially damage scenic resources including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.

The proposed project facilities are not located in the vicinity of a state designated or eligible scenic highway. The nearest officially designated state scenic highway is a segment of SR-91, which is approximately 10.5 miles northwest of the project area (Caltrans 2019). Neither project construction nor operation activities would be visible from motorists traveling along this portion of SR-91 due to the distance and intervening topography. Therefore, the proposed project would not impact scenic resources, which include rock outcroppings, trees, or historic buildings within a designated state scenic highway corridor. No impact would occur.

Mitigation Measures

None required

Significance Determination

No Impact

Visual Character and Quality

Impact 3.1-3: The proposed project could substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public views are those that are experienced from publicly accessible vantage point).

As described above in Section 3.1.1 Environmental Setting and in Table 3.1-1, the project site and surrounding area has moderate to high visual quality, but is not considered highly visually sensitive when affected viewers and viewer exposure conditions are taken into account. An assessment of impacts to the visual character and quality of the site due to construction and operation of the proposed project is summarized using the three screening criteria discussed above in the Methodology.

Construction

The public vantage points from which views of construction activities could occur are from Portola Parkway and Sand Canyon Avenue, the closest public rights-of-way to the west, and SR-133, the closest public right-of-way to the southeast. The visual sensitivity from Portola Parkway and Sand

Canyon Avenue is considered moderate due to moderate visual quality and moderate viewer exposure. The visual sensitivity from SR-133 is considered moderate due to high visual quality and low viewer exposure. Due to the hillsides surrounding the existing reservoir where construction would occur, public views are otherwise limited.

Construction activities associated with the proposed project would result in temporary, short-term, impacts to the visual character and quality of the project area. Construction activities would require the use of construction equipment and materials such as scrapers, dozers, water wagons, rollers, graders, loaders, dozers, and trucks for the construction workers. All work within the existing reservoir footprint would generally be shielded from view along Portola Parkway by the walls of the existing dam. Construction activities associated with the proposed intersection improvements and construction of an on-site access road would be visible for a short duration (from a few seconds to several minutes) from the intersection of Portola Parkway and Sand Canyon Avenue for the 5-month construction period; as work progresses northeast along the access route and into the project site, views would be shielded by existing topography from public rights-of-way. Views from SR-133 to the construction activities within the existing reservoir would be short in duration (a few seconds) and would not be perceivable to motorists passing by. Construction of the treatment facilities, new dam, spillway and other appurtenant facilities may be visible from public vantage points along Portola Parkway. However, the majority of these features would be partially obstructed by the Crean Lutheran High School Athletic Complex. Additionally, the equipment would not have the scale or massing to significantly obstruct or provide contrast to the ridgelines in the background. The low contrasting visual elements of construction would be temporary and would not permanently affect the existing visual character and quality of the surrounding area. All impacts from construction-related activities would be less than significant.

Operation

Once constructed, the dam would be raised from its existing height of 59 feet to 136 feet in order to achieve water storage capacity of 5,000 AF. The crest of the dam would be elevated from 388 feet amsl to 477 amsl. Other aboveground structures would include a spillway on the left abutment and a 6,400 square foot treatment facility near the toe of the dam. Visual simulations of the proposed dam are included in Figure 3.1-4 (from Viewpoint A) and Figure 3.1-5 (Viewpoint B). Figure 3.1-6 (Viewpoint C) includes a visual simulation of the proposed maximum water surface elevation in the expanded reservoir. Visual simulations of the proposed on-site access road and retaining wall are included in Figure 3.1-7 (Viewpoint D). These figures compare existing views with simulated views after project implementation. The visual simulations show that the proposed new dam, expanded reservoir, and features such as the access road and retaining wall would be fully visible once operational from surrounding public viewpoints. A description of the simulated views in relation to visual character and quality is provided below per the screening criteria of visual obstruction, contrast, and alteration of natural resources.

For Viewpoint A (Figure 3.1-4), the existing visual sensitivity is considered moderate due to moderate visual quality and moderate viewer exposure. With the addition of the proposed dam as shown in the simulation, the ridgelines of the Santa Ana Mountains and Loma Ridge would be eliminated from this vantage point. These ridgelines are considered to have natural land form and

open space value and contribute to the area's visual character and quality. No natural landforms would be regraded, altered, or otherwise destroyed as a result of project implementation because the existing dam is an artificial feature. The dam face would be revegetated as a project design feature, which would maintain consistency with the existing natural hillsides. The types of vegetation used and associated maintenance would conform with DSOD requirements. The proposed dam would not provide significant contrast nor alter color of the surrounding landscape. The proposed treatment facilities would be the only facilities installed aboveground other than the dam and associated spillway. To ensure that all aboveground project structures would not impact the visual character or quality of the project site or surrounding area, Mitigation Measure AES-1 would require design of the aboveground project structures to have color palettes that blend in with the surrounding character of the project site. As a result, the proposed project would not modify the visual quality of the surrounding area. Direct unobstructed views of the proposed dam would be available for brief periods of time (i.e., seconds to several minutes) when approximately 19,000 daily motorist users, as well as pedestrians/cyclists, are passing the site. It is important to note that motorists traveling northwest/southwest on Portola Parkway would not view the site from the angle depicted in the viewpoint; the angle from Viewpoint A looking northwest would mainly be experienced by pedestrians/cyclists, with motorists experiencing a lesser degree of the project site due to the angle of the roadway. Given the lack of temporal frequency of public viewers and the revegetation of the dam face that would be consistent with the surrounding natural hillsides, the existing visual sensitivity of the view from this location would not be compromised. As a result, impacts to the established visual character and quality from this view as a result of project implementation would be less than significant with mitigation.

For Viewpoint B (Figure 3.1-5), the existing visual sensitivity is considered moderate due to moderate visual quality and moderate viewer exposure. As shown in the simulation, the proposed dam would barely be visible from Stonegate Park and Stonegate Elementary School due to the intervening vegetation and residences in the middleground. The proposed dam would not provide significant contrast nor alter color of the surrounding landscape from this location. No ridgelines or natural landforms would be regraded, altered, or otherwise destroyed from this vantage point, and distant views of the Santa Ana Mountains and Loma Ridge would be preserved. While approximately 1,000 students and recreationalists would be using the Stonegate Elementary School and Stonegate Park for durations of up approximately 1 to 3 hours, view obstruction would not be perceived by these users. As a result, the existing visual sensitivity would not be compromised, and impacts to established visual character and quality from this view as a result of project implementation would be less than significant.

For Viewpoint C (Figure 3.1-6), the existing visual sensitivity is considered moderate due to high visual quality and low viewer exposure. With addition of the proposed reservoir as shown in the simulation, the increase in water surface would provide an expanded man-made water feature. While native vegetation would be removed to achieve the larger reservoir, the area would be surrounded by a wetland/riparian area that would enhance the view from this location. Neither the existing background view of the Santiago Hills nor any other ridgelines or landforms would be obstructed from this vantage point. The expanded reservoir would be consistent with the site and its surroundings, and would not result in a visual contract as in terms of altered landscape colors or textures. While the view of the project site would be unobstructed, views would be available

for merely a number of seconds as motorists are traveling at high speeds along the transportation corridor. As a result, the existing visual sensitivity would not be compromised, and the impacts to the established visual character and quality from this view a result of project implementation would be less than significant.

For Viewpoint D (Figure 3.1-7), the existing visual sensitivity is considered moderate due to moderate visual quality and moderate viewer exposure. The proposed access road would extend along the alignment of an existing access road and would be widened and paved. Additionally, a retaining wall would be added to stabilize the hillside behind the access road. As shown in the simulation in Figure 3.1-7, the hillsides that have open space value and that contribute to the area's visual character and quality would be slightly altered by installation of a paved access road and a retaining wall. As a result, the impact would be considered a potentially significant impact to the existing visual character or quality of the project site and its surroundings. To ensure that all aboveground non-natural project features such as the retaining wall would not impact the visual character or quality of the project site or surrounding area, Mitigation Measure AES-1 would require design of the retaining wall to have color palettes that blend in with the surrounding character of the project site. As a result, the proposed project would not significantly modify the visual quality of the surrounding area. Direct unobstructed views of the proposed access road would be available for brief periods of time (i.e., seconds to several minutes) when approximately 19,000 daily motorist users are passing the site. Given the lack of temporal frequency of public viewers and the fact that the retaining wall that would be designed to blend in with the surrounding natural hillsides, the existing visual sensitivity of the view from this location would not be significantly compromised. As a result, impacts to the established visual character and quality from this view as a result of project implementation would be less than significant with mitigation.

Mitigation Measures

Implement Mitigation Measure AES-1

Significance Determination

Less than Significant Impact with Mitigation

Light and Glare

Impact 3.1-4: The proposed project could create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

Existing light sources in the vicinity of the project area include existing uses of the adjacent Crean Lutheran High School Athletic Complex and residential uses to the south across Portola Parkway. There are no existing light sources on the project site. Project construction would take place from 7:00 A.M. to 4:00 P.M. As such, proposed project construction would not create a new source of light or glare and impacts would be less than significant.

Once operational, aboveground project components that could require lighting in the project area include the proposed treatment facilities and new access road. The proposed treatment facilities and access road would require lighting that could affect nighttime views. **Mitigation Measure AES-2** would require all new permanent exterior lighting to be shielded or directed downward to minimize light cast on neighborhood residences directly adjacent to the project site. As a result, impacts to light during operation would be less than significant with mitigation.

When reservoir levels are at their peak in the winter and spring months, the reservoir could create new sources of glare from an increased water surface area. However, this potential increase would be marginal, not in effect in the summer months when daytime hours are at their highest, and only noticeable to motorists travelling on SR-133 for brief periods of time (several seconds). As a result, impacts to daytime glare would be less than significant.

Mitigation Measures

AES-2: All new permanent exterior lighting associated with the proposed project shall be shielded and directed downward to avoid light spill onto neighboring parcels and visibility from surrounding public vantage points.

Significance Determination

Less than Significant Impact with Mitigation

Cumulative Impacts

Impact 3.1-5: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative short-term and long-term impacts to aesthetics.

The geographical extent of cumulative impacts related to aesthetic includes viewsheds in which the project is visible as outlined in Table 3-1 of Chapter 3 of this Draft EIR. There are three community improvement projects, Project 3 (Gateway Community Park), Project 9 (Truck Route Roadway Rehabilitation Project), and Project 10 (18-19 Athletic Court Resurfacing) that are located in close proximity to the proposed project and could contribute to cumulatively considerable aesthetic impacts.

Construction and Operation

Significant cumulative impacts related to aesthetics could occur if the project, in conjunction with Cumulative Projects 3, 9 and 10, could block significant scenic vistas, create cumulative light and glare, or substantially degrade the visual quality of an area. Projects 3, 9, and 10 are projects that either involve resurfacing of roadways or recreational facilities, or creation of recreational facilities. While these projects would involve construction equipment similar to the proposed project, the machinery would not be visible above the existing vegetation lines within the City of Irvine and would therefore not combine together with the project to create a significant impact to nearby scenic vistas. Once constructed, these projects would not involve aboveground facilities and therefore would not contribute to cumulative visual impacts. There are no other projects

within the cumulative scenario in close proximity to the project site that would block scenic vistas, resources, or negatively impact visual character or quality. As discussed above, the proposed project would result in the introduction of project features that could contrast with designated scenic resources in the City of Irvine and the County of Orange. The project would be required to implement Mitigation Measures AES-1 and AES-2, which would require permanent facilities to blend in with the surrounding color palette. During construction, less than sufficient impacts due to equipment would occur. Implementation of mitigation measures would reduce the project's incremental contribution to cumulative impacts in the area, and impacts would be less than significant with mitigation. Therefore, the project would not combine together with the projects in the cumulative scenario to be cumulatively considerable, and impacts would be less than significant with mitigation.

Mitigation Measures

Implement Mitigation Measures AES-1 and AES-2

Significance Determination

Less than Significant Impact with Mitigation

3.2 Air Quality

This section evaluates the potential for impacts related to air emissions generated by construction and operation of the proposed project. This section includes: a description of the existing air quality conditions regionally and in and around the proposed project site; a summary of applicable regulations related to air quality; and an evaluation of the potential impacts of the proposed project related to air quality in and around the project site, including cumulative impacts. Details regarding the air quality assumptions and calculations are provided in the Air Quality and Greenhouse Gas Technical Report prepared by ESA for this project and included as **Appendix B** of this Draft EIR.

3.2.1 Environmental Setting

Air Quality Fundamentals

Criteria Pollutants

Elevated concentrations of certain air pollutants in the atmosphere have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants. In the United States, such pollutants have been identified and are regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. The following pollutants are regulated by the United States Environmental Protection Agency (USEPA) and are subject to emissions control requirements adopted by federal, State and local regulatory agencies. These pollutants are referred to as “criteria air pollutants” as a result of the specific standards, or criteria, which have been adopted pertaining to them. The USEPA established the National Ambient Air Quality Standards (NAAQS) to “provide public health protection, including protecting the health of ‘sensitive’ populations such as asthmatics, children, and the elderly,” (USEPA 2016a) allowing “an adequate margin of safety” (42 USC Section 7409; CAA Section 109). California Ambient Air Quality Standards (CAAQS) were “established to protect the health of the most sensitive groups in our communities” and “defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment” (CARB 2020a). NAAQS and CAAQS for each of the monitored pollutants and their effects on health are discussed below.

Ozone: Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds (VOCs) and nitrogen oxides (NO_x) in the presence of sunlight under certain meteorological conditions, such as high temperature and stagnation episodes. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable.

According to the USEPA, ozone can cause the muscles in the airways to constrict potentially leading to wheezing and shortness of breath (USEPA 2019a). Ozone can make it more difficult to breathe deeply and vigorously; cause shortness of breath and pain when taking a deep breath; cause coughing and sore or scratchy throat; inflame and damage the airways; aggravate lung diseases such as asthma, emphysema and chronic bronchitis; increase the frequency of asthma attacks; make the

lungs more susceptible to infection; continue to damage the lungs even when the symptoms have disappeared; and cause chronic obstructive pulmonary disease (USEPA 2019a).

Long-term exposure to ozone is linked to aggravation of asthma and is likely to be one of many causes of asthma development. Long-term exposures to higher concentrations of ozone may also be linked to permanent lung damage, such as abnormal lung development in children (USEPA 2019a). According to the California Air Resources Board (CARB), inhalation of ozone causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms, and exposure to ozone can reduce the volume of air that the lungs breathe in and cause shortness of breath (CARB 2020b).

The USEPA states that people most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers (USEPA 2019a). Children are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure (USEPA 2019a). According to CARB, studies show that children are no more or less likely to suffer harmful effects than adults; however, children and teens may be more susceptible to ozone and other pollutants because they spend nearly twice as much time outdoors and engaged in vigorous activities compared to adults (CARB 2020b). Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults and are less likely than adults to notice their own symptoms and avoid harmful exposures (CARB 2020b). Further research may be able to better distinguish between health effects in children and adults (CARB 2020b).

Volatile Organic Compounds: VOCs are organic chemical compounds of carbon and are not “criteria” air pollutants themselves; however, in combination with NO_x they form ozone, and are regulated to prevent the formation of ozone (USEPA 2017a). According to CARB, some VOCs are highly reactive and play a critical role in the formation of ozone. Potential health effects of ozone exposure are discussed above. Other VOCs can result in adverse health effects from direct exposure and are classified by the State of California as toxic air contaminants or Hazardous Air Pollutants (HAPs) by the USEPA (CARB 2020c; USEPA 2018a). The health effects of VOCs, as Toxic Air Contaminants/Hazardous Air Pollutants (TACs/HAPs), are discussed more thoroughly below.

VOCs are typically formed from combustion of fuels and/or released through evaporation of organic liquids. Fuel combustion can occur in internal combustion sources, such as motor vehicle usage, landscape and other portable equipment, and stationary generators, or external combustion, such as for water and space heating. Evaporation sources include fueling operations, consumer products (e.g., cleaning solutions), and architectural coatings (USEPA 2017b).

Nitrogen Dioxide (NO₂) and Nitrogen Oxide: NO_x is a term that refers to a group of compounds containing nitrogen and oxygen. As mentioned above, NO_x combines with VOCs to form ozone. The health effects associated with the formation of ozone were discussed above under Ozone. The primary compounds of air quality concern include NO₂ and nitric oxide (NO). Ambient air quality standards have been promulgated for NO₂, which is a reddish-brown, reactive gas (CARB 2020d).

The principal form of NO_x produced by combustion is NO, but NO reacts quickly in the atmosphere to form NO₂, creating the mixture of NO and NO₂ referred to as NO_x. Major sources of NO_x include emissions from cars, trucks and buses, power plants, and off-road equipment. The terms NO_x and NO₂ are sometimes used interchangeably. However, the term NO_x is typically used when discussing emissions, usually from combustion-related activities, and the term NO₂ is typically used when discussing ambient air quality standards. Where NO_x emissions are discussed in the context of the thresholds of significance or impact analyses, the discussions are based on the conservative assumption that all NO_x emissions would oxidize in the atmosphere to form NO₂.

According to the USEPA, short-term exposures to NO₂ can potentially aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms while longer exposures to elevated concentrations of NO₂ may contribute to the development of asthma and potentially increase susceptibility to respiratory infections (USEPA 2016b). According to CARB, controlled human exposure studies that show that NO₂ exposure can intensify responses to allergens in allergic asthmatics (CARB 2020d).

In addition, a number of epidemiological studies have demonstrated associations between NO₂ exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses (CARB 2020d). Infants and children are particularly at risk from exposure to NO₂ because they have disproportionately higher exposure to NO₂ than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration while in adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease (CARB 2020d).

CARB states that much of the information on distribution in air, human exposure and dose, and health effects is specifically for NO₂ and there is only limited information for NO and NO_x, as well as large uncertainty in relating health effects to NO or NO_x exposure (CARB 2020d).

Carbon Monoxide (CO): CO is primarily emitted from combustion processes and motor vehicles due to the incomplete combustion of fuel, such as natural gas, gasoline, or wood, with the majority of outdoor CO emissions from mobile sources (CARB 2020e).

According to the USEPA, breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain and at very high levels, which are possible indoors or in other enclosed environments, CO can cause dizziness, confusion, unconsciousness and death (USEPA 2016c). Very high levels of CO are not likely to occur outdoors; however, when CO levels are elevated outdoors, they can be of particular concern for people with some types of heart disease since these people already have a reduced ability for getting oxygenated blood to their hearts and are especially vulnerable to the effects of CO when exercising or under increased stress (USEPA 2016c). In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart accompanied by chest pain also known as angina (USEPA 2016c).

According to CARB, the most common effects of CO exposure are fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain (CARB 2020e). For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress; inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance (CARB 2020e). Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO (CARB 2020e).

Sulfur Dioxide (SO₂): According to the USEPA, the largest source of SO₂ emissions in the atmosphere is the burning of fossil fuels by power plants and other industrial facilities while smaller sources of SO₂ emission include industrial processes such as extracting metal from ore; natural sources such as volcanoes; and locomotives, ships and other vehicle and heavy equipment that burn fuel with a high sulfur content (USEPA 2019b). In 2006, California phased-in the ultra-low-sulfur diesel regulation limiting vehicle diesel fuel to a sulfur content not exceeding 15 parts per million, down from the previous requirement of 500 parts per million, substantially reducing emissions of sulfur from diesel combustion (CARB 2004).

According to the USEPA, short-term exposures to SO₂ can harm the human respiratory system and make breathing difficult (USEPA 2019b). According to CARB, health effects at levels near the State one-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath and chest tightness, especially during exercise or physical activity and exposure at elevated levels of SO₂ (above 1 parts per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality (CARB 2020f). Children, the elderly, and those with asthma, cardiovascular disease, or chronic lung disease (such as bronchitis or emphysema) are most likely to experience the adverse effects of SO₂ (CARB 2020f; USEPA 2019b).

Particulate Matter (PM₁₀ and PM_{2.5}): Particulate matter air pollution is a mixture of solid particles and liquid droplets found in the air (USEPA 2018b). Some particles, such as dust, dirt, soot, or smoke, are large or dark enough to be seen with the naked eye while other particles are so small they can only be detected using an electron microscope (USEPA 2018b). Particles are defined by their diameter for air quality regulatory purposes: inhalable particles with diameters that are generally 10 micrometers and smaller (PM₁₀); inhalable particles with diameters that are 2.5 micrometers or less (PM_{2.5}) (USEPA 2018b). Thus, PM_{2.5} comprises a portion or a subset of PM₁₀.

Sources of PM₁₀ emissions include dust from construction sites, landfills and agriculture, wildfires and brush/waste burning, industrial sources, and wind-blown dust from open lands (CARB 2020g). Sources of PM_{2.5} emissions include combustion of gasoline, oil, diesel fuel, or wood (CARB 2020g). PM₁₀ and PM_{2.5} may be either directly emitted from sources (primary particles) or formed in the atmosphere through chemical reactions of gases (secondary particles) such as SO₂, NO_x, and certain organic compounds (CARB 2020g).

According to CARB, both PM10 and PM2.5 can be inhaled, with some depositing throughout the airways; PM10 is more likely to deposit on the surfaces of the larger airways of the upper region of the lung, while PM2.5 is more likely to travel into and deposit on the surface of the deeper parts of the lung, which can induce tissue damage, and lung inflammation (CARB 2020g). Short-term (up to 24-hours duration) exposure to PM10 has been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits (CARB 2020g). The effects of long-term (months or years) exposure to PM10 are less clear, although studies suggest a link between long-term PM10 exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer (CARB 2020g).

Short-term exposure to PM2.5 has been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. Long-term exposure to PM2.5 has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children (CARB 2020g). According to CARB, populations most likely to experience adverse health effects with exposure to PM10 and PM2.5 include older adults with chronic heart or lung disease, children, and asthmatics. Children and infants are more susceptible to harm from inhaling pollutants such as PM10 and PM2.5 compared to healthy adults because they inhale more air per pound of body weight than do adults, spend more time outdoors, and have developing immune systems (CARB 2020g).

Lead (Pb): Major sources of lead emissions include ore and metals processing, piston-engine aircraft operating on leaded aviation fuel, waste incinerators, utilities, and lead-acid battery manufacturers (USEPA 2017c). In the past, leaded gasoline was a major source of lead emissions; however, the removal of lead from gasoline has resulted in a decrease of lead in the air by 98 percent between 1980 and 2014 (USEPA 2017c).

Lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems and the cardiovascular system, and affects the oxygen carrying capacity of blood (USEPA 2017c). The lead effects most commonly encountered in current populations are neurological effects in children, such as behavioral problems and reduced intelligence, anemia, and liver or kidney damage (CARB 2020h). Excessive lead exposure in adults can cause reproductive problems in men and women, high blood pressure, kidney disease, digestive problems, nerve disorders, memory and concentration problems, and muscle and joint pain (CARB 2020h).¹

California Only Criteria Pollutants

The California Ambient Air Quality Standards regulate the same criteria pollutants as the NAAQS but in addition, regulate State-identified criteria pollutants, including sulfates, hydrogen

¹ While the SCAQMD CEQA Air Quality Handbook contains a thresholds of significance of significance for lead, project construction and operation would not include sources of lead emissions and would not exceed the thresholds of significance for lead. Unleaded fuel and unleaded paints have virtually eliminated lead emissions from commercial land use projects such as the Project. As a result, lead emissions are not further evaluated.

sulfide, visibility-reducing particles, and vinyl chloride (CARB 202a). With respect to the State-identified criteria pollutants (i.e., sulfates, hydrogen sulfide, visibility reducing particles, and vinyl chloride), the Project would either not emit them (i.e., hydrogen sulfide and vinyl chloride), or they would be accounted for as part of the pollutants estimated in this analysis (i.e., sulfates and visibility reducing particles). For example, visibility reducing particles are associated with particulate matter emissions and sulfates are associated with SO₂ emissions. Both particulate matter and SO₂ are included in the emissions estimates for the project. A description of the health effects of the State-identified criteria air pollutants is provided below.

Sulfates (SO₄²⁻): Sulfates in the environment occur as a result of SO₂ (sulfur dioxide) being converted to SO₄²⁻ compounds in the atmosphere where sulfur is first oxidized to SO₂ during the combustion process of sulfur containing, petroleum-derived fuels (e.g., gasoline and diesel fuel) (CARB 2020i). Exposure to SO₄²⁻, which are part of PM_{2.5}, results in health effects similar to those from exposure to PM_{2.5} including reduced lung function, aggravated asthmatic symptoms, and increased risk of emergency department visits, hospitalizations, and death in people who have chronic heart or lung diseases (CARB 2020i). Population groups with higher risks of experiencing adverse health effects with exposure to SO₄²⁻ include children, asthmatics, and older adults who have chronic heart or lung diseases (CARB 2020i).

Hydrogen Sulfide (H₂S): H₂S is a colorless gas with a strong odor of rotten eggs. The most common sources of H₂S emissions are oil and natural gas extraction and processing, and natural emissions from geothermal fields. Industrial sources of H₂S include petrochemical plants and Kraft paper mills. H₂S is also formed during bacterial decomposition of human and animal wastes, and is present in emissions from sewage treatment facilities and landfills (CARB 2020j). Exposure to H₂S can induce tearing of the eyes and symptoms related to overstimulation of the sense of smell, including headache, nausea, or vomiting; additional health effects of eye irritation have only been reported with exposures greater than 50 ppm, which is considerably higher than the odor threshold (CARB 2020j). H₂S is regulated as a nuisance based on its odor detection level; if the standard were based on adverse health effects, it would be set at a much higher level (CARB 2020j). According to CARB, there are insufficient data available to determine whether or not some groups are at greater risk than others (CARB 2020j).

Visibility-Reducing Particles: Visibility-reducing particles are any particles in the atmosphere that obstruct the range of visibility by creating haze (CARB 2020k). These particles vary in shape, size and chemical composition, and come from a variety of natural and manmade sources including windblown metals, soil, dust, salt, and soot. Other haze-causing particles are formed in the air from gaseous pollutant (e.g., sulfates, nitrates, organic carbon particles) which are the major constituents of fine PM, such as PM_{2.5} and PM₁₀, and are caused from the combustion of fuel. CARB's standard for visibility reducing particles is not based on health effects, but rather on welfare effects, such as reduced visibility and damage to materials, plants, forests, and ecosystems. The health impacts associated with PM_{2.5} and PM₁₀ are discussed above under Particulate Matter.

Vinyl Chloride: Vinyl chloride is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products and are generally emitted from

industrial processes and other major sources of vinyl chloride have been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents (CARB 2020l). Short-term health effects of exposure to high levels of vinyl chloride in the air include central nervous system effects, such as dizziness, drowsiness, and headaches while long-term exposure to vinyl chloride through inhalation and oral exposure causes liver damage and has been shown to increase the risk of angiosarcoma, a rare form of liver cancer in humans (CARB 2020l). Most health data on vinyl chloride relate to carcinogenicity; thus, the people most at risk are those who have long-term exposure to elevated levels, which is more likely to occur in occupational or industrial settings; however, control methodologies applied to industrial facilities generally prevent emissions to the ambient air (CARB 2020l).

Air Toxics

Toxic Air Contaminants (TACs): TACs, or hazardous air pollutants (HAPs) as defined by the USEPA, are defined as those contaminants that are known or suspected to cause serious health problems, but do not have a corresponding ambient air quality standard (USEPA 2017d). For consistency within this document they will be referred to as TACs. TACs are also defined as an air pollutant that may increase a person's risk of developing cancer and/or other serious health effects. TACs are emitted by a variety of industrial processes such as petroleum refining, electric utility and chrome plating operations, commercial operations such as gasoline stations and dry cleaners, and motor vehicle exhaust. TACs may exist as PM10 and PM2.5 or as vapors (gases). TACs include metals, other particles, gases absorbed by particles, and certain vapors from fuels and other sources. The emission of a TAC does not automatically create a health hazard. Other factors, such as the amount of the TAC, its toxicity, how it is released into the air, the weather, and the terrain, all influence whether the emission could be hazardous to human health. Emissions of TACs into the air can be damaging to human health and to the environment. Human exposure to TACs at sufficient concentrations and durations can result in cancer, poisoning, and rapid onset of sickness, such as nausea or difficulty in breathing. Other less measurable effects include immunological, neurological, reproductive, developmental, and respiratory problems. TACs deposited onto soil or into lakes and streams affect ecological systems and eventually human health through consumption of contaminated food. The carcinogenic potential of TACs is a particular public health concern because many scientists currently believe that there is no "safe" level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer (CARB 2020m).

The public's exposure to TACs is a significant public health issue in California. The Air Toxics "Hotspots" Information and Assessment Act is a State law requiring facilities to report emissions of TACs to air districts (CARB 2020m). The program is designated to quantify the amounts of potentially HAPs released, the location of the release, the concentrations to which the public is exposed, and the resulting health risks. The State Air Toxics Program (AB 2588) identified over 200 TACs, including the 188 TACs identified in the Clean Air Act (CAA) (CARB 2020m).

The USEPA has assessed this expansive list and identified 21 TACs as Mobile Source Air Toxics (MSATs) (USEPA 2004). MSATs are compounds emitted from highway vehicles and non-road equipment. Some toxic compounds are present in fuel and are emitted to the air when the fuel evaporates or passes through the engine unburned. Other toxics are emitted from the incomplete

combustion of fuels or as secondary combustion products. Metal air toxics also result from engine wear or from impurities in oil or gasoline. USEPA also extracted a subset of these 21 MSAT compounds that it now labels as the nine priority MSATs: 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (DPM)/diesel exhaust organic gases, ethylbenzene, naphthalene, and polycyclic organic matter (POM). While these nine MSATs are considered the priority transportation toxics, USEPA stresses that the lists are subject to change and may be adjusted in future rules (USDOT 2016).

Diesel Exhaust: According to the California Almanac of Emissions and Air Quality, the majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from the exhaust of diesel-fueled engines, i.e., DPM (CARB 2020n). DPM differs from other TACs in that it is not a single substance, but rather a complex mixture of hundreds of substances.

Diesel exhaust is composed of two phases, gas and particle, and both phases contribute to the health risk. The gas phase is composed of many of the urban HAPs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde and polycyclic aromatic hydrocarbons. The particle phase is also composed of many different types of particles by size or composition. Fine and ultra-fine diesel particulates are of the greatest health concern and may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines; the on-road diesel engines of trucks, buses and cars and the off-road diesel engines that include locomotives, marine vessels and heavy-duty equipment. Although DPM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present.

The most common exposure to DPM is breathing air that contains diesel exhaust. The fine and ultra-fine particles are respirable (similar to PM_{2.5}), which means that they can avoid many of the human respiratory system defense mechanisms and enter deeply into the lung. Exposure to DPM comes from both on-road and off-road engine exhaust that is either directly emitted from the engines or lingering in the atmosphere.

Diesel exhaust causes health effects from long-term chronic exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Individuals also react differently to different levels of exposure. There is limited information on exposure to only DPM, but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes chronic health effects as well as having cancer-causing potential.

Because it is part of PM_{2.5}, DPM also contributes to the same non-cancer health effects as PM_{2.5} exposures. These effects include premature death, hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma, increased respiratory symptoms, and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies. Those most vulnerable to non-cancer health

effects are children whose lungs are still developing and the elderly who often have chronic health problems (CARB 2020n).

Regional Air Quality

The Air Basin's meteorological conditions, in combination with regional topography, are conducive to the formation and retention of ozone. Pollutant concentrations in the Air Basin vary with location, season, and time of day. Concentrations of ozone, for example, tend to be lower along the coast, higher in the near inland valleys, and lower in the far inland areas of the Air Basin and adjacent desert (SCAQMD 2017). The worst air pollution conditions throughout the Air Basin typically occur from June through September.

California Health and Safety Code section 39607(e) requires CARB to establish and periodically review area designation criteria. As shown in **Table 3.2-1**, the Air Basin is designated under federal or State ambient air quality standards as nonattainment for ozone, PM10, and fine particulate matter PM2.5. It is noteworthy to mention that air quality in the Air Basin has improved substantially over the years, primarily due to the impacts of air quality control programs at the federal, State and local levels. The ozone and PM levels have fallen significantly compared to the worst years and are expected to continue to trend downward in the future despite increases in the economy and population in the Air Basin.

TABLE 3.2-1
SOUTH COAST AIR BASIN ATTAINMENT STATUS (ORANGE COUNTY)

Pollutant	National Standards (NAAQS)	California Standards (CAAQS)
Ozone (1-hour standard)	N/A ^a	Non-attainment – Extreme
Ozone (8-hour standard)	Non-attainment – Extreme	Non-attainment
CO	Attainment – Maintenance	Attainment
NO ₂	Attainment – Maintenance	Attainment
SO ₂	Attainment	Attainment
PM10	Attainment – Maintenance	Non-attainment
PM2.5	Non-attainment – Serious	Non-attainment
Lead (Pb)	Attainment (Partial) ^b	Attainment
Visibility Reducing Particles	N/A	Unclassified
Sulfates	N/A	Attainment
Hydrogen Sulfide	N/A	Unclassified
Vinyl Chloride ^c	N/A	N/A

NOTES:

N/A = not applicable

^a The NAAQS for 1-hour ozone was revoked on June 15, 2005, for all areas except Early Action Compact areas.

^b Partial Non-attainment designation – Los Angeles County portion of the Air Basin only for near-source monitors. Orange County is designated as attainment.

^c In 1990, the California Air Resources Board identified vinyl chloride as a toxic air contaminant and determined that it does not have an identifiable threshold. Therefore, the California Air Resources Board does not monitor or make status designations for this pollutant.

SOURCE: USEPA 2020; CARB 2020p.

With respect to the State-identified criteria air pollutants (sulfates, hydrogen sulfide, visibility reducing particles, and vinyl chloride) present in Table 3.2.1, the proposed project would either not use these pollutants in the day to day operations or during construction and therefore would not have emissions of those pollutants (hydrogen sulfide, vinyl chloride, and lead), or such emissions would be accounted for as part of the pollutants estimated in this analysis (visibility reducing particles are associated with particulate matter emissions, and sulfates are associated with SO₂). Vinyl chloride is used in the process of making PVC plastic and vinyl products and is primarily emitted from industrial processes (CARB 2020l). Vinyl chloride would not be emitted directly during operations or during construction; therefore, there would be no project emissions of vinyl chloride. In addition, CARB determined there is not sufficient scientific evidence available to support the identification of a threshold exposure level for vinyl chloride, therefore, CARB does not monitor or make status designations for this pollutant (CARB 2020o).

As detailed in the AQMP, the major sources of air pollution in the Air Basin are divided into four major source classifications: point and area stationary sources, and on-road and off-road mobile sources. Point and area sources are the two major subcategories of stationary sources (SCAQMD 2017). Point sources are permitted facilities that contain one or more emission sources at an identified location (e.g., power plants, refineries, emergency generator exhaust stacks). Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products, restaurant charbroilers and permitted sources such as large boilers), which are distributed across the region. Mobile sources consist of two main subcategories: On-road sources (such as cars and trucks) and off-road sources (such as heavy construction equipment). The main source associated with the proposed project is mobile source use during construction activities.

Local Air Quality

Existing Ambient Air Quality

SCAQMD maintains monitoring stations within district boundaries that monitor air quality and compliance with associated ambient standards. The project area is located in the Inland County of Orange general forecast area and specifically within the Saddleback Valley source receptor area. Currently, the nearest monitoring station to the project area is the Mission Viejo Station (26081 Via Pera Mission Viejo, CA 92691 – SCAQMD Station Number 3812). This station monitors ambient concentrations of CO, ozone, PM10 and PM2.5. The nearest monitoring station that monitors for NO₂ is the Anaheim station (SRA 17, Central County of Orange Station Number 3176). There are no stations within the Inland County of Orange general forecast area that monitor for SO₂. Historical data of ambient ozone, NO₂, CO, PM10 and PM2.5 concentrations from these monitoring stations for the most recent three years of available data (2017–2019) are shown in **Table 3.2-2**.

**TABLE 3.2-2
AMBIENT AIR QUALITY IN THE PROJECT VICINITY**

Pollutant/Standard	2017	2018	2019
Ozone, (1-hour) – Mission Viejo			
Maximum Concentration (ppm)	0.103	0.121	0.106
Days > CAAQS (0.09 ppm)	3	2	3
Ozone, (8-hour) – Mission Viejo			
Maximum Concentration (ppm)	0.083	0.088	0.087
4th High 8-hour Concentration (ppm)	0.082	0.074	0.082
Days > CAAQS (0.070 ppm)	25	9	11
Days > NAAQS (0.070 ppm)	25	9	11
Nitrogen Dioxide, NO₂ (1-hour) - Anaheim			
Maximum Concentration (ppm)	0.081	0.066	0.059
Days > CAAQS (0.18 ppm)	0	0	0
98th Percentile Concentration (ppm)	0.064	0.055	0.049
Days > NAAQS (0.100 ppm)	0	0	0
Nitrogen Dioxide, NO₂ (Annual)			
Annual Arithmetic Mean (0.030 ppm)	0.014	0.014	0.013
Carbon Monoxide, CO (1-hour) – Mission Viejo			
Maximum Concentration (ppm)	1.4	1.2	1.0
Days > CAAQS (20 ppm)	0	0	0
Days > NAAQS (35 ppm)	0	0	0
Carbon Monoxide, CO (8-hour)

Samples > NAAQS (35 µg/m ³)	0	0	0
Fine Particulate Matter, PM_{2.5} (Annual)			
Annual Arithmetic Mean (12 µg/m ³)	8.11	8.31	7.11

NOTE:

^a ppm = parts per million; µg/m³ = micrograms per cubic meter

SOURCE: SCAQMD 2020b.

Existing Area Health Risk

Between July 2012 and June 2013, the SCAQMD conducted the Multiple Air Toxics Exposure Study IV (MATES IV), which focuses on the carcinogenic risk from exposure to air toxics. The MATES IV Final Report was issued in May 2015. The study, based on actual monitored data throughout the Air Basin, consisted of several elements, which included a monitoring program, an updated emissions inventory of TACs, and a modeling effort to characterize carcinogenic risk across the Air Basin from exposure to TACs. As part of the MATES IV study, the SCAQMD has prepared a series of maps that show regional trends in estimated outdoor inhalation cancer risk from toxic emissions, as part of an ongoing effort to provide insight into relative risks. The maps represent the estimated number of potential cancers per million people associated with a lifetime of breathing air toxics (24 hours per day outdoors for 70 years). The background potential cancer risk per million people in the proposed project area using the updated Office of Environmental Health Hazard Assessment (OEHHA) methodology is estimated at 587 in one million (compared to an overall Air Basin-wide risk of 1,023 in one million for the average of 10 fixed monitoring sites) (SCAQMD 2015b). Generally, the risk from air toxics is lower near the coastline and increases inland, with higher risks concentrated near large diesel sources (e.g., freeways, airports, and ports).

Existing Site Emissions

The existing Syphon Reservoir activities result in negligible mobile source emissions from maintenance trips and current recreational activities. The number of maintenance and recreational trips are nominal and are not anticipated to change with the improvements to the reservoir. Therefore, existing emissions were not modeled, and the proposed project's air quality emissions would all be considered new emissions.

Sensitive Receptors and Locations

Certain population groups, such as children, elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to the potential effects of air pollution than others. As a result, certain land uses that are occupied by these population groups, such as residences, hospitals and schools, are considered to be air quality-sensitive land uses. The proposed project site is bordered to the north and west by predominantly open space, agricultural (including a residence), and commercial/industrial uses. The proposed project site is bordered to the south by Portola Parkway with residential and school land uses directly south. The proposed project is bordered to the east by SR-133 followed by residential land uses. The nearest land uses are the residential neighborhoods approximately 180 feet southwest of the intersection of Portola Parkway and Sand Canyon Ave, which is the proposed project site entrance. The Crean Lutheran High School is located approximately 140 feet southeast of the project site at the intersection of Portola Parkway and Sand Canyon Road.² Residences to the east of SR-133 are approximately 1,000 feet from onsite construction activities. Sensitive receptor locations are shown **Figure 3.2-1**.

² While the Crean Lutheran High School Athletic Complex is located adjacent to the project site area, the athletic complex itself is not considered a sensitive receptor as it would only be occupied for a limited amount of time, similar to that of a local gym, park, or other commercial establishment. The majority of student time would be spent at the main school site and therefore that would be the closest school associated sensitive receptor.

SOURCE: ESA, 2019; ESRI, 2019.

Syphon Reservoir Improvement Project

Figure 3.2-1
Sensitive Receptor Locations Nearest to the Project Site

All other air quality-sensitive uses are located at greater distances from the proposed project site and would experience lower air pollutant impacts from potential sources of pollutants from the proposed project site due to atmospheric dispersion effects.

3.2.2 Regulatory Framework

Federal

This section provides a summary of pertinent federal, State, and local statutes, regulations, plans, and policies that have been adopted that address air quality.

Clean Air Act

The 1963 CAA was the first federal legislation regarding air pollution control and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990. At the federal level, USEPA is responsible for implementation of certain portions of the CAA including mobile source requirements.

The CAA establishes federal air quality standards and specifies future dates for achieving compliance. The CAA also mandates that the State submit and implement a State Implementation Plan (SIP) for areas not meeting these standards. SIPs must include pollution control measures that demonstrate how the NAAQS will be met. The 1990 amendments to the CAA identify specific emission reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress toward attainment and incorporation of additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA that are most applicable to the proposed project include Title I (Nonattainment Provisions).

Title I requirements are implemented for the purpose of attaining NAAQS for the following criteria air pollutants: ozone; NO₂; CO; SO₂; PM₁₀; and lead. The NAAQS were amended in July 1997 to include an 8-hour standard for ozone and to adopt a NAAQS for PM_{2.5}. The NAAQS were also amended in September 2006 to include an established methodology for calculating PM_{2.5} as well as revoking the annual PM₁₀ threshold. **Table 3.2-3** shows the NAAQS currently in effect for each criteria air pollutant.

**TABLE 3.2-3
AMBIENT AIR QUALITY STANDARDS**

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
Ozone ^h	1 Hour	0.09 ppm (180 µg/m ³)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m ³)		0.070 ppm (137 µg/m ³)		
NO ₂ ⁱ	1 Hour	0.18 ppm (339 µg/m ³)	Gas Phase Chemi- luminescence	100 ppb (188 µg/m ³)	None	Gas Phase Chemi- luminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m ³)		53 ppb (100 µg/m ³)	Same as Primary Standard	
CO	1 Hour	20 ppm (23 mg/m ³)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m ³)	None	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10mg/m ³)		9 ppm (10 mg/m ³)		
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m ³)		—		
SO ₂ ^j	1 Hour	0.25 ppm (655 µg/m ³)	Ultraviolet Fluorescence	75 ppb (196 µg/m ³)	—	Ultraviolet Fluorescence; Spectro- photometry (Pararosaniline Method) ^g
	3 Hour	—		—	0.5 ppm (1300 µg/m ³)	
	24 Hour	0.04 ppm (105 µg/m ³)		0.14 ppm (for certain areas) ^j	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas) ^j	—	
PM10 ^k	24 Hour	50 µg/m ³	Gravimetric or Beta Attenuation	150 µg/m ³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m ³		—		
PM2.5 ^k	24 Hour	No Separate State Standard	Gravimetric or Beta Attenuation	35 µg/m ³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m ³		12.0 µg/m ^{3k}		

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
Lead ^{l,m}	30 Day Average	1.5 µg/m ³	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 µg/m ³ (for certain areas) ^m	Same as Primary Standard	
	Rolling 3-Month Average ^m	--		0.15 µg/m ³		
Visibility-Reducing Particles ⁿ	8 Hour	Extinction coefficient of 0.23 per kilometer—visibility of 10 miles or more due to particles when relative humidity is less than 70 percent.		No Federal Standards		
Sulfates (SO ₄)	24 Hour	25 µg/m ³	Ion Chromatography	No Federal Standards		
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m ³)	Ultraviolet Fluorescence	No Federal Standards		
Vinyl Chloride ^l	24 Hour	0.01 ppm (26 µg/m ³)	Gas Chromatography	No Federal Standards		

NOTES:

- ^a California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
- ^b National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 micrograms/per cubic meter (µg/m³) is equal to or less than one. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
- ^c Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
- ^d Any equivalent procedure which can be shown to the satisfaction of the California Air Resources Board to give equivalent results at or near the level of the air quality standard may be used.
- ^e National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
- ^f National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
- ^g Reference method as described by the U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.
- ^h On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
- ⁱ To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb.
- ^j On June 2, 2010, a new 1-hour SO₂ standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO₂ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated non-attainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
- ^k On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 µg/m³ to 12.0 µg/m³.
- ^l CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
- ^m The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated non-attainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
- ⁿ In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

SOURCE: CARB 2016; CARB 2020a–l

State

California Clean Air Act

The California Clean Air Act, signed into law in 1988, requires all areas of the State to achieve and maintain the CAAQS by the earliest practical date. The CAAQS are established to protect the health of the most sensitive groups and apply to the same criteria air pollutants as the federal CAA and also includes State-identified criteria air pollutants, which are sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride (CARB 2020a). Table 3.2-3, provided above, shows the CAAQS currently in effect for each of the federally identified criteria air pollutants as well as state recognized pollutants, such as sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride.

On-Road and Off-Road Vehicle and Equipment Rules

Heavy-Duty Vehicles and Equipment

In 2004, CARB adopted an Airborne Toxic Control Measure to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time.

In 2008 CARB approved the Truck and Bus Regulation to reduce NO_x, PM₁₀, and PM_{2.5} emissions from existing diesel vehicles operating in California. The requirements were amended in December 2010 and apply to nearly all diesel fueled trucks and busses with a gross vehicle weight rating greater than 14,000 pounds. For the largest trucks in the fleet (i.e., those with a gross vehicle weight rating greater than 26,000 pounds), there are two methods to comply with the requirements. The first method is for the fleet owner to retrofit or replace engines, starting with the oldest engine model year, to meet 2010 engine standards, or better. This is phased over eight years, starting in 2015 and would be fully implemented by 2023, meaning that all trucks operating in the State subject to this option would need to meet or exceed the 2010 engine emission standards for NO_x and PM by 2023. The second option, if chosen, requires fleet owners, starting in 2012, to retrofit a portion of their fleet with diesel particulate filters achieving at least 85 percent removal efficiency, so that by January 1, 2016, their entire fleet is equipped with diesel particulate filters. However, diesel particulate filters do not typically lower NO_x emissions. Thus, fleet owners choosing the second method must still comply with the 2010 engine emission standards for their trucks and busses by 2020. Beginning January 1, 2020, this requirement is enforced by the California Department of Motor Vehicles (DMV). Senate Bill 1 (SB 1), the Road Repair and Accountability Act of 2017, was signed into law on April 28, 2017. SB 1 authorizes the DMV to check that vehicles are compliant with or exempt from CARB's Truck and Bus Regulation. Effective January 1, 2020, if a vehicle is not compliant with the rule, DMV will no longer register that vehicle.

In addition to limiting exhaust from idling trucks, CARB promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation adopted by CARB on July 26, 2007, aims to reduce emissions by installation of diesel

soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models. Implementation is staggered based on fleet size (which is the total of all off-road horsepower under common ownership or control), with the largest fleets to begin compliance by January 1, 2014. Each fleet must demonstrate compliance through one of two methods. The first option is to calculate and maintain fleet average emissions targets, which encourages the retirement or repowering of older equipment and rewards the introduction of newer cleaner units into the fleet. The second option is to meet the Best Available Control Technology (BACT) requirements by turning over or installing Verified Diesel Emission Control Strategies (e.g., engine retrofits) on a certain percentage of its total fleet horsepower. The compliance schedule requires that BACT turn overs or retrofits be fully implemented by 2023 in all equipment in large and medium fleets and across 100 percent of small fleets by 2028.

Low Carbon Fuel Standard

In January 2007, Governor Schwarzenegger enacted Executive Order S-01-07, which mandates that the state: (1) establish a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020; and (2) adopt a Low Carbon Fuel Standard (LCFS) for transportation fuels in California. The overall goal of the LCFS is to lower the carbon intensity of California transportation fuel. The 2017 Scoping Plan Update calls for the LCFS to reduce fuel carbon intensity by at least 18 percent by 2030. In September 2018, CARB extended the LCFS program to 2030, making significant changes to the design and implementation of the Program including a doubling of the carbon intensity reduction to 20 percent by 2030.

Regional

South Coast Air Quality Management District

SCAQMD has jurisdiction over air quality planning for all of County of Orange, Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The Air Basin is a subregion within SCAQMD jurisdiction. While air quality in the Air Basin has improved, the Air Basin requires continued diligence to meet the air quality standards.

Air Quality Management Plan

SCAQMD has adopted a series of AQMPs to meet the CAAQS and NAAQS, the 2012 and the 2016 AQMPs. While the 2016 AQMP is the most recent and was adopted by SCAQMD and CARB, it has not received full USEPA approval for inclusion in the SIP. Therefore, until such time as the 2016 AQMP is completely approved by the USEPA, the 2012 AQMP remains the applicable AQMP; however, this analysis considers both the 2012 and 2016 AQMPs as appropriate.

The 2012 AQMP includes a comprehensive strategy aimed at controlling pollution from all sources, including stationary sources, and on-road and off-road mobile sources. It highlights the significant amount of emission reductions needed and the urgent need to identify additional strategies, especially in the area of mobile sources, to meet all federal criteria air pollutant standards within the timeframes allowed under the CAA (SCAQMD 2013).

The key undertaking of the 2012 AQMP is to bring the Air Basin into attainment with the NAAQS for the 24-hour PM_{2.5} standard. It also intensifies the scope and pace of continued air quality improvement efforts toward meeting the 2024 8-hour ozone standard deadline with new measures designed to reduce reliance on the CAA section 182(e)(5) long-term measures for NO_x and VOC reductions. SCAQMD expects exposure reductions to be achieved through implementation of new and advanced control technologies as well as improvement of existing technologies.

The SCAQMD Governing Board adopted the 2016 AQMP on March 3, 2017 (SCAQMD 2017). CARB approved the 2016 AQMP on March 23, 2017. Key elements of the 2016 AQMP include implementing fair-share emissions reductions strategies at the federal, state, and local levels; establishing partnerships, funding, and incentives to accelerate deployment of ZE and near-zero-emissions (NZE) technologies; and taking credit from co-benefits from greenhouse gas, energy, transportation and other planning efforts (SCAQMD 2017). The strategies included in the 2016 AQMP are intended to demonstrate attainment of the NAAQS for the national non-attainment pollutants ozone and PM_{2.5} (SCAQMD 2018). The strategies that are particularly relevant to the project include the following:

MOB-08 – Accelerated Retirement of Older On-Road Heavy-Duty Vehicles: This measure seeks to replace up to 2,000 heavy-duty vehicles per year with newer or new vehicles that at a minimum, meet the 2010 on-road heavy-duty NO_x exhaust emissions standard of 0.2 grams per brake horsepower-hour (g/bhp-hr).

MOB-10 – Extension of the SOON Provision for Construction/Industrial Equipment: This measure continues the Surplus Off-Road Option for NO_x (SOON) provision of the Statewide In-Use Off-Road Fleet Vehicle Regulation through the 2031 timeframe.

Air Quality Guidance Documents

SCAQMD's CEQA Guidelines are voluntary initiatives recommended for consideration by local planning agencies. The *CEQA Air Quality Handbook* (Handbook) published by SCAQMD provides local governments with guidance for analyzing and mitigating project-specific air quality impacts (SCAQMD 1993). SCAQMD is currently updating some of the information and methods in the Handbook, such as the screening tables for determining the air quality significance of a project and the on-road mobile source emission factors. While this process is underway, SCAQMD recommends using other approved models to calculate emissions from land use projects, such as CalEEMod (SCAQMD 2020a).

The SCAQMD *Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning* considers impacts to air quality sensitive receptors from TAC-emitting facilities (SCAQMD 2005). SCAQMD's siting distance recommendations are the same as those provided by CARB (e.g., a 500-foot siting distance for air quality sensitive receptors proposed in proximity to freeways and high-traffic roads, and the same siting criteria for distribution centers and drycleaning facilities).

The SCAQMD *Final Localized Significance Threshold Methodology and Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM2.5 Significance Thresholds* provides guidance when evaluating the localized effects of emissions in the CEQA evaluation (SCAQMD 2008a; SCAQMD 2006). These guidance documents were promulgated by the SCAQMD Governing Board as a tool to assist lead agencies to analyzed localized impacts associated with project-specific level proposed projects. The guidance documents establish mass emission rate “look up tables” as significance thresholds for projects that are five acres or less. For projects that are larger than five acres, such as the proposed project, it is recommended that project-specific air quality dispersion modeling is completed to determine localized air quality.

Toxic Air Contaminants

At the local level, air pollution control or management districts may adopt and enforce CARB control measures. Under SCAQMD Regulation XIV (Toxics and Other Non-Criteria Pollutants), and in particular Rule 1401 (New Source Review), all sources that possess the potential to emit TACs are required to obtain permits from SCAQMD. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including new source review standards and air toxics control measures. SCAQMD limits emissions and public exposure to TACs through a number of programs. SCAQMD prioritizes TAC-emitting stationary sources based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors.

In 2000, The Air Toxics Control Plan (revised in 2004) examined the overall direction of SCAQMD’s air toxics control program. It includes development and implementation of strategic initiatives to monitor and control air toxics emissions. Control strategies that are deemed viable and are within SCAQMD’s jurisdiction will each be brought to the SCAQMD Board for further consideration through the normal public review process. Strategies that are to be implemented by other agencies will be developed in a cooperative effort, and the progress will be reported back to the Board periodically.

In 2015, SCAQMD completed the Multiple Air Toxics Exposure Study IV (MATES IV) (SCAQMD 2015a), which is a monitoring and evaluation study conducted in the Air Basin. MATES IV is a follow up to the 2008 MATES III study and consists of several elements including a monitoring program, an updated emissions inventory of toxic air contaminants, and a modeling effort to characterize risk across the Air Basin (SCAQMD 2008b). MATES IV focuses on the carcinogenic risk from exposure to air toxics. However, it does not estimate mortality or other health effects from particulate exposures. SCAQMD is currently in the process of updating the MATES studies series with MATES V; however, the analysis has not yet been completed.

Rules and Regulations

The SCAQMD has adopted many rules and regulations to regulate sources of air pollution in the Air Basin and to help achieve air quality standards. The proposed project may be subject to the following SCAQMD rules and regulations:

Regulation IV – Prohibitions: This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air emissions, fuel contaminants, start-up/shutdown exemptions and breakdown events. The following is a list of rules which apply to the project:

Rule 401 – Visible Emissions: This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.

Rule 402 – Nuisance: This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

Rule 403 – Fugitive Dust: This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM10 emissions to less than 50 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by USEPA. As a large site, the proposed project would also be required to comply with subsection (e) of Rule 403 which includes additional requirements for large operations.

Regulation XI – Source Specific Standards: Regulation XI sets emissions standards for specific sources. The following is a list of rules which may apply to the proposed project:

Rule 1113 – Architectural Coatings: This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

Rule 1186 – PM10 Emissions from Paved and Unpaved Roads, and Livestock Operations: This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM10 emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).

Regulation XIV – Toxics and Other Non-Criteria Pollutants: Regulation XIV sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other non-criteria pollutants. The following is a list of rules which may apply to the proposed project:

Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities: This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.

Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines: This rule applies to stationary compression ignition engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

Southern California Association of Governments

The Southern California Association of Governments (SCAG) is the Metropolitan Planning Organization for the region in which the County of Orange and City of Irvine are located. In April 2016, SCAG adopted the *2016 Regional Transportation Plan/Sustainable Communities Strategy: A Plan for Mobility, Accessibility, Sustainability and a High Quality of Life* (RTP/SCS), which is an update to the previous 2012 RTP/SCS (SCAG 2016).

The 2016 RTP/SCS considers the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address mobility needs. The 2016 RTP/SCS describes how the region can attain the GHG emission-reduction targets set by CARB by achieving an 8 percent reduction in passenger vehicle GHG emissions on a per capita basis by 2020, 18 percent reduction by 2035, and 21 percent reduction by 2040 compared to the 2005 level. Although the focus of the 2016 RTP/SCS is on GHG emission-reduction, compliance with and implementation of 2016 RTP/SCS policies and strategies would also have co-benefits of reducing per capita criteria air pollutant and TAC emissions associated with reduced per capita vehicle miles traveled (VMT). Improved air quality with implementation of the 2016 RTP/SCS policies would decrease reactive organic gases (ROG) by 8 percent, CO by 9 percent, NO_x by 9 percent, and PM_{2.5} by 5 percent (SCAG 2016).

The 2016 RTP/SCS includes goals and strategies to promote active transportation and improve transportation demand management. The 2016 RTP/SCS strategies support local planning and projects that serve short trips, increase access to transit, expand understanding and consideration of public health in the development of local plans and projects, and support improvements in sidewalk quality, local bike networks, and neighborhood mobility areas. The 2016 RTP/SCS proposes to better align active transportation investments with land use and transportation strategies, increase competitiveness of local agencies for federal and state funding, and to expand the potential for all people to use active transportation.

Local

Local jurisdictions, such as the County of Orange (County) and the City of Irvine (City), have the authority and responsibility to reduce air pollution through their land use decision-making authority.

Orange County General Plan

The County is responsible for the assessment and mitigation of pollutant emissions resulting from its land use decisions. The County's General Plan Resource Element sets forth the goals, objectives, and policies which guide the County in its implementation of its air quality improvement programs and strategies. A number of these goals, objectives, and policies are relevant to the proposed project, and relate to minimizing particulate emissions from construction activities, managing traffic congestion during peak hours, and increasing energy efficiency in private developments.

The Resource Element establishes the following air quality goal pertaining to the proposed project: Promote optimum sustainable environmental quality standards for air resources.

The Resource Element establishes the following goal pertaining to the proposed project's energy use: Goal 3: Maximize the conservation of energy resources in all future land use and transportation planning decisions.

City of Irvine General Plan

The City is responsible for the assessment and mitigation of pollutant emissions resulting from its land use decisions. The City's General Plan does not have any objectives or policies that are directly related to air quality emissions with respect to the proposed project.

3.2.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from CEQA Guidelines Appendix G are used as thresholds of significance to determine the impacts of the proposed project as related to air quality. The proposed project would have a significant impact if it would:

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.
3. Expose sensitive receptors to substantial pollutant concentrations.
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.
5. Result in cumulatively considerable impacts to air quality.

In addition to the Appendix G significant impacts listed above, cumulative impacts with respect to air quality are also addressed as part of the analysis.

Pursuant to the CEQA Guidelines (Section 15064.7), a lead agency may consider using, when available, significance thresholds established by the applicable air quality management district or air pollution control district when making determinations of significance. For purposes of this analysis, the potential air quality impacts of the proposed project are assessed in accordance with the most recent thresholds adopted by the SCAQMD in connection with its CEQA Air Quality Handbook,

Air Quality Analysis Guidance Handbook, and subsequent SCAQMD guidance, as discussed below.³

Regional Criteria Air Pollutant Emissions Thresholds

SCAQMD has established numerical significance thresholds for regional emissions during construction and operation. The numerical significance thresholds are based on the recognition that the Air Basin is a distinct geographic area with a critical air pollution problem for which ambient air quality standards have been promulgated to protect public health (SCAQMD 1993).

Given that construction impacts are temporary, SCAQMD has established significance thresholds specific to construction activity. Based on the thresholds of significance in the SCAQMD CEQA Air Quality Analysis Handbook, the proposed project would potentially cause or contribute to an exceedance of an ambient air quality standard if the following would occur (SCAQMD 2020c).

Regional construction emissions from both direct and indirect sources would exceed any of the following SCAQMD prescribed daily emissions thresholds (SCAQMD 2020c):

- 75 pounds a day for VOC,
- 100 pounds per day for NO_x,
- 550 pounds per day for CO,
- 150 pounds per day for SO_x,
- 150 pounds per day for PM₁₀, and
- 55 pounds per day for PM_{2.5}

SCAQMD has also established numeric significance thresholds for operations. SCAQMD has established significance thresholds in part based on CAA section 182(e), which identifies 10 tons per year of VOC and NO_x as a significance level for stationary source emissions in extreme non-attainment areas for ozone. The numeric significance thresholds for other pollutants are also based on federal major source thresholds, which vary depending on regional attainment status. For example, the Air Basin is in attainment for carbon monoxide, which yields a corresponding major source threshold of 100 tons per year, or 550 pounds per day (USEPA 2017e). These “major source” significance thresholds were developed under the Federal Title V Operating Permit Program (SCAQMD 2020d). SCAQMD converted these significance levels to pounds per day. The attainment status designation is based on the healthfulness of air quality and the corresponding significance thresholds are intended to be health protective (CARB 2020p).

A similar approach is applied to PM_{2.5}, where the daily limit of 55 pounds per day is based on the USEPA proposed rule to implement a PM_{2.5} NAAQS, with a significant emission rate of 10 tons per year (SCAQMD 2006).

³ While the SCAQMD CEQA Air Quality Handbook contains significance thresholds for lead, project construction and operation would not include sources of lead emissions and would not exceed the significance thresholds for lead. Unleaded fuel and unleaded paints have virtually eliminated lead emissions from projects. As a result, lead emissions are not further evaluated.

The proposed project would potentially cause or contribute to an exceedance of an ambient air quality standard if regional operational emissions exceed any of the following SCAQMD prescribed daily emissions thresholds (SCAQMD 2019):

- 55 pounds a day for VOC,
- 55 pounds per day for NO_x,
- 550 pounds per day for CO,
- 150 pounds per day for SO_x,
- 150 pounds per day for PM₁₀, and
- 55 pounds per day for PM_{2.5}.

SCAQMD has set its CEQA significance threshold for NO_x and VOC at 10 tons per year (expressed as 55 pounds per day). because the federal CAA defines a major stationary source for extreme ozone nonattainment areas such as SCAQMD as one emitting 10 tons/year (42 U.S.C. §§ 7511a(e), 7511a(f); CAA §§ 182(e), 182(f)). Under the federal CAA, such sources are subject to enhanced control requirements (42 U.S.C. §§ 7502(c)(5), 7503; CAA §§ 172(c)(5), 173), so SCAQMD determined that 55 lb/day was an appropriate threshold for making a CEQA significance finding and requiring feasible mitigation. As, SCAQMD has stated:

... a project source that emits 10 tons/year of NO_x or VOC is small enough that its regional impact on ambient ozone levels may not be detected in the regional air quality models that are currently used to determine ozone levels. Thus, in this case it would not be feasible to directly correlate project emissions of VOC or NO_x with specific health impacts from ozone. (SCAQMD 2015c.)

Therefore, lead agencies that use SCAQMD thresholds of significance may determine that projects have a significant air quality impact and correspondingly are required to implement all feasible mitigation measures, yet are not able to correlate the project impact to quantifiable health effects.

Localized Significance Thresholds

SCAQMD published its Final Localized Significance Threshold Methodology in June 2003, (revised July 2008) and Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM_{2.5} Significance Thresholds in October 2006, recommending that all air quality analyses include a localized assessment of both construction and operational impacts on the air quality of nearby air quality sensitive receptors (SCAQMD 2008a). LSTs represent the maximum emissions from a project site that are not expected to result in an exceedance of a NAAQS or CAAQS. LSTs are based on the ambient concentrations of that pollutant within the Source Receptor Area (SRA) where a project is located and the distance to the nearest air quality sensitive receptor. LSTs are only applicable to the following criteria air pollutants: NO_x, CO, PM₁₀, and PM_{2.5}. The proposed project site is located in the central portion of SRA 19 (Saddleback Valley) (SCAQMD 2020e).

The Basin is in attainment for NO₂ and CO, meaning their ambient concentrations are below their respective air quality standards. When evaluating localized impacts for NO₂ and CO, the local ambient concentrations and the proposed project related concentrations are summed and then compared to

the NAAQS and CAAQS. If the sum of the ambient concentrations and proposed project concentrations are greater than the air quality standard, this would result in a significant impact.

The Basin is in nonattainment for PM10 and PM2.5, meaning their ambient concentrations are above their respective air quality standards. If ambient levels already exceed a NAAQS or CAAQS, then project impacts may be considered significant if they increase ambient concentrations in excess of the allowable increase established by SCAQMD. This would apply to PM10 and PM2.5, both of which are nonattainment pollutants in the Basin. For these latter two pollutants, the significance criteria are the pollutant concentration thresholds presented in SCAQMD Rules 403 and 1301. The Rule 403 threshold of 10.4 µg/m³ applies to construction emissions (and may apply to operational emissions at aggregate handling facilities). The Rule 1301 threshold of 2.5 µg/m³ applies to non-aggregate handling operational activities.

SCAQMD recommends that sites larger than 5 acres perform air dispersion modeling to determine localized air quality (SCAQMD 2008a). While the proposed project site is greater than 5 acres, the individual phases of construction are localized to smaller portions of the site on any given day (i.e., construction at the toe of the dam would not be occurring at the same time as the access road near the intersection of Sand Canyon Avenue and Portola Parkway). Based on the daily areas of disturbance, the onsite areas are analyzed as either one-acre sites or five-acre sites and screening level LSTs are used to determine significance. Operational emissions would be centralized around the proposed Treatment Facility, which is conservatively assumed to be 328 feet (100 meters) from the nearest sensitive receptor. **Table 3.2-4** shows the threshold levels used for a one-acre site located within 164 feet (50 meters) of the nearest sensitive receptor and for a five-acre site located within 164 feet of the proposed project.

**TABLE 3.2-4
 LOCALIZED SCREENING LEVELS**

Source	NO _x	CO	PM10	PM2.5
Construction - 1-acre site at 164 feet (50 meters)	52	883	11	4
Construction - 5-acre site at 328 feet (100 meters)	112	2,763	49	16
Operational – 1-acre site at 328 feet (100 meters)	60	1,234	6	2

SOURCE: SCAQMD 2008a.

Toxic Air Contaminants

Based on the criteria set forth by SCAQMD, the proposed project would expose air quality sensitive receptors to substantial concentrations of TACs if the proposed project emits carcinogenic materials or TACs that exceed the maximum incremental cancer risk of 10 in one million or a non-cancer hazard index of 1.0. Similarly, the proposed project would result in a potentially significant impact if cancer burden corresponds to an increase in more than 0.5 excess cancer cases in areas where the proposed project-related increase in individual cancer risk exceeds 1 in one million (SCAQMD 2019).

Health Impacts

Currently, the health impact of a particular criteria air pollutant is analyzed by air districts on a regional scale based on how close the area is to attaining the NAAQS. Such an analysis has generally not been performed at the project level. The SCAQMD states that an exceedance of the significance thresholds does not necessarily cause localized human health effects as, even with relatively high levels of emissions. However, the Air Basin is a distinct geographic area that has critical air pollution problems for which AAQS have been established to protect human health and welfare. Therefore, analyzing a project against these thresholds conservatively assesses whether these emissions directly contribute to regional or local exceedances of AAQS and assesses their potential to be harmful to human health. Thus, in order to determine the potential for adverse health effects, project emissions are compared to the SCAQMD's regional emissions thresholds of significance. Additional discussion of significance thresholds used in this analysis for health impacts is discussed in the Air Quality Technical Report attached as Appendix B of this Draft EIR.

General Conformity Determination

A conformity determination is required for each criteria pollutant or precursor where the total of direct emissions of the criteria pollutant or precursor in a federal non-attainment or maintenance area would equal or exceed specified annual emission rates, referred to as "de minimis" thresholds." These de minimis thresholds are provided in 40 CFR 93.153(b)(1) and (2). For ozone precursor emissions, the de minimis thresholds depend on the severity of the non-attainment classification. In an extreme ozone non-attainment area, the de minimis thresholds are 10 tons per year for both NO_x and VOC. In a federal serious non-attainment area, the de minimis threshold is 70 tons per year for PM_{2.5}. In a federal attainment-maintenance area, the de minimis threshold is 100 tons per year for CO, and PM₁₀. Effective June 13, 2012, the USEPA designated the South Coast Air Basin as extreme non-attainment for the 1997 ozone standard. In 2012, the USEPA designated the Air Basin as extreme non-attainment for the 2008 ozone standard. The Air Basin is also attainment-maintenance for the federal CO and PM₁₀ standards, and serious non-attainment for the federal PM_{2.5} standards. Thus, based on the present attainment status of the Air Basin, a federal action would conform to the SIP if its annual emissions remain below 10 tons of VOC or NO_x, 100 tons of CO or PM₁₀, and 70 tons of PM_{2.5}.

Methodology

Construction Impacts

Regional Construction Emissions

Project construction activities that would have the potential to create regional air quality impacts including vehicle trips generated by construction workers, vendor trucks, and haul trucks traveling to and from the proposed project site and building activities such as the application of paint and other surface coatings. The proposed project's daily regional criteria pollutant emissions during construction have been estimated by assuming a conservative scenario for construction activities (i.e., assuming all construction occurs at the earliest feasible date) and applying the mobile source and fugitive dust emissions factors.

The emissions have been estimated using the CalEEMod software, an emissions inventory software program recommended by the SCAQMD for off-road construction equipment emissions.⁴ On-road mobile source emissions were estimated using the 2017 CARB on-road vehicle emissions factor model (EMFAC) and incorporating the adjustment factors for the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part I: One National Program (SAFE Rule Part I).

Project construction is estimated to start in 2022 and continue for approximately 41 months, ending in 2026. Construction phasing would include vegetation clearing, mobilization and creation of access road/intersection improvements, excavation of sediments and the existing dam, construction of the dam, spillway and reservoir, construction of the treatment facilities, creation of wetlands/riparian habitat, installation of recreational components (hiking trail), and demobilization. The proposed project would import approximately 100,000 cubic yards of soil with a maximum of 66 haul trucks accessing the site per day. The remaining soil needed for the new dam construction would come from soils excavated onsite. No soil removal is estimated. An estimated 420,000 cubic yards of vegetation would be removed from the project site with a maximum of 78 haul trucks per day. One daily fuel delivery per day is estimated during construction activities. Worker and vendor deliveries vary by phase with a maximum of 114 worker vehicles and 29 vendor trucks accessing the site daily.⁵

The input values used in this analysis were adjusted to be proposed project-specific based on provided equipment types and the construction schedule. Haul truck trips and concrete truck trips estimates were based on information obtained from IRWD. Haul and concrete truck trip VMT were based on a 28-mile one-way trip. Worker trip and vendor truck trip estimates were based on default calculation methodologies in CalEEMod (worker trips equal 14.7 miles and vendor trips equal 6.9 miles).

Per Chapter 2, *Project Description*, additional geotechnical work may or may not occur, and the intensity of any geotechnical work is unknown at this time. There are three potential geotechnical tests that could occur: borings, test pits, or trenches. Because the intensity of any work that will occur is unknown, the analysis determines the maximum intensity of geotechnical work that can occur concurrently and independent from the reservoir work. The *Irvine Ranch Water District Syphon Reservoir Geotechnical Investigations Project Initial Study/Mitigated Negative Declaration* was used to determine the equipment and workers that would be used to conduct the additional geotechnical investigations.

Emissions from proposed project construction activities were estimated based on the construction phase in which the activity would be occurring. The maximum daily emissions estimate the worst-case day and do not represent the emissions that would occur for every day of proposed project construction. The maximum daily emissions are compared to SCAQMD daily regional

⁴ CalEEMod was developed in collaboration with the air districts of California and is recommended by SCAQMD for evaluating emissions for projects under CEQA. Regional data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) were provided by the various California air districts to account for local requirements and conditions.

⁵ It is unknown how many additional geotechnical tests would be required for completion of the project. The 114 maximum workers are based on the maximum geotechnical work that can occur with non-geotechnical work. Geotechnical activities would require between 9 to 12 workers per activity.

thresholds of significance. A detailed discussion of the proposed project's construction phasing and equipment list as well as emissions calculations and modeling output are included in Appendix B of this Draft EIR.

Localized Construction Emissions

Proposed project construction activities that would have the potential to create local air quality impacts including fugitive dust from grading, demolition, and building activities such as the application of paint and other surface coatings. The localized effects from the on-site portion of the proposed project's construction emissions were evaluated at the nearby sensitive receptor locations that would be potentially impacted by proposed project construction in accordance with the SCAQMD's *Final Localized Significance Threshold Methodology* (June 2003, revised July 2008). The localized significance thresholds only address NO_x, CO, PM₁₀, and PM_{2.5} emissions. The SCAQMD has established screening criteria that can be used to determine the maximum allowable daily emissions that would satisfy the localized significance thresholds and therefore not cause or contribute to an exceedance of the applicable ambient air quality standards without the need for proposed project-specific dispersion modeling. The localized analysis for the proposed project is based on this SCAQMD screening criteria. The maximum daily onsite emissions from construction of the proposed project were compared to these screening criteria. Emissions calculations and modeling output are included in Appendix B of this Draft EIR.

Health Impacts

Health impacts associated with the proposed project are assessed based on the estimated project's regional emissions, as discussed above for regional construction and operational emissions, in comparison to the SCAQMD regional emissions thresholds of significance.

Toxic Air Contaminants

The proposed project would emit TACs during construction, exposure to which may result in an increase in carcinogenic and non-carcinogenic health risks on the residents and other air quality sensitive receptors in the vicinity. A Health Risk Assessment (HRA) was prepared to evaluate the risk of potential negative health outcomes (cancer, or other acute or chronic conditions) related to TACs exposure from airborne emissions during proposed project construction activities. Incremental increase in lifetime cancer risk is assessed over longer exposure time periods (i.e., 30-year for residential receptors).

The HRA followed the procedure and methods provided in the *Guidance Manual for Preparation of Health Risk Assessments* issued by OEHHA in 2015, as well as the methods the SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1, and 212, version 8.1*, used in conjunction with the associated *SCAQMD Permit Application Package "N" (OEHHA 2015; SCAQMD 2017b; SCAQMD 2017c)*. The procedure involved emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure routes, identification of exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels. The revised 2015 OEHHA Guidance takes into account the sensitivity of children to TAC emissions, breathing rates, and time spent at home since children have higher breathing rate compared to adults and would likely spend more time at home

resulting in longer exposure durations. A full detailed methodology of health risk assessment is included in the Air Quality Technical Report attached as Appendix B of this Draft EIR.

Operational Impacts

Regional Operational Emissions

The proposed project's operational activities would have minimal changes from the existing scenario. There are no new permanent maintenance or recreational trips associated with the reservoir improvements, and no natural gas emissions, water use or solid waste generation anticipated. Maintenance of the wetland/riparian area would be required for approximately 5 years after construction is complete to ensure success of the vegetated areas, and would result in infrequent trips to the project site. Operational vehicle trips during the first five years of maintenance would equal 12 to 24 round trips for 30 to 40 days per year. However, these trips would not result in substantial daily or annual emissions.

The main operational emissions associated with air quality impacts would occur from consumer product use associated with onsite maintenance activities. While electrical consumption will increase, electrical consumption does not result in direct air quality impacts and therefore are not addressed in the regional or localized air quality emissions analysis. Assumptions, calculations and modeling output are included in Appendix B of this Draft EIR.

Localized Operational Emissions

The localized effects from the on-site portion of the maximum daily emissions from proposed project operation were evaluated at the nearby sensitive receptor locations that would be potentially impacted by operation of the proposed project according to the SCAQMD's Final Localized Significance Threshold Methodology (June 2003, revised July 2008).⁶ The localized impacts from operation of the proposed project were assessed similar to the construction emissions, as discussed previously. For further explanation, please see the Air Quality Technical Report attached as Appendix B of this Draft EIR.

Carbon Monoxide Hotspots

The greatest quantities of CO are produced from motor vehicle combustion and are usually concentrated at or near ground level because they do not readily disperse into the atmosphere, particularly under cool, stable (i.e., low or no wind) atmospheric conditions. Localized areas where ambient concentrations exceed State and/or federal standards are termed "CO hotspots." As the operation of the proposed project would not result in any new mobile source emissions, the project would not result in CO hotspots. Therefore, CO hotspots are not discussed further in this analysis.

Toxic Air Contaminants

Operation of the proposed project, i.e., periodic maintenance and remotely operated electrical equipment), would not include the operation of non-permitted stationary sources of TACs. Permitted sources would be regulated by the SCAQMD and therefore would be mandated to be

⁶ SCAQMD, Final Localized Significance Threshold Methodology.

within regulatory thresholds. Therefore, the proposed project would not result in significant TAC emissions and operational TACs are not addressed further in this analysis.

General Conformity

Under section 176(c)(1) of the federal CAA, federal agencies that “engage in, support in any way or provide financial assistance for, license or permit, or approve any activity” must demonstrate that such actions do not interfere with state and local plans to bring an area into attainment with the NAAQS (42 USC 7506(c)). Orange County is designated extreme non-attainment for the federal 8-hour ozone NAAQS; serious non-attainment for PM_{2.5}; and attainment for the federal CO, NO₂, SO₂, and PM₁₀ standards. The program by which a federal agency determines that its action would not obstruct or conflict with air quality attainment plans is called "General Conformity." The implementing regulations for General Conformity are found in 40 CFR 93(B) (75 FR 17254 (April 5, 2010, amended July 6, 2010)). Under the General Conformity regulations, both the direct and indirect emissions associated with a federal action must be evaluated.

Each year of construction (2022 through 2026) are analyzed against the *de minimis* thresholds. Annual emissions for the construction activities are quantified for both the unmitigated and mitigated scenarios. Operational emissions are discussed qualitatively as there is a minimal operational component.

Impact Analysis

Conflict with or Obstruct Air Quality Plans

Impact 3.2-1: The proposed project could conflict with or obstruct implementation of the applicable air quality plan.

Construction

The proposed project is located within the Air Basin, which is under the jurisdiction of the SCAQMD. As such, SCAQMD's 2016 AQMP is the applicable air quality plan for the proposed project. Projects that are consistent with the regional population, housing, and employment forecasts identified by SCAG are considered to be consistent with the AQMP growth projections, since the forecast assumptions by SCAG forms the basis of the land use and transportation control portions of the AQMP. Additionally, because SCAG's regional growth forecasts are based upon, among other things, land uses designated in general plans, a project that is consistent with the land use designated in a general plan would also be consistent with the SCAG's regional forecast projections, and thus also with the AQMP growth projections.

The proposed project would result in an increase in short-term employment compared to existing conditions. Also, construction employees are typically employees of the construction firm and are not hired specifically for any one construction job. Being relatively small in number and temporary in nature, construction jobs under the project would not conflict with the long-term employment projections upon which the AQMP is based. Control strategies in the AQMP with applicability to short-term emissions from construction activities include strategies denoted in the 2016 AQMP as MOB-08 and MOB-10 and are intended to reduce emissions from on-road and off-road heavy-duty vehicles and equipment by accelerating replacement of older, emissions-prone engines with newer

engines meeting more stringent emission standards. Construction contractors would be required to comply with the CARB Air Toxic Control Measure that limits heavy duty diesel motor vehicle idling to no more than five minutes at any given location with certain limited exceptions defined in the regulation for equipment in which idling is integral to the function of the equipment or activity (such as concrete trucks and concrete pouring). In addition, contractors would be required to comply with required and applicable BACT and the CARB In-Use Off-Road Diesel Vehicle Regulation to use lower emitting equipment in accordance with the phased-in compliance schedule for equipment fleet operators. The proposed project would not conflict with implementation of these strategies. The proposed project is also required to comply with SCAQMD regulations for controlling fugitive dust pursuant to SCAQMD Rule 403. Compliance with these requirements is consistent with and meets or exceeds the AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities.

Nonetheless, as discussed further below in the analysis for Impact 3.2-2, even though the proposed project would be consistent with applicable strategies in the AQMP, local and state regulations, and other voluntary measures designed to reduce non-attainment pollutants, regional emissions during construction of the proposed project would exceed the significance threshold for NO_x. Therefore, impacts related to consistency with air quality plans during construction of the proposed project would be potentially significant.

As detailed in Impact 3.2-2 below, construction-related daily emissions would be reduced to below the SCAQMD threshold of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of mitigation would increase the emissions of CO, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. For all other criteria pollutants, emission levels would remain below the applicable thresholds of significance. As the proposed project's maximum regional emissions from construction would not exceed the regional thresholds of significance with implementation of mitigation measures, the proposed project would be consistent with the AQMP, and impacts would be reduced to a less-than-significant level.

Operation

The proposed project is the expansion of the capacity of the Syphon Reservoir. There are no new permanent maintenance or recreational trips associated with the reservoir improvements, and no natural gas emissions, water use or solid waste generation anticipated. Maintenance of the wetland/riparian area would be required for approximately 5 years after construction is complete to ensure success of the vegetated areas, and would result in infrequent trips to the project site. The project does not result in a change in land use, nor does it result in residential or employment growth for the region. Additionally, as detailed under Impact 3.2-2 below, the operational emissions will not exceed regulatory thresholds. Therefore, operation of the proposed project would be consistent with the AQMP, and impacts would be reduced to a less-than-significant level.

Mitigation Measures

AIR-1: IRWD shall require the construction contractor to implement construction equipment features for equipment operating at the project site during certain construction phases. Construction features will include the following: The proposed project shall utilize off-road diesel-powered construction equipment that meet or exceed CARB and

USEPA Tier 4 off-road emissions standards for standard construction equipment rated at 50 horsepower (hp) or greater during project construction. Such equipment will be outfitted with BACT devices including a CARB certified Level 3 Diesel Particulate Filter or equivalent. At a minimum, this measure shall apply during implementation of the following construction sub-phases: upstream excavation and foundation treatment, dam excavation and foundation treatment, installation of embankment to the bottom of the blanket drain, and installation of the chimney/remaining embankment.

Significance Determination

Less than Significant Impact with Mitigation

Criteria Pollutants

Impact 3.2-2: The proposed project could result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.

The proposed project would contribute to local and regional air pollutant emissions during construction (short-term or temporary) and operation (long-term).

Construction

Regional Emissions Analysis

Construction of the proposed project has the potential to generate temporary regional criteria pollutant emissions through the use of heavy-duty construction equipment, such as excavators and forklifts, through vehicle trips generated by workers and haul trucks traveling to and from the proposed project site, and through building activities such as the application of paint and other surface coatings. In addition, fugitive dust emissions would result from demolition and various soil-handling activities. Mobile source emissions, primarily NO_x, would result from the use of construction equipment such as dozers and loaders. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions.

The maximum daily construction emissions for the proposed project were estimated for each construction phase. Some individual construction phases could potentially overlap; therefore, the estimated maximum daily emissions include these potential overlaps by combining the relevant construction phase emissions. The maximum daily emissions are predicted values for a representative worst-case day, and do not represent the actual emissions that would occur for every day of construction, which would likely be lower on many days. As stated above, in order to provide a conservative emissions analysis, for modeling purposes, construction emissions were modeled beginning in 2022. Detailed emissions calculations are provided in Appendix B of this Draft EIR.

The results of the criteria pollutant calculations are presented in **Table 3.2-5** and include dust control measures required to be implemented by SCAQMD Rule 403 (Control of Fugitive Dust), including subsection (e) – Additional Requirements for Large Operations, and fugitive VOC control measures required to be implemented by architectural coating emission factors based on

SCAQMD Rule 1113 (Architectural Coatings). As shown in Table 3.2-5, construction-related daily emissions would exceed the SCAQMD threshold of significance for NO_x. For all other criteria pollutants, emission levels would be below the applicable thresholds of significance. As the proposed project's maximum regional emissions from construction would exceed the regional threshold of significance for NO_x, regional construction emissions impacts would be potentially significant.

The results of the mitigated criteria pollutant calculations are presented in **Table 3.2-6** and include dust control measures required to be implemented by SCAQMD Rule 403 (Control of Fugitive Dust), including subsection (e) – Additional Requirements for Large Operations and fugitive VOC control measures required to be implemented by architectural coating emission factors based on

SCAQMD Rule 1113 (Architectural Coatings). As shown in Table 3.2-6, construction-related daily emissions would be reduced to below the SCAQMD threshold of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of Mitigation Measure AIR-1 would slightly increase the emissions of CO due to the emissions control technology used, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. For all other criteria pollutants, emission levels would remain below the applicable thresholds of significance. As the proposed project's maximum regional emissions from construction would not exceed the regional thresholds of significance with implementation of mitigation measures, the proposed project's regional construction emissions impacts would be less than significant.

Conformity Analysis

Annual emissions for unmitigated and mitigated emissions were compared to the General Conformity *de minimis* levels for NAAQS non-attainment areas (see **Table 3.2-7**). In the unmitigated scenario, annual construction emissions of NO_x, would exceed the 10 tons per year General Conformity threshold. With implementation of Mitigation Measure AIR-1, annual construction emissions of VOC, CO, NO_x, PM10, and PM2.5 would be below applicable General Conformity *de minimis* levels and thus would not conflict with implementation of the SIP. Additionally, short-term direct construction emissions associated with the project would not conflict with or obstruct implementation of applicable long-term air quality management plans. Therefore, no further conformity analysis is required for any of the pollutants because their emissions would be less than the conformity *de minimis* levels, and no significant adverse effect from the project would occur.

**TABLE 3.2-7

Operation

Regional Emissions Analysis

As discussed previously, operational activities would result in area source emissions and an increase in electrical consumption. No new permanent vehicle trips would occur as maintenance and recreational activities are anticipated to remain the same as the existing conditions. Operational vehicle trips during the first 5 years of maintenance would equal 12 to 24 round trips for 30 to 40 days per year. However, these trips would not result in substantial daily or annual emissions. Operational regional criteria pollutant emissions were calculated for the proposed project's buildout year of 2026 and emissions were assumed not to exceed 1 pound per day for all criteria pollutants during operational activities. Detailed emissions calculations are provided in Appendix B of this Draft EIR. The proposed project's operational-related daily emissions would not exceed the SCAQMD thresholds of significance for any criteria pollutants. As the proposed project's maximum regional emissions from operational activities would be below the regional thresholds of significance, regional operation-related emissions impacts would be less than significant.

General Conformity Analysis

Daily operational emissions are less than one pound per day for all criteria pollutants. Therefore, annual emissions would be less than 0.2 tons per year, well below any of the de minimis thresholds, thus in conformance with the SIPs. Additionally, operational emissions associated with the proposed project would not conflict with or obstruct implementation of applicable long-term air quality management plans. Therefore, no further conformity analysis is required for any of the pollutants because their emissions would be less than the conformity thresholds and no significant adverse effect from the project would occur.

Health Impact Assessment

NO_x and VOC emissions from projects are directly related to the increase in ozone in the local area/region which aggravate respiratory diseases, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms and may contribute to the development of asthma and potentially increase susceptibility to respiratory infections. As shown in Table 3.2-5, unmitigated project-related construction emissions would potentially exceed regional thresholds for NO_x. Accordingly, elevated levels of criteria air pollutants as a result of a project's emissions could cause adverse health effects associated with this pollutant. All other criteria pollutants would be below the thresholds of significance. Implementation of Mitigation Measure AIR-1 would reduce both localized (discussed in detail in Impact 3 below) and regional project generated construction emissions (with the exception of CO, which increases slightly with Mitigation Measure AIR-1 but still remains below the threshold of significance), and therefore would reduce the potential to result in regional health effects associated with ozone precursors (VOC and NO_x). As shown in Table 3.2-6, mitigated project construction emissions would not exceed the thresholds of significance. As a result, construction of the proposed project would not have the potential to result in additional quantifiable health impacts, and impacts would be reduced to a less-than-significant level with implementation of Mitigation Measure AIR-1.

As discussed under operational emissions above, unmitigated project-related operational emissions would not exceed regional thresholds for any criteria pollutant. Accordingly, levels of criteria air pollutants as a result of a project's emissions are not anticipated to cause adverse health effects. Impacts would be less than significant.

Mitigation Measures

Implement Mitigation Measure AIR-1

Significance Determination

Less than Significant Impact with Mitigation

Sensitive Receptors

Impact 3.2-3: The proposed project could expose sensitive receptors to substantial pollutant concentrations.

Construction

Local Criteria Pollutant Emissions

The maximum daily localized emissions for each of the construction phases and the localized significance thresholds are presented in **Table 3.2-8**. The same phasing, equipment assumptions, and compliance with SCAQMD Rule 403 and Rule 1113 were used as for the regional emissions calculations discussed above. As shown in Table 3.2-8, maximum localized construction emissions for sensitive receptors would exceed the localized threshold of significance for NO_x, therefore, with respect to localized construction emissions, impacts to sensitive receptors would be potentially significant. All other criteria pollutants of local concern (CO, PM₁₀, and PM_{2.5}) would not exceed the localized thresholds of significance. Detailed emissions calculations are provided in Appendix B of this Draft EIR.

^a Emissions include fugitive dust control measures consistent with SCAQMD Rule 403.

SOURCE: ESA 2021.

The results of the mitigated localized emissions calculations are presented in **Table 3.2-9**. And include dust control measures required to be implemented by SCAQMD Rule 403 (Control of Fugitive Dust), including subsection (e) – Additional Requirements for Large Operations and fugitive VOC control measures required to be implemented by architectural coating emission factors based on SCAQMD Rule 1113 (Architectural Coatings). As shown in Table 2.3-9, construction-related daily emissions would be reduced to below the SCAQMD threshold of significance of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of Mitigation Measure AIR-1 would slightly increase CO emissions due to the emissions control technology used, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. For all other criteria pollutants, emissions levels would remain below the applicable thresholds of significance. As the proposed project's maximum localized emissions from construction would not exceed the localized thresholds of significance, localized construction emissions impacts would be less than significant with the incorporation of Mitigation Measure AIR-1.

Toxic Air Contaminates

Carcinogenic Health Risk

Excess lifetime cancer risk is estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to carcinogens. As the individual incremental increase in lifetime cancer risk is assessed over long exposure time periods (i.e., 30-year for residential receptors), the potential effects of proposed project-related carcinogenic TAC emissions must include the combination of exposure to construction-related activities and exposure to operation-related activities. For cancer risk, SCAQMD guidance identifies a significant impact if a project would result in an incremental cancer risk that is greater than 10 in one million for any receptor.

The TAC emissions of the proposed project would be generated from mobile sources including diesel-powered heavy-duty trucks and construction equipment. These sources generate DPM from combustion of diesel fuels. The analysis uses exhaust PM10 emissions associated with each construction phase as a surrogate for DPM emissions. The potential emission sources of DPM

would be diesel-fueled heavy-duty equipment, on-road travel and idling emissions from diesel-fueled haul trucks. For operational activities the proposed project would not result in new TAC sources and therefore would not contribute to the cumulative health risk of the local sensitive receptors.

The maximum health risk impacts to exposed sensitive receptors was determined through placing receptor locations around the proposed project site and haul truck routes. The estimated incremental cancer risks for the proposed project's construction activities over a maximum 30-year exposure in line with OEHHA guidance starting with the first year of construction as analyzed. Cancer risk for the maximum impacted sensitive receptor is 11.16 per million which would exceed the SCAQMD's threshold of 10 per million. As the cancer risk would exceed the SCAQMD's significance thresholds, the lifetime cancer risk that would result from construction and operation of the proposed project would result in significant impacts without mitigation.

Implementation of Mitigation Measure AIR-1 would reduce DPM emissions from the proposed project's construction activities. The estimated incremental cancer risk for the proposed project's construction activities with implementation of Mitigation Measure AIR-1 would be between 1.43 per million and 3.44 per million depending on the level at which the mitigation is implemented.

Non-carcinogenic Health Risk

As previously discussed, an HRA was prepared to evaluate the risk of potential non-carcinogenic negative health outcomes related to TACs exposure from airborne emissions during the construction of the proposed project. For construction, the potential TAC emission sources were heavy-duty equipment and haul/vendor trucks used during the improvements to the reservoir. Non-cancer effects of chronic (i.e., long-term) exposure were evaluated using the HI approach consistent with the OEHHA and SCAQMD guidance.

A chronic HI equal to or greater than 1.0 represents a significant chronic health hazard. A chronic health effect could include irritation to eyes, throat, lungs or neurological damage. Construction of the proposed project would result in non-carcinogenic health risk of 0.02 under the unmitigated scenario and between 0.004 and 0.02 with implementation of mitigation. Both unmitigated and mitigated non-carcinogenic health risk would be below the significance threshold of a chronic HI of 1.0 for the maximum impacted receptor. Therefore, this this impact would be less than significant.

Operation

The localized operational air quality analysis was conducted using the methodology prescribed in the SCAQMD Localized Significance Threshold Methodology (June 2003, revised July 2008). The screening criteria provided in the Localized Significance Threshold Methodology were used to determine the localized operational thresholds of significance for the proposed project. The maximum daily localized emissions would not exceed 1 pound per day and therefore would not exceed localized significance thresholds. Detailed emissions calculations are provided in Appendix B of this Draft EIR. As the proposed project's maximum localized operational emissions would not exceed the localized thresholds of significance for NO_x, CO, PM₁₀, or PM_{2.5}, operational emissions impacts to sensitive receptors would be less than significant.

Mitigation Measures

Implement Mitigation Measure AIR-1

Significance Determination

Less than Significant Impact with Mitigation

Other Emissions

Impact 3.2-4: The proposed project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Construction

Potential activities that may emit odors during the proposed project's construction include the use of architectural coatings and solvents, as well as the combustion of diesel fuel in on-and off-road equipment. SCAQMD Rule 1113 would limit the amount of VOCs in architectural coatings and solvents. In addition, the proposed project would comply with the applicable provisions of the CARB Air Toxics Control Measure regarding idling limitations for diesel trucks. Through mandatory compliance with SCAQMD Rules, no construction activities or materials are expected to create objectionable odors affecting a substantial number of people. Furthermore, as shown in Table 3.2-5, construction emissions would not exceed the SCAQMD regional significance thresholds for attainment, maintenance, or unclassifiable criteria air pollutants (i.e., CO and SO₂). Therefore, the proposed project's construction activities would result in less-than-significant impacts with respect to other emissions, including those leading to odors.

Operation

According to the SCAQMD *CEQA Air Quality Handbook*, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The proposed project would not include any uses identified by the SCAQMD as being associated with substantial odors. As a result, the proposed project is not expected to discharge contaminants into the air in quantities that would cause a nuisance, injury, or annoyance to the public or property pursuant to SCAQMD Rule 402. Furthermore, as discussed under Impact 3.2-2 above, operational emissions would not exceed the SCAQMD regional significance thresholds for attainment, maintenance, or unclassifiable criteria air pollutants (i.e., CO and SO₂). Therefore, operation of the proposed project would result in less-than-significant impacts with respect to other emissions, including those leading to odors.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Cumulative Impacts

Impact 3.1-5: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative short-term and long-term impacts to air quality.

The following cumulative impact analysis is based on the recommendations provided by SCAQMD in the Potential Control Strategies to Address Cumulative Impacts from Air Pollution White Paper. SCAQMD's guidance for assessing a project's cumulative impacts recommends the use of two alternative methodologies: (1) that project-specific air quality impacts be used to determine the project's potential cumulative impacts to regional air quality; or (2) that a project's consistency with the AQMPs are used to determine its potential cumulative impacts.

Under SCAQMD's guidance, "[p]rojects that exceed the project-specific significance thresholds are considered by SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant."

Therefore, consistent with this guidance, the potential for the Proposed Project to result in cumulative impacts from regional emissions is assessed based on SCAQMD thresholds.

Consistency with AQMP

As described above under Impact AIR-1, construction of the proposed project would not be consistent with the AQMP as the proposed project would generate emissions of nonattainment pollutants or precursors (i.e., NO_x) that exceed the applicable significance thresholds. Based on SCAQMD guidance, the exceedance of these thresholds indicates that the proposed project would have a considerable contribution to a significant impact. Construction-related daily emissions would be reduced to below the SCAQMD threshold of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of this mitigation measure would slightly increase the emissions of CO due to the emissions control technology used, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. For all other criteria pollutants, emission levels would remain below the applicable thresholds of significance. As the proposed project's maximum regional emissions from construction would not exceed the regional thresholds of significance, the proposed project would be consistent with the AQMP and cumulative impacts would be less than significant.

Operation of the proposed project would be consistent with the AQMP as the proposed project would not generate emissions of nonattainment pollutants or precursors (i.e., VOC, NO_x, CO, SO_x, PM₁₀, and PM_{2.5}) that exceed the applicable significance thresholds. Therefore, the proposed project would result in a less than significant cumulative operational impact.

Project-Specific Impacts

Construction

As described above under Impact 3.2-2 and Impact 3.2-3, regional and localized emissions during construction of the proposed project would exceed the SCAQMD significance threshold for NO_x. Thus, based on SCAQMD methodology, the proposed project construction emissions would represent a considerable contribution to a cumulative impact, resulting in a potentially significant

cumulative impact. The proposed project's construction-related daily emissions would be reduced to below the SCAQMD regional and local thresholds of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of Mitigation Measure AIR-1 would slightly increase the emissions of CO due to the emissions control technology used, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. As the proposed project's maximum mitigated regional emissions from construction would not exceed the regional thresholds of significance, the proposed project would not represent a considerable contribution to a cumulative impact, resulting in a less than cumulative impact.

Operation

As discussed under Impact 3.2-2 and Impact 3.2-3, above, regional and localized operational emissions of VOC, NO_x, CO, PM₁₀, and PM_{2.5} would not exceed the SCAQMD significance thresholds. Thus, based on SCAQMD methodology, the proposed project operational emissions would not represent a considerable contribution to a cumulative impact, resulting in a less than significant cumulative impact.

Mitigation Measures

Implement Mitigation Measure AIR-1

Significance Determination

Less than Significant Impact with Mitigation

3.3 Biological Resources

This section evaluates the potential for impacts related to biological resources resulting from construction and operation of the proposed project. This section includes: a description of the existing biological resources conditions in and around the proposed project site; a summary of applicable regulations related to biological resources; and an evaluation of the potential impacts of the proposed project related to biological resources in and around the Project site, including cumulative impacts. The biological resources described in this section are based on the findings provided in the Syphon Reservoir Improvement Project Biological Resources Technical Report (ESA 2021; **Appendix C**).

3.3.1 Environmental Setting

The proposed project site is located within central Orange County, California. The proposed project site is within the Central Subregion of the Orange County Central & Coastal Subregions Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP). Although the proposed project site is located within the NCCP/HCP Reserve (**Figure 3.3-1**), the existing reservoir is not actually within the NCCP/HCP Reserve; rather, it is surrounded by it. Significant regional geographic features around the area include the Santa Ana Mountains to the northeast, the Tustin plain and the City of Irvine to the north and southwest. The proposed project site is within the Newport Bay watershed. The climate in the region is Mediterranean, with dry summers and moderately wet winters; however, the region has experienced severe drought conditions in recent years.

The proposed project site was previously part of the Irvine Ranch and was subject to disturbance in the 1940s for planting of orchards and construction of the reservoir to provide irrigation for agricultural uses. In the 1970s, agriculture was expanded within the eastern and northern portions of the project site, mainly for citrus orchards. Following construction of the dam, impounded water accumulated from direct runoff from the Highline Canal. Currently within the proposed project site, a portion of the Highline Canal conveys recycled water flows from IRWD's Rattlesnake Reservoir into Syphon Reservoir. The Highline Canal, located southwest of the Syphon Reservoir, was historically used for irrigation but has been abandoned. Additionally, a culvert inlet in the northeast portion of the project site conveys stormwater runoff from a portion of the open space area east of the reservoir (under SR-133 and SR-241), and multiple culverts within the project site drain the upland portions of the reservoir. The central drainage supports riparian habitat and conveys intermittent flow through the center of the project site to the reservoir. With the exception of limited seasonal inflows from rain events, IRWD controls all flows in and out of the reservoir, as part of their recycled water storage and management. The reservoir currently drains through a series of underground pipes that convey flows through a strainer and chlorination facility, before being distributed to customers through IRWD's recycled water system.

SOURCE: ESRI, 2020.

Syphon Reservoir Improvement Project

Figure 3.3-1
Project Site Location within NCCP/HCP

Between 1995 and 2000, approximately 102 acres of the project site were preserved and 112 acres were restored to native coastal sage scrub habitat as mitigation for the Transportation Corridor Agencies (TCA) Eastern Transportation Corridor Project's impacts to coastal California gnatcatcher (*Poliophtila californica californica*). Restoration activities involved removal of orchard trees, native coastal sage scrub planting, temporary irrigation, and monitoring. The revegetation was successfully completed in accordance with regulatory requirements and supported mature coastal sage scrub suitable for California gnatcatcher (Dudek 2012). When IRWD acquired Syphon Reservoir from the Irvine Company (TIC), the Conveyance Agreement included a Grant Deed with use restrictions to protect biological resources within the area that was used for mitigation for the TCA (as shown in Figure 3.3-1).

Since completion of the restoration program in 2000, on-site management of biological resources was limited to annual cowbird trapping (which is required in perpetuity) and few additional studies, including a cactus transplantation and subsequent cactus wren monitoring in the northwest portion of the property. In October 2007, the entire project site burned in the Santiago Fire and was in post-fire succession through 2020 (Dudek 2012). The proposed project site supports native vegetation communities, restored coastal sage scrub, and some disturbed communities.

The majority of the proposed project site was burned again in the October 2020 Silverado Fire, and much of the vegetation on-site was destroyed by the fire. However, since native natural communities such as coastal sage scrub are adapted to fire, it is anticipated most of the vegetation should regrow to pre-fire conditions or similar, though it is possible the habitat quality may be degraded by opportunistic non-native invasive plant species. To provide a conservative assessment, this analysis presents the biological conditions at the time the Notice of Preparation (NOP) was published and analyzes proposed project impacts against those conditions.

Topography

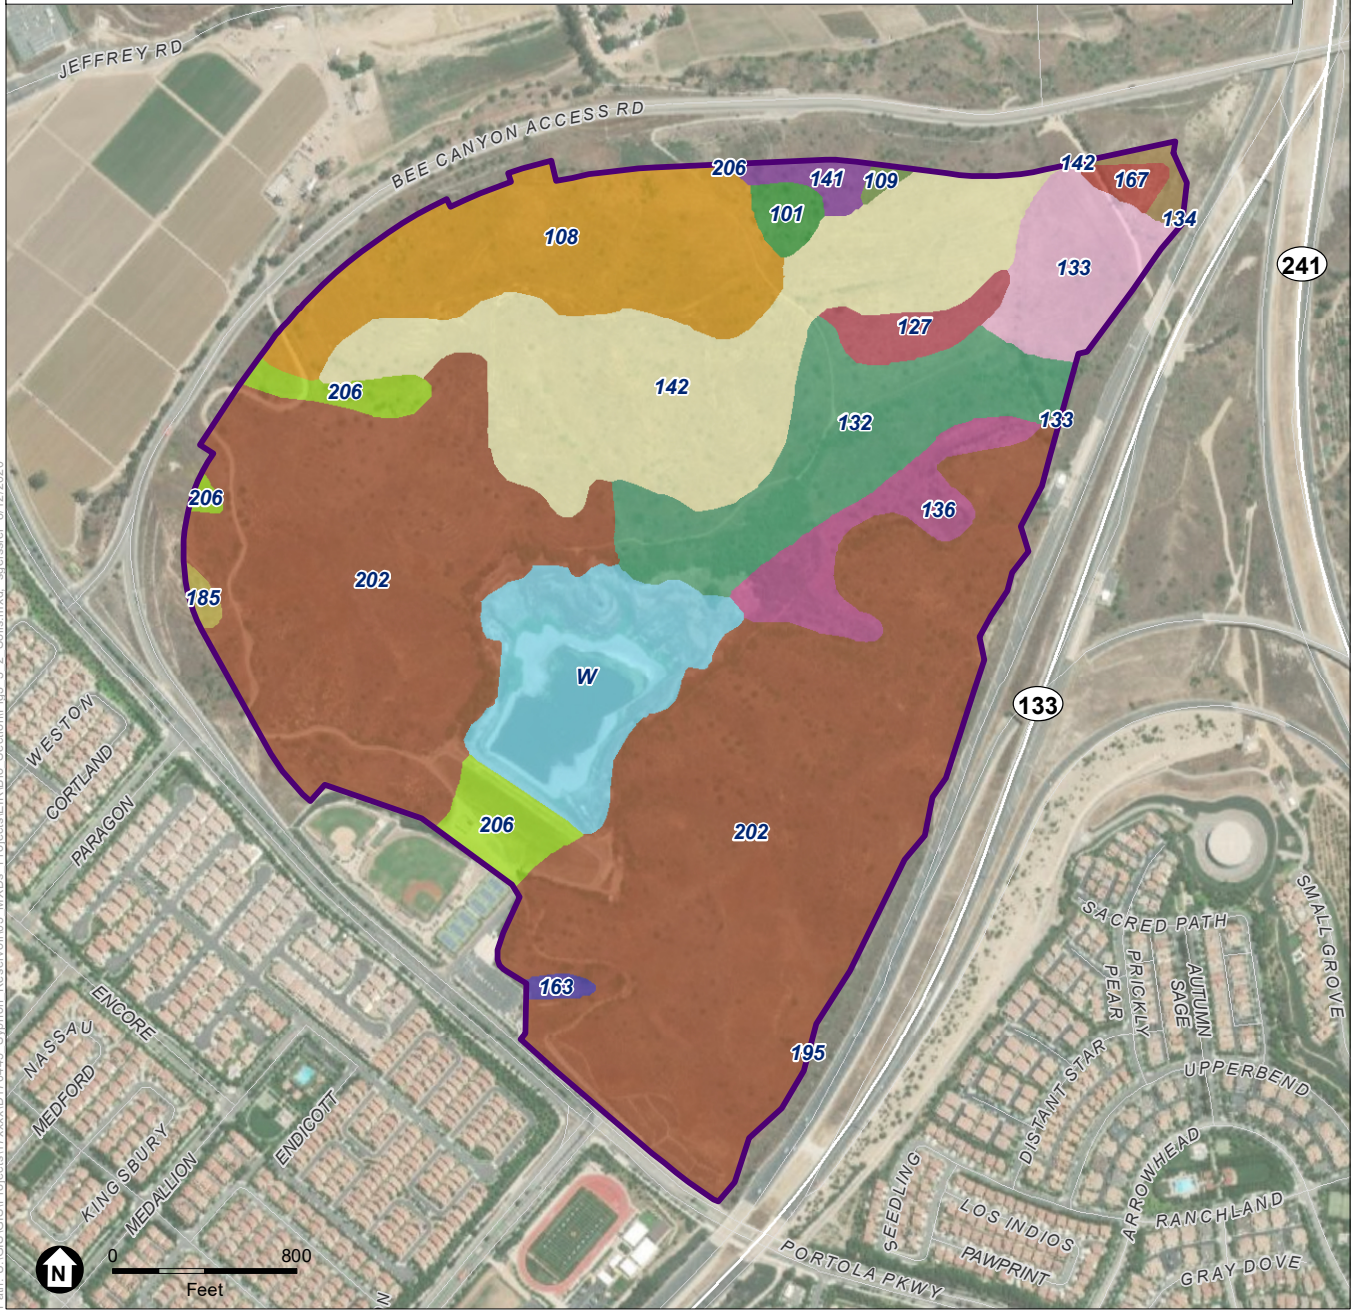

The proposed project site is characterized by steep topography of rolling hills, ridgelines and terraced slopes (from previous agricultural activities) surrounding the reservoir in the center of the project site. Within the project site, elevations range from 326 to 654 feet (99 to 200 meters) above mean sea level.

Soils

Based on review of the Natural Resources Conservation Service (NRCS) *Web Soil Survey* (2018), the proposed project site contains 16 soil series (**Figure 3.3-2**). The following is a brief description of mapped soils within the project site.

Alo Clay

Alo clay, 15 to 30 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay in the first 22 inches, and weathered bedrock from 22 to 59 inches. Alo clay loam is not considered hydric by the NRCS.

SOURCE: ESRI, 2016; USDA, 2018

Syphon Reservoir Improvement Project

Figure 3.3-2
Soils

Anaheim Clay Loam

Anaheim clay loam, 15 to 30 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay loam in the first 26 inches, and weathered bedrock from 26 to 59 inches. Anaheim clay loam is not considered hydric by the NRCS.

Anaheim clay loam, 30 to 50 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay loam in the first 26 inches, and bedrock from 26 to 59 inches. Anaheim clay loam is not considered hydric by the NRCS.

Bosanko Clay

Bosanko clay, 15 to 30 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is slightly alkaline to moderately acidic. The profile consists of clay in the first 31 inches, and weathered bedrock from 31 to 59 inches. Bosanko clay is not considered hydric by the NRCS.

Botella Clay Loam

Botella clay loam, 2 to 9 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is slightly alkaline to moderately acidic. The profile consists of clay loam in the first 8 inches, silty clay loam between 8 and 35 inches, and clay loam from 35 to 66 inches. Botella clay loam is not considered hydric by the NRCS.

Botella clay loam, 9 to 15 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay loam in the first 8 inches, silty clay loam between 8 and 35 inches, and sandy clay loam from 35 to 66 inches. Botella clay loam is not considered hydric by the NRCS.

Calleguas Clay Loam

Calleguas clay loam, 50 to 75 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay loam in the first 11 inches, very channery clay loam between 11 and 15 inches, and bedrock from 15 to 42 inches. Calleguas clay loam is not considered hydric by the NRCS.

Capistrano Sandy Loam

Capistrano sandy loam, 9 to 15 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is neutral to medium acidic. The profile consists of sandy loam in the first 27 inches and fine sandy loam between 27 and 65 inches. Capistrano sandy loam is not considered hydric by the NRCS.

Cieneba Sandy Loam

Cieneba sandy loam, 15 to 30 percent slopes, is a somewhat excessively-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile

consists of sandy loam in the first 17 inches, and weathered bedrock from 17 to 59 inches. Cieneba sandy loam is not considered hydric by the NRCS.

Cieneba sandy loam, 30 to 75 percent slopes, is a somewhat excessively drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is neutral to strongly acidic. The profile consists of sandy loam in the first 17 inches and weathered bedrock between 17 and 59 inches. Cieneba sandy loam is not considered hydric by the NRCS.

Metz Loamy Sand

Metz loamy sand is a somewhat excessively-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of loamy sand in the first 17 inches, and stratified sand to fine sandy loam from 17 to 63 inches. Metz loamy sand is not considered hydric by the NRCS.

Mocho Loam

Mocho loam, 2 to 9 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of loam in the first 60 inches. Mocho loam is not considered hydric by the NRCS.

Pits

Pits consist of concave igneous, metamorphic, and sedimentary rock. The profile consists of extremely gravelly coarse sand in the first 6 inches, and extremely gravelly sand, extremely gravelly coarse sand, or very gravelly coarse sand from 6 to 60 inches. Pits are not considered hydric by the NRCS.

San Emigdio Fine Sandy Loam

San Emigdio fine sandy loam, 2 to 9 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of fine sandy loam in the first 7 inches, and stratified gravelly loamy coarse sand to fine sandy loam from 7 to 61 inches. San Emigdio fine sandy loam is not considered hydric by the NRCS.

Soper Gravelly Loam

Soper gravelly loam, 30 to 50 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is mildly alkaline to slightly acidic. The profile consists of gravelly loam in the first 8 inches, gravelly clay loam between 8 and 29 inches, and bedrock from 29 to 79 inches. Soper gravelly loam is not considered hydric by the NRCS.

Sorrento Loam

Sorrento loam, 0 to 2 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of loam in the first 12 inches, silty clay loam between 12 and 62 inches, and sandy loam from 62 to 72 inches. Sorrento loam is not considered hydric by the NRCS.

Natural Communities

The upland parts of the proposed project site primarily exhibit forms of coastal sage scrub and non-native herbaceous communities with variable levels of native versus non-native plant species cover. The most prevalent forms include the California sagebrush alliance and non-native herbaceous cover/California sagebrush alliance (i.e., communities intermixed with both native and non-native species) in the upland areas. Woody riparian vegetation (e.g., arroyo willow and mule fat) and patches of tules (i.e., a form of freshwater marsh habitat dominated by cat tails and bulrushes) occur around the fringe of the existing reservoir in areas that are frequently inundated.

Natural communities are mapped in **Figure 3.3-3**. The natural communities are described below according to the *Methods Used to Survey the Vegetation of Orange County Parks and Open Space Areas and The Irvine Company Property* (Jones & Stokes Associates 1993), *Orange County Habitat Classification System* (OCHCS) (Gray and Bramlet 1992) and California natural alliances described in *A Manual of California Vegetation, Second Edition* (Sawyer et al. 2009). Acreages of each natural community in the proposed project site are summarized in **Table 3.3-1**. Alternate names for communities are indicated in parentheses. Natural communities considered that are identified as sensitive on the California Natural Community List (California Department of Fish and Wildlife [CDFW] 2019b) are also noted as such.

Arroyo Willow Thicket

Arroyo willow thicket (i.e., *Salix lasiolepis* Shrubland Alliance or Arroyo Willow Riparian Forest [OCHCS 7.6]) is characterized by a canopy cover dominated by mature arroyo willow (*Salix lasiolepis*) with an understory of smaller willows, and variable herbaceous layer. This alliance is typically found within stream banks and benches, slope seeps, and stringers along drainages (Sawyer et al. 2009). A total of 0.24 acre of arroyo willow thicket occurs primarily within the northern and northeastern portions of the proposed project site.

Arroyo willow thicket is considered a sensitive natural community by CDFW (61.201.01 – *Salix lasiolepis*) (CDFW 2019b).

Black Willow Thicket

Black willow thicket (i.e., *Salix gooddingii* Woodland Alliance or Black Willow Riparian Forest [OCHCS 7.7]) is characterized by a canopy cover dominated by mature black willow (*Salix gooddingii*) with an understory of smaller willows, mule fat (*Baccharis salicifolia*), and variable herbaceous layer. This alliance is typically found on terraces along large rivers, canyons, and along rocky floodplains of small, intermittent streams, seeps, and springs (Sawyer et al. 2009). Species associated with this alliance include native arroyo willow and non-native tamarisk (*Tamarix ramosissima*) and red gum (*Eucalyptus camaldulensis*). A total of 4.13 acres of black willow thicket was mapped around the northern and northeastern perimeter of the reservoir within the center of the proposed project site.

Black willow thicket is considered a sensitive natural community by CDFW (61.211.01 – *Salix gooddingii*) (CDFW 2019b).

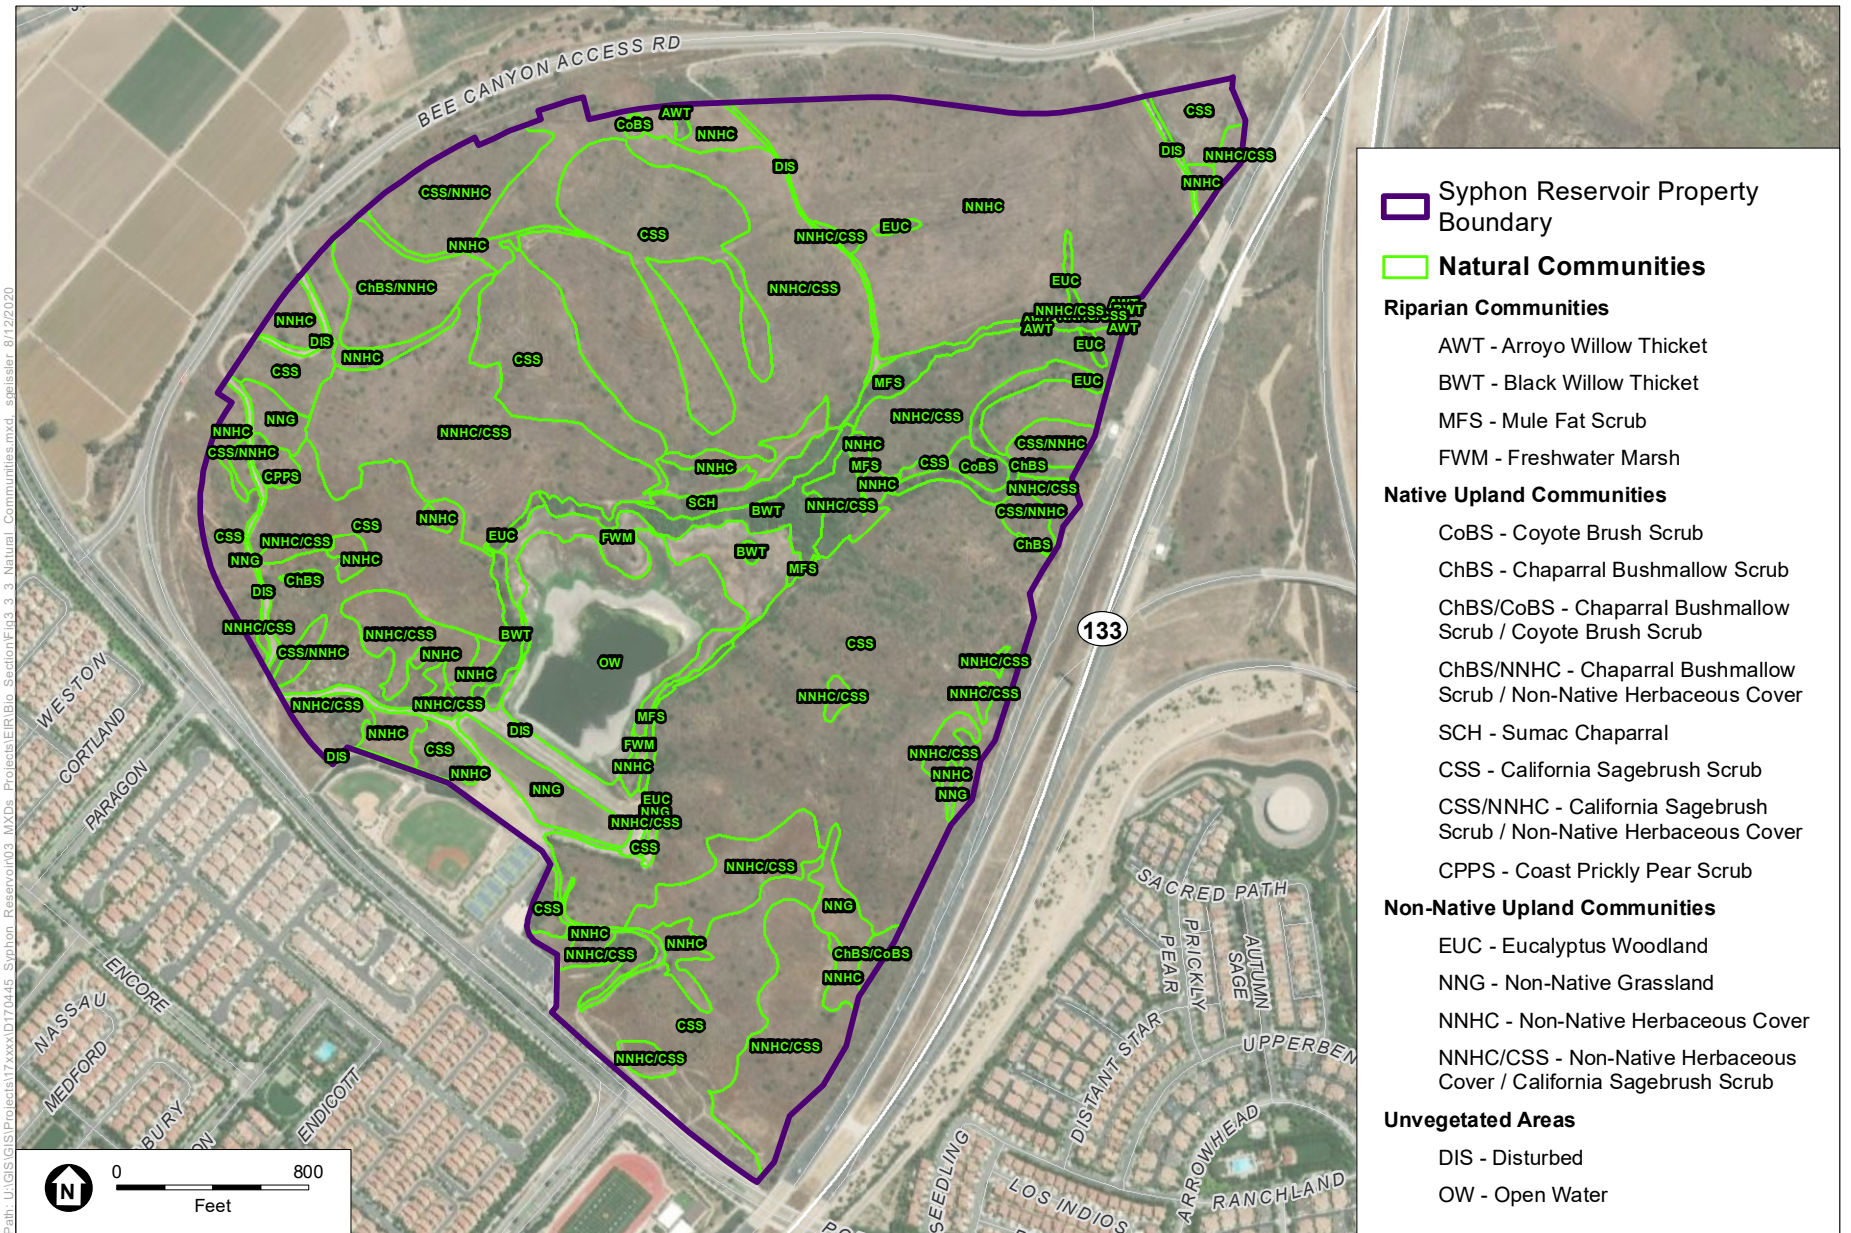

**TABLE 3.3-1
 NATURAL COMMUNITIES**

Natural Community	Acres	State Rank¹
Riparian Communities		
Arroyo Willow Thicket*	0.24	S4
Black Willow Thicket*	4.13	S3
Mule Fat Scrub	2.25	S4
Freshwater Marsh	5.87	S4
Native Upland Communities		
Coyote Brush Scrub**	0.91	S5
Chaparral Bushmallow Scrub**	0.45	S4

Chaparral Bushmallow Scrub/Non-Native Herbaceous Cover**	4.72	S4/None
Sumac Chaparral	1.63	S4
California Sagebrush Scrub**	91.74	S5
California Sagebrush Scrub**/Non-Native Herbaceous Cover	7.86	S5/None
Coast Prickly Pear Scrub*	0.69	S3
Non-Native Upland Communities		
Eucalyptus Woodland	2.78	None
Non-Native Grassland	5.27	None
Non-Native Herbaceous Cover	44.16	None
Non-Native Herbaceous Cover/California Sagebrush Scrub**	71.70	None/S5
Unvegetated Areas		
Open Water	13.93	None
Disturbed	6.92	None
Total	265.74	

* Asterisk indicates that an alliance/association is considered sensitive by CDFW.

** Double asterisk indicates that an alliance/association that is a covered habitat type under the NCCP/HCP and is therefore considered a sensitive natural community.

¹ CDFW state rank denotes the rarity of a natural type within the state as follows:
 S1 = Critically Imperiled – At very high risk of extirpation due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.
 S2 = Imperiled – At high risk of extirpation due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
 S3 = Vulnerable – At moderate risk of extirpation due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
 S4 = Apparently Secure – At a fairly low risk of extirpation due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.
 S5 = Secure - At very low or no risk of extirpation due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats.

SOURCE: ESRI, 2016

Syphon Reservoir Improvement Project

Figure 3.3-3
Natural Communities

Mule Fat Scrub

Mule fat scrub (i.e., mulefat thickets [*Baccharis salicifolia* Shrubland Alliance]; OCHCS 7.3) is characterized by large shrub cover dominated by mule fat and variable herbaceous layer. This alliance is typically found within canyon bottoms, floodplains, lake margins, and stream channels with soils of mixed alluvium (Sawyer et al. 2009). Species associated with this alliance include native black willow, California sagebrush (*Artemisia californica*), laurel sumac (*Malosma laurina*), cocklebur (*Xanthium strumarium*), and non-native Spanish false fleabane (*Pulicaria paludosa*), and black mustard (*Brassica nigra*). A total of 2.25 acres of black willow thicket were mapped around the northern and northeastern perimeter of the reservoir within the center of the proposed project site.

Mule fat scrub is not considered a sensitive natural community by CDFW (63.510.01 – *Baccharis salicifolia*) (CDFW 2019b).

Freshwater Marsh

Freshwater marsh (i.e., California Bulrush Marsh [*Schoenoplectus californicus* Herbaceous Alliance]; OCHCS 6.4) is characterized by a dominance of dense stands of California bulrush (*Schoenoplectus californicus*) in the herbaceous layer. This alliance is typically found within freshwater or brackish marshes, shores, bars, and channels of river mouth estuaries, within areas with soils that have a high organic contents and are poorly aerated (Sawyer et al. 2009). Dried cattails (*Typha* sp.) were also observed within this alliance. A total of 5.87 acres of freshwater marsh occur around the northern and northeastern perimeter of the reservoir in the center of the proposed project site.

Freshwater marsh is not considered a sensitive natural community by CDFW (52.114.02 – *Schoenoplectus californicus*) (CDFW 2019b).

Coyote Brush Scrub

Coyote brush scrub (i.e., *Baccharis pilularis* Shrubland Alliance; Coyote Brush [OCHCS 2.3.9]) is characterized by a dominance of coyote brush (*Baccharis pilularis*) in the shrub layer. This alliance is typically found within river mouths, stream sides, terraces, open slopes, and ridges, within variable soils (Sawyer et al. 2009). A total of 0.91 acre of coyote brush scrub was mapped around the northern and northeastern portions of the proposed project site.

Coyote brush scrub is not considered a sensitive natural community by CDFW (32.060.23 – *Baccharis pilularis*) (CDFW 2019b).

Chaparral Bushmallow Scrub

Chaparral bushmallow scrub (i.e., bush mallow scrub [*Malacothamnus fasciculatus* Shrubland Alliance]; Bush Mallow [OCHCS 2.3.11]) is dominated by chaparral bushmallow (*Malacothamnus fasciculatus*) in the shrub layer. This alliance is typically found within gentle to very steep slopes of variable aspect within loam or clay soils (Sawyer et al. 2009). Species associated with this alliance include native laurel sumac, California brittlebush (*Encelia californica*), California matchweed (*Gutierrezia californica*), giant wild rye (*Elymus condensatus*), and non-native short-podded

mustard (*Hirschfeldia incana*). A total of 0.45 acre of chaparral bushmallow scrub was mapped around the northeastern and western portions of the proposed project site.

Chaparral bushmallow scrub is not considered a sensitive natural community by CDFW (45.450.01 – *Malacothamnus fasciculatus*) (CDFW 2019b).

Chaparral Bushmallow Scrub/Coyote Brush Scrub

Chaparral bushmallow scrub/coyote brush scrub (OCHCS 2.3.11/2.3.9) is characterized by a shrub layer with a dominance of chaparral bushmallow and a sub-dominance of coyote brush. A total of 0.49 acre of chaparral bushmallow scrub/coyote brush scrub was mapped in the southern portion of the proposed project site.

Chaparral bushmallow scrub/coyote brush scrub is not considered a sensitive natural community by CDFW (45.450.01 – *Malacothamnus fasciculatus*/32.060.23 – *Baccharis pilularis*) (CDFW 2019b).

Chaparral Bushmallow Scrub/Non-Native Herbaceous Cover

Chaparral bushmallow scrub/non-native herbaceous cover (OCHCS 2.3.11; *Brassica (nigra)* and Other Mustards [Semi-Natural Herbaceous Stand]; Ruderal [OCHCS 4.6]) is characterized by a shrub layer with a dominance of chaparral bushmallow and a sub-dominance of non-native herbaceous cover. A total of 4.72 acres of chaparral bushmallow scrub/non-native herbaceous cover were mapped in the western portion of the proposed project site.

Chaparral bushmallow scrub/non-native herbaceous cover is not considered a sensitive natural community by CDFW (45.450.01 – *Malacothamnus fasciculatus*) (CDFW 2019b).

Sumac Chaparral

Sumac chaparral (i.e., *Malosma laurina* Shrubland Alliance; Toyon-Sumac [OCHCS 3.12]) is characterized by large shrub cover dominated by laurel sumac with a variable understory of coastal sage scrub species and/or herbaceous grassy layer. This alliance is typically found on slopes, which are often steep, within soils that are shallow and fine-textured (Sawyer et al. 2009). Species associated with this alliance include native California sagebrush. A total of 1.63 acres of sumac chaparral were mapped throughout the eastern portion of the proposed project site.

Sumac chaparral is not considered a sensitive natural community by CDFW (45.455.01 – *Malosma laurina*) (CDFW 2019b).

California Sagebrush Scrub

California sagebrush scrub (i.e., *Artemisia californica* Shrubland Alliance; Sagebrush [OCHCS 2.3.6]) is characterized by a dominance of by California sagebrush intermixed with coastal sage scrub species and a variable herbaceous layer. This alliance is typically found on slopes that are usually steep and rarely flooded within soils that are alluvial or colluvial derived shallow (Sawyer et al. 2009). Species associated with this alliance include native California buckwheat (*Eriogonum fasciculatum*), laurel sumac, California brittle bush, California matchweed, deerweed (*Acmispon*

glaber), lemonadeberry (*Rhus integrifolia*), chaparral bushmallow, coast live oak (*Quercus agrifolia*), toyon (*Heteromeles arbutifolia*), Island false bindweed (*Calystegia macrostegia*), foothill needlegrass (*Stipa lepida*), black sage (*Salvia mellifera*), white sage (*Salvia apiana*), soap plant (*Chlorogalum pomeridianum*), prickly pear (*Opuntia littoralis*), common goldenstar (*Bloomeria crocea*), false rosinweed (*Osmadenia tenella*), California plantain (*Plantago erecta*), and Ladies' tobacco (*Pseudognaphalium californicum*), and non-native black mustard, foxtail chess (*Bromus madritensis*), Mexican fan palm (*Washingtonia robusta*), giant yucca (*Yucca gigantea*), oleander (*Nerium oleander*), Chinese elm (*Ulmus parvifolia*), and fountaingrass (*Pennisetum setaceum*). A total of 91.74 acres of California sagebrush scrub occurs throughout the proposed project site.

California sagebrush scrub is not considered a sensitive natural community by CDFW (32.010.01 – *Artemisia californica*) (CDFW 2019b). However, this alliance is recognized as a covered habitat type within the Central & Coastal NCCP/HCP, and is therefore considered a sensitive natural community.

California Sagebrush Scrub/Non-Native Herbaceous Cover

California sagebrush scrub/non-native herbaceous cover (i.e., *Artemisia californica* Shrubland Alliance; Sagebrush [OCHCS 2.3.6]; *Brassica (nigra)* and Other Mustards [Semi-Natural Herbaceous Stand]; Ruderal [OCHCS 4.6]) is characterized by a dominance of California sagebrush intermixed with a sub-dominance of non-native herbaceous cover primarily comprised of black mustard. Species associated with this alliance include native California buckwheat, chaparral bushmallow, fasciated tarweed (*Deinandra fasciculata*), black sage, prickly pear, splendid mariposa lily (*Calochortus splendens*), wishbone bush (*Mirabilis laevis*), golden yarrow (*Eriophyllum confertiflorum*), and non-native tocalote (*Centaurea melitensis*), slender oat (*Avena barbata*), Australian saltbush (*Atriplex semibaccata*). A total of 7.86 acres of California sagebrush scrub/non-native herbaceous cover occurs throughout the proposed project site.

California sagebrush scrub/non-native herbaceous cover is not considered a sensitive natural community by CDFW (32.010.01 – *Artemisia californica*) (CDFW 2019b). However, this alliance is recognized as a covered habitat type within the Central & Coastal NCCP/HCP, and is therefore considered a sensitive natural community.

Coast Prickly Pear Scrub

Coast prickly pear scrub (i.e., *Opuntia littoralis* Shrubland Alliance; Southern Cactus [OCHCS 2.4]) is characterized by a dominance of by prickly pear intermixed with coastal sage scrub species. This alliance is typically found on south-facing slopes within soils that are shallow loams and clays that may be rocky (Sawyer et al. 2009). Species associated with this alliance include native laurel sumac, lemonadeberry, California sagebrush, California buckwheat, deerweed, blue elderberry (*Sambucus nigra* ssp. *caerulea*), and non-native fountaingrass and tree tobacco (*Nicotiana glauca*). A total of 0.69 acre of coast prickly pear scrub occurs within the western portion of the proposed project site.

Coast prickly pear scrub is considered a sensitive natural community by CDFW (32.150.02 – *Opuntia littoralis* – mixed coastal sage scrub) (CDFW 2019b).

Eucalyptus Woodland

Eucalyptus woodland (i.e., eucalyptus groves [*Eucalyptus* Semi-Natural Woodland Stands]; Ornamental Landscaping [OCHCS 15.5]) is dominated of by planted rows of gum trees. Associated species include native coyote brush and laurel sumac. A total of 2.78 acres of eucalyptus woodland occurs within the central and northeastern portion of the proposed project site.

Eucalyptus woodland is not considered a sensitive natural community by CDFW (CDFW 2019b).

Non-Native Grassland

Non-native grassland (i.e., *Bromus madritensis* [Semi-Natural Herbaceous Stands]; Annual [OCHCS 4.1]) is dominated of by foxtail chess with a mix of non-native and native grasses and forbs. Species associated with this alliance include native telegraph weed (*Heterotheca grandiflora*), Island false bindweed, California buckwheat, deerweed, Menzies' goldenbush (*Isocoma menziesii* var. *menziesii*), blue elderberry, prickly pear, fiddleneck (*Amsinckia* sp.), and non-native red-stemmed filaree (*Erodium cicutarium*), Russian thistle (*Salsola tragus*), castor bean (*Ricinus communis*), and fountaingrass. A total of 5.27 acres of non-native grassland occurs within the southern portion of the proposed project site.

Non-native grassland is not considered a sensitive natural community by CDFW (CDFW 2019b).

Non-Native Herbaceous Cover

Non-native herbaceous cover (i.e., *Brassica (nigra)* and other mustard species [Semi-Natural Herbaceous Stand]; Ruderal [OCHCS 4.6]) is characterized by a dominance of by black mustard. This alliance is typically associated with fallow fields, grasslands, roadsides, disturbed scrublands, riparian areas, and waste places (Sawyer et al. 2009). Species associated with this alliance include native telegraph weed, laurel sumac, fascicled tarweed, Our Lord's candle (*Hesperoyucca whipplei*), foothill needlegrass, mule fat, western prickly pear (*Opuntia occidentalis*), and non-native foxtail chess, Peruvian pepper (*Schinus molle*), ripgut brome (*Bromus diandrus*), horehound (*Marrubium vulgare*), and tuna cactus (*Opuntia ficus-indica*). A total of 44.16 acres of non-native herbaceous cover coast occurs throughout the proposed project site.

Non-native herbaceous cover is not considered a sensitive natural community by CDFW (CDFW 2019b).

Non-Native Herbaceous Cover/California Sagebrush Scrub

Non-native herbaceous cover/California sagebrush scrub (i.e., *Brassica (nigra)* and Other Mustards [Semi-Natural Herbaceous Stand]; Ruderal [OCHCS 4.6]; *Artemisia californica* Shrubland Alliance; Sagebrush [OCHCS 2.3.6]) is dominated by black mustard with a sub-dominance of intermixed coastal sage scrub species. A total of 71.70 acres of non-native herbaceous cover/California sagebrush scrub coast occurs throughout the proposed project site.

Non-native herbaceous cover/California sagebrush scrub is not considered a sensitive natural community by CDFW (CDFW 2019b). Although California sagebrush scrub is recognized as a covered habitat type within the Central & Coastal NCCP/HCP and is considered to have value to

covered species in that context, this non-native herbaceous cover/California sagebrush scrub community is predominantly disturbed and dominated by non-native herbaceous cover; thus, it is not considered a sensitive natural community.

Open Water

Open water (OCHCS 12.2) consists of the reservoir, and natural vegetation present within this area is negligible. A total of 13.93 acres of open water occurs within the proposed project site.

Open water is not considered a sensitive natural community by CDFW (CDFW 2019b).

Disturbed

Disturbed (i.e., Disturbed or Barren [OCHCS 16.1]) includes lands that have been significantly disturbed as the result of human activity, and natural vegetation is very sparse or absent from these areas. Associated species found occasionally may include non-native foxtail chess, short-podded mustard, yellow sweetclover (*Melilotus officinalis*), Mexican sprangletop (*Leptochloa fusca* ssp. *uninervia*), fountaingrass, tree tobacco, red-stemmed filaree, and Mediterranean grass (*Schismus barbatus*). Disturbed areas within the project site include unpaved dirt trails that provide access around the perimeter of the reservoir and also include the earthen dam which is actively maintained to limit any vegetation from becoming established. A total of 6.92 acres of disturbed areas occur within the proposed project site.

Disturbed areas are not considered a sensitive natural community by CDFW (CDFW 2019b).

Jurisdictional Resources

The U.S. Army Corps of Engineers (USACE) issued an Approved Jurisdictional Determination letter (Appendix C), which confirmed the determination that waters of the U.S. do not occur within the proposed project site since Syphon Reservoir is an intrastate isolated water with no apparent interstate or foreign commerce connection (USACE 2018). Thus, the proposed project site only includes features potentially subject to the jurisdiction of the State (i.e., Regional Water Quality Control Board [RWQCB] wetlands and non-wetland waters of the State, and CDFW lakes, streams, and associated vegetation). **Table 3.3-2** and **Figures 3.3-4A** and **3.3-4B** identify and quantify the areas regulated by the RWQCB and CDFW within the project site.

TABLE 3.3-2
POTENTIALLY JURISDICTIONAL AREAS

Jurisdiction Types	Acres
RWQCB Wetlands	4.33
RWQCB Non-Wetland Waters of the State	13.95
CDFW Lakes, Streams, and Associated Vegetation	26.55

SOURCE: ESRI, 2016

Syphon Reservoir Improvement Project

Figure 3.3-4B
CDFW Jurisdictional Areas

RWQCB Wetlands and Waters of the State

Wetlands

The freshwater wetlands within the proposed project site are largely dominated by native plant species including California bulrush (OBL¹), black willow (FACW²), and yellow sweetclover (*Melilotus officinalis*, FACU³). This habitat also supports a range of non-native plant species including seaside heliotrope (*Heliotropium curassavicum*, FACU), spiny cocklebur (*Xanthium strumarium*, FAC), short-podded mustard (UPL⁴), and telegraph weed (UPL). The wetlands occur along the margins of Syphon Reservoir (Figure 3.3-4A). Although not mapped as hydric soils according to NRCS, hydric soil indicators were observed in the wetlands include the presence of muck, hydrogen sulfide, depleted below dark surface, redox dark surface, and sandy gleyed matrix. The wetland areas generally had very silty loam, clay soils, while sandy soils were encountered at one soil pit. Indicators of wetland hydrology include a high water table, saturation, biotic crust, and hydrogen sulfide odor.

Waters of the State

The ordinary high-water mark (OHWM) of the reservoir was determined to be along the edge of the reservoir where surface water was observed at the time of the delineation, or based on physical characteristics of water fluctuation, such as downed emergent vegetation (Figure 3.3-4A). The water surface elevation of the reservoir is influenced by IRWD's management of the recycled water system. The reservoir functions as a seasonal recycled water storage facility; as such, the reservoir includes areas where open water persists throughout the year at a minimum water surface elevation but fluctuates seasonally up to a maximum water surface elevation based on demands for recycled water. The reservoir captures runoff from adjacent areas, including a primary drainage in the central portion of the project site that supports intermittent flows and riparian vegetation north of the reservoir and wetlands. However, there was no OHWM observed in this central drainage and the primary drainage was not mapped as potential waters of the State.

In addition, two ephemeral drainages (Ephemeral Drainage 1 and Ephemeral Drainage 2) were mapped north of the reservoir. These drainages convey stormwater runoff from upland areas to the central drainage via a culvert under the existing dirt road that runs along the west and north sides of the reservoir. The OHWM was an average of two feet wide, based on evidence of shelving. Ephemeral Drainage 1 supports a mix of non-native herbaceous cover and California sagebrush scrub, while Ephemeral Drainage 2 supports a mix of non-native herbaceous cover, California sagebrush scrub, and laurel sumac scrub. No surface water was observed in either drainage.

-
- ¹ OBL – obligate. Plant species with this wetland indicator status occur almost always under natural conditions in wetlands.
 - ² FACW – facultative wetland. Plant species with this wetland indicator status usually occur in wetlands but are occasionally found in non-wetlands.
 - ³ FACU – facultative upland. Plant species with this wetland indicator status usually occur in non-wetlands but are occasionally found in wetlands.
 - ⁴ UPL – upland. Plant species with this wetland indicator status occur in wetlands in another region, but occur almost always under natural conditions in non-wetlands in the Arid West Region.

CDFW Lakes, Streams, and Associated Vegetation

Areas within CDFW jurisdiction typically refer to streambeds and associated wetland or riparian vegetation. Within the proposed project site, the potential extent of CDFW limits was taken to the outer edge of the overhanging riparian or wetland vegetation adjacent to the reservoir, and to the top of bank for the ephemeral drainages (Figure 3.3-4B). Therefore, as shown in Table 3.3-2, approximately 26.55 acres of the proposed project site are deemed to be subject to CDFW jurisdiction.

Plant Species

The proposed project site currently supports native vegetation communities, restored coastal sage scrub, and natural communities that are moderately to substantially dominated by non-native species. A compendium of the plant species observed within the proposed project site is included in Appendix C. Special-status plant species are discussed in Section 3.3.8.2.

Wildlife Species

The upland and riparian communities within the proposed project site provide suitable habitat for a variety of wildlife species including reptiles, birds, and mammals, and many species were observed during surveys conducted in the project site. A compendium of the wildlife species observed within the proposed project site is included in Appendix C. Special-status wildlife species are discussed in Section 3.3.8.2.

Special-Status Biological Resources

Sensitive Natural Communities

Sensitive natural communities are designated as such by various resource agencies, such as the CDFW, or in local policies and regulations. These communities are generally considered to have important functions or values for wildlife and/or are recognized as declining in extent or distribution and may be considered threatened enough to warrant some level of protection. Sensitive natural communities include those that are identified in the CDFW *California Natural Community List* (CDFW 2019b). The CDFW state rank denotes the rarity and endangerment of a vegetation type within the state as described below, with S1 through S3 considered to be a sensitive natural community by CDFW.

State Conservation Rank

- S1** = Critically Imperiled – At very high risk of extirpation due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.
- S2** = Imperiled – At high risk of extirpation due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- S3** = Vulnerable – At moderate risk of extirpation due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.

S4 = Apparently Secure – At a fairly low risk of extirpation due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.

S5 = Secure - At very low or no risk of extirpation due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats.

Based on the state ranks, ten sensitive natural communities occur within the proposed project site: arroyo willow thicket, black willow thicket, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/coyote brush scrub, chaparral bushmallow scrub/non-native herbaceous cover, California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coast prickly pear scrub, and non-native herbaceous cover/California sagebrush scrub (**Figure 3.3-5**).

Special-Status Species

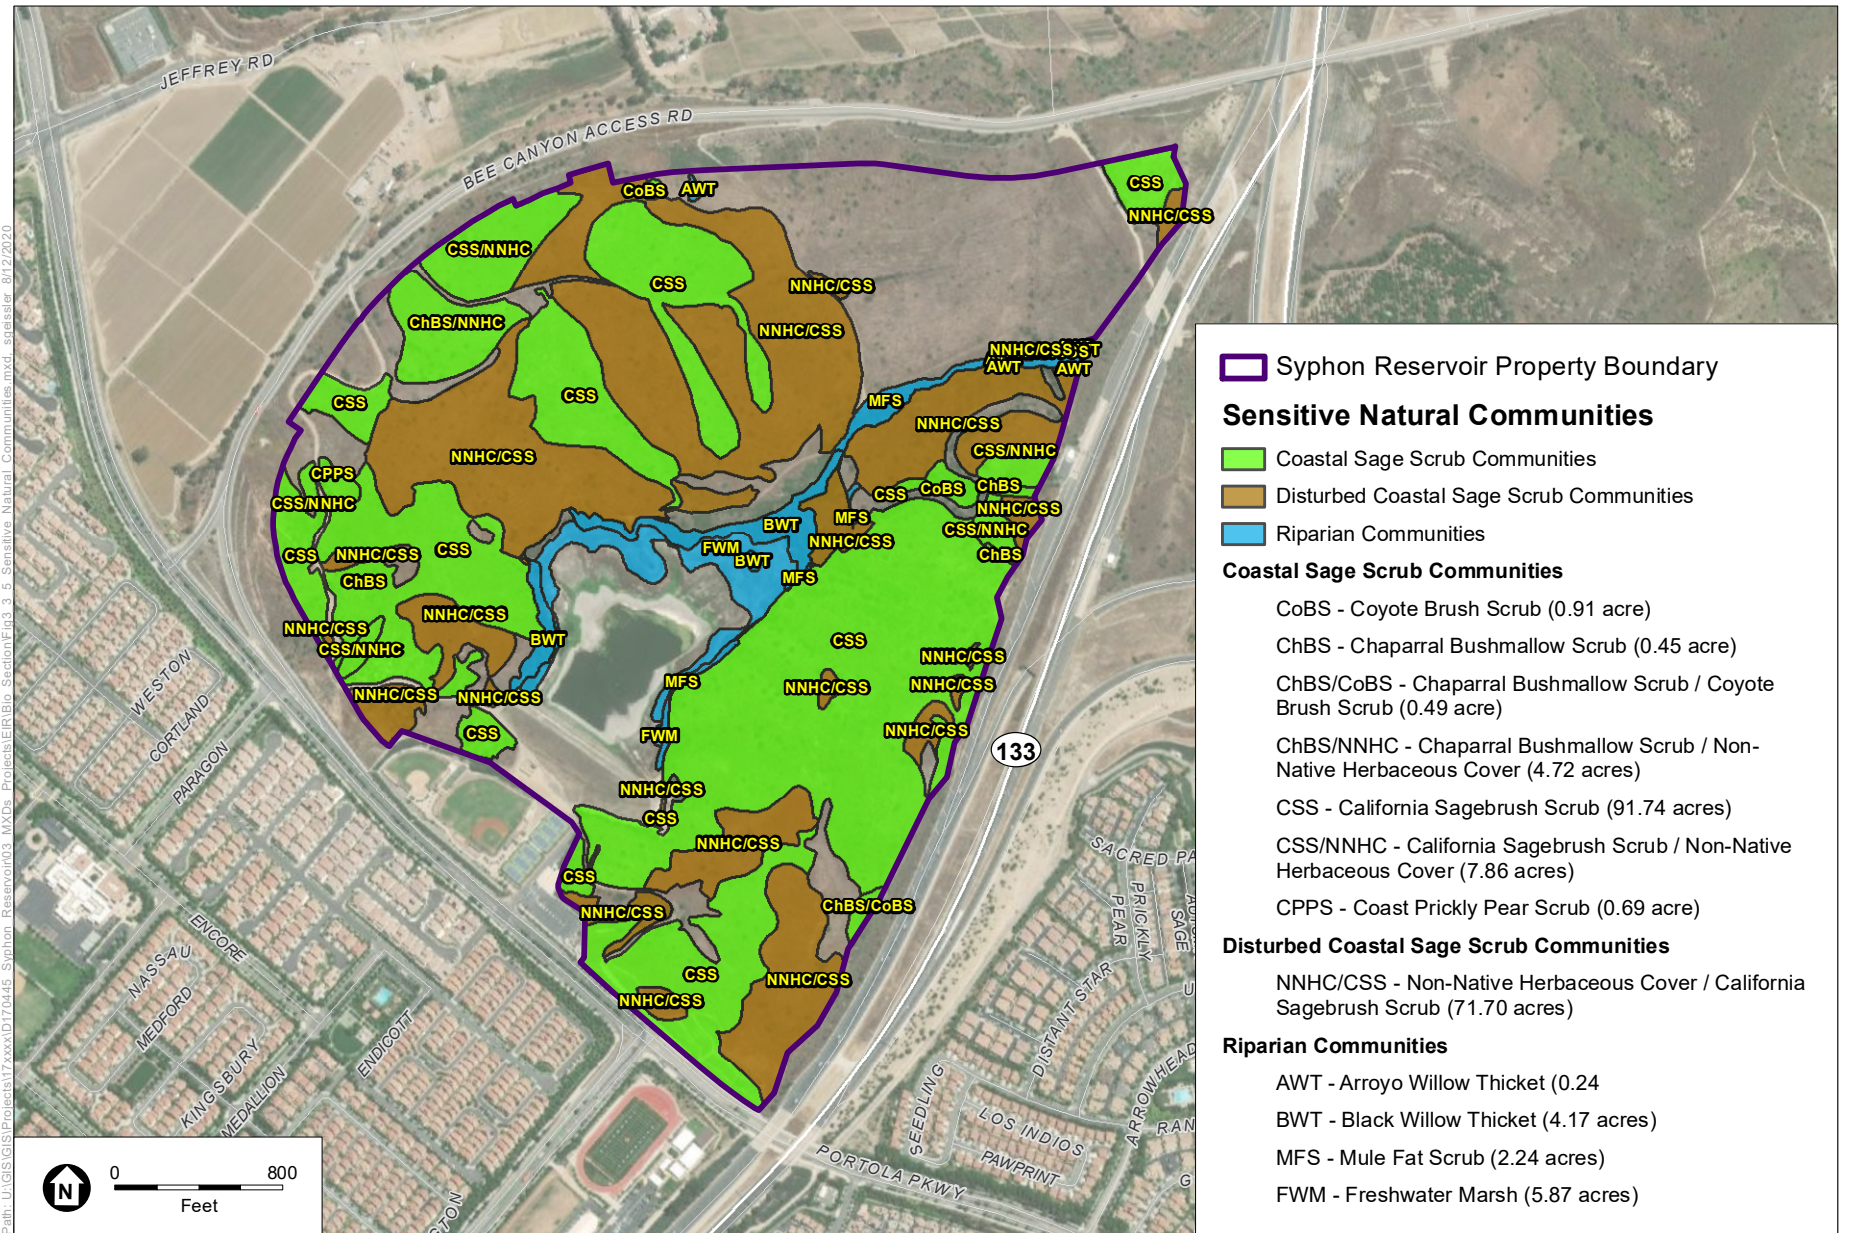

“Special-status” species are plants and animals that are listed under the California Endangered Species Act (CESA) or Federal Endangered Species Act (FESA), as well as species protected under other regulations and species that are considered sufficiently rare or sensitive by the scientific community to be considered rare. Special-status species are categorized as follows:

- Species listed or proposed for listing as threatened or endangered, or designated as candidates for possible future listing as threatened or endangered, under CESA or FESA.
- Species protected under the federal Bald and Golden Eagle Protection Act.
- Species that meet the definitions of rare or endangered under CEQA (State CEQA Guidelines § 15380).
- Plants designated as rare or endangered in accordance with the California Native Plant Protection Act (NPPA) (Fish and Game Code § 1900 et seq.).
- Plants considered by the CDFW and California Native Plant Society (CNPS) to be rare (California Rare Plant Ranks [CRPR] 1A, 1B, 2A, and 2B) in California.
- Species covered under an adopted Natural Community Conservation Plan (NCCP)/Habitat Conservation Plan (HCP).
- Species identified by CDFW and designated as Special Animals, including wildlife species designated as species of special concern in California (SC).
- Wildlife species listed as fully protected in California (California Fish and Game Code § 3511, 4700, and 5050).

Based on the literature review and field reconnaissance, special-status species were evaluated for their potential to occur within the proposed project site or immediate vicinity, using the following definitions:

Unlikely: The proposed project site or immediate vicinity do not support suitable habitat for a particular species, and therefore the species is unlikely to occur within the proposed project site.

Low Potential: The proposed project site or immediate vicinity only provide low-quality or very limited habitat for a particular species. In addition, the proposed project site may lie outside the known geographic or elevational range for a particular species.

SOURCE: ESRI, 2016

Syphon Reservoir Improvement Project
Figure 3.3-5
 Sensitive Natural Communities

Moderate Potential: The proposed project site or immediate vicinity provide suitable habitat for a particular species. However, the habitat or substrate may be limited or the desired vegetation assemblage or density is less than ideal.

High Potential: The proposed project site or immediate vicinity provides high-quality suitable habitat conditions for a particular species. Additionally, known populations of the species may occur in the project site or immediate vicinity.

Present: The species were observed within the proposed project site during relevant biological surveys or other project visits.

Based on the database search results, a list of potentially occurring special-status species was developed and evaluated for the study area. Special-status species with potential to occur were defined as those species whose geographic and elevational range include the project site and that require habitat similar to habitat present within the proposed project site or immediate vicinity.

Special-Status Plant Species

Of the 56 special-status plant species considered for their potential to occur within the proposed project site, 37 species are unlikely to occur and 15 species were assessed as having low potential to occur because the project site is outside of the known elevation range for these species and/or lacks suitable habitat to support these species. None of the special-status plant species with a low potential to occur were observed during focused surveys conducted in 2018 and 2019. Species determined to be unlikely or to have only a low potential to occur are included in Appendix C. These species are not discussed further in this analysis.

Four special-status plant species were observed within the proposed project site during focused surveys in 2018 and 2019, including Catalina mariposa lily (*Calochortus catalinae*) (CRPR 4.2, NCCP/HCP Covered), intermediate mariposa lily (*Calochortus weedii* var. *intermedius*) (CRPR 1B.2), multi-stemmed dudleya (*Dudleya multicaulis*) (CRPR 1B.2), and San Diego County viguiera (*Bahiopsis laciniata*) (CRPR 4.3).

Approximately 309 Catalina mariposa lily individuals were observed on-site in the western and southeastern portions of the proposed project site. This species was also observed on-site during previous surveys by Harmsworth Associates in 1998 (Dudek 2012). Approximately 19 intermediate mariposa lily individuals were observed on-site in the western portion of the proposed project site. Approximately 109 multi-stemmed dudleya above-ground specimens were observed on-site in the western portion of the project site. San Diego County viguiera was not noted by the California Natural Diversity Database (CNDDDB) and CNPS database searches as a plant with potential to occur; however, one individual was observed on-site in the easternmost portion of the proposed project site.

Appendix C provides details of each special-status species, their habitat, and their potential to occur within the proposed project site. Special-status species noted in the U.S. Fish and Wildlife Service (USFWS) and CNDDDB databases in the vicinity of the proposed project site are shown in **Figures 3.3-6A and 3.3-6B**. Special-status plant species observed on-site are shown in **Figure 3.3-7A**.

Special-Status Wildlife Species

Of the 68 special-status wildlife species considered regarding their potential to occur within the proposed project site, 37 species are deemed unlikely to occur due to the lack of any potentially suitable habitat and 14 species were assessed as having low potential to occur because the proposed project site lacks suitable habitat to support these species and/or is outside of the known geographic or elevational range for these species. Species considered but determined to be unlikely or to have a low potential to occur are still included in Appendix C. It should be noted that coastal cactus wren (*Campylorhynchus brunneicapillus cousei*) (Species of Special Concern [SC], NCCP/HCP Covered Species) was previously observed on-site in 1999 and reported in the CNDDDB and also around 2000, prior to the Santiago Fire that burned the entire site in October 2007 (Dudek 2012). However, there are currently very limited, isolated coast prickly pear cactus plants on-site so this species has a low potential to occur due to presence of a negligible amount of cacti-dominated vegetation on-site or within the immediate vicinity. These species are not discussed further in this analysis.

ESA conducted focused surveys for western spadefoot (*Spea hammondi*), least Bell's vireo (*Vireo bellii pusillus*), and southwestern willow flycatcher (*Empidonax traillii extimus*) in 2019. No western spadefoot (SC, NCCP/HCP Covered Species) or southwestern willow flycatcher (Federally Endangered [FE], State Endangered [SE], NCCP/HCP Conditionally Covered) were detected during focused surveys.

Seven special-status species were observed within the proposed project site during 2018 and/or 2019 surveys, including least Bell's vireo (FE, SE, NCCP/HCP Conditionally Covered Species), coastal California gnatcatcher (Federally Threatened [FT], SC, NCCP/HCP Covered Species), yellow warbler (*Setophaga petechia*) (SC), yellow-breasted chat (*Icteria virens*) (SC), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*) (NCCP/HCP Covered Species), Vaux's swift (*Chaetura vauxi*) (SC), and orange-throated whiptail (*Aspidoscelis hyperythra*) (NCCP/HCP Covered Species). In addition, coastal cactus wren and seven other special-status species have been observed within the proposed project site during previous surveys or were reported in the CNDDDB, including grasshopper sparrow (*Ammodramus savannarum*) (SC), red-shouldered hawk (*Buteo lineatus*) (NCCP/HCP Covered Species), northern harrier (*Circus cyaneus*) (SC, NCCP/HCP Covered Species), white-tailed kite (*Elanus leucurus*) (State Fully Protected [FP]), prairie falcon (*Falco mexicanus*) (NCCP/HCP Conditionally Covered Species), American peregrine falcon (*Falco peregrinus anatum*) (FP, NCCP/HCP Covered Species), and coyote (*Canis latrans*) (NCCP/HCP Covered Species) (Dudek 2012). It must be recognized that among the raptors (birds of prey) noted above, the prairie falcon and American peregrine falcon are noted as species that may soar above or occasionally forage in this area but that have a negligible potential to nest on-site.

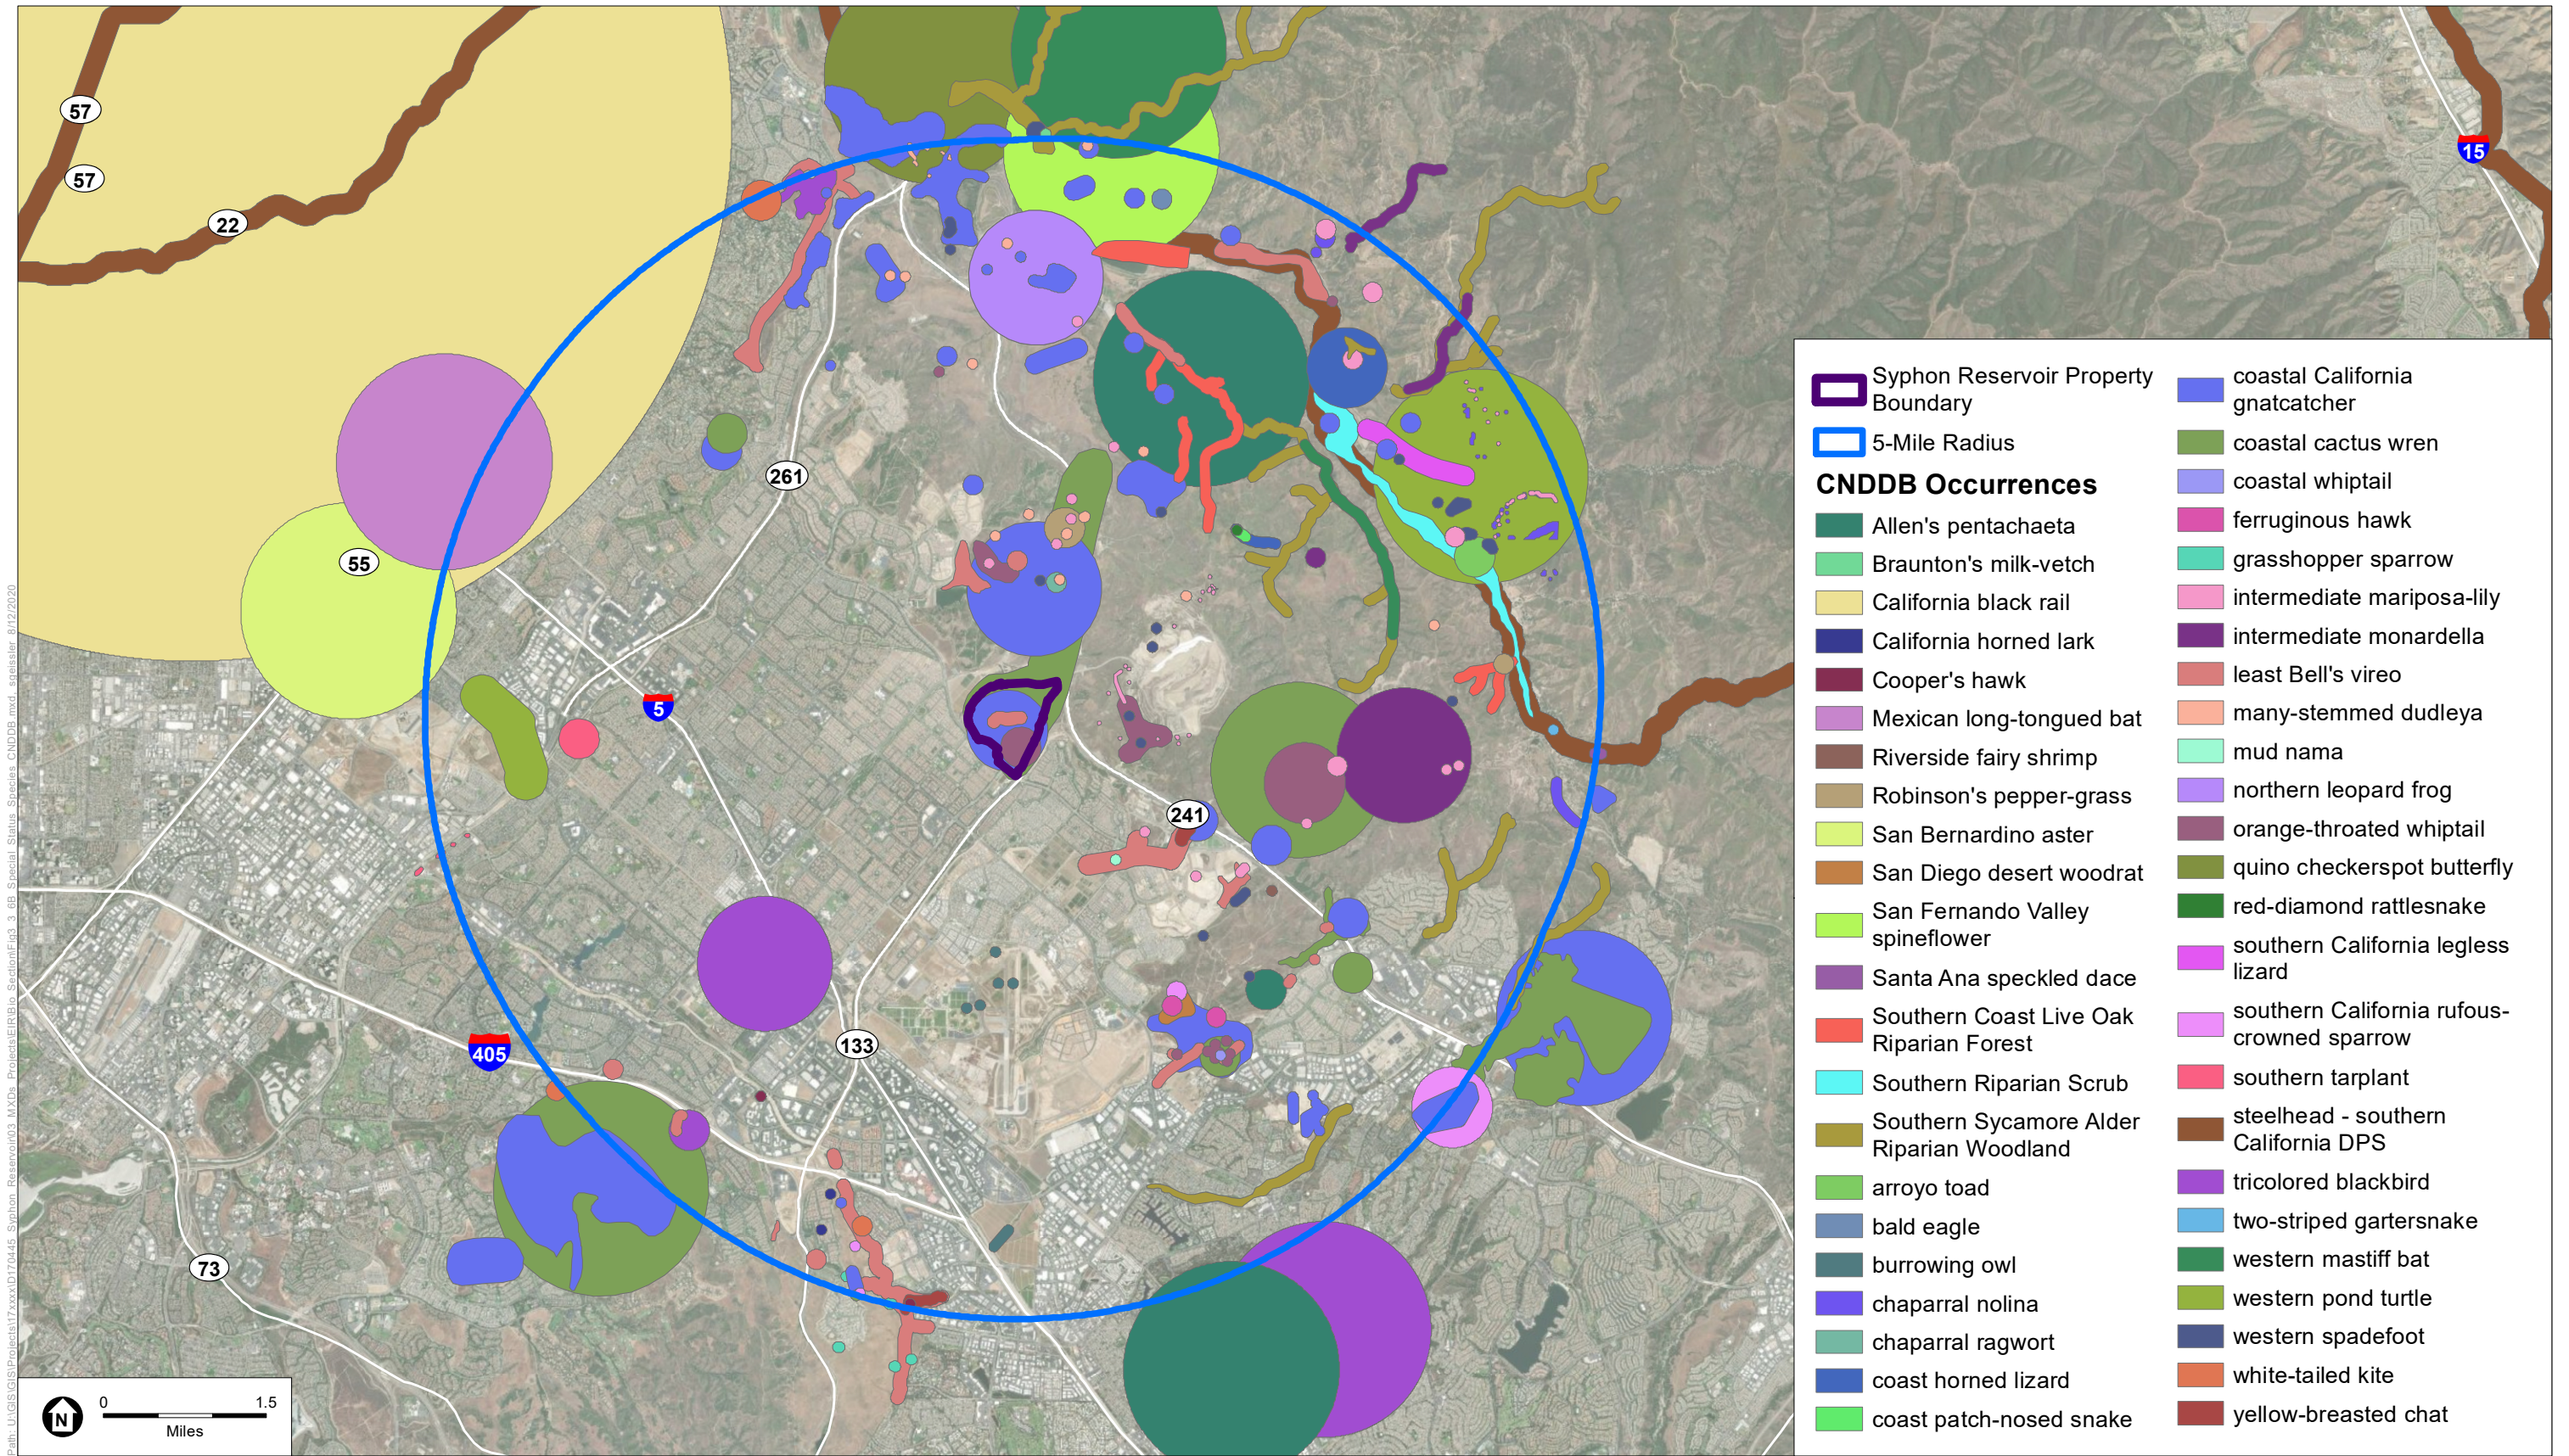

In addition, one special-status species, sharp-shinned hawk (*Accipiter striatus*) (NCCP/HCP Covered Species), has a high potential to occur. Two special-status species, coastal whiptail (*Aspidoscelis tigris stejnegeri*) (SC, NCCP/HCP Covered Species) and San Diego desert woodrat (*Neotoma lepida intermedia*) (SC, NCCP/HCP Covered Species), have a moderate potential to occur.

Special-Status Plant Species Observed
Within the Project Site in 2018 and 2019

Appendix C provides details for each special-status species, their habitat associations, and a determination regarding their potential to occur within the proposed project site. Special-status species occurrences from the USFWS and CNDDDB occurrences databases within the vicinity of the proposed project site are shown in Figures 3.3-6A and 3.3-6B. Special-status wildlife species observed on-site are shown in **Figure 3.3-7B**.

Critical Habitat

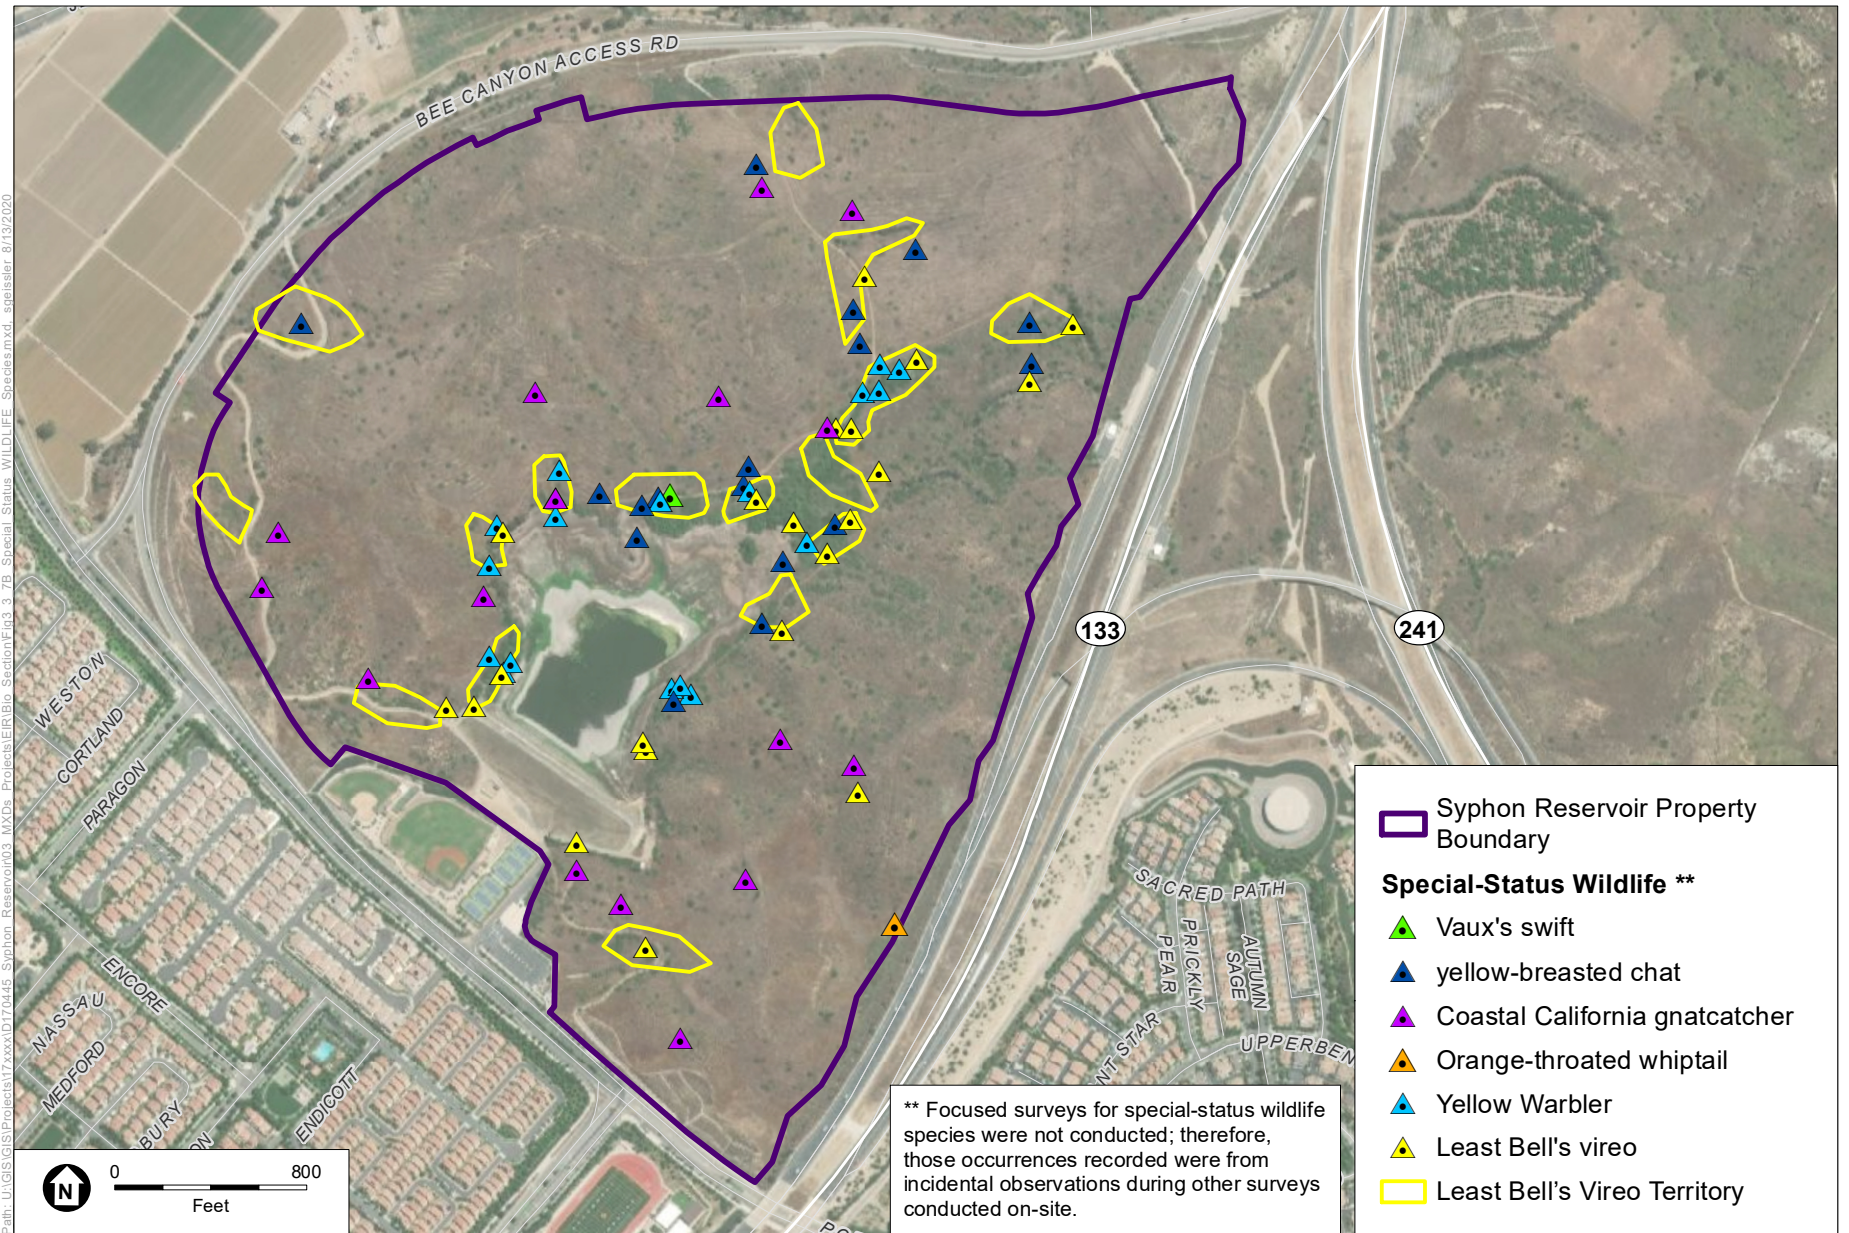

Under the FESA, when species are proposed for listing as Threatened or Endangered, the USFWS is required to consider whether there are geographic areas that contain essential features or areas that are essential to conserve the specie, and if so, USFWS may propose designating these areas as critical habitat. Critical habitat is defined as areas that contain the physical or biological features that are essential to the conservation of endangered and threatened species and that may need special management or protection. Critical habitat may also include areas that were not occupied by the species at the time of listing but are essential to its conservation. Critical habitat designations affect only Federal agency actions or federally funded or permitted activities. Critical habitat designations do not affect activities by private landowners if there is no Federal “nexus”—that is, no Federal funding or authorization (USFWS 2017).

The proposed project site does not occur or overlap within any USFWS-designated critical habitat areas (USFWS 2020b). The nearest designated critical habitat areas are both located a bit more than 2 miles to the southeast, on the south side of the SR-241 where a very small area is designated as Critical Habitat for the Federally Endangered Riverside fairy shrimp (*Streptocephalus wootoni*) and larger area is designated for the Federally Threatened coastal California gnatcatcher.

Wildlife Movement

Effective wildlife movement is essential for dispersal, genetic exchange, migration, foraging, and breeding. Wildlife movement corridors or habitat linkages are linear habitat features that connect blocks of habitat that are otherwise disconnected. Functional wildlife movement corridors are especially important in highly fragmented habitat, such as developed or agricultural areas. Wildlife movement corridors are generally used by terrestrial animals, although they may also be important for aquatic species, avian dispersal, and as avenues for genetic exchange in plants. On a regional scale, movement corridors can include bird flyways, such as wetland areas that provide essential habitat to be used as a stopover for several days during migration.

The proposed project site lies within central Orange County between the City of Irvine and the foothills of the Santa Ana Mountains. The proposed project site is not identified as a Missing Linkage in the *South Coast Missing Linkages* report (South Coast Wildlands 2008). However, the proposed project site is identified as a Small Natural Area in the California Essential Habitat Connectivity Project (CEHC) (California Department of Transportation and California Department of Fish and Game 2010). CEHC is a CDFW and California Department of Transportation (CalTrans) project that ran a statewide assessment of essential habitat connectivity using spatial analyses and modeling techniques to identify large remaining blocks of intact habitat or natural landscape and model linkages between them that need to be maintained, particularly as corridors for wildlife.

Special-Status Wildlife Species Observed
Within the Project Site in 2018 and 2019

The proposed project site is located within the Central Subregion of the County of Orange NCCP/HCP, and the majority is located within the NCCP/HCP Reserve (i.e., the central portion of the reservoir is excluded from the Reserve) (**Figure 3.3-8**). Although the proposed project site is bordered by dense residential development to the southwest and southeast, as well as by the SR-133 and SR-241 and interchange to the east and northeast, it is contiguous to agricultural and undeveloped areas to the west along Loma Ridge in the Orchard Hills planning area. Additionally, the proposed project site includes upland and riparian habitat that provides important resources for wildlife, such as foraging habitat, potential nesting and denning sites, and cover. Although terrestrial wildlife movement through the proposed project site is extremely restricted to the northeast, east, or south, the proposed project site lies at the southeastern limit of a larger contiguous block of habitat that may be used by local terrestrial wildlife movement and provide a small part of regional habitat connectivity for avian species (e.g., dispersal habitat for coastal California gnatcatcher within this region). The reservoir is also an important regional water source that attracts a number of avian species. Thus, from a regional perspective, the proposed project site functions as a part of a wildlife movement corridor, particularly for avian species.

On a local scale, the proposed project site provides live-in habitat for a variety of invertebrate, fish, amphibian, reptile, bird, and mammal species, and movement habitat for invertebrate, reptile, bird, and mammal species. Immediately surrounding the proposed project site, the City of Irvine is located to the south, and human activity and dense development within these residential and commercial areas do not provide suitable habitat or resources for most native wildlife, with the exception of a few wide-ranging species that are adapted to urban environments (e.g., raccoon, skunk, coyote, some birds). In addition, the SR-133 and Bee Canyon Landfill Access Road, which is frequented by trucks hauling trash to the landfill, are hazards to wildlife. However, the proposed project site is undeveloped, contains natural habitats, and wildlife movement is not restricted within the project site or to and from other undeveloped and agricultural areas to the north with the exception of a chain-link fence around the perimeter of the property. Thus, although some wildlife movement (e.g., more secretive wildlife that require larger home ranges, such as mountain lion and deer) may be deterred by the human activity and development nearby, these barriers to movement (e.g., development and roads) would not preclude smaller wildlife that are better adapted to urbanized areas from moving through the project site or the surrounding region.

In summary, the proposed project site supports live-in and movement habitat for species on a local scale, and likely functions to facilitate movement for a number of avian species on a regional scale.

3.3.2 Regulatory Framework

Federal

Endangered Species Act (USC, Title 16, § 1531 through 1543)

The FESA and subsequent amendments provides for the conservation and protection of wildlife and plant species that are listed or proposed for listing as endangered or threatened species and the ecosystems upon which they depend. The FESA also provides statutory framework for the conservation and recovery of threatened and endangered species as well as for the conservation of designated critical habitat that USFWS determines is required for the survival and recovery of these listed species.

Section 7 of the FESA requires federal agencies, in consultation with and assistance from the Secretary of the Interior or the Secretary of Commerce, as appropriate, to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of threatened or endangered species or result in the destruction or adverse modification of critical habitat for these species. The USFWS and National Marine Fisheries Service (NMFS) share responsibilities for administering the FESA. Regulations governing interagency cooperation under Section 7 are found in CCR Title 50, Part 402. The opinion issued at the conclusion of consultation will include a statement authorizing “take” (to harass, harm, pursue, hunt, wound, kill, etc.) that may occur incidental to an otherwise legal activity. Although federal funding is not expected, if the proposed project were to receive federal funding the funding agency would be required to initiate a consultation with USFWS under Section 7. The consultation process would then lead to issuance of a Biological Opinion from USFWS. In most cases, a Biological Opinion addresses the proposed project’s potential to result in “take” of listed species (as defined below), and includes mandatory conditions that would allow for limited incidental take to occur subject to prescribed conditions.

Section 9 lists those actions that are prohibited under the FESA. Although take of a listed species is prohibited, it is allowed when it is incidental to an otherwise legal activity. Section 9 prohibits take of listed species of fish, wildlife, and plants without special exemption. The definition of “harm” includes significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns related to breeding, feeding, or shelter. “Harass” is defined as actions that create the likelihood of injury to listed species by disrupting normal behavioral patterns related to breeding, feeding, and shelter significantly.

Section 10 provides a means whereby a non-federal action with the potential to result in take of a listed species can be allowed under an incidental take permit which may be issued once a HCP is approved. Application procedures are found at 50 CFR 13 and 17 for species under the jurisdiction of USFWS and 50 CFR 217, 220, and 222 for species under the jurisdiction of NMFS.

In addition, a local regulatory program established by the NCCP/HCP and associated governing documents provides for regional conservation of many species while also allowing limited impacts to biological resources in association with planned development. The NCCP/HCP

establishes an alternative pathway to the Section 10 and Section 7 procedures by which local projects in the Plan Area may receive both State and federal incidental take authorization for species identified as “covered” and “conditionally covered”, based on compliance with relevant conditions set forth in the plan. Further details about the regional NCCP/HCP and its provisions for incidental take coverage are discussed in the local regulatory framework below.

Migratory Bird Treaty Act (16 USC 703 through 711)

The Migratory Bird Treaty Act (MBTA) is the domestic law that affirms, or implements, a commitment by the U.S. to four international conventions (with Canada, Mexico, Japan, and Russia) for the protection of a shared migratory bird resource. The MBTA makes it unlawful at any time, by any means, or in any manner to pursue, hunt, take, capture, or kill migratory birds. “Migratory bird” means any bird protected by any of the treaties and currently includes 1,027 bird species in the United States (50 CFR 10.13), regardless of whether the particular species actually migrates. The law also applies to the removal of nests occupied by migratory birds during the breeding season. The MBTA makes it unlawful to take, pursue, molest, or disturb these species, their nests, or their eggs anywhere in the United States.

Federal Clean Water Act (33 USC 1251 through 1376)

The USACE regulates “discharge of dredged or fill material” into “waters” of the United States, which includes tidal waters, interstate waters, and "all other waters, interstate lakes, rivers, streams (including intermittent streams), mud flats, sand flats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes or natural ponds, the use, degradation, or destruction of which could affect interstate or foreign commerce or which are tributaries to waters subject to the ebb and flow of the tide" (33 C.F.R. 328.3(a)), pursuant to provisions of Section 404 of the Clean Water Act (CWA). The CWA also excludes certain features from this regulation, including “wastewater recycling facility constructed on dry land” (see 33 CFR §230.3 (o)(2)(vii)). Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not considered waters of the U.S. The USACE determination stated that they do not consider the site to contain waters of the U.S. (Appendix C).

Fish and Wildlife Conservation Act

The Fish and Wildlife Conservation Act declares that fish and wildlife are of ecological, educational, esthetic, cultural, recreational, economic, and scientific value to the United States. The purposes of this Act are to encourage all federal departments and agencies to utilize their statutory and administrative authority, to the maximum extent practicable and consistent with each agency's statutory responsibilities and to conserve and to promote conservation of non-game fish and wildlife and their habitats. Another purpose is to provide financial and technical assistance to the states for the development, revision, and implementation of conservation plans and programs for nongame fish and wildlife.

State

California Endangered Species Act (California Fish and Game Code § 2050 et seq.)

CESA establishes the policy of the state to conserve, protect, restore, and enhance threatened or endangered species and their habitats. CESA mandates that state agencies should not approve projects that would jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available that would avoid jeopardy. There are no state agency consultation procedures under CESA. For projects that would affect a listed species under both CESA and FESA, compliance with FESA would satisfy CESA if CDFW determines that the federal incidental take authorization is “consistent” with CESA under California Fish and Game Code Section 2080.1. For projects that would result in take of a species listed under the CESA only, the project operator would have to apply for a take permit under Section 2081(b). Further details about the regional NCCP/HCP are discussed in the local regulatory framework below.

California Fish and Game Code § 1600 et seq.

CDFW is responsible for protecting and conserving fish and wildlife resources, and the habitats upon which they depend. Under Section 1600 of the California Fish and Game Code, CDFW administers the Lake and Streambed Alteration (LSA) Program and regulates all substantial diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake (which typically include reservoirs), which supports fish or wildlife.

Applicants proposing changes to such regulated water resources must submit a Lake or Streambed Alteration Notification to CDFW for such projects. CDFW will then determine if the proposed activity may substantially adversely affect an existing fish or wildlife resource and will issue a final agreement for the applicant’s signature that includes reasonable measures necessary to protect the resource. Preliminary notification to, and project review by CDFW may occur during or after the CEQA environmental review process but prior to project implementation.

California Fish and Game Code §§ 2080 and 2081

Section 2080 of the California Fish and Game Code states that “No person shall import into this state [California], export out of this state, or take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the Commission [State Fish and Game Commission] determines to be an endangered species or threatened species, or attempt any of those acts, except as otherwise provided in this chapter, or the Native Plant Protection Act, or the California Desert Native Plants Act.” Pursuant to Section 2081, CDFW may authorize individuals or public agencies to import, export, take, or possess state-listed endangered, threatened, or candidate species. These otherwise prohibited acts may be authorized through Incidental Take permits or Memoranda of Understanding if the take is incidental to an otherwise lawful activity, impacts of the authorized take are minimized and fully mitigated, the permit is consistent with any regulations adopted pursuant to any recovery plan for the species, and the project operator ensures adequate funding to implement the measures required by CDFW, which makes this determination based on available scientific information and considers the ability of the species to survive and reproduce.

Since the NCCP/HCP provides coverage for take of some State-listed species, there would not be a need for an additional 2081 permit process unless a project does not comply with NCCP/HCP requirements and may result in take of a State-listed species or if a State-listed species not covered by the NCCP/HCP were to result in take. Further details about the regional NCCP/HCP are discussed in the local regulatory framework below.

California Fish and Game Code §§ 3503 and 3503.5

Under these sections of the California Fish and Game Code, the project operator is not allowed to conduct activities that would result in the taking, possessing, or destroying of any birds of prey; the taking or possessing of any migratory nongame bird as designated in the MBTA; the taking, possessing, or needlessly destroying of the nest or eggs of any raptors or nongame birds protected by the MBTA; or the taking of any nongame bird pursuant to California Fish and Game Code Section 3800.

California Environmental Quality Act Guidelines, § 15380

Although threatened and endangered species are protected by specific federal and state statutes, CEQA Guidelines § 15380(b) provides that a species not listed on the federal or state list of protected species may be considered rare or endangered if the species can be shown to meet certain specified criteria. These criteria have been modeled after the definition in FESA and the section of the California Fish and Game Code dealing with rare or endangered plants or animals. This section was included in CEQA primarily to deal with situations in which a public agency is reviewing a project that may have a significant effect on, for example, a candidate species that has not been listed by either USFWS or CDFW. Thus, CEQA provides an agency with the ability to protect a species from the potential impacts of a project until the respective government agencies have an opportunity to designate the species as protected, if warranted. CEQA also calls for the protection of other locally or regionally significant resources, including natural communities. Although natural communities do not at present have legal protection of any kind, CEQA calls for an assessment of whether any such resources would be affected and requires findings of significance if there would be substantial losses. Natural communities listed by CNDDDB as sensitive are considered by CDFW to be significant resources and fall under the State CEQA Guidelines for addressing impacts. Local planning documents such as General Plans often identify these resources as well.

California Water Quality Control Act (Porter-Cologne California Water Code Section 13260)

The State Water Resources Control Board (SWRCB) and the RWQCB (together “Boards”) are the principal State agencies with primary responsibility for the coordination and control of water quality. The Boards regulate activities pursuant to Section 401(a)(1) of the federal CWA as well as the Porter Cologne Water Quality Control Act (Porter-Cologne) (Water Code Section 13260). Section 401 of the CWA specifies that certification from the State is required for any applicant requesting a federal license or permit to conduct any activity including but not limited to the construction or operation of facilities that may result in any discharge into navigable waters. The certification shall originate from the State in which the discharge originates or will originate, or,

if appropriate, from the interstate water pollution control agency having jurisdiction over the navigable water at the point where the discharge originates or will originate. Any such discharge will comply with the applicable provisions of Sections 301, 302, 303, 306, and 307 of the CWA.

In Porter-Cologne, the Legislature declared that the “State must be prepared to exercise its full power and jurisdiction to protect the quality of the waters in the State from degradation...” (California Water Code Section 13000). Porter-Cologne grants the Boards the authority to implement and enforce the water quality laws, regulations, policies and plans to protect the groundwater and surface waters of the State. It is important to note that enforcement of the State's water quality requirements is not solely the purview of the Boards and their staff. Other agencies (e.g., CDFW) have the ability to enforce certain water quality provisions in state law.

The State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (procedures), adopted by the State Water Resources Control Board on April 2, 2019, became effective May 28, 2020. Based on the procedures, artificial wetlands greater than or equal to one acre in size constructed for purposes of treatment, storage, or distribution of recycled water are not waters of the State unless specifically identified in a water quality control plan as a wetland or other water of the State. Since Syphon Reservoir is identified in the 1995 Water Quality Control Plan for the Santa Ana River Basin (most recently updated in June 2019; California Regional Water Quality Control Board 2019) as a water of the State, the wetlands would likely also be considered waters of the State.

Local

County of Orange

General Plan, Land Use Element

The Land Use Element is one of nine elements of the restructured General Plan, and contains official County policies on the location and character of land uses necessary for orderly growth and development. One of the major land use policies adopted for the purpose of guiding the planning and development of those areas for both the short-term and long-term future includes:

Policy 9. Enhancement of Environment – To guide development so that the quality of the physical environment is enhanced. The purpose of the Enhancement of Environment Policy is to ensure that all land use activities seek to enhance the physical environment, including the air, water, sound levels, landscape, and plant and animal life. This policy does not mean that environmental enhancement precludes development. It recognizes the need to improve both the manmade and natural environments. Where aspects of the natural environment are deemed to be truly significant, this policy requires measures be taken to preserve these aspects.

General Plan, Resources Element

The Resources Element contains official County policies on the conservation and management of resources, including natural resources. Some of the goals, objectives, and policies pertaining to natural resources includes:

Goal 1 – Protect wildlife and vegetation resources and promote development that preserves these resources.

Objective 1.1 – To prevent the elimination of significant wildlife and vegetation through resource inventory and management strategies.

Policy 1. Wildlife and Vegetation – To identify and preserve the significant wildlife and vegetation habitats of the County.

County of Orange Central & Coastal Subregion NCCP/HCP

In 1996, the Orange County Central & Coastal Subregion NCCP/HCP, a comprehensive natural resources conservation and management plan for central and coastal Orange County, was adopted. The purpose of the NCCP/HCP was to create a multiple-species and multiple-habitat reserve system and to implement a long-term conservation program on a subregional level to primarily protect coastal sage scrub and the species that use this habitat, while allowing for social and economic uses compatible with the protection of these resources.

The NCCP/HCP was prepared in cooperation with the UFSWS and CDFW, who are the agencies responsible for implementing the FESA and CESA, respectively. Implementation of the NCCP/HCP in accordance with the terms of the Implementation Agreement allows for the conservation of large, diverse areas of natural habitat, including habitat for the coastal California gnatcatcher and other federally-listed species; provides for the conservation, protection, and management of three “Target Species” and 36 “Identified Species” and their habitats; and satisfies federal and state mitigation requirements for designated development.

IRWD and the County of Orange, among others, are participating landowners of the Central & Coastal NCCP/HCP. As a participating landowner that contributed significant funding toward land acquisition, management, and the implementation of the NCCP/HCP Reserve System, IRWD was allotted 60 acres of Incidental Take Credits from within the NCCP/HCP Reserve and 27 acres of Incidental Take Credits outside of the NCCP/HCP Reserve (i.e., non-Reserve lands) for impacts to coastal sage scrub communities (Dudek 2012). An additional 9 acres of Incidental Take Credits from within the NCCP/HCP Reserve were acquired through IRWD’s consolidation with Santiago County Water District (SCWD). For participating landowners, development activities and uses that are addressed by the NCCP/HCP are considered fully mitigated under the NCCP Act, FESA, and CESA for impacts to habitat occupied by listed and other species “identified” by the NCCP/HCP and Implementation Agreement. Satisfactory implementation of the NCCP/HCP under the terms of the Implementation Agreement means that no additional mitigation is required of the participating landowners for impacts to “identified” species and their habitat, or for species residing in specified non-coastal sage scrub habitats, or covered habitats.

The NCCP/HCP included provisions for IRWD to build a future reservoir “as a permitted use within the Reserve System” (R.J. Meade Consulting 1996a). At the time that the NCCP/HCP was prepared, IRWD was considering four alternative locations (including the Syphon Reservoir site) for seasonal recycled water storage reservoirs, all of which were located within the subregional Reserve System, though only one reservoir would ultimately be needed. The need for a future

reservoir was identified as “a permitted use within the Reserve System in the event that public health, safety, and welfare require such a facility in the future. At the time such a facility is needed, IRWD will review the plans with appropriate agencies and propose a specific mitigation plan or pay fees adequate to mitigate the Incidental Take associated with the new reservoir” (R.J. Meade Consulting 1996a).

3.3.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from Appendix G of the *CEQA Guidelines* are used as thresholds of significance to determine the impacts of the proposed project as related to biological resources. The proposed project would have a significant impact if it would:

1. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.
2. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.
3. Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
4. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.
5. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
6. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.
7. Result in cumulatively considerable impacts to biological resources.

Methodology

This section describes the potential effects of the proposed project on biological resources that may occur as a result of project implementation, including net ecological benefits. Direct, indirect, temporary, and/or permanent effects to biological resources may occur as a result of project implementation, as defined below:

- **Direct Effects:** Any alteration, disturbance, or destruction of biological resources that would result from project-related activities is considered a direct effect. Examples include loss of individual species and/or their associated plant communities, diversion of surface water flows, and encroachment into wetlands. Under FESA, direct effects are defined as the immediate effects of a project on a species or its habitat, including construction noise disturbance, sedimentation, or habitat loss.

- **Indirect Effects:** Biological resources may also be affected in an indirect manner as a result of project-related activities. Under FESA, indirect effects are defined as those effects that are caused by, or would result from, a proposed project but occur later in time and are reasonably certain to occur [50 C.F.R. §402-02]. An example of indirect effects may include irrigation runoff from a developed area into surrounding natural vegetation. Indirect effects could also include increased wildfire frequency as a result of power line failures.
- **Temporary Effects:** Any effects to biological resources that are considered reversible can be viewed as temporary. Examples include the generation of fugitive dust during construction activities.
- **Permanent Effects:** All effects that result in the irreversible removal of biological resources are considered permanent. Examples include constructing a building or permanent road on an area with native vegetation, such that the native vegetation is permanently removed and replaced with a developed structure.

A project is generally considered to have a significant effect if it proposes or results in any of the effects or conditions described in the significance thresholds discussed below, absent specific evidence to the contrary. Conversely, if a project does not propose or result in any of the following effects or conditions, it would generally not be considered to have a significant effect on biological resources, absent specific evidence of such an effect.

Impact Analysis

Candidate, Sensitive, or Special Status Species

Impact 3.3-1: The proposed project could have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

Construction

Special-Status Plant Species

Four special-status plant species, Catalina mariposa lily (CRPR 4.2, NCCP/HCP Covered), intermediate mariposa lily (CRPR 1B.2), multi-stemmed dudleya (CRPR 1B.2), and San Diego County viguiera (CRPR 4.3), were observed within the proposed project site during focused surveys in 2018 and 2019. The proposed project will avoid removal or damage to any specimens of intermediate mariposa lily, multi-stemmed dudleya, and San Diego County viguiera. Therefore, the proposed project would not impact these special-status plant species, and no mitigation is required.

The proposed project will avoid more than 90 percent of the Catalina mariposa lily specimens identified on-site, and would remove approximately 24 of the total 309 Catalina mariposa lily individuals during construction (shown in **Figure 3.3-9A**). The number affected comprises less than 8 percent of the total population on-site. Impacts to 24 individuals is not considered a substantial loss for this species which is known to occur over a wide area in southern California. This loss would not threaten the existence of the on-site population, and would not be significant. Moreover, Catalina mariposa lily is a covered species under the NCCP/HCP

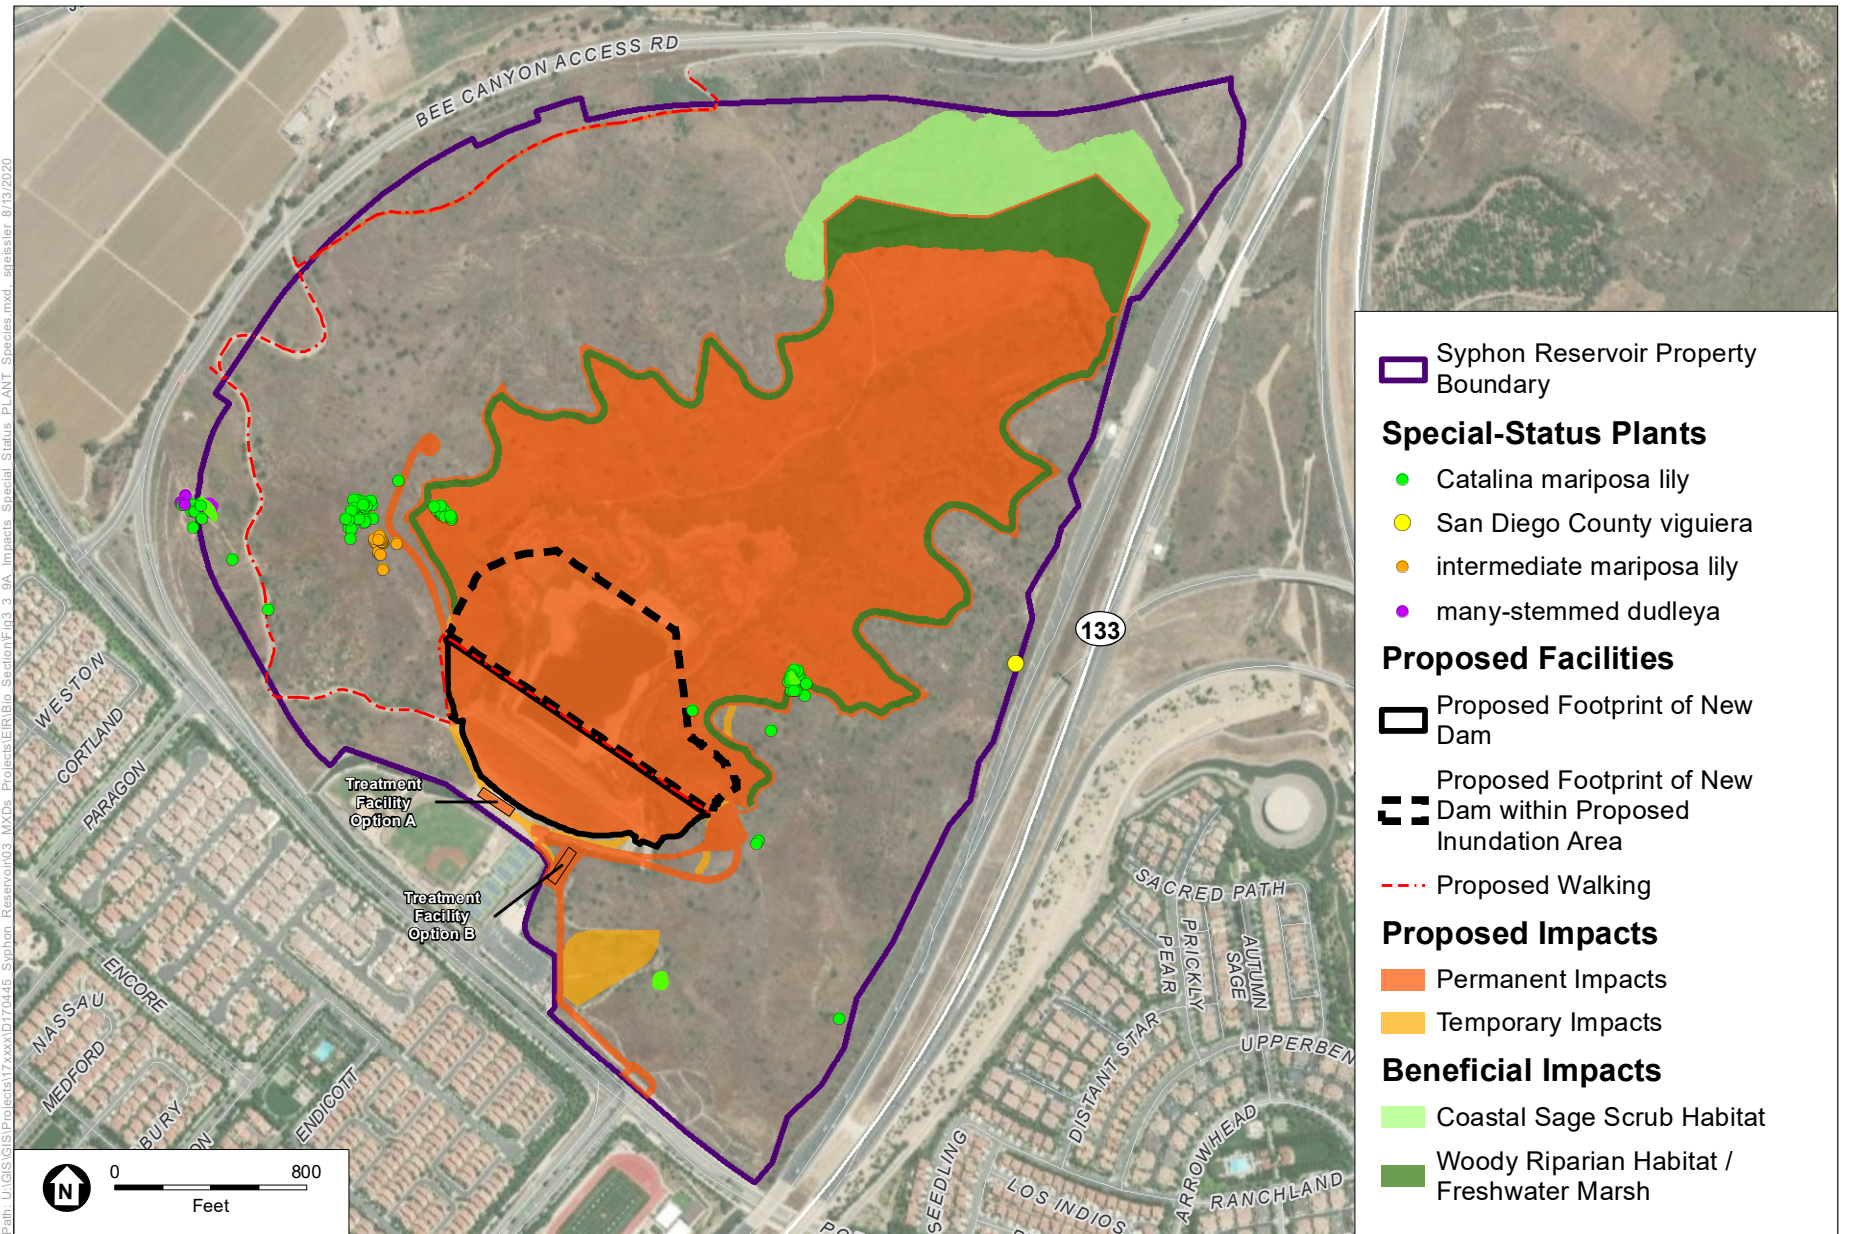

provided that the proposed project complies with the NCCP/HCP provisions, and thus this species is considered conserved since the NCCP/HCP Reserve provides for the regional conservation for this and other covered species. Although the majority of the proposed project site is within the NCCP/HCP Reserve and potential impacts to any Catalina mariposa lily would occur within the Reserve, at the time that the NCCP/HCP was prepared the NCCP/HCP included provisions for IRWD to build a future reservoir, and the proposed project is “a permitted use within the Reserve System” (R.J. Meade Consulting 1996a). Thus, even with potential impacts to this species within the Reserve, this species is considered adequately covered under the NCCP/HCP. Therefore, impacts to Catalina mariposa lily are less than significant, and no mitigation is required.

Special-Status Wildlife Species

Special-status wildlife species observed, or considered to have a moderate or high potential to occur within the proposed project site, include the following NCCP/HCP Covered Species: coastal California gnatcatcher, orange-throated whiptail, southern California rufous-crowned sparrow, red-shouldered hawk, northern harrier, American peregrine falcon, sharp-shinned hawk, coastal whiptail, San Diego desert woodrat, and coyote. Two species that are Conditionally Covered under the NCCP/HCP, least Bell’s vireo and prairie falcon, were also observed. Several other species that are not “covered species” under the NCCP/HCP were also identified, including yellow warbler, yellow-breasted chat, grasshopper sparrow, Vaux’s swift, and the California fully protected white-tailed kite. It should be noted that the two falcons and Vaux’s swift may fly over the site but have virtually no potential to nest on site. Likewise, white-tailed kite has only been observed foraging or flying over but is not known to nest in the study area. Locations where special-status wildlife species were observed in the project site in 2018 and 2019 are shown in **Figure 3.3-9B**.

The coastal California gnatcatcher, orange-throated whiptail, southern California rufous-crowned sparrow, red-shouldered hawk, northern harrier, prairie falcon,⁵ American peregrine falcon, sharp-shinned hawk, coastal whiptail, San Diego desert woodrat, and coyote, as covered species under the NCCP/HCP, are considered to be conserved within the NCCP/HCP region provided that the project complies with the NCCP/HCP provisions. As previously mentioned, although the majority of the proposed project site is within the NCCP/HCP Reserve and potential impacts to NCCP/HCP Covered Species may occur within the Reserve, the NCCP/HCP included provisions for IRWD to build a future reservoir.

⁵ Prairie falcon is a conditionally covered under the NCCP/HCP. Planned activities are authorized if the habitat is more than one-half mile from an active or historically active nesting site, and this species is currently not known to nest within Orange County, and have not occurred within the county for over a decade (CDFW 2020, Catino-Davenport 2019).

Syphon Reservoir Improvement Project

Figure 3.3-9B
 Impacts to Special-Status Wildlife Species Observed
 Within the Project Site in 2018 and 2019

As a future infrastructure improvement that was originally recognized by the NCCP/HCP and for which IRWD has a credit allotment that can be “spent” or exchanged for the displacement of areas within the NCCP Reserve, the proposed project is considered a permitted use within the Reserve System. Potential impacts to Covered Species within the Reserve are considered adequately covered under the NCCP/HCP provided that the proposed project complies with the NCCP/HCP provisions. The proposed project would permanently impact a total of 28.37 acres (with Treatment Facility Option A⁶)/28.49 acres (with Treatment Facility Option B) of coastal sage scrub communities.⁷ The proposed project would temporarily impact 0.85 acre of California sagebrush scrub. Implementation of Mitigation Measures BIO-1 (to spend allotted Incidental Take Credits for participating landowners), BIO-2, and BIO-3, prescribed below, would reduce impacts to a less than significant level.

The least Bell’s vireo is federal and state Endangered and is a Conditionally Covered species under the NCCP/HCP. This species is found in riparian habitat, and 17 least Bell’s vireo individuals and/or territories were observed on-site in 2019 (point locations and territories are shown in Figure 3.3-9B). The proposed reservoir improvement project will include dam replacement, reservoir enlargement, and the installation of an on-site riparian and upland habitat area around the perimeter of the reservoir. The proposed project would displace approximately 6.41 acres of woody riparian communities (including 0.09 acre of arroyo willow thicket, 4.07 acres of black willow thicket, and 2.25 acres of mule fat scrub). However, the proposed project would also create at least 6.58 acres of on-site woody riparian habitat that would provide replacement nesting habitat for the least Bell’s vireo and will also create up to approximately 5.88 acres consisting of additional on-site woody riparian vegetation and/or freshwater marsh habitat that would replace the other wetland habitat values impacted by construction. The new riparian and wetland habitat areas will be maintained with supplemental irrigation and will not depend on the reservoir being full or nearly full to be sustained. Woody riparian and freshwater marsh habitats around the larger reservoir perimeter, once established will provide both foraging and nesting opportunities that would benefit least Bell’s vireo and other species.

Ultimately, there will be no net loss of woody riparian habitat for least Bell’s vireo, and no net loss of any wetland habitat, with the creation of both riparian and wetland habitat areas on-site as part of the proposed project. IRWD is engaged with the Wildlife Agencies and is collaboratively developing a comprehensive program to address potential impacts to least Bell’s vireo. Based on provision of acceptable mitigation, the Wildlife Agencies have indicated that the NCCP/HCP conditional coverage will apply for the proposed project’s impacts to least Bell’s vireo.⁸

⁶ Indicates impact acreages for Treatment Facility Option A/Option B. The potential locations of the treatment facilities, which would be determined during detailed design, are depicted in Figure 3.3-9B (labeled as Treatment Facility Option A and Option B). Only one treatment facility in one of the optional locations will be built-out as part of the proposed project.

⁷ This total includes 26.37 acres (Treatment Facility Option A)/26.49 acres (Treatment Facility Option B) of California sagebrush scrub, 0.98 acre of California sagebrush scrub/non-native herbaceous cover, 0.06 acre of chaparral bushmallow scrub/non-native herbaceous cover, 0.19 acre of chaparral bushmallow scrub, and 0.77 acre of coyote brush scrub.

⁸ This determination was made over the course of extensive discussions between IRWD, ESA, and the Wildlife Agencies, which considered multiple factors to arrive at this determination, including but not limited to IRWD being a Participating Landowner, Syphon Reservoir being a man-made waterbody sustained by an artificial water source, consideration of least Bell’s vireo population distribution within the NCCP/HCP plan area, and because impacts will be temporary as riparian habitat will be replaced on-site.

Nevertheless, there will be a temporary loss of these habitats until construction is completed and riparian habitat can be reestablished that the species can use again. This temporary loss would be potentially significant in terms of the temporary reduction to the amount of habitat available in the local region. Implementation of Mitigation Measures BIO-3 and BIO-4, prescribed below, would reduce impacts to a less than significant level.

The yellow warbler, yellow-breasted chat, and grasshopper sparrow are species of special concern, Vaux's swift, and white-tailed kite is a state fully protected species. The yellow warbler and yellow-breasted chat occur within the riparian habitat on-site; the grasshopper sparrow favors native grasslands on rolling hills with a mix of grasses, forbs, and scattered shrubs; Vaux's swift inhabits redwood and Douglas-fir habitat in northern California and the Sierra Nevada; and the white-tailed kite prefers grasslands, meadows, or marshes for foraging next to deciduous woodland with dense-topped trees for nesting and perching. Since Vaux's swift was observed flying over and likely a migrant that is not expected to nest on-site, it is not discussed further in this analysis.

For yellow warbler and yellow-breasted chat, which utilize woody riparian habitat similar to the least Bell's vireo, several of each species were observed on-site in 2019. The locations of yellow warbler and yellow-breasted chat observed within the project site are shown in Figure 3.3-9B; many of these are multiple point locations of the same individual taken on multiple dates, but based on the clustering of point locations, there are likely eight yellow warbler territories and nine yellow-breasted chat territories. The proposed project would have both impacts and benefits to the riparian and marsh habitat that supports these special-status species. As stated above, the proposed project would permanently impact 12.28 acres of woody riparian (6.37 acres) and freshwater marsh communities (5.88 acres). However, the proposed project would also create at least 6.58 acres of on-site woody riparian and will also provide approximately 5.88 acres of on-site woody riparian and/or freshwater marsh habitat that would be maintained to consistently provide habitat year-round. Construction of the larger reservoir would also expand the open water areas that may be used for foraging, which would also be a benefit to these and other species. As noted previously, although there will ultimately be no net loss of riparian habitat for these special-status species with the creation of riparian habitat areas on-site, the temporal loss of habitat for yellow warbler and yellow-breasted chat may be considered potentially significant as it would reduce the amount of available habitat for these species in the local region until an equivalent habitat area is reestablished. Implementation of Mitigation Measures BIO-3 and BIO-4, prescribed below, would reduce impacts to a less than significant level.

Grasshopper sparrow was previously observed on-site; however, there are no recent records or observations of this species during the numerous surveys conducted in 2018 and 2019. For grasshopper sparrow, which favors native grasslands with a mix of grasses, forbs, and scattered shrubs, the proposed project will impact 2.53 acres of non-native grassland but will avoid 2.74 acres. In addition, the proposed project will impact 27.25 acres of non-native herbaceous cover and 28.18 acres of non-native herbaceous cover/California sage scrub, but avoid 67.31 acres of mixed grass and forblands with scattered shrubs (16.91 acres of non-native herbaceous cover, 43.52 acres of non-native herbaceous cover/California sagebrush scrub, and 6.88 acres California sagebrush scrub/non-native herbaceous cover) that would remain available to this species within the approximately 265-acre project site. Given the potentially suitable habitat acreage that will be

avoided by the proposed project, as well as natural areas within the surrounding vicinity, the limited potential impacts to foraging and/or nesting habitat for this species if still present on-site is not expected to threaten regional populations.

White-tailed kite was previously observed on-site; however, there were no recent records or observations of this species during the numerous surveys conducted in 2018 and 2019 and this species has not been documented to nest on-site. For white-tailed kite, which uses grasslands and marshes for foraging and isolated, dense-topped trees for nesting, the proposed project would impact 2.53 acres of non-native grassland, 5.87 acres of freshwater marsh, 0.09 acre of arroyo willow thicket, 4.07 acres of black willow thicket, and 2.67 acres of eucalyptus woodland. The proposed project would avoid 2.74 acres of non-native grassland, 0.15 acre of arroyo willow thicket, 0.06 acres of black willow thicket, and 0.11 acre of eucalyptus woodland, which would provide habitat for this species if still present on-site, as well as natural areas within the surrounding vicinity; thus, potential impacts to foraging and/or nesting habitat for these species are not expected to threaten regional populations. The proposed project would also create at least 6.58 acres of riparian woodland and an additional 5.88 acres of woody riparian and/or freshwater marsh wetland habitat.

Direct impacts to avian species during the non-breeding season would not be potentially significant as these species are mobile and would be expected to fly away from the construction area, if present. However, if construction and maintenance work cannot be scheduled outside of nesting season, impacts to nesting special-status bird species would be potentially significant. Implementation of Mitigation Measure BIO-3, prescribed below, would reduce impacts to a less than significant level.

Operation

The majority of proposed project impacts to biological resources would occur during project construction, and impacts associated with operations and maintenance activities of the reservoir are expected to be negligible and similar to the current operations and maintenance of the existing Syphon Reservoir. Similar to the current reservoir, operation of the proposed project would not require daily on-site staffing but, rather, would require only periodic maintenance. Water levels at Syphon Reservoir would fluctuate substantially and typically would follow a seasonal pattern wherein water would be stored in winter when recycled water supply exceeds demand, and the reservoir would be drawn down in summer when recycled water demand is high.

It is anticipated that a strip of opportunistic herbaceous vegetation and some woody riparian species may develop intermittently just below the reservoir's upper inundation limit during periods when the reservoir is not full. If a fringe of incidental vegetation occasionally arises during periods when the reservoir is partly drained, such intermittent vegetation would be purely incidental and would not be associated with the proposed riparian woodland and freshwater marsh that are intended to be established around the perimeter of the reservoir. Any temporary habitat values provided by adventive vegetation below the "rim" of the filled reservoir would not be subject to protection or maintenance and are expected to be very short-lived since soils would not be expected to retain sufficient moisture for extended periods when the water level drops. Also, adventive vegetation below the upper fill level would disappear whenever the reservoir is completely refilled. As any vegetation that may develop around the fringe of the reservoir would not be maintained and is not expected to persist since soils will dry out quickly, it is not likely

that such vegetation would provide suitable habitat for special-status species. However, it is possible that special-status birds, such as least Bell's vireo, yellow warbler, or yellow-breasted chat, could use such incidental fringe vegetation. Due to its operational requirements, it will not be practical, and IRWD will be under no obligation, to manage or protect such areas, and removal of such vegetation to avoid creating potential nesting habitat will not be considered a "new" impact as this area is not meant to be vegetated and should not provide potentially suitable nesting habitat that, if occupied, might interfere with operational requirements.

IRWD's operations and maintenance of the expanded Syphon Reservoir may not be construed to result in a "take" of a listed species. Rather, any incidental vegetation that may be allowed to develop briefly during drawdown of the reservoir would be considered to be an unintended indirect benefit to special-status wildlife species.

Maintenance of the created riparian and upland habitat areas around the perimeter at the maximum fill level is expected to continue for up to 5 years after construction is complete for the proposed habitat areas to meet success criteria and provide good quality wildlife habitat. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. The riparian and upland habitat areas would be irrigated as needed from a main supply line installed around the perimeter of the reservoir that connects to the reservoir water source. When maintenance of the riparian and upland habitat areas involves vegetation removal (e.g., weeding) and cannot be scheduled outside of nesting season, such work could impact nesting special-status bird species, which could be potentially significant. Implementation of Mitigation Measure BIO-3, prescribed below, would reduce impacts to a less than significant level.

In addition, a walking trail is proposed to be made available for passive recreation along the south and western sides of the proposed project site. The trail will begin at the new permanent access road at Portola Parkway and Sand Canyon Avenue and traveling along that route, then across the dam crest. A large portion of the proposed walking trail will then follow the existing dirt access road along the Highline Canal alignment, and an additional extension is being considered to continue northeast past the Highline Canal to a northern access road. The proposed walking trail traverses through coastal sage scrub and disturbed coastal sage scrub communities (and direct impacts to vegetation are included in the construction impact acreages discussed above). Three least Bell's vireo territories, three California gnatcatcher occurrences, and one yellow-breasted chat occurrence were observed during 2019 surveys along habitat areas immediately adjacent to the existing Highline Canal and the associated dirt access road. No special-status wildlife species were observed along the alignment of the portion of the proposed trail from the existing Highline Canal along the northwestern boundary of the proposed project site to a northern access road. However, this area also contains coastal sage scrub and disturbed coastal sage scrub communities and, although not directly along the alignment, one least Bell's vireo territory, one California gnatcatcher occurrence, and one yellow-breasted chat occurrence were observed in the vicinity of the northern extent of the proposed walking trail during 2019 surveys. The property is currently closed to public use, so opening a walking trail would increase human use of the area. Noise from pedestrian use would be relatively minimal, and the northwestern boundary of the proposed project site is already subject to considerable noise from truck traffic on the adjacent Bee Canyon Access Road. Nevertheless,

pedestrians on the trail could indirectly impact special-status wildlife species and such impacts may occasionally be potentially significant. Implementation of Mitigation Measure BIO-5, prescribed below, would reduce impacts to a less than significant level.

Mitigation Measures

BIO-1: IRWD has been engaged in close coordination with the Wildlife Agencies (i.e., USFWS and CDFW) since 2018 to develop a multi-faceted mitigation strategy to address impacts to California gnatcatcher, as well as to address the additional mitigation the agencies mandate to compensate for displacement of habitat and land previously set aside for mitigation and subject to the restrictions and requirements imposed under the Mitigation Grant Deed, of which USFWS is a third party beneficiary. To date, IRWD has researched numerous off-site lands with high value habitat and biological resources, and initiated negotiations with landowners for possible acquisition. IRWD shall implement one, or a combination, of the following measures to mitigate permanent impacts to special-status wildlife species:

- a. Use of Incidental Take Credits for participating landowners (within the Reserve, or outside of the Reserve) to offset permanent impacts to coastal sage scrub (e.g., California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/non-native herbaceous cover, and non-native herbaceous cover/California sagebrush scrub) at a 1:1 impact-to-mitigation ratio.
- b. On- and/or off-site creation, restoration, and/or enhancement containing natural communities suitable for special-status species or comparable, as determined acceptable by the USFWS and CDFW.
- c. Off-site land acquisition, preservation, creation, restoration, and/or enhancement containing natural communities suitable for special-status species or comparable, as determined acceptable by the USFWS and CDFW.
- d. Areas where temporary impacts occur would be returned to pre-project conditions (i.e., pre-project elevation contours and revegetated with native upland scrub species) within one-year after construction is completed, and will be monitored for three years, or until a qualified biologist determines that the project site has returned to pre-project conditions. A revegetation plan would be prepared to re-seed/re-plant the area with local species, and would include performance standards, success criteria, maintenance, and future monitoring.

BIO-2: In accordance with the NCCP/HCP, certain construction-related mitigation measures are required to minimize impacts to the coastal California gnatcatcher and other coastal sage scrub species. The removal of coastal sage scrub communities will be conducted in compliance with the NCCP/HCP's Construction Related Minimization Measures:

- a. To the maximum extent practicable, no grading of coastal sage scrub habitat that is occupied by nesting gnatcatchers will occur during the breeding season (February 15 through July 15).
- b. Prior to the commencement of grading operations or other activities involving significant soil disturbance, all areas of coastal sage scrub habitat to be avoided under the provisions of the NCCP/HCP shall be identified with temporary fencing or other markers clearly visible to construction personnel. Additionally, prior to the

commencement of grading operations or other activities involving disturbance of coastal sage scrub, a survey will be conducted to locate gnatcatchers and cactus wrens within 100 feet of the outer extent of projected soil disturbance activities and the locations of any such species shall be clearly marked and identified on the construction/grading plans.

- c. A monitoring biologist, acceptable to USFWS/CDFW, will be on-site during any clearing of coastal sage scrub. IRWD will advise USFWS/CDFW at least seven calendar days (and preferably fourteen calendar days) prior to the clearing of any habitat occupied by Identified Species⁹ to allow USFWS/CDFW to work with the monitoring biologist in connection with bird flushing/capture activities. The monitoring biologist will flush Identified Species (avian or other mobile Identified Species) from occupied habitat areas immediately prior to brush-clearing and earth-moving activities. If birds cannot be flushed, they will be captured in mist nets, if feasible, and relocated to areas of the site to be protected or to the NCCP/HCP Reserve System. It will be the responsibility of the monitoring biologist to assure that Identified bird species will not be directly impacted by brush-clearing and earth-moving equipment in a manner that also allows for construction activities on a timely basis.
- d. Following the completion of initial grading/earth moving activities, all areas of coastal sage scrub habitat to be avoided by construction equipment and personnel will be marked with temporary fencing and other appropriate markers clearly visible to construction personnel. No construction access, parking, or storage of equipment or materials will be permitted within such marked areas.
- e. In areas bordering the NCCP Reserve System or Special Linkage/Special Management areas containing significant coastal sage scrub identified in the NCCP/HCP for protection, vehicle/equipment transportation routes and staging areas will be restricted to a minimum number during construction consistent with project construction requirements. Waste dirt or rubble will not be deposited on adjacent coastal sage scrub identified in the NCCP/HCP for protection. Pre-construction meetings involving the monitoring biologist, construction supervisors, and equipment operators will be conducted and documented to ensure maximum practicable adherence to these measures.
- f. Coastal sage scrub identified in the NCCP/HCP for protection and located within the likely dust drift radius of construction areas shall be periodically sprayed with water to reduce accumulated dust on the leaves as recommended by the monitoring biologist.

BIO-3: Impacts to nesting birds would be avoided by conducting all clearing and grubbing outside of the bird nesting season (i.e., work should occur September 1 to February 14, or July 1 to January 14 for raptors). If clearing and grubbing cannot avoid the bird nesting season, the following measures would be implemented:

- a. Prior to work during the bird nesting season (February 15 to August 31, or January 15 to June 31 for raptors), a qualified biologist should conduct a pre-construction survey of all suitable habitat for the presence of nesting birds no more than 7 days prior to construction and/or maintenance activities. The results of the pre-construction survey would be valid for 7 days; if vegetation removal activities do not

⁹ NCCP/HCP Identified Species that occur, or have potential to occur, on-site include the following: coastal California gnatcatcher, coastal cactus wren, orange-throated whiptail, coastal western whiptail, red-diamond rattlesnake, coast horned lizard, northern harrier, sharp-shinned hawk, prairie falcon, American peregrine falcon, red-shouldered hawk, southern California rufous-crowned sparrow, San Diego desert woodrat, gray fox, and coyote.

commence within 7 days following the survey, a new pre-construction nesting bird survey should be conducted before these activities begin again. If no active nests are found, then no further mitigation is required.

- b. If any active nests are found during a pre-construction nesting bird survey, a buffer of 300 feet (500 feet for raptors), or as determined appropriate by the qualified biologist (based on species-specific tolerances and site-specific conditions) in consultation with IRWD, would be delineated, flagged, and avoided until the nesting cycle is complete (i.e., the qualified biologist determines that the young have fledged or the nest has failed). The qualified biologist may also recommend other measures to minimize disturbances to the nest, which may include, but are not limited to, erection of sound barriers (e.g., noise blankets), erection of visual barriers (e.g., hay bales), or full-time monitoring by a qualified biologist.

BIO-4: With the creation of on-site riparian and wetland habitat areas, as part of the proposed project, there will be no net loss of woody riparian habitat for least Bell's vireo and no net loss of any wetland habitat. Nevertheless, there will be a temporary loss of these habitats until construction is completed and riparian habitat can be reestablished that the species can use again. IRWD is engaged with the Wildlife Agencies and is collaboratively developing a comprehensive program to address temporal impacts to least Bell's vireo and other riparian-associated special-status wildlife species (e.g., yellow warbler, yellow-breasted chat). IRWD shall implement the following measure to compensate for temporal impacts to least Bell's vireo and associated riparian special-status wildlife species (e.g., yellow warbler, yellow-breasted chat):

- a. Off-site land acquisition and preservation, and/or creation, restoration, and/or enhancement, of areas containing habitat suitable for least Bell's vireo and associated riparian special-status wildlife species (e.g., yellow warbler, yellow-breasted chat) to compensate for temporal loss in an amount or at a ratio determined acceptable by the USFWS and CDFW. Any private lands acquired and/or restored for this mitigation would be permanently preserved and dedicated for habitat conservation.

BIO-5: IRWD shall implement the following measure to mitigate indirect impacts to special-status wildlife species:

- a. Educational signage shall be posted at the entrances of the proposed walking trail to inform the public about the sensitive biological resources in the area and local wildlife in the area (e.g., rattlesnakes, coyotes). Signage would also be posted periodically along the proposed trail to remind public to keep on the trail and out of sensitive habitat areas.
- b. The proposed trail shall only be open during daylight hours (e.g., dawn to dusk).
- c. A Resource Management Plan (RMP) shall be prepared to outline long-term maintenance and management responsibilities for the preservation of the biological resources on-site (e.g., invasive species management, monitoring access issues, off-trail use, erosion, trash). The RMP should also provide guidance to ensure that all operations and maintenance activities performed on-site must also comply with all applicable requirements of the NCCP/HCP and the preservation of the biological resources on-site. The RMP would also outline monitoring requirements for species populations for federal and state-listed species (i.e., least Bell's vireo and California gnatcatcher).

Significance Determination

Less than Significant Impact with Mitigation

Riparian Habitat or Other Sensitive Natural Community

Impact 3.3-2: The proposed project could have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service.

Construction

Table 3.3-3 summarizes the permanent and temporary impacts on natural communities from the proposed project (shown in **Figure 3.3-10**). Ten sensitive natural communities occur within the project site: arroyo willow thicket, black willow thicket, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/coyote brush scrub, chaparral bushmallow scrub/non-native herbaceous cover, California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coast prickly pear scrub, and non-native herbaceous cover/California sagebrush scrub (shown in **Figure 3.3-11**).

The proposed project would permanently impact 61.56 acres (with Treatment Facility Option A¹⁰)/61.68 acres (with Treatment Facility Option B) acres of sensitive natural communities, including 0.09 acre of arroyo willow thicket, 4.07 acres of black willow thicket, 0.77 acre of coyote brush scrub, 0.19 acre of chaparral bushmallow scrub, 0.06 acre of chaparral bushmallow scrub/non-native herbaceous cover, 27.22 acres (with Option A)/27.34 acres (with Option B) of California sagebrush scrub, 0.98 acre of California sagebrush scrub/non-native herbaceous cover, and 28.18 acres of non-native herbaceous cover/California sagebrush scrub. The proposed project would temporarily impact 0.85 acre of California sagebrush scrub. The proposed project would avoid 121.37 acres (with Option A)/121.25 acres (with Option B) of sensitive natural communities (including 0.15 acre of arroyo willow thicket, 0.06 acre of black willow thicket, 0.14 acre of coyote brush scrub, 0.26 acre of chaparral bushmallow scrub, all 0.49 acre of chaparral bushmallow scrub/coyote brush scrub, 4.66 acres of chaparral bushmallow scrub/non-native herbaceous cover, 64.52 acres [with Option A]/64.40 acres [with Option B] of California sagebrush scrub, 6.88 acres of California sagebrush scrub/non-native herbaceous cover, all 0.69 acre of coast prickly pear scrub, and 43.52 acres of non-native herbaceous cover/California sagebrush scrub within the proposed project site.

¹⁰ The potential locations of the treatment facilities, which would be determined during detailed design, are depicted in Figures 13 and 14 (labeled as Treatment Facility Option A and Option B). Only one treatment facility in one of the optional locations will be built-out as part of the proposed project.

Syphon Reservoir Improvement Project

Figure 3.3-11
Impacts to Sensitive Natural Communities

The proposed project would also create at least 6.58 acres of riparian woodland, and approximately 5.88 acres of additional woody riparian and/or freshwater marsh habitat. The proposed project would also potentially add more than 10 acres of coastal sage scrub habitat where it is planned to be restored on the slope that will be cut northeast of the proposed reservoir to make space for the on-site riparian/wetland habitat areas. Impacts to sensitive natural communities that would result from the proposed project would be potentially significant. Implementation of Mitigation Measure BIO-6, prescribed below, would reduce impacts to a less than significant level.

In addition, a large portion of the proposed project site contains riparian and freshwater marsh habitat as well as the open water associated with the existing reservoir, which are all considered to be subject to CDFW jurisdiction, which includes lakes, streams, and associated vegetation. The proposed project would temporarily impact 26.35 acres of CDFW jurisdictional lakes, streams, and associated vegetation, of which 0.05 acre would be considered a beneficial impact (i.e., the areas will be impacted to create riparian woodland or freshwater marsh habitat). **Table 3.3-4** summarizes the temporary impacts on CDFW jurisdictional riparian habitat from the proposed project (shown in **Figure 3.3-12A**). The proposed project would avoid 0.20 acre of CDFW jurisdictional lakes, streams, and associated vegetation within the proposed project site. The proposed project would also create at least 6.58 acres of on-site riparian woodland and approximately 5.88 acres of additional on-site woody riparian and/or freshwater marsh habitat and enlarge the reservoir, which would expand the open water resources on-site. Thus, the proposed project would result in a beneficial impact, which would increase the amount of CDFW jurisdictional riparian habitat, and impacts would be less than significant. Because the proposed project will be altering a substantial area subject to CDFW jurisdiction, the proposed project must comply with Mitigation Measure BIO-7, prescribed below, to obtain a Streambed Alteration Agreement from CDFW.

**TABLE 3.3-4
 IMPACTS TO CDFW POTENTIALLY JURISDICTIONAL AREAS**

Jurisdiction Types	Existing (Acres)	Permanent Impacts (Acres)	Permanent Beneficial Impacts* (Acres)	Temporary Impacts (Acres)	Total Impacts (Acres)	Avoided (Acres)
CDFW Lakes, Streams, and Associated Vegetation	26.55	26.30	0.05	-	26.35	0.20
Total	26.55	26.30	0.05	0.0	26.35	0.20

* Although these areas will be permanently impacted by the proposed project, they will have the beneficial effect of creating riparian and upland habitat areas on-site.

Syphon Reservoir Improvement Project

Figure 3.3-12A
Impacts to CDFW Jurisdictional Areas

This page intentionally left blank

Operation

The majority of the proposed project's impacts to biological resources, including the beneficial impact of creating wetland/riparian areas, will occur during the proposed project's construction, and impacts associated with operations and maintenance activities of the reservoir are expected to be negligible and similar to the current operations and maintenance of the existing Syphon Reservoir.

Maintenance of the created riparian/wetland habitat areas, which will include creation of sensitive riparian communities that include riparian habitat subject to CDFW regulatory jurisdiction, would be required for up to 5 years after construction is complete for the proposed habitat areas to meet success criteria and provide good quality wildlife habitat. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. The work will promote establishment of the habitat that will replace the existing riparian/wetland habitat area currently subject to CDFW jurisdiction. Reestablishing an equivalent or greater area of such habitat would be considered to have a beneficial impact as it would result in no net loss of CDFW jurisdictional area.

Mitigation Measures

BIO-6: IRWD shall implement one, or a combination, of the following measures to mitigate impacts to sensitive natural communities:

- a. Use of Incidental Take Credits for NCCP/HCP participating landowners (within the Reserve, or outside of the Reserve) to offset permanent impacts to coastal sage scrub (e.g., California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/non-native herbaceous cover, and non-native herbaceous cover/California sagebrush scrub) at a 1:1 impact-to-mitigation ratio.
- b. On- and/or off-site land acquisition and preservation, and/or creation, restoration, and/or enhancement of sensitive natural communities comparable or equivalent to a 1:1 impact-to-mitigation ratio, or as determined acceptable by the USFWS and CDFW.
- c. Areas where temporary impacts occur to sensitive natural communities (e.g., California sagebrush scrub) would be returned to pre-project conditions (i.e., pre-project elevation contours and revegetation initiated) within one-year after the construction is completed, and will be monitored for three years, or until a qualified biologist determines that affected natural communities have been restored to equivalent or better condition as compared to pre-project conditions. A revegetation plan would be prepared to re-seed/re-plant the area with locally indigenous native species, and would include performance standards, success criteria, maintenance, and future monitoring.

BIO-7: IRWD shall negotiate and execute a Lake or Streambed Alteration Agreement under Section 1602 of the California Fish and Game Code with CDFW.

Significance Determination

Less than Significant Impact with Mitigation

State or Federally Protected Wetlands

Impact 3.3-3: The proposed project would not have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

Construction

In response to a request to review the resources on-site as described in the delineation report, the USACE issued an Approved Jurisdictional Determination letter (Appendix C), which confirmed that waters of the U.S. do not occur within the proposed project site since Syphon Reservoir is an intrastate isolated water with no apparent interstate or foreign commerce connection (USACE 2018). The CWA also excludes certain features from this regulation, including “wastewater recycling facility constructed on dry land” (see 33 CFR §230.3 (o)(2)(vii)). Thus, jurisdictional features identified are only subject to the jurisdiction of the State (i.e., wetlands and non-wetland waters of the State [discussed in this section below], and CDFW lakes, streams, and associated vegetation [previously discussed above]).

The proposed project would permanently impact 18.28 acres of wetlands and waters of the State (4.33 acres of wetlands, 13.95 acres of non-wetland waters of the State). **Table 3.3-5** summarizes the impacts on wetlands and waters of the State from the proposed project (shown in **Figure 3.3-12B**). The proposed project would also create 5.88 acres of freshwater marsh wetland habitat and enlarge the reservoir, which would expand the open water resources on-site. Thus, the proposed project would result in a beneficial impact, which would increase the amount of potential RWQCB jurisdictional wetlands and water of the State, and impacts would be less than significant.

**TABLE 3.3-5
 IMPACTS TO RWQCB POTENTIALLY JURISDICTIONAL AREAS**

Jurisdiction Types	Existing (Acres)	Permanent Impacts (Acres)	Permanent Beneficial Impacts* (Acres)	Temporary Impacts (Acres)	Total Impacts (Acres)	Avoided (Acres)
Wetland Waters of the State	4.33	4.33	-	-	4.33	-
Non-Wetland Waters of the State	13.95	13.95	-	-	13.95	-
Total	18.28	18.28	0.0	0.0	18.28	0.0

* Although these areas will be permanently impacted by the proposed project, they will have the beneficial effect of creating riparian and upland habitat areas on-site.

Operation

The majority of the proposed project’s impacts to biological resources, including the beneficial impact of creating more jurisdictional wetlands and water of the State, will occur during project construction, and impacts associated with operations and maintenance activities of the reservoir are expected to be negligible and similar to the current operations and maintenance of the existing Syphon Reservoir.

This page intentionally left blank

Maintenance of the created wetland areas would be required for up to 5 years after construction is complete to ensure success of the vegetated areas. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. Operations and maintenance efforts to establish and maintain the proposed riparian/wetland habitat around the fringe of the future reservoir would avoid a net loss of areas subject to RWQCB jurisdiction and would therefore have a beneficial impact.

Mitigation Measures

Less than Significant Impact

Wildlife Corridors

Impact 3.3-4: The proposed project could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.

Construction

The existing toll roads (SR-133 and SR-241) effectively stop most terrestrial wildlife movement from the proposed project site to the west and Portola Parkway and dense suburban development also block most wildlife from proceeding to the south. Nevertheless, the proposed project site lies at the southeastern edge of a large contiguous block of habitat that is an important element in the context of regional wildlife movement, particularly for avian species (e.g., dispersal habitat for coastal California gnatcatcher within this region). The reservoir is also one of several local water sources that attracts a number of avian species and provides habitat for migrating birds. Thus, the proposed project site functions as a part of a wildlife movement corridor from a regional perspective, as well as providing live-in and movement habitat for a variety of species on a local scale.

The proposed project would temporarily drain the existing reservoir, which is used by a number of birds and other wildlife for water supply and foraging. IRWD already periodically drains the reservoir as part of its current normal operations; however, the reservoir will be drained until project completion. It should be noted that Rattlesnake Reservoir, located just 1.1 miles to the north-northwest, could be utilized as a water source and for riparian habitat by migratory species moving through the region. The proposed project would impact 121.43 acres of natural communities during construction on-site, which could disrupt local movement and displace wildlife within the proposed project's footprint, particularly within the riparian habitats on-site. The proposed project would avoid 144.31 acres of natural communities; thus, displaced wildlife utilizing upland habitats can disperse to other upland areas on-site, and the impacted areas would not inhibit local or regional movement of wildlife within these avoided areas of the proposed

project site, though wildlife that is more sensitive to human disturbances and noise may be deterred by the nearby construction activities. Once completed, the enlarged reservoir will provide greater water storage capacity and an expanded open water area for migrating birds, and the proposed project will create at least 6.58 acres of on-site riparian woodland, approximately 5.88 acres of additional on-site woody riparian and/or freshwater marsh habitat that would be maintained to consistently provide habitat year-round, which would be a benefit to migratory species. In addition, approximately 10.47 acres of coastal sage scrub habitat would be created in an area northeast of the reservoir that currently exhibits predominantly low-value ruderal grassland. Therefore, with the creation of the on-site riparian and upland habitat, impacts to local movement are not expected to be significant. Thus, impacts to regional and local wildlife movement are considered less than significant, and no mitigation is required.

Regarding the proposed project's potential to "impede the use of native wildlife nursery sites", to the extent mass grading and construction activities occur during the breeding season and in close proximity to active nests or suitable nesting habitat, the proposed project may have potentially significant direct impacts. Nesting activity typically occurs from February 15 to August 31 (or January 15 to June 31 for raptors). Active nests and eggs are protected under Fish and Wildlife Code Section 3503. Impacts to any active songbird or raptor nests would violate State law and may be considered potentially significant, particularly with regard to special-status bird species. Implementation of Mitigation Measure BIO-3 would avoid violation of the Fish and Game Code and reduce potential impacts to special-status birds to a less than significant level.

Operation

The majority of the proposed project's impacts to biological resources will occur during proposed project construction, and impacts associated with operations and maintenance activities of the reservoir are expected to be negligible and comparable to the current operations and maintenance of the existing Syphon Reservoir. Similar to the current reservoir, operation of the proposed project would not require daily on-site staffing but, rather, would require only periodic maintenance. Water levels at Syphon Reservoir would fluctuate substantially and typically will follow a seasonal pattern wherein water would be stored in winter when recycled water supply exceeds demand, and the reservoir would be drawn down in summer when recycled water demand is high.

Maintenance of the created riparian and upland habitat areas would be required for up to 5 years after construction is complete for the proposed habitat areas to meet success criteria and provide good quality wildlife habitat. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. The riparian and upland habitat areas would be irrigated as needed from a main supply line installed around the perimeter of the reservoir that connects to the reservoir water source. When maintenance of the riparian and upland habitat areas involves vegetation removal (e.g., weeding) and cannot be scheduled outside of nesting season, such work could impact nesting bird species, which could be potentially significant. Implementation of Mitigation Measure BIO-3 would reduce impacts to a less than significant level.

In addition, a walking trail is proposed along the northwestern boundary of the proposed project site. The proposed walking trail traverses through coastal sage scrub and disturbed coastal sage scrub communities (and direct impacts to vegetation are included in the construction impact acreages discussed above). The property is currently closed to public use, but a proposed walking trail would increase human use of the area. However, the level of activity and disturbance associated with people occasionally using the proposed trail would not impede local wildlife movement through the area. Thus, impacts would be less than significant and no mitigation is required.

Mitigation Measures

Implement Mitigation Measure BIO-3

Significance Determination

Less than Significant Impact with Mitigation

County Policies or Ordinances

Impact 3.3-5: The proposed project could conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.

Construction

The General Plan's Land Use Element Policy 9, Enhancement of Environment ensures that all land use activities seek to enhance the physical environment, including the air, water, sound levels, landscape, and plant and animal life, and recognizes the need to improve both the manmade and natural environments. Where aspects of the natural environment are deemed to be truly significant, this policy requires measures be taken to preserve these aspects. The proposed project's objective is to increase the recycled water storage capacity at Syphon Reservoir in order to meet the seasonal demand of recycled water customers and to enhance IRWD's water supply reliability. Plant and animal life that may be disrupted by the proposed project will be offset through the creation of riparian and upland habitat areas and proposed mitigation, so while these created habitat and mitigation areas may not enhance the physical environment, they will ensure the preservation of biologically equivalent plant and wildlife resources. Thus, the proposed project would not conflict with this policy.

The General Plan's Resources Element Policy 1, Wildlife and Vegetation requires the identification and preservation of the significant wildlife and vegetation habitats of the County. As discussed above, impacts to special-status species and sensitive natural communities are analyzed and mitigation is proposed for impacts that are determined to be potentially significant. Implementation of Mitigation Measures BIO-1, BIO-2, BIO-3, BIO-4, BIO-5, and BIO-6 would reduce impacts to a less than significant level.

Operation

As discussed above, impacts associated with operations and maintenance activities of the reservoir are expected to be negligible and similar to the current operations and maintenance of the existing Syphon Reservoir.

If maintenance of the riparian and upland habitat areas includes vegetation removal (e.g., weeding) and cannot be scheduled outside of nesting season, impacts to nesting special-status bird species, would be potentially significant. Implementation of Mitigation Measure BIO-3 would reduce impacts to a less than significant level.

Mitigation Measures

Implement Mitigation Measures BIO-1, BIO-2, BIO-3, BIO-4, BIO-5, and BIO-6

Significance Determination

Less than Significant Impact with Mitigation

Habitat Conservation Plan

Impact 3.3-6: The proposed project could conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

Construction

The proposed project site is within the Central Subregion of the County of Orange NCCP/HCP, and is located with the NCCP/HCP Reserve. IRWD is participating landowner and a signatory of the Central & Coastal Subregion NCCP/HCP. The NCCP/HCP included provisions for IRWD to build a future reservoir “as a permitted use within the Reserve System” (R.J. Meade Consulting 1996a). At the time that the NCCP/HCP was prepared, IRWD had identified and was considering four alternative seasonal recycled water storage reservoirs (including the Syphon Reservoir site), all of which were located within the subregional Reserve System, though only one reservoir would ultimately be needed. Thus, the need for a future reservoir was identified as “a permitted use within the Reserve System in the event that public health, safety, and welfare require such a facility in the future. At the time such a facility is needed, IRWD will review the plans with appropriate agencies and propose a specific mitigation plan or pay fees adequate to mitigate the Incidental Take associated with the new reservoir” (R.J. Meade Consulting 1996a).

The proposed Syphon Reservoir Improvement Project is a permitted use within the Reserve System. Compliance with specific conditions required for NCCP/HCP conditionally covered species (i.e., least Bell’s vireo) are discussed above. However, the removal of coastal sage scrub communities would be considered potentially significant. Implementation of Mitigation Measures BIO-1 and BIO-2 would reduce impacts to a less than significant level.

Operation

The operations and maintenance activities of the reservoir are expected to be similar to the current operations and maintenance of the existing Syphon Reservoir.

Maintenance of the created upland habitat areas would be required for up to 5 years after construction is complete to ensure success of the vegetated areas. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. The upland habitat areas would be irrigated from a main supply line installed around the perimeter of the reservoir that connects to the reservoir water source. When maintenance of the riparian and upland habitat areas involves vegetation removal (e.g., weeding) and cannot be scheduled outside of nesting season, such work could impact nesting special-status bird species, which could be potentially significant. Implementation of Mitigation Measure BIO-3 would reduce impacts to a less than significant level, and thus would not conflict with the provisions of the Central & Coastal Subregion NCCP/HCP.

Mitigation Measures

Implement Mitigation Measures BIO-1, BIO-2, and BIO-3

Significance Determination

Less than Significant Impact with Mitigation

Cumulative Impacts

Impact 3.3-7: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to biological resources.

Construction and Operation

The cumulative projects to be considered in the analysis of cumulative impacts are listed in Table 3-1 and illustrated on Figure 3-1 in Section 3 of this Draft EIR. The projects listed in Table 3-1 include a range of project types, including residential and commercial development, and park construction and improvements, that could contain biological resources. The geographic area of analysis of cumulative impacts for biological resources includes the area bounded by those projects listed in Table 3-1 and generally corresponds to the portion of Orange County along the front of the Santiago Hills in the vicinity of the proposed project, as well as adjacent mountains and lowlands to the east and west, respectively. This geographic scope of analysis is appropriate because the biological resources within this area are expected to be similar to those that occur on the proposed project site because of their proximity, and because similar habitats, landforms, and hydrology are likely to support a similar composition of plant and wildlife species. However, the greater Central Subregion of the NCCP/HCP (as shown on Figure 3.3-1) is also considered in the context of this cumulative impacts' analysis for biological resources.

Cumulative impacts to biological resources could occur if other related projects, in conjunction with the proposed project, had or would have impacts on biological resources that, when considered together, would be significant. These projects could be constructed simultaneously in areas proximate to, or overlapping geographically with the proposed project. Construction and operation of the proposed project, in combination with other projects in the area, has the potential to contribute to a cumulatively significant impact to biological resources due to the potential disturbance and/or loss of natural communities, some of which are sensitive, and the wildlife species that they support, including special-status species unique to the region.

Cumulative Projects 1 (Peters Canyon Regional Park General Development Plan and Resource Management Plan) and Cumulative Project 2 (2014 Irvine Ranch Open Space Donation Interim Recreation and Resource Management Plan) are proposed within areas that support native habitat, and Peters Canyon Regional Park has known locations of California gnatcatchers and least Bell's vireo; however, both of these projects include recreational improvements (e.g., trail/trailhead improvements, and associated facilities) that will have minimal impacts on biological resources. Cumulative Projects 3, 4, 6, 7, and 17 include a park, residential developments, and a pump station, and all are located on sites that currently or formerly support agriculture; thus, impacts on biological resources are minimal. For all of these projects, significant impacts to biological resources will be mitigated to a less than significant level.

The proposed project site is within the Central Subregion of the Central/Coastal NCCP/HCP. The NCCP/HCP Reserve System design has set aside approximately 37,000 acres within the NCCP/HCP Reserve for long-term management. By preserving large habitat blocks and maintaining connectivity, the NCCP/HCP Reserve System has minimized the cumulative impacts of projects in the region to allow for the protection of natural communities and species while allowing a reasonable amount of economic development in the region. The NCCP/HCP authorizes "take" of 39 "Identified Species" of plants and wildlife to the extent take authorization may be required for those species under the state or federal endangered species acts. The NCCP/HCP addresses the protection and management of coastal sage scrub habitat and coastal sage scrub-obligate species, and other covered habitats and species, and mitigates anticipated impacts to those habitats and species, on a programmatic, sub-regional level, rather than on a project-by-project, single species basis. The 37,000-acre NCCP/HCP Reserve System, adaptive management program, and other measures of the NCCP/HCP were determined to fully mitigate "take" of these species and habitats, and minimize the cumulative impacts of proposed projects within authorized take lands. Conditionally covered species are also authorized for "take" so long as the specific conditions (e.g., mitigation measures) outlined in the NCCP/HCP are implemented.

Mitigation measures are included in this EIR to reduce potentially significant proposed project impacts to biological resources during construction and operation and to comply with the NCCP/HCP, which would reduce the proposed project's incremental contribution to cumulative impacts.

- Mitigation Measure BIO-1 requires mitigation for impacts to coastal sage scrub and the California gnatcatcher, as well as addressing additional mitigation the agencies mandate to

compensate for displacement of habitat subject to the restrictions and requirements imposed under the Mitigation Grant Deed.

- For the removal of coastal sage scrub communities during construction, Mitigation Measure BIO-2 outlines construction-related mitigation measures required to minimize impacts to the coastal California gnatcatcher and other coastal sage scrub species in accordance with the NCCP/HCP.
- Mitigation Measure BIO-3 requires clearing and grubbing of vegetation to be conducted outside of the bird nesting season, or pre-construction nesting bird survey must be conducted and avoidance buffers established around any active nests.
- Mitigation Measure BIO-4 requires mitigation for impacts to the least Bell's vireo, which is a conditionally covered species under the NCCP/HCP, and associated riparian special-status wildlife species (e.g., yellow warbler, yellow-breasted chat).
- Mitigation Measure BIO-5 requires educational signage and use restrictions on the trail, as well as a Resource Management Plan to outline long-term maintenance and management responsibilities for the preservation of the biological resources on-site.
- Mitigation Measure BIO-6 requires mitigation for impacts to sensitive natural communities.
- Mitigation Measure BIO-7 requires that a Lake or Streambed Alteration Agreement be obtained from CDFW.

With implementation of Mitigation Measures BIO-1 through BIO-7 as described above, the proposed project would not result in significant impacts to biological resources and would be consistent with the provisions of the NCCP/HCP. Given the required mitigation for the current proposed project, the NCCP/HCP, which minimizes the cumulative impacts of proposed projects within authorized take lands, and requires adherence to federal, state, and local laws for other projects in the cumulative region, the proposed contribution to cumulative impacts to biological resources would not be cumulatively considerable and would be considered less than significant.

Mitigation Measures

Implement Mitigation Measures BIO-1 through BIO-7

3.4 Cultural Resources

This section describes and evaluates potential impacts related to cultural resources that could result from construction and operation of the proposed project. The section contains: a description of the existing setting as it pertains to cultural resources; a summary of the regulations related to cultural resources; and an evaluation of the potential impacts related to cultural resources associated with the implementation of the proposed project, including cumulative impacts. The cultural resources described in this section are based on the findings provided in the Syphon Reservoir Improvement Project Cultural Resources Assessment Report (ESA 2019).

3.4.1 Environmental Setting

Natural Setting

The proposed project site lies within a shallow valley, commonly referred to as Syphon Canyon, located between Bee and Hicks Canyons (GEI 2012). The site is situated along the southwestern flank of the Loma Ridge in the Santiago Hills portion of the Santa Ana Mountains. The valley and the surrounding terrain drains onto the Tustin Plain, an alluvial plain that extends southwest from the Santa Ana Mountains to the San Joaquin Hills. The Tustin Plain is located at the eastern edge of the large sedimentary basin that incorporates most of the flat-lying areas of Orange and Los Angeles Counties. The proposed project site is hilly, with ridgelines and terraced slopes surrounding the reservoir basin in the central portion of the site. Ground surface elevations at the site range from about 675 feet above mean sea level (amsl) in the northeast corner to about 319 feet amsl at Portola Parkway immediately downstream of the existing reservoir. Beyond the reservoir itself, the hills and lowlands of the proposed project site are generally undeveloped, with the exception of dirt roads, terracing, and erosion control, and are covered with sensitive upland and wetland vegetation communities. The area surrounding the project site is generally developed, with school athletic facilities, major roadways, and residential neighborhoods.

Prehistoric Setting

The chronology of coastal Southern California is typically divided into three general time periods: Early Holocene (11,000 to 8,000 before present [B.P.]), Middle Holocene (8,000 to 4,000 B.P.), and Late Holocene (4,000 B.P. to A.D. 1769). Within this general timeframe, the archaeology of Southern California is generally described in terms of cultural “complexes.” A complex is a specific archaeological manifestation of a general mode of life, characterized archaeologically by technology, particular artifacts, economic systems, trade, burial practices, and other aspects of culture.

Early Holocene (11,000 to 8,000 B.P.)

While it is not certain when humans first came to California, their presence in Southern California by about 11,000 B.P. has been well documented. At Daisy Cave, on San Miguel Island, cultural remains have been radiocarbon dated to between 11,100 and 10,950 years B.P. (Byrd and Raab 2007). On the mainland, radiocarbon evidence confirms occupation of the Orange County and

San Diego County coasts by about 9,000 B.P., primarily in lagoon and river valley locations (Gallegos 2002). During the Early Holocene, the climate of Southern California became warmer and more arid and the human population, residing mainly in coastal or inland desert areas, began exploiting a wider range of plant and animal resources (Horne and McDougall 2003).

The primary Early Holocene cultural complex in coastal Southern California was the San Dieguito Complex. The people of the San Dieguito Complex (about 10,000–8,000 B.P.) inhabited the chaparral zones of southwestern California, exploiting the plant and animal resources of these ecological zones (Moratto 1984; Warren 1968). Leaf-shaped and large-stemmed projectile points are typical of San Dieguito Complex material culture.

Middle Holocene (8,000 to 4,000 B.P.)

During the Middle Holocene, there is evidence for the processing of acorns for food and for the increased importance of hunting (Horne and McDougall 2003). As the processing of plant foods, particularly acorns, increased, a wider variety of animals were hunted, and trade with neighboring regions intensified (Horne and McDougall 2003). Major technological changes appeared as well, particularly with the advent of the bow and arrow, which largely replaced the use of the dart and atlatl.

The Middle Holocene La Jolla Complex (about 8,000–4,000 B.P.) is essentially a continuation of the San Dieguito Complex. La Jolla groups lived in chaparral zones or along the coast, often migrating between the two. Coastal settlement focused around the bays and estuaries of coastal Orange and San Diego counties. La Jolla peoples produced large, coarse stone tools, but also produced well-made projectile points, and milling slabs. The La Jolla Complex represents a period of population growth and increasing social complexity, and it was also during this time period that the first evidence of the grinding of seeds for flour appears, as indicated by the abundance of millstones in the archaeological record (Horne and McDougall 2003).

Late Holocene (4,000 B.P. to A.D. 1769)

During the Late Holocene, native populations of Southern California were becoming less mobile and populations began to gather in small sedentary villages with satellite resource-gathering camps. Evidence indicates that the overexploitation of larger, high-ranked food resources may have led to a shift in subsistence, towards a focus on acquiring greater amounts of smaller resources, such as shellfish and small-seeded plants (Byrd and Raab 2007). In coastal Southern California, conditions became drier and many lagoons were transformed into saltwater marshes. Because of this, populations abandoned mesa and ridge tops to settle nearer to permanent freshwater resources (Gallegos 2002). Trading reached its zenith during this time period, with asphaltum (tar), seashells and steatite being exchanged from Southern California to the Great Basin.

Ethnographic Setting

According to Bean and Smith (1978), the Gabrielino, with the exception of the Chumash to the north, “were the wealthiest, most populous, and most powerful ethnic nationality in aboriginal Southern California.” Prior to European colonization, the Gabrielino occupied a diverse area that included: the watersheds of the Los Angeles, San Gabriel, and Santa Ana rivers; the Los Angeles

basin; and the islands of San Clemente, San Nicolas, and Santa Catalina (Kroeber 1925). The Gabrielino language was part of the Takic branch of the Uto-Aztecan language family (Kroeber 1925). The Gabrielino subsisted on a variety of resources in several ecological zones. Acorns, sage, and yucca were gathered throughout the inland areas whereas shellfish, fish, as well as a variety of plants and animals were exploited within the marshes and along the coast. Deer and various kinds of small mammals were hunted on an opportunistic basis. Their material culture reflected the subsistence technology. Lithic tools such as arrow points and modified flakes were used to hunt and process animals. A variety of ground stone grinding implements, such as the mortar, pestle, mano, and metate, were used to process both plant and animal remains for food (Bean and Smith 1978).

The settlement patterns of the Gabrielino, and other nearby groups, such as the Juaneño and Luiseño, were similar and they often interacted through marriage, trade and warfare. The seasonal availability of water and floral and faunal resources dictated seasonal migration rounds with more permanent villages and base camps being occupied primarily during winter and spring months. In the summer months, the village populations divided into smaller units that occupied seasonal food procurement areas. The more permanent settlements tended to be near major waterways and food sources and various secular and sacred activities, such as food production and storage and tool manufacturing, were conducted at these areas (Bean and Smith 1978).

Historic Setting

In 1769, the Gaspar de Portola expedition is known to have camped at Tomato Springs, approximately 1.15 miles southeast of the proposed project site (Meadows 1965). At various times, Tomato Springs has been referred to as *Los Ojitos de San Pantaleon*, *El Aguaje del Padre Gomez*, and *Aguaje de los Tomates*. According to anthropologist John Peabody Harrington's early 20th century notes, Tomato Springs was identified by Native American informants as a camping place by the name of *Usronvana* (Archer 2008).

Upon their arrival, the Spanish divided lands for the missions and a few large private land grants. However, in 1831, after the Mexican government gained independence from Spain, it secularized the missions and distributed ranchos to Mexican citizens who applied for grants. In the vicinity of the proposed project area, these included Rancho Santiago de Santa Ana, Rancho San Joaquin, and Rancho Los de Santiago. The 47,000-acre Rancho Lomas de Santiago, granted to Teodosio Yorba in 1846, encompasses the project site. In 1866, James Irvine, Thomas Flint, and Llewellyn Bixby purchased the rancho for \$7,000. The lands were devoted to sheep grazing primarily, although in the 1870s tenant farming was allowed. In 1878, Irvine acquired his partners' shares for \$150,000. Irvine passed away in 1886, and in 1893, his son James Irvine Jr., took possession of the rancho, incorporating the land into the Irvine Company a year later. Irvine Jr. shifted the rancho's operations into agricultural activities (olive and citrus orchards). When James Irvine Jr. passed away in 1947, his son Myford took over and started opening small sections of the ranch for urban development. In 1959, the University of California purchased land from the Irvine Company to construct a new school campus. In 1970, the Irvine Company finished the construction of the Irvine Business Complex (including the villages of Turtle Rock, University Park, Culverdale, the Ranch, and Walnut) surrounding the university.

Water Management in the Irvine Ranch

Agricultural development in the Irvine Ranch was originally dependent upon residual streamflow, the Cienega de las Ranas, and the Laguna Lakes. By 1893, James Irvine started “to divert water from Santiago Creek to an area known as, ‘the Flats’ and down Peters Canyon to the new ranch house” (Nelson 2009: 6). However, the Carpenter and Serrano Irrigation Districts located west of the Irvine Ranch property, which had previously acquired riparian rights to irrigate land, were opposed to this action. By 1928, litigation between the Irvine Ranch and the Serrano Irrigation District led to an agreement to share equal rights to the water supply that would later be conserved with the construction of the Santiago Dam. In the 1920s, and in an effort to provide water to his tenant farmers of grain and bean crops, James Irvine developed a system of acquiring ground water from water wells through gasoline driven and electrical pumping technology. As the groundwater resources started to decline, C.R. Browning, P.E., with the Irvine Company, began to design water conservation facilities for the Syphon Canyon Dam and Reservoir, Peters Canyon Dam, the Highline Canal, the Rattlesnake Canyon Reservoir, Sand Canyon Reservoir, Lambert Reservoir, Laguna Reservoir, Bonita Reservoir, the Irvine Conservation Dam, and the Little Peters Reservoir. Similarly, plans for the Santiago Dam were prepared by A. Kempkey, P.E. The capacity of the reservoirs would total approximately 30,000 acre-feet (Nelson 2009: 6). A summary of these facilities is provided below.

Syphon Canyon Dam and Reservoir

The Syphon Canyon Dam and Reservoir is located within the proposed project boundaries and was created between 1948 and 1949. Since its initial development, the reservoir was used to store irrigation water. According to information provided by the Irvine Irrigation District, water from the reservoir was distributed to two citrus packing plants along the former Santa Fe Railway spur line in the center of the ranch. However, as the Irvine Irrigation District notes, the irrigation service came to an end around 1970 (Nelson 2009). In 2010, the Irvine Ranch Water District (identified as the Transferee) acquired the “Reservoir Property,” including the dam, reservoir, and other facilities (consisting of the Highline Canal, pipelines, pump stations, and vaults) along with recreational rights over the reservoir, through a Conveyance Agreement (P.R. No. 30341) between the Irvine Company and the Irvine Community Development Department (identified as the Transferors). In addition, the Transferors handed over “all right, title and interest of Transferor under that certain Entry Agreement between TIC’s predecessor in interest and Val Verde Sportsmen’s Club... (“The Fishing License”) (IRWD 2009:1). The reservoir now operates as a small seasonal storage facility for recycled water with a capacity of 535 acre-feet (174 million gallons) (IRWD 2009).

Highline Canal

Other early water management infrastructure in the area included the Highline Canal. This water conveyance feature was constructed in the 1930s and is lined with unreinforced concrete. A portion of the Highline Canal crosses the southwest portion of the proposed project site. It commences at the Peters Canyon outlet pipeline and follows the contour of the Lomas de Santiago for approximately 7 miles southeast to other lower reservoirs and to orchards and crops. While it served as a functioning water conveyance component since its original construction, its

use began to decline in 1970 after connection of the new Irvine Lake Pipeline, which conveyed water from Colorado River to the Rattlesnake Canyon Reservoir (Nelson 2009).

3.4.2 Regulatory Framework

Numerous laws and regulations require federal, state, and local agencies to consider the effects a project may have on cultural resources. These laws and regulations stipulate a process for compliance, define the responsibilities of the various agencies proposing the action, and prescribe the relationship among other involved agencies.

Federal

National Historic Preservation Act

Although federal funding is not expected, if the proposed project were to receive federal funding, the funding agency would be required to comply with Section 106 of the National Historic Preservation Act (NHPA), as amended (54 United States Code of Laws [USC] 300101 et seq.), and its implementing regulations (36 CFR Part 800). The NHPA is the principal federal law addressing historic properties. Section 106 requires a federal agency with jurisdiction over a proposed federal action (referred to as an “undertaking” under the NHPA), including federal funding for projects, to take into account the effects of the undertaking on historic properties, and to provide the Advisory Council on Historic Preservation (ACHP) an opportunity to comment on the undertaking.

The term “historic properties” refers to “any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register” (36 CFR Part 800.16(l)(1)). The implementing regulations (36 CFR Part 800) describe the process for identifying and evaluating historic properties, for assessing the potential adverse effects of federal undertakings on historic properties, and seeking to develop measures to avoid, minimize, or mitigate adverse effects. The Section 106 process does not require the preservation of historic properties; instead, it is a procedural requirement mandating that federal agencies take into account effects to historic properties from an undertaking prior to approval.

The steps of the Section 106 process are accomplished through consultation with the State Historic Preservation Officer (SHPO), federally-recognized Indian tribes, local governments, and other interested parties. The goal of consultation is to identify potentially affected historic properties, assess effects to such properties, and seek ways to avoid, minimize, or mitigate any adverse effects on such properties. Consultation between the lead federal agency and SHPO ensures that the Section 106 process has been completed. The agency also must provide an opportunity for public involvement (36 CFR 800.1(a)). Consultation with Indian tribes regarding issues related to Section 106 and other authorities (such as NEPA and Executive Order No. 13007) must recognize the government-to-government relationship between the Federal government and Indian tribes, as set forth in Executive Order 13175, 65 FR 87249 (Nov. 9, 2000), and Presidential Memorandum of November 5, 2009.

National Register of Historic Places

The National Register of Historic Places (National Register) was established by the NHPA of 1966, as “an authoritative guide to be used by federal, State, and local governments, private groups and citizens to identify the Nation’s historic resources and to indicate what properties should be considered for protection from destruction or impairment” (36 CFR 60.2) (U.S. Department of the Interior 2002). The National Register recognizes a broad range of cultural resources that are significant at the national, state, and local levels and can include districts, buildings, structures, objects, prehistoric archaeological sites, historic-period archaeological sites, traditional cultural properties, and cultural landscapes. As noted above, a resource that is listed in or eligible for listing in the National Register is considered “historic property” under Section 106 of the NHPA.

To be eligible for listing in the National Register, a property must be significant in American history, architecture, archaeology, engineering, or culture. Properties of potential significance must meet one or more of the following four established criteria:

- A. Are associated with events that have made a significant contribution to the broad patterns of our history;
- B. Are associated with the lives of persons significant in our past;
- C. Embody the distinctive characteristics of a type, period, or method of construction or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
- D. Have yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting one or more of the criteria of significance, a property must have integrity. Integrity is defined as “the ability of a property to convey its significance” (U.S. Department of the Interior 2002). The National Register recognizes seven qualities that, in various combinations, define integrity. The seven factors that define integrity are location, design, setting, materials, workmanship, feeling, and association. To retain historic integrity a property must possess several, and usually most, of these seven aspects. Thus, the retention of the specific aspects of integrity is paramount for a property to convey its significance (U.S. Department of the Interior 2002).

State

California Environmental Quality Act

CEQA is the principal statute governing environmental review of projects occurring in the state and is codified at Public Resources Code (PRC) Section 21000 et seq. CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on historical or unique archaeological resources. Under CEQA (Section 21084.1), a project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

The CEQA Guidelines (Title 14 California Code of Regulations [CCR] Section 15064.5) recognize that historical resources include: (1) a resource listed in, or determined to be eligible by

the State Historical Resources Commission, for listing in the California Register of Historical Resources (California Register); (2) a resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g); and (3) any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California by the lead agency, provided the lead agency's determination is supported by substantial evidence in light of the whole record. The fact that a resource does not meet the three criteria outlined above does not preclude the lead agency from determining that the resource may be an historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

If a lead agency determines that an archaeological site is a historical resource, the provisions of Section 21084.1 of CEQA and Section 15064.5 of the CEQA Guidelines apply. If an archaeological site does not meet the criteria for a historical resource contained in the CEQA Guidelines, then the site may be treated in accordance with the provisions of Section 21083, which is as a unique archaeological resource. As defined in Section 21083.2 of CEQA a "unique" archaeological resource is an archaeological artifact, object, or site, about which it can be clearly demonstrated that without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- Contains information needed to answer important scientific research questions and there is a demonstrable public interest in that information;
- Has a special and particular quality such as being the oldest of its type or the best available example of its type; or,
- Is directly associated with a scientifically recognized important prehistoric or historic event or person.

If an archaeological site meets the criteria for a unique archaeological resource as defined in Section 21083.2, then the site is to be treated in accordance with the provisions of Section 21083.2, which state that if the lead agency determines that a project would have a significant effect on unique archaeological resources, the lead agency may require reasonable efforts be made to permit any or all of these resources to be preserved in place (Section 21083.1(a)). If preservation in place is not feasible, mitigation measures shall be required. The CEQA Guidelines note that if an archaeological resource is neither a unique archaeological nor a historical resource, the effects of the project on those resources shall not be considered a significant effect on the environment (CEQA Guidelines Section 15064.5(c)(4)).

A significant effect under CEQA would occur if a project results in a substantial adverse change in the significance of a historical resource as defined in CEQA Guidelines Section 15064.5(a). Substantial adverse change is defined as "physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of a historical resource would be materially impaired" (CEQA Guidelines Section 15064.5(b)(1)). According to CEQA Guidelines Section 15064.5(b)(2), the significance of a historical resource is materially

impaired when a project demolishes or materially alters in an adverse manner those physical characteristics that:

- A. Convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register; or
- B. Account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in a historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- C. Convey its historical significance and that justify its eligibility for inclusion in the California Register as determined by a Lead Agency for purposes of CEQA.

In general, a project that complies with the Secretary of the Interior’s Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings (Standards) (Grimer 2017) is considered to have mitigated its impacts to historical resources to a less-than-significant level (CEQA Guidelines Section 15064.5(b)(3)).

California Register of Historical Resources

The California Register is “an authoritative listing and guide to be used by State and local agencies, private groups, and citizens in identifying the existing historical resources of the State and to indicate which resources deserve to be protected, to the extent prudent and feasible, from substantial adverse change” (PRC Section 5024.1[a]). The criteria for eligibility for the California Register are based upon National Register criteria (PRC Section 5024.1[b]). Certain resources are determined by the statute to be automatically included in the California Register, including California properties formally determined eligible for, or listed in, the National Register.

To be eligible for the California Register, a prehistoric or historic-period property must be significant at the local, state, and/or federal level under one or more of the following four criteria:

- 1. Is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage;
- 2. Is associated with the lives of persons important in our past;
- 3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
- 4. Has yielded, or may be likely to yield, information important in prehistory or history.

A resource eligible for the California Register must meet one of the criteria of significance described above, and retain enough of its historic character or appearance (integrity) to be recognizable as a historical resource and to convey the reason for its significance. It is possible that a historic resource may not retain sufficient integrity to meet the criteria for listing in the National Register, but it may still be eligible for listing in the California Register.

Additionally, the California Register consists of resources that are listed automatically and those that must be nominated through an application and public hearing process. The California Register automatically includes the following:

- California properties listed on the National Register and those formally determined eligible for the National Register;
- California Registered Historical Landmarks from No. 770 onward; and,
- Those California Points of Historical Interest that have been evaluated by the OHP and have been recommended to the State Historical Commission for inclusion on the California Register.

Other resources that may be nominated to the California Register include:

- Historical resources with a significance rating of Category 3 through 5 (those properties identified as eligible for listing in the National Register, the California Register, and/or a local jurisdiction register);
- Individual historical resources;
- Historical resources contributing to historic districts; and,
- Historical resources designated or listed as local landmarks, or designated under any local ordinance, such as an historic preservation overlay zone.

California Health and Safety Code Section 7050.5

California Health and Safety Code Section 7050.5 requires that in the event human remains are discovered, the County Coroner be contacted to determine the nature of the remains. In the event the remains are determined to be Native American in origin, the Coroner is required to contact the NAHC within 24 hours to relinquish jurisdiction.

California Public Resources Code Section 5097.98

California PRC Section 5097.98, as amended by Assembly Bill 2641, provides procedures in the event human remains of Native American origin are discovered during project implementation. PRC Section 5097.98 requires that no further disturbances occur in the immediate vicinity of the discovery, that the discovery is adequately protected according to generally accepted cultural and archaeological standards, and that further activities take into account the possibility of multiple burials. PRC Section 5097.98 further requires the NAHC, upon notification by a County Coroner, designate and notify a Most Likely Descendant (MLD) regarding the discovery of Native American human remains. Once the MLD has been granted access to the site by the landowner and inspected the discovery, the MLD then has 48 hours to provide recommendations to the landowner for the treatment of the human remains and any associated grave goods.

In the event that no descendant is identified, or the descendant fails to make a recommendation for disposition, or if the land owner rejects the recommendation of the descendant, the landowner may, with appropriate dignity, reinter the remains and burial items on the property in a location that will not be subject to further disturbance.

California Government Code Sections 6254(r) and 6254.10

These sections of the California Public Records Act were enacted to protect archaeological sites from unauthorized excavation, looting, or vandalism. Section 6254(r) explicitly authorizes public agencies to withhold information from the public relating to “Native American graves, cemeteries, and sacred places maintained by the Native American Heritage Commission.” Section 6254.10 specifically exempts from disclosure requests for “records that relate to archaeological site information and reports, maintained by, or in the possession of the Department of Parks and Recreation, the State Historical Resources Commission, the State Lands Commission, the Native American Heritage Commission, another state agency, or a local agency, including the records that the agency obtains through a consultation process between a Native American tribe and a state or local agency.”

Local

County of Orange

General Plan, VI. Resources Element

The Orange County General Plan identifies the goals, objectives, and policies relevant to cultural resources (Orange County General Plan, VI. Resources Element). Cultural historic resources are defined as buildings, structures, objects, sites, and districts of significance in history, archaeology, architectural history, and culture. The County maintains a list of certified archaeological professionals who are qualified to work on projects within the County’s jurisdiction (i.e., unincorporated areas). The following policies are applicable to the proposed project.

Historic Resources Policies

1. To identify historic resources through literature and records research and/or onsite surveys.
2. To evaluate historic resources through comparative analysis or through subsurface or materials testing.
3. To preserve significant historic resources by one or a combination of the following alternatives, as agreed upon by RDMD and the project sponsor:
 - a. Adaptive reuse of historic resource.
 - b. Maintaining the historic resource in an undisturbed condition.
 - c. Moving the historic resource and arranging for its treatment.
 - d. Salvage and conservation of significant elements of the historic resources.
 - e. Documentation (i.e., research narrative, graphics, photography) of the historic resource prior to destruction.

Archaeological Resources Policies

1. To identify archaeological resources through literature and records research and surface surveys.
2. To evaluate archaeological resources through subsurface testing to determine significance and extent.

3. To observe and collect archaeological resources during the grading of a project.
4. To preserve archaeological resources by:
 - a. Maintaining them in an undisturbed condition, or
 - b. Excavating and salvaging materials and information in a scientific manner

City of Irvine

General Plan, Cultural Resources Element, Element E

The project site is located within the City of Irvine's Sphere of Influence. The City of Irvine General Plan identifies the goals, objectives, and policies relevant to cultural resources.

Goal: Ensure the proper disposition of historical, archaeological, and paleontological resources to minimize adverse impacts, and to develop an increased understanding and appreciation for the community's historic and prehistoric heritage, and that of the region.

Objective E-1: Historical, Archaeological, Paleontological Surveys: Identify and obtain information on the existence and significance of historical, archaeological, and paleontological sites and encourage land use planning which incorporates this information.

The following policies support Objective E-1:

Policy (a): Require appropriate surveys and necessary site investigations in conjunction with the earliest environmental document prepared for a project, in accordance with California Environmental Quality Act (CEQA) and the City's CEQA procedures.

Policy (b): Require surveys, prior to discretionary approval, for areas where the possibility of encountering sites exists. Additional specific site investigations may also be required in order to obtain sufficient information to determine the site's significance. The project sponsor shall fund this level of investigation.

Policy (c): Require a written report be submitted to the City following a survey or investigation describing the findings and making recommendations as to the site's significance, future disposition, and the amount of further investigation which should be undertaken. Copies of site survey records and reports shall be filed with the appropriate clearinghouse.

Policy (d): Encourage, if appropriate, removal of all materials collected during the survey/investigation to local museums, universities, or other depositories providing access for public review or scientific research.

Policy (e): Funding of Archaeological Excavations: Use the following in the case of archaeological salvage excavations: 75 percent project sponsor; 25 percent City or other public or quasipublic agency or organization. The costs of other mitigation measures may also be shared by the landowner or developer, the City, and other agencies or organizations.

Policy (f): Maintain information on areas surveyed, numbers of sites located, their status and the names and addresses of individuals or organizations knowledgeable of the sites.

Policy (g): Maintain specific locations of unprotected sites as confidential information to avoid vandalism and the resultant irretrievable loss of the historic and prehistoric record of the community.

Policy (h): Determine the proper disposition of each historical site prior to approval of zoning or discretionary development applications. Disposition determinations shall be based upon a detailed historical report, including an inventory form, a written evaluation, and slides documenting the building and its location. This information shall be reviewed by staff and the approval authority for discretionary development cases. Each historical report shall be filed at the Irvine Historical Museum and the City of Irvine Community Development Department.

Policy (i): Buffer and protect the integrity of an historic site and/or resources contained therein, if the Planning Commission, during review of a discretionary development case, determines preservation is required.

Objective E-2: Hazard Occurrence: Evaluate surveyed sites for their present and potential cultural, educational, recreational, and scientific value to the community and the region, and determine their proper disposition prior to the approval of any project which could adversely affect them.

The following policies support Objective E-2:

Policy (a): Ensure that sites determined to be significant are protected through the City's planning policies, ordinances, approval conditions, and mitigation measures.

Policy (b): Encourage the nomination of significant historical sites to the National Registry of Historic Places.

Policy (c): Include sites which are appropriate for educational or recreational purposes as an integral part of either public or community facilities or as part of the Citywide bikeway, pedestrian, and equestrian trail systems. Encourage agencies, organizations, and individuals to develop interpretive and educational programs in order to properly utilize the site for the benefit of the entire community.

Policy (e): Determine the methods and means of preservation on a case-by-case basis according to a site's importance and disposition methods available. These may include public or private acquisition or one of the following, provided extreme care is exercised not to adversely affect the site:

- Including the site within greenbelts, parks, open space spines, preservation areas or other open space.
- Covering surface or sub-surface sites by adequate fill, pavement, or buildings.
- Using the site for nondestructive public interest or educational purposes, such as museums, interpretive centers, or outdoor classrooms.
- Moving buildings for preservation as part of a consolidated historic site.
- Using significant historic buildings in a preserved state as a part of their functional capacity (e.g., a building preserved and used as an office, restaurant, or home).

Policy (f): Encourage site preservation through economic incentives such as increased building densities, reduced taxes, credit toward park dedication, or reduction of other amenity requirements. Where incentives are not sufficient, the land owner shall be directly compensated by the City or other public or quasi-public agencies or organizations for land preserved as an archaeological, paleontological, or historical site. The costs of site preservation may be the principal responsibility of the City, other public, or quasi-public agencies, or other organizations.

Policy (g): Ensure that adverse impacts of a proposed project on cultural resources are mitigated in accordance with CEQA, as well as other appropriate City policies and procedures, where preservation of a significant site is not practical.

3.4.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from Appendix G of the CEQA Guidelines are used as thresholds of significance to determine the impacts of the proposed project as related to cultural resources. The proposed project would have a significant impact if it would:

1. Cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5.
2. Cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5.
3. Disturb any human remains, including those interred outside of dedicated cemeteries.
4. Result in a cumulatively considerable impact to cultural resources.

Methodology

The following discussion is based primarily on studies conducted as part of the cultural resources assessment prepared for the project (ESA 2019).

Records Search

A records search for the proposed project was conducted on October 2, 2018 at the California Historical Resources Information System (CHRIS), South Central Coastal Information Center (SCCIC) housed at California State University, Fullerton. The records search included a review of all recorded archaeological resources and previous studies within the proposed project site and a ½-mile radius, and historic architectural resources within a ¼-mile of the project site. In addition, the California Points of Historical Interest, the California Historical Landmarks, the California Register, the National Register, the Archaeological Determinations of Eligibility (ADOE), and the California State Historic Resources Inventory (HRI), were reviewed.

The records search indicates that 33 cultural resources studies have been conducted within a ½-mile radius of the proposed project site. The entire ½-mile records search radius has been included in previous cultural resources assessments, and of the 33 previous studies, nine archaeological surveys and one other study (a peer review) have overlapped portions of the proposed project site, essentially covering its entirety.

The records search also indicates that 11 cultural resources have been previously recorded within the ½-mile radius of the proposed project site. Of these, four prehistoric archaeological sites (CA-ORA-601, -1237, -1246 and - 1400) are located within the proposed project site. These are described under *Resource Descriptions* below.

Sacred Lands File Search

The NAHC maintains a confidential Sacred Lands File (SLF) which contains sites of traditional, cultural, or religious value to the Native American community. The NAHC was contacted on May 21, 2018 to request a search of the SLF. The NAHC responded to the request in a letter dated May 23, 2018, indicating negative results.

In compliance with AB 52, on May 24, 2019 IRWD submitted outreach letters to the tribes on their AB 52 Master List. Contacted tribes included the Gabrieleño Band of Mission Indians – Kizh Nation, the Juaneño Band of Mission Indians – Acjachemen Nation, and the Torres-Martinez Desert Cahuilla Indians. The letters included a description of the proposed project and an invitation to consult under AB 52. Two responses were received.

By letter dated June 6, 2019, Mr. Michael Mirelez, Cultural Resources Coordinator for the Torres-Marinez Desert Cahuilla Indians, indicated that they would defer to tribes closer to the proposed project area.

Via email and letter, Mr. Andrew Salas, Chairman of the Gabrieleño Band of Mission Indians – Kizh Nation, indicated that the tribe wished to engage in consultation. On June 27, 2019, the District conducted consultation via telephone with the tribe. Mr. Salas provided historic maps, documents, and other reference materials confirming the tribe’s association with the proposed project area. He also discussed tribal ancestry in the broader vicinity of the proposed project, and indicated that the proposed project area falls along a prominent travel route for the tribe. Given the sensitivity of the proposed project area to the tribe, Mr. Salas requested Native American monitoring during ground disturbing activities. (See Section 3.13 for further discussion of the tribal consultation for this project.)

Historic Maps and Aerial Photographs

Historic maps and aerial photographs were examined to provide historical information about land uses of the proposed project area and to contribute to an assessment of the proposed project area’s archaeological sensitivity. Available topographic maps include the 1901 Southern California No. 1 map (1:250,000 scale), the 1942 Santiago Peak 15-minute quadrangle, and the 1949 El Toro 7.5- minute quadrangle. Aerial photographs were available for the years 1946, 1949, 1952, 1963, 1967, 1972, 1980 (historicaerials.com, 2018), and 2018 (Google Earth, 2018).

The 1901 topographic map depicts the project site as undeveloped and as located within the Rancho Lomas de Santiago. As depicted on the map, the nearest historical water source is Santiago Creek, located about 3.65 miles northeast of the proposed project site. The 1942 topographic map shows that dirt roads traverse the east, south and west sides of the proposed

project site. An unnamed drainage is also shown as following along the east portion of the project site along a dirt road.

The 1946 aerial photograph shows the proposed project site as located within mountainous terrain, and a canyon (predating the reservoir) is apparent within the middle portion of the proposed project site, following a north- south direction. A portion of the proposed project site is also depicted as developed and disturbed. For instance, the southwest portion of the proposed project site is depicted as containing about 10 structures/buildings. A dirt road and the Highline Canal are also shown in the southwest portion of the proposed project site, following a meandering path towards the southeast and stopping at the mid-south portion of the proposed project site. The canal appears to go underground for approximately 800 feet to the east, but then the canal and dirt road are observed again on the southeast portion of the proposed project site. By this time, the southernmost slopes of the proposed project site also appear as graded and partially terraced.

The 1949 topographic map depicts the Syphon Reservoir in the middle portion of the proposed project site and the previously observed canal and dirt road south of the reservoir. The 1952 aerial photograph depicts the Syphon Reservoir along with a dam. By 1952, the previously observed structures on the southwest portion of the proposed project site appear to have been demolished and only remnants of three structures (possibly concrete pads) are seen. The 1963, 1967, and 1972 aerial photographs continue to depict the proposed project site as it was shown in the 1952 aerial photograph, with the exception of one structure located in the southwest portion of the proposed project site. The 1972 aerial photograph also depicts several structures southeast of the dam. The 1980 aerial photograph shows the northern portion of the proposed project site as graded and terraced, and partially used as an agricultural field. A small structure is also depicted southeast of the dam, next to a line of trees. The 2018 aerial imagery shows the proposed project site as generally unchanged from the 1980 aerial photograph.

Survey

A cultural resource survey of the proposed project site was conducted on November 6, 7, and 14 of 2018. The survey was designed to identify historic architectural resources and archaeological resources within the proposed project site, including previously documented resources. Areas with visible ground surface were subject to pedestrian survey using transect intervals spaced no more than 15 meters (approximately 50 feet) apart. Slopes greater than 25 percent were subject to a reconnaissance-level survey where feasible. Portions of the proposed project site with thick marsh vegetation were subject to an opportunistic survey strategy, wherein trails and clearings were intensively inspected.

Approximately 60 percent of the proposed project site was surveyed. The remaining 40 percent was not surveyed due to constraints imposed by steep and inaccessible slopes or standing water within the reservoir. Approximately 50 percent of the surveyed site was largely vegetated with coastal sage scrub community and tall grasses. As a result, ground surface visibility in these areas ranged from 30 to 70 percent. Approximately 10 percent of the proposed project site, which includes an open space area immediately south and east of the dam, the dam itself, and various dirt roads had approximately 50 to 100 percent ground surface visibility.

As a result of the survey, the four previously recorded archaeological resources (CA-ORA-601, -1237, -1246, and -1400) within the proposed project site were revisited, though only two were relocated. It appears that both CA-ORA-601 and -1246 have been destroyed. In addition, one prehistoric isolate (ISO-HC-001), one historic-period archaeological resource (designated as the Latrine Site), and three historic architectural resources (designated as IRWD- cottage, a segment of the Highline Canal/P-30-176748, and the Syphon Reservoir and associated facilities) were identified and recorded within the proposed project site.

Resource Descriptions

A total of nine resources have been identified within the proposed project site, although two of these could not be relocated during the survey and are presumed destroyed. The resources are described below and summarized in **Table 3.4-1**.

**TABLE 3.4-1
CULTURAL RESOURCES DOCUMENTED WITHIN THE PROJECT SITE**

Primary No. (P-30-)	Permanent Trinomial (CA-ORA-)	Temporary Identifier	Resource Description	Newly Recorded/ Updated	National and California Register Eligibility
000601	601	—	Prehistoric site: flake scatter.	Not relocated	N/A
001237	1237	—	Prehistoric site: flake scatter.	Updated	Not evaluated
001246	1246	—	Prehistoric: cluster of nine manos and one possible meta-volcanic core.	Not relocated	N/A
001400	1400	—	Prehistoric site: sparse flake scatter and groundstone implements	Updated	Not eligible for either
—	—	ISO-HC-001	Prehistoric isolate: basalt handstone	Newly recorded	Not eligible for either
—	—	Latrine Site	Historic-period archaeological site: latrine area with five toilet seats on a cement block, two incomplete concrete foundation, a circular cement feature (possibly a well), and a sparse refuse scatter.	Newly recorded	Not evaluated
—	—	IRWD-Cottage	Historic-period built resource: a small building with stucco exterior and corrugated metal roofing.	Newly recorded	Not eligible for either
176748	—	Highland Canal segment	Historic-period built resource: a 1-mile-long segment of the Highline Canal located partially within the project site.	Updated	Not eligible for either
—	—	Syphon Reservoir and Facilities	Historic-period built resource: Syphon Reservoir and associated facilities.	Newly recorded	Not eligible for either

CA-ORA-601/P-30-000601

Resource CA-ORA-601/P-30-000601 is a prehistoric archaeological site that was originally recorded in 1974 as located immediately south of the Syphon Reservoir and consisting of a flake scatter containing seven chert flakes, two basalt flakes, and one quartzite flake. In a 1982 assessment, only one non-cortical white chert flake was observed and it was concluded that the

site may have been destroyed by construction. ESA did not identify any surface remnants of CA-ORA-601 during the pedestrian survey. It is likely that the resource has been destroyed by the construction of an immediately adjacent modern concrete ditch and a sports complex to the south. Because the site could not be relocated, it has not been formally evaluated for listing in the National Register or California Register, nor has a discretionary determination of eligibility been made.

CA-ORA-1237/P-30-001237

Resource CA-ORA-1237/P-30-001237 is a prehistoric archaeological site recorded in 1990 as consisting of a light scatter of lithic debris and tools. The archaeological site record for this resource indicates that the items found at the site include cores, core fragments, debitage (material produced during the process of lithic reduction), hammerstones, one chopper, one biface fragment, and one unifacially modified tool. The form also indicates that site integrity was poor due to terracing for orange groves, excavation for irrigation pipes, and improvements to Sand Canyon Avenue. ESA revisited site CA-ORA-1237 during the pedestrian survey and only two artifacts were observed. The site is located on a heavily vegetated slope that was previously terraced, likely creating disturbance to the resource. The site has not been formally evaluated for listing in the National Register or California Register and a discretionary determination of eligibility has not been made.

CA-ORA-1246/P-30-001246

Resource CA-ORA-1246/P-30-001240 is a prehistoric archaeological site recorded in 1990 as consisting of a cluster of nine manos and one possible meta-volcanic core. No artifacts associated with CA-ORA-1246 were observed during the current survey. It is likely that the site has been disturbed and eroded by off road vehicles that have crossed the site. Because the site could not be relocated, it has not been formally evaluated for listing in the National Register or California Register, nor has a discretionary determination of eligibility been made.

CA-ORA-1400/P-30-001400

Resource CA-ORA-1400/P-30-001400 is a prehistoric archaeological site recorded in 1994. The site is described as consisting of two loci on a hilltop and along a hillslope. The site measures approximately 400 meters long by 50 meters wide and among the artifacts encountered are flaked cores, tools, and debitage, a fragmentary grinding slab, several handstones, and various pieces of rock showing striations and grinding polish. The archaeological site record indicates that site integrity is very poor due to previous disturbances such as terracing, bulldozing, installation of irrigation pipes, and the construction of a dirt road for orange groves. In addition, it was noted that a high density of naturally occurring cobbles exist at the site, raising the possibility that some pieces identified as artifacts may have been created by bulldozers. During the 1994 study, a 1-by-1-meter archaeological test unit was placed in the area of densest concentration and the excavation of two 10-centimeter levels was conducted, yielding only one piece of chert debitage. Given disturbance and lack of integrity, the resource was determined ineligible for the National Register by consensus through Section 106. The current survey identified a high density of naturally occurring cobbles, and major disturbances (terraces and a dirt road crossing the site) within the CA-ORA-1400 site boundaries. A high density of artifacts was also observed at the

highest point of the ridge. The site appears to be in the same condition as previously documented, and for the same reasons it was determined ineligible for the National Register, it is also recommended as ineligible for the California Register. Additionally, a discretionary determination of eligibility has not been made.

ISO-HC-001

This newly documented resource is a prehistoric isolate that was recorded in the northeast portion of the proposed project site. It consists of a basalt handstone measuring 6.2 centimeters (cm) in length by 3.7 cm in width. The area of the resource appeared to show signs of recent fire, and has been impacted by the construction of SR 133. As an isolated occurrence, the resources is not eligible for listing in either the National Register or the California Register, nor has a discretionary determination of eligibility been made.

Latrine Site

This newly documented historic-period archaeological resource, designated as “Latrine Site,” was identified in the southwestern portion of the proposed project site. The resource consists of a latrine area with five toilet seats on a cement block (measuring 23 feet long by 17 feet wide), two incomplete concrete foundation features with rebar and wood reinforcement on the sides, a circular cement feature (possibly a well) measuring 8 feet in diameter, a scatter of unidentifiable metal and seven glass bottles scattered around. The bottles appear to date between 1945 and 1950, based on the maker’s marks. It is likely that this resource is associated with structures depicted in a 1946 aerial photograph. The site has not been formally evaluated for listing in the either National Register or California Register, nor has a discretionary determination of eligibility been made.

IRWD-Cottage

The newly documented resource identified as IRWD-Cottage consists of a small building with stucco exterior and corrugated metal roofing, and is depicted in a 1952 aerial photograph. It is located approximately 500 feet southwest of the reservoir. The resource measures approximately 45 feet long by 33 feet wide, and it is rectangular in plan. The resource has a gabled roof and two small windows: one located in the upper front and another one on the upper back facade. While conducting the field investigation, a number of significant alterations were noted. These include a covered porch addition to the primary façade, transparent corrugated plastic panels installed atop the roof to serve as skylights, repairs to the stucco exterior walls and modifications resulting from a number of recent changes to weatherize the structure including metal sheeting patches and wood panels to block exterior openings. As a result of these alterations, which have significantly impacted the integrity of the resources, it was recommended as ineligible for listing in both the National Register and the California Register. Additionally, a discretionary determination of eligibility has not been made.

Highline Canal/P-30-176748

An approximately 1-mile-long segment of the Highline Canal was identified within the proposed project site, and continuing south of the Syphon Reservoir. A different segment of the Highline Canal (P-30-176748), encompassing approximately 10 linear miles, was previously recorded

outside and approximately 0.20 miles northwest of the proposed project site. The primary record form for the previously recorded segment indicates that the Highline Canal was constructed in 1933 with associated features (such as diversion gates, debris traps, flume remains, and conduits) and extended from Santiago Reservoir (Irvine Lake) to Laguna Canyon. The resource is known to have carried water by gravity flow to the reservoirs and the agricultural fields of the Irvine Ranch. However, during the 1940s, a large segment of the canal was destroyed when the El Toro Marine Base was constructed. The primary record form also indicates that, while the previously recorded segment of the Highline Canal is a good example of a gravity-fed water conveyance system, it does not retain “integrity of design, association, location, setting or materials” and as a result, the resource is ineligible for the National Register, California Register, or Local designation through survey evaluation. The current pedestrian survey revealed that the 1-mile-long segment of the Highline Canal within the proposed project site is in very poor condition (showing signs of disrepair and degradation). As such, this portion of the Highline Canal is also recommended as ineligible for listing in both the National Register and California Register. Additionally, a discretionary determination of eligibility has not been made.

Syphon Reservoir and Associated Facilities

The Syphon Reservoir and its associated facilities was also documented as part of the cultural resources’ assessment for the proposed project. Since its initial development in the 1930s, the reservoir was used to store irrigation water and distribute it to two citrus packing plants along the former Santa Fe Railway spur line in the center of the Irvine Ranch. However, the irrigation service came to an end around 1970. In 2010, IRWD acquired the “Reservoir Property,” including the dam, reservoir, and other facilities (consisting of the Highline Canal, pipelines, pump stations, and vaults) along with recreational rights over the reservoir. The reservoir now operates as a small seasonal storage facility for recycled water with a capacity of 535 acre-feet (174 million gallons) (IRWD 2009).

Associated with the Syphon Reservoir is the earthen dam wall that constitutes the southwest perimeter of the basin, as well as portions of a dock. According to available aerial images, the dock appears to have been installed between 1963 and 1967 at the southern corner of the reservoir while the original dam wall was constructed during the initial construction of the reservoir between 1948 and 1949. Both elements appear to have been altered since first being installed. As depicted in available aerials and noted during the field investigation, numerous attempts to improve the dam wall are evident. This includes terracing along the inner embankment and installing access roads atop the wall, both done within the last decade. Further efforts appear to have been made since the 1980 aerial photograph to broaden the width of the dam wall to reinforce its retention strength. With regard to the dock, only remnants of the original structure currently remain. Most of this built environment feature has been replaced with contemporary materials to allow for better access to small recreation vessels used at the reservoir. As a result, the Syphon Reservoir and related built environment features have, without exception, been subject to significant alterations, and the resources have been recommended as ineligible for listing in both the National Register and California Register. Additionally, a discretionary determination of eligibility has not been made.

Impact Analysis

Impacts on cultural resources could result from ground-disturbing activities and/or damage, destruction, or alteration of historic structures. Ground-disturbing activities include project-related excavation, grading, trenching, vegetation clearance, the operation of heavy equipment, or other surface and sub-surface disturbance that could damage or destroy surficial or buried cultural resources including prehistoric or historic-period archaeological resources or human burials. The evaluation of the project's potential effects on significant cultural resources per thresholds included in the CEQA Guidelines is included below.

Historic Resource

Impact 3.4-1: The proposed project could cause a substantial adverse change in the significance of a historical resource pursuant to CEQA Guidelines Section 15064.5.

Construction

A total of nine resources were identified within the proposed project site as a result of the cultural resources assessment. These include four prehistoric archaeological sites (CA-ORA-601, -1237, -1246, and -1400), an isolated prehistoric mano (ISO-HC-001), a historic-period archaeological site consisting of an artifact scatter and foundation remnants (the Latrine Site), and three historic period built architectural resources (a segment of P-30-176748/Highline Canal, a small stucco building designated IRWD-Cottage, and the Syphon Dam Reservoir and Facilities).

Five of the resources (CA-ORA-601, -1237, -1246, ISO-HC-001, and the Latrine Site), while documented within the proposed project area, occur along the margins of the proposed project site. Two of these resources (CA-ORA-601 and -1246) appear to have been destroyed. Isolated artifacts, given their lack of context and association, generally are not considered eligible for listing in the California Register; therefore, ISO-HC-001 does not qualify as a historical resource. The remaining two resources (CA-ORA-1237 and the Latrine Site) have not been evaluated for eligibility for listing in the California Register. For the purposes of this proposed project, the resources are considered historical resources, and impacts to these resources could constitute a significant impact on the environment. Site CA-ORA-1237 occurs along the northern boundary of the proposed project site, in close proximity to proposed grading and contouring, which will involve ground disturbance. The Latrine site occurs in the western portion of the proposed project site, near a proposed recreational trail. With implementation of **Mitigation Measure CR-1**, however, which provides procedures for avoidance of the two unevaluated resources, impacts would be less than significant.

The remaining four resources (CA-ORA-1400, a segment of P-30-176748/Highline Canal, the IRWD-Cottage, and the Syphon Reservoir and Facilities) likely will be impacted by the proposed project. However, through a program of surface inventory and subsurface testing, prehistoric archaeological site CA-ORA-1400 was previously determined ineligible for listing in the National Register due to a lack of integrity. For the same reason, it does not qualify for listing in the California Register. A previously recorded segment of resource P-30-176748 (the Highline Canal) located outside the project boundary and outside IRWD property was previously determined ineligible for the National Register and California Register because the segment does

not retain integrity. The segment of P-30-176748 documented within the proposed project boundary on IRWD property is likewise in poor condition, and also has been recommended not eligible for listing in the California Register. Finally, both the IRWD-Cottage and the Syphon Reservoir dam and associated facilities have been subject to significant alterations that have severely compromised their integrity. Consequently, both resources have been determined ineligible for listing in the California Register. Since none of the four resources that will be impacted by the proposed project qualify for listing in the California Register, none are historical resource as defined in CEQA Guidelines Section 15064.5, and impacts to the resources would not be significant. Finally, an analysis of indirect impacts to adjacent historical resources was conducted and the proposed project would not result in an indirect impact to historical resources. Impacts would be less than significant to known resources.

The presence of both historic period and prehistoric archaeological sites within, and within the vicinity of, the proposed project area indicates that the area is sensitive for archaeological resources. If unknown archaeological resources are encountered during the proposed project's implementation, and if such resources are determined to be historical resources as defined in CEQA Guidelines Section 15064.5, impacts to the resources would be considered significant. **Mitigation Measures CR-2** through **CR-4**, which require construction worker sensitivity training, cultural resources monitoring, and treatment of unanticipated discoveries, would ensure that impacts are reduced to a less-than-significant level.

Operation

While potential impacts to cultural resources are most likely to occur during the proposed project's construction, operation and maintenance activities, including activities that involve ground disturbance, do have a low potential to encounter previously undocumented archaeological resources. Mitigation Measure CR-4, which requires appropriate treatment of unanticipated discoveries, would ensure that any resources encountered during maintenance are not significantly impacted. As a result, impacts during operation would be reduced to a less-than-significant level.

Mitigation Measures

CR-1: Avoidance of Unevaluated Resources. Two resources (CA-ORA-1237 and the Latrine Site) are considered historical resources for purposes of this project. Both resources occur within close proximity to proposed project activities. Prior to work in the vicinity of the resources (i.e., within 100 feet), Environmentally Sensitive Areas consisting of protective fencing or flagging shall be established around the boundary of each resource, including a 50-foot buffer. The establishment of the Environmentally Sensitive Areas and installation of required fencing or flagging shall be carried out under the supervision of a Qualified Archaeologist, defined as an archaeologist meeting the Secretary of the Interior's standards for archaeology (USDI 2008), or an archaeologist working under the direction of the Qualified Archaeologist. Environmentally Sensitive Areas should be clearly marked in the field and on design plans with exclusion markers to ensure avoidance during project-related ground disturbance. The protective fencing or flagging should not identify the Environmentally Sensitive Areas as cultural resource areas to discourage unauthorized disturbance or collection of artifacts. Ground disturbing

activities in the vicinity of the Environmentally Sensitive Areas should be monitored, as described in Mitigation Measure CR-3.

CR-2: Worker Sensitivity Training. Prior to the start of construction activities, all construction personnel should be trained to identify the types of cultural resources that may be encountered during project implementation. These include both prehistoric and historic period archaeological resources. In addition to cultural resources recognition, the training should convey procedures to follow in the event of a potential cultural resources discovery, including notification procedures. The training should be provided by the Qualified Archaeologist or an archaeologist working under their supervision.

CR-3: Construction Monitoring. An archaeological monitor (working under the direct supervision of the Qualified Archaeologist) shall observe all ground-disturbing activities, including but not limited to brush clearance, vegetation removal, grubbing, grading, and excavation, in undisturbed areas of the project site. In addition, the Qualified Archaeologist, in coordination with IRWD, may reduce or discontinue monitoring if it is determined that the possibility of encountering buried archaeological deposits is low based on observations of soil stratigraphy or other factors. Archaeological monitoring shall be conducted by an archaeologist familiar with the types of archaeological resources that could be encountered within the project site. The archaeological monitor, in consultation with IRWD, shall be empowered to halt or redirect ground-disturbing activities away from the vicinity of a discovery until the Qualified Archaeologist has evaluated the discovery, consulted with IRWD, and determined appropriate treatment (as prescribed in CR-4). The archaeological monitor shall keep daily logs detailing the types of activities and soils observed, and any discoveries. After monitoring has been completed, the Qualified Archaeologist shall prepare a monitoring report that details the results of monitoring. The report shall be submitted to IRWD and any Native American groups who request a copy. The Qualified Archaeologist shall submit a copy of the final report to the California Historic Resources Information System (CHRIS) South Central Coastal Information Center (SCCIC).

In addition, prior to the commencement of earthwork activities, IRWD shall provide written notification to the Native American representatives from the Gabrieleno Band of Mission Indians - Kizh Nation indicating the date and time of the commencement of earthwork activities. The representatives from the Gabrieleno Band of Mission Indians - Kizh Nation (“tribal representative”) shall be provided reasonable access to the project site in a manner that does not interfere with the earthwork activities. Tribal representatives, at their own expense, and in a manner that does not interfere with earthwork activities, shall be allowed to monitor subsurface ground-disturbing construction activities. The monitoring may consist of either direct observation of the earthwork activities or the examination of the excavated soils prior to disposal for evidence of cultural resources. If any cultural resources are identified during the monitoring and evidence is presented that the discovery proves to be potentially significant under CEQA, as determined by IRWD’s consulting Qualified Archaeologist, additional measures such as data recovery excavation, avoidance of the area of the find, documentation, testing, data recovery, reburial, archival review and/or transfer to the appropriate museum or educational institution, or other appropriate actions may be warranted as recommended by IRWD’s consulting Qualified Archeologist in consultation with the tribal representative.

CR-4: Protocols for Unanticipated Discoveries. If cultural resources are encountered during project implementation, all activity within 50 feet of the find should cease until

the find can be evaluated by the Qualified Archaeologist. If the Qualified Archaeologist determines that the resources may be significant, he or she will notify IRWD and together with IRWD, shall develop an appropriate treatment plan for the resource. IRWD should consult with the Native American monitor or other appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature. Under CEQA, preservation in place is the preferred manner of mitigating impacts to archaeological sites. However, if avoidance is infeasible, other appropriate measures will be instituted, which could include, among other options, detailed documentation, or data recovery excavation. Work may proceed on other parts of the project area while mitigation for cultural resources is being carried out.

Significance Determination

Less than Significant Impact with Mitigation

Archaeological Resource

Impact 3.4-2: The proposed project could cause a substantial adverse change in the significance of an archaeological resource pursuant to CEQA Guidelines Section 15064.5.

Construction

Six archaeological resources were identified within the proposed project site, including four previously documented archaeological sites, one prehistoric isolate and one historic-period archaeological site. As discussed above, two of the previously documented sites (CA-ORA-601 and -1246) could not be relocated and are presumed destroyed. CA-ORA-1400 was previously determined ineligible for the National Register and the California Register, and is not a significant archaeological resource pursuant to CEQA Guidelines Section 15064.5. As an isolated occurrence, ISO-HC-001 also is not a significant archaeological resource. Two resources (CA-ORA-1237 and the Latrine Site) have not been evaluated for listing in the California Register and could qualify as archaeological resources pursuant to Section 15064.5. Both occur in close proximity to proposed project activities. However, with implementation of Mitigation Measure CR-1, both resources would be protected by Environmentally Sensitive Area fencing and avoided.

The presence of both historic period and prehistoric archaeological sites within and within the vicinity of the proposed project area indicates that the area is sensitive for archaeological resources. If unknown archaeological resources are encountered during project implementation, and if such resources are determined to be archaeological resources as defined in CEQA Guidelines Section 15064.5, impacts to the resources would be considered significant. Mitigation Measures CR-2 through CR-4 would ensure that any impacts are reduced to a less-than-significant level.

Operation

While potential impacts to cultural resources are most likely to occur during the proposed project's construction, operation and maintenance activities, including activities that involve ground disturbance, do have a low potential to encounter previously undocumented

archaeological resources. Mitigation Measure CR-4, which requires appropriate treatment of unanticipated discoveries, would ensure that any resources encountered during maintenance are not significantly impacted. As a result, impacts during operation would be reduced to a less-than-significant level.

Mitigation Measures

Implement Mitigation Measures CR-1 through CR-4

Significance Determination

Less than Significant Impact with Mitigation

Human Remains

Impact 3.4-3: The proposed project could disturb human remains, including those interred outside of formal cemeteries.

Construction

No human remains were identified in the proposed project area as a result of the archival research or survey, and it is anticipated that the proposed project would have no impact on human remains. That said, the area is known to have been used by prehistoric Native Americans. In the unlikely event that human remains are uncovered during ground disturbing activities, appropriate state law would apply. Specifically, California Health and Safety Code (HSC) Section 7050.5 requires that in the event human remains are discovered, the County Coroner be contacted to determine the nature of the remains. In the event the remains are determined to be Native American in origin, the Coroner is required to contact the NAHC within 24 hours to relinquish jurisdiction.

Further, California PRC Section 5097.98, as amended by Assembly Bill 2641, provides procedures in the event human remains of Native American origin are discovered during project implementation. PRC Section 5097.98 requires that no further disturbances occur in the immediate vicinity of the discovery, that the discovery is adequately protected according to generally accepted cultural and archaeological standards, and that further activities take into account the possibility of multiple burials. PRC Section 5097.98 further requires the NAHC, upon notification by a County Coroner, designate and notify a MLD regarding the discovery of Native American human remains. Once the MLD has been granted access to the site by the landowner and inspected the discovery, the MLD then has 48 hours to provide recommendations to the landowner for the treatment of the human remains and any associated grave goods. With adherence to these regulations, any impacts to human remains would be reduced to a less-than-significant level.

Operation

As with construction, operation and maintenance activities are not expected to encounter human remains. However, if human remains are encountered during operations and maintenance activities, compliance with state law, including HSC Section 7050.5, PRC Section 5097.98, and Assembly Bill 2641, as noted above, would ensure that impacts are reduced to a less-than-significant level.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Cumulative Impacts

Impact 3.3-4: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to cultural resources.

The cumulative projects to be considered in the analysis of cumulative impacts are listed in Table 3-2 and illustrated on Figure 3-1 in Section 3 of this Draft EIR. The geographic area of analysis of cumulative impacts for cultural resources includes the area bounded by those projects listed in Table 3-1 and generally corresponds to the portion of Orange County along the front of the Santiago Hills in the vicinity of the proposed project, as well as adjacent mountains and lowlands to the east and west, respectively. This geographic scope of analysis is appropriate because the archaeological and historical resources within this area are expected to be similar to those that occur on the proposed project site because of their proximity, and because the similar environments, landforms, and hydrology would result in similar land-use and thus, site types. The projects listed in Table 3-2 include a range of project types, including residential and commercial development, and park construction and improvements, that could contain cultural resources. Of particular note is the proposed Gateway Community Park, which is to the west and directly adjacent to the project. Cumulative impacts to cultural resources could occur if other related projects, in conjunction with the proposed project, had or would have impacts on cultural resources that, when considered together, would be significant.

Construction and Operation

Construction and operation of the proposed project, in combination with other projects in the area, has the potential to contribute to a cumulatively significant cultural resources impact due to the potential loss of historical and archaeological resources unique to the region. A total of nine resources were identified within the proposed project site as a result of the cultural resources assessment, including six archaeological resources and three historic period-built resources. However, these resources were either found ineligible for listing in the California Register or will be avoided by project construction and operation. While there is potential to encounter unknown resources during ground-disturbing activities, mitigation measures are included in this EIR to reduce potentially significant project impacts to both known and unknown cultural resources during construction, which would reduce the project's incremental contribution cumulative impacts. Mitigation Measure CR-1 requires flagging and avoidance of the two unevaluated resources. Mitigation Measures CR-2 requires worker sensitivity training prior to the start of construction. Mitigation Measures CR-3 and CR-4 require archaeological and Native American monitoring and treatment of unanticipated discoveries of cultural resources, respectively. Implementation of these four mitigation measures would reduce potential impacts to historical and archaeological resources to a less-than-significant level. Although the proposed project's

construction has the potential to disturb human remains, this potential is low, and state laws dictate appropriate treatment of any unearthed human remains. As such, there will be a less-than-significant impact to human remains.

With implementation of Mitigation Measures CR-1 through CR-4 as described above, the proposed project would not result in significant impacts to cultural resources. Given the required mitigation for the proposed project, and required adherence to state and local laws for other projects in the cumulative region, cumulative impacts to cultural resources would be less than significant.

Mitigation Measures

Implement Mitigation Measures CR-1 through CR-4

3.5 Energy

This section evaluates the potential for impacts related to energy emitted by construction and operation of the proposed project. This section includes: a description of the existing electricity and energy conditions regionally and in and around the proposed project site; a summary of applicable regulations related to energy; and an evaluation of the potential impacts of the proposed project related to energy, including cumulative impacts.

3.5.1 Environmental Setting

Electricity

Electricity, as a consumptive utility, is a man-made resource. The production of electricity requires the consumption or conversion of energy resources, including water, wind, oil, gas, coal, solar, geothermal, and nuclear resources, into energy. The delivery of electricity involves a number of system components for distribution and use. The electricity generated is distributed through a network of transmission and distribution lines commonly called a power grid.

Energy capacity, or electrical power, is generally measured in watts (W), while energy use is measured in watt-hours (Wh). For example, if a light bulb has a capacity rating of 100 W, the energy required to keep the bulb on for 1 hour would be 100 Wh. If ten 100 W bulbs were on for 1 hour, the energy required would be 1,000 Wh or 1 kilowatt-hour (kWh). On a utility scale, the capacity of a generator is typically rated in megawatts (MW), which is 1 million watts, while energy usage is measured in megawatt-hours (MWh) or gigawatt-hours (GWh), which is one billion watt-hours.

Southern California Edison (SCE) provides electrical services to approximately 15 million people, 15 counties including the County of Orange and the proposed project site, 180 incorporated cities including the City of Irvine, 5,000 large businesses, and 280,000 small businesses throughout its 50,000-square-mile service area (SCE 2020). SCE produces and purchases energy from a mix of conventional and renewable generating sources.

SCE generates power from a variety of energy sources, including large hydropower (greater than 30 MW), coal, gas, nuclear sources, and renewable resources, such as wind, solar, small hydropower (less than 30 MW), and geothermal sources. Approximately 36 percent of the SCE 2018 electricity purchases were from renewable sources, which is similar to the 31 percent statewide percentage of electricity purchases from renewable sources (SCE 2019a). The annual electricity sale to customers in 2018 was approximately 84,654,000 MWh (SCE 2019b). See **Table 3.5-1** for a summary of SCE 2018 electricity use.

**TABLE 3.5-1
EXISTING ANNUAL REGIONAL ENERGY USE**

Source	Amount
Electricity (SCE) ^a	84,654,000 MWh
Natural Gas (SoCalGas) ^b	991,659,000 MMBtu
Gasoline (Orange County) ^c	1,402,000,000 gallons
Diesel (Orange County) ^c	114,600,000 gallons

Natural Gas

Natural gas is a combustible mixture of simple hydrocarbon compounds (primarily methane) that is used as a fuel source. Natural gas consumed in California is obtained from naturally occurring reservoirs and delivered through high-pressure transmission pipelines. Natural gas provides almost one-third of the total energy requirements in California. Natural gas is measured in terms of both cubic feet (cf) or British thermal units (Btu).

The proposed project site does not have any natural gas service and would not begin service as part of the project. However, the surrounding area is served by the Southern California Gas Company (SoCalGas), which is the principal distributor of natural gas in Southern California, serving residential, commercial, and industrial markets. SoCalGas serves approximately 21.6 million customers in more than 500 communities encompassing approximately 24,000 square miles throughout central and southern California, from the City of Visalia to the US/Mexican border (SoCalGas 2020).

SoCalGas, along with five other California utility providers, released the *2018 California Gas Report*, presenting a forecast of natural gas supplies and requirements for California through the year 2035. This report predicts gas demand for all sectors (residential, commercial, industrial, energy generation and wholesale exports) and presents best estimates, as well as scenarios for hot and cold years. Overall, SoCalGas predicts a decrease in natural gas demand in future years due to a decrease in per capita usage, energy efficiency policies, and the transition of the State to renewable energy displacing fossil fuels including natural gas (California Gas and Electric Utilities 2018).

SoCalGas receives gas supplies from several sedimentary basins in the western United States (US) and Canada, including supply basins located in New Mexico (San Juan Basin), west Texas (Permian Basin), the Rocky Mountains, and western Canada as well as local California supplies (California Gas and Electric Utilities 2018). Sources of natural gas in the southwestern U.S. will continue to supply most of the SoCalGas natural gas demand. The Rocky Mountain supply is available but is used as an alternative supplementary supply source, and Canadian sources provide only a small share of SoCalGas supplies due to the high cost of transport (California Gas and Electric Utilities 2018). Gas supply available to SoCalGas from California sources averaged

2,625 million cf per day or 2,717 million Btu (MMBtu) in 2017, the most recent year for which data are available (California Gas and Electric Utilities 2018). This equates to an annual average of 892,060 million cf per year or 992 million MMBtu per year. See Table 3.5-1 for a summary of the SoCalGas 2017 natural gas use.

Transportation Energy

According to the California Energy Commission (CEC), transportation accounted for nearly 40 percent of total energy consumption in California during 2018 (CEC 2019a). In 2018, 13.5 billion gallons of gasoline and 1.6 billion gallons of diesel fuel were sold in California (CEC 2018a).

The State is now working on developing flexible strategies to reduce petroleum use. Over the last decade, California has implemented several policies, rules, and regulations to improve vehicle efficiency, increase the development and use of alternative fuels, reduce air pollutants and greenhouse gas emissions (GHGs) from the transportation sector, and reduce vehicle miles traveled (VMT). Accordingly, gasoline consumption in California has declined. The CEC predicts that the demand for gasoline will continue to decline over the next 10 years, and there will be an increase in the use of alternative fuels (CEC 2018b). According to fuel sales data from the CEC, fuel consumption in Orange County was approximately 1.4 billion gallons of gasoline and 114.6 million gallons of diesel fuel in 2018 (CEC 2018a). See Table 3.5-1 for a summary of Statewide fossil fuel consumption in 2018.

Proposed Project Site

The proposed project site is comprised of approximately 123 acres of land. The proposed project site is an active recycled water reservoir with a dechlorination facility and underground infrastructure to fill and drain the reservoir which are operated by offsite pumps. The majority of the site is undeveloped land with a riparian habitat/wetlands and scrub brush. The dechlorination facility actively consumes electricity but there is no connection of the site to natural gas, potable water, wastewater or solid waste infrastructure. Currently the existing facility consumes 217,273 kWh of electricity annually.

3.5.2 Regulatory Framework

Federal

Energy Policy Act of 1992

The Energy Policy Act (EPAct) of 1992 was passed to reduce U.S. dependence on foreign petroleum and improve air quality. EPAct includes several provisions intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. EPAct requires certain Federal, State, and local government and private fleets to purchase a percentage of light-duty AFVs capable of running on alternative fuels each year. Financial incentives are also included in EPAct. Federal tax deductions will be allowed for businesses and individuals to cover the incremental cost of AFVs. States are also required by the EPAct to consider a variety of incentive programs to help promote AFVs.

Energy Policy Act of 2005

The Energy Policy Act of 2005 includes provisions for renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan guarantees for clean renewable energy and rural community electrification; and establishes a Federal purchase requirement for renewable energy.

On-Road Vehicle Rules

Heavy-Duty Vehicles

Fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by USEPA and NHTSA. The Phase 1 heavy-duty truck standards apply to combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles for model years 2014 through 2018, and result in a reduction in fuel consumption from 6 to 23 percent over the 2010 baseline, depending on the vehicle type (USEPA 2011). USEPA and NHTSA have also adopted the Phase 2 heavy-duty truck standards, which cover model years 2021 through 2027 and require the phase-in of a 5 to 25 percent reduction in fuel consumption over the 2017 baseline depending on the compliance year and vehicle type (USEPA 2016).

Light-Duty Vehicles

Established by the U.S. Congress in 1975, the Corporate Average Fuel Economy (CAFE) standards reduce energy consumption by increasing the fuel economy of cars and light trucks. The National Highway Traffic Safety Administration (NHTSA) and United States Environmental Protection Agency (USEPA) jointly administer the CAFE standards. The U.S. Congress has specified that CAFE standards must be set at the “maximum feasible level” with consideration given to: (1) technological feasibility; (2) economic practicality; (3) effect of other standards on fuel economy; and (4) need for the nation to conserve energy (NHTSA 2020). In August 2018, the USEPA and NHTSA proposed the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule that would, if adopted, maintain the CAFE standards applicable in model year 2020 for model years 2021 through 2026. The estimated CAFE standards for model year 2020 is 43.7 mpg and 31.3 mpg for light trucks, projecting an overall industry average of 37 mpg. See Section 3.7 *Greenhouse Gas Emissions*, of this Draft EIR for additional details regarding the SAFE Vehicles Rule.

State

California Global Warming Solutions Act of 2006

In 2006, Governor Schwarzenegger signed Assembly Bill (AB) 32, the California Global Warming Solutions Act of 2006 (codified in the California Health and Safety Code (HSC), Division 25.5), which focused on reducing GHG emissions in California to 1990 levels by 2020. Under HSC Division 25.5, California Air Resources Board (CARB) has the primary responsibility for reducing the GHG emissions in California; however, AB 32 also tasked the CEC and CPUC with providing information, analysis, and recommendations to CARB regarding strategies to reduce GHG emissions in the energy sector.

In 2016, Governor Brown signed SB 32 and its companion bill AB 197. SB 32 and AB 197 amend HSC Division 25.5 and establish a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and include provisions to ensure that the benefits of state climate

policies reach into disadvantaged communities. Please see Section 3.7 Greenhouse Gas Emissions of this Draft EIR for additional details regarding these statutes.

On-Road and Off-Road Vehicle and Equipment Rules

Heavy-Duty Vehicles and Equipment

Several measures have been adopted by the State to control emissions from heavy-duty vehicles and equipment. While the goals of these measures are primarily to reduce public health impacts from diesel emissions, compliance with the regulation has shown an increase in energy savings in the form of reduced fuel consumption from more fuel-efficient engines (Cummins 2014).

In 2004, CARB adopted an Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling to reduce public exposure to diesel particulate matter emissions (Title 13 CCR section 2485). The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure prohibits diesel-fueled commercial vehicles from idling for more than 5 minutes at any given location. While the goal of this measure is primarily to reduce public health impacts from diesel emissions, compliance with the regulation also results in energy savings in the form of reduced fuel consumption from unnecessary idling.

In addition to limiting exhaust from idling trucks, in 2008 CARB approved the Truck and Bus regulation to reduce NO_x, PM10, and PM2.5 emissions from existing diesel vehicles operating in California (13 CCR section 2025). The phased regulation aims to reduce emissions by requiring installation of diesel soot filters and encouraging the retirement, replacement, or retrofit of older engines with newer emission-controlled models. The phasing of this regulation has full implementation by 2023.

CARB also promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower (hp) such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The In-Use Off-Road Diesel-Fueled Fleets regulation adopted by CARB on July 26, 2007, aims to reduce emissions by installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models (13 CCR section 2449). The compliance schedule requires full implementation by 2023 in all equipment for large and medium fleets and by 2028 for small fleets.

Light-Duty Vehicles

The transportation sector accounts for more than half of carbon dioxide (CO₂) emissions in California. AB 1493 (commonly referred to as Pavley regulations), enacted on July 22, 2002, requires CARB to set GHG emission standards for new passenger vehicles, light duty trucks, and other vehicles manufactured in and after 2009 whose primary use is non-commercial personal transportation. Phase I of the legislation established standards for model years 2009–2016 and Phase II established standards for model years 2017-2025 (CARB 2020; USEPA 2012). Refer to Section 3.7 Greenhouse Gas Emissions of this Draft EIR for additional details regarding this regulation.

Integrated Energy Policy Report

Senate Bill (SB) 1389 (Public Resources Code [PRC] sections 25300–25323) requires the CEC to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the electricity, natural gas, and transportation fuel sectors in California, and provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the State economy; and protect public health and safety (PRC section 25301(a)).

Renewables Portfolio Standards

The State of California adopted standards to increase the percentage of electricity that retail sellers, including investor-owned utilities and community choice aggregators, must provide from renewable resources.¹ The standards are referred to as the Renewables Portfolio Standards (RPS). The legislation requires utilities to increase the percentage of electricity obtained from renewable sources to 33 percent by 2020 and 50 percent by 2030.

On September 10, 2018, Governor Jerry Brown signed SB 100, which further increased the California RPS and requires retail sellers and local publicly owned electric utilities to procure eligible renewable electricity for 44 percent of retail sales by December 31, 2024; 52 percent by December 31, 2027; and 60 percent by December 31, 2030. SB 100 also provides that CARB should plan for 100 percent eligible renewable energy resources and zero-carbon resources by December 31, 2045.

The CPUC and the CEC jointly implement the RPS program. The responsibilities of the CPUC include: (1) determining annual procurement targets and enforcing compliance; (2) reviewing and approving renewable energy procurement plan of each investor-owned utility; (3) reviewing contracts for RPS-eligible energy; and (4) establishing the standard terms and conditions used in contracts for eligible renewable energy (CPUC 2020b). Refer to Section 3.7 Greenhouse Gas Emissions of this Draft EIR for additional details regarding this program.

California Building Standards Code (Title 24, Parts 6 and 11)

The California Building Energy Efficiency Standards for Nonresidential Buildings (California Code of Regulations [CCR], Title 24, Part 6) were adopted to ensure that building construction and system design and installation achieve energy efficiency and preserve outdoor and indoor environmental quality. The current California Building Energy Efficiency Standards (Title 24 standards) are the 2019 Title 24 standards, which became effective on January 1, 2020 (CEC 2019b). The 2019 Title 24 standards include requirements for solar photovoltaic systems in all new homes, requirements for newly constructed healthcare facilities which were previously not included, the encouragement of demand response and light-emitting diode (LED) technology for both residential and nonresidential buildings, and the use of more efficient air filters to trap hazardous particulates (CEC 2019b). The California Green Building Standards Code (CCR, Title 24, Part 11), commonly referred to as the CALGreen Code, became effective on January 1, 2017. The 2016 CALGreen Code includes mandatory measures for non-residential development related to site development, energy efficiency, water efficiency and conservation; material

¹ SB 1078 (Chapter 526, Statutes of 2002); SB 107 (Chapter 464, Statutes of 2006); Executive Order S-14-08.

conservation and resource efficiency; and environmental quality (CBSC 2017). Most mandatory measure changes, when compared to the previously applicable 2013 CALGreen Code, were related to the definitions and to the clarification or addition of referenced manuals, handbooks, and standards. For non-residential mandatory measures, Table 5.106.5.3.3 of the CALGreen Code, identifying the number of required EV charging spaces has been revised in its entirety. Refer to Section 3.7 Greenhouse Gas Emissions of this Draft EIR for additional details regarding these standards.

2017 Climate Change Scoping Plan Update

In response to SB 32 and the 2030 GHG reduction target, CARB approved California's 2017 Climate Change Scoping Plan Update (2017 Scoping Plan Update) in December 2017 (CARB 2017). The 2017 Scoping Plan Update outlines the proposed framework of action for achieving the 2030 GHG target of 40 percent reduction in GHG emissions relative to 1990 levels (CARB 2017). The 2017 Scoping Plan Update identifies key sectors of the state's implementation strategy, which includes improvements in low-carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. Through a combination of data synthesis and modeling, CARB determined that the target statewide 2030 emissions limit is 260 MMTCO_{2e}, and that further commitments will need to be made to achieve an additional reduction of 50 MMTCO_{2e} beyond current policies and programs. The cornerstone of the 2017 Scoping Plan Update is an expansion of the Cap-and-Trade Program (discussed further below) to meet the aggressive 2030 GHG emissions goal and ensure achievement of the 2030 limit set forth by E.O. B-30-15.

The 2017 Scoping Plan Update's strategy for meeting the state's 2030 GHG target incorporates the full range of legislative actions and state-developed plans that have relevance to the year 2030, including the following, described elsewhere in this section:

- Extending the low-carbon fuel standard (LCFS) beyond 2020 and increasing the carbon intensity reduction requirement to 18 percent by 2030;
- SB 350, which increases the Renewables Portfolio Standard (RPS) to 50 percent by 2030 and requires the CEC to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by 2030. These targets may be achieved through energy efficiency savings and demand reductions from a variety of programs, including but not limited to appliance and building energy efficiency standards and a comprehensive program to achieve greater energy efficiency standards in existing buildings;
- The 2016 Mobile Source Strategy is estimated to reduce emissions from mobile sources including an 80 percent reduction in smog-forming emissions and a 45 percent reduction in diesel particulate matter from 2016 levels in the Air Basin, a 45 percent reduction in statewide GHG emissions (from both on-road and off-road mobile sources) and a 50 percent reduction in statewide consumption of petroleum-based fuels;
- The Sustainable Freight Action Plan to improve freight efficiency and transition to zero emission freight handling technologies (described in more detail below);

- SB 1383, which requires a 50 percent reduction in anthropogenic black carbon and a 40 percent reduction in hydrofluorocarbon and methane emissions below 2013 levels by 2030; and
- AB 398, which extends the state Cap-and-Trade Program through 2030.

In the 2017 Scoping Plan Update, CARB recommends statewide targets of no more than six MT CO₂e per capita by 2030 and no more than two metric tons CO₂e per capita by 2050. CARB acknowledges that because the statewide per capita targets are based on the statewide GHG emissions inventory that includes all emissions sectors in the state (including large industrial sources covered under the state's cap and trade program), they are not applicable for use at the local level. Rather, it is appropriate for local jurisdictions to derive evidence-based local per-capita goals based on local emissions sectors and growth projections.

To demonstrate how a local jurisdiction can achieve their long-term GHG goals at the community plan level, CARB recommends developing a geographically specific GHG reduction plan (i.e., climate action plan) consistent with the requirements of CEQA Guidelines section 15183.5(b). A so-called "CEQA-qualified" GHG reduction plan, once adopted, can provide local governments with a streamlining tool for project-level environmental review of GHG emissions, provided there are adequate performance metrics for determining project consistency with the plan. Absent conformity with such a plan, CARB recommends "that projects incorporate design features and GHG reduction measures, to the degree feasible, to minimize GHG emissions. Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development (CARB 2017)."

Local

County of Orange General Plan

Local jurisdictions, such as the County of Orange, have the authority and responsibility to reduce energy consumption through their land use decision-making authority. The County's General Plan Resource Element sets forth the goals, objectives, and policies which guide the County in its implementation of its air quality improvement programs and strategies.

The Resource Element establishes the following goal pertaining to project energy use:

Goal 3: Maximize the conservation of energy resources in all future land use and transportation planning decisions.

City of Irvine General Plan

The City of Irvine is responsible for the assessment and mitigation of pollutant emissions resulting from its land use decisions. The City's General Plan Energy Element sets forth the objectives and policies which guide the City in its implementation of its energy improvement programs and strategies. The Energy Element establishes the following objectives pertaining to the proposed project energy use:

Goal I-1: Maximize energy efficiency through land use and transportation planning.

3.5.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from Appendix G of the CEQA Guidelines are used as thresholds of significance to determine the impacts of the project as related to energy. The proposed project would have a significant impact if it would:

1. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
2. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.
3. Result in cumulatively considerable impacts to energy.

Methodology

The discussion below presents the methodology used to analyze the potential energy usage of the proposed project, including electricity and transportation fuels during construction and operational phases. Specific assumptions and data sources needed to quantify energy consumption during both construction and operation are presented. The methods and scenarios used for the energy calculations are the same as those used for the GHG calculations, as summarized in the Methodology section in Section 3.7 Greenhouse Gas Emissions of this Draft EIR and detailed in the Air Quality and Greenhouse Gas Technical Report provided as **Appendix B** of this Draft EIR.

Impact Analysis

Energy Consumption

Impact 3.5-1: The proposed project would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

Construction

Construction energy consumption would result from transportation fuels (e.g., diesel, gasoline, and compressed natural gas [CNG]) used for haul trucks, heavy-duty construction equipment, construction workers traveling to and from the proposed project site, electricity consumed to power the construction trailers (lights, electronic equipment, and heating and cooling) and exterior uses such as lights, conveyance of water for dust control, and any electrically-driven construction equipment.

Construction activities could vary substantially from day to day, depending on the specific type of construction activity and the number of workers and vendors that would travel to the proposed project site. This analysis considered these factors and provides the estimated maximum construction energy consumption for the purposes of evaluating the associated impacts on energy resources.

Construction fuel use was forecasted by assuming a conservative estimate of construction activities and applying mobile source emission factors. Construction of the proposed project

would occur over approximately 41 months, from late 2022 through early 2026 (i.e., assuming all construction occurs at the earliest feasible date). If, for various site planning, financial, or other reasons, the onset of construction is delayed to a later date than assumed in the analysis, construction impacts to energy consumption would be similar to or less than those analyzed below, because more energy-efficient and cleaner burning construction equipment and vehicle fleet mix would be expected in the future. This is due to the In-Use Off-Road Diesel-Fueled Fleets Regulation implemented by CARB that requires construction equipment fleet operators to phase-in less polluting heavy-duty equipment and trucks over time (CARB 2010).

Electricity

Electricity use during construction would be short-term, the majority of which would be limited to working hours and used for necessary construction-related activities. Electricity would be used for electrically driven construction devices such as air compressors, pumps and other equipment, and the operation of the construction trailer. Electricity for equipment operating remotely on the proposed project site would use a portable generator to power the equipment. Electricity for the temporary construction office would be accessed from the existing electrical grid via temporary connections to provide temporary power and would be disconnected when construction activities cease. Construction would not result in a substantial use of energy or the need to increase infrastructure or supply. Therefore, the proposed project's construction would not result in the wasteful, inefficient, or unnecessary consumption of electricity resources and impacts would be less than significant.

Natural Gas

Natural gas would not be consumed during construction of the proposed project because construction offices would not be heated with natural gas, and construction equipment and vehicles would be primarily powered by either diesel, gasoline, or electricity. Therefore, project construction would result in no impacts to natural gas resources.

Transportation Fuels

Transportation fuels would be consumed for transportation of construction workers and materials to and from the proposed project site, and operation of construction equipment on the proposed project site throughout the construction phase.

Fuel consumption from on-site heavy-duty construction equipment was calculated based on the equipment mix estimated by IRWD and usage factors provided in the CalEEMod® construction calculations; summaries are included in Appendix B of this Draft EIR.

The energy usage required for construction of the proposed project was estimated based on the number and type of construction equipment that would be used during construction by assuming a conservative estimate of construction activities (i.e., maximum daily equipment usage levels). Energy for construction workers commuting trips was estimated based on the predicted number of workers for the various phases of construction and the estimated VMT based on the conservative values in the CalEEMod and EMFAC2017 models.

The estimated fuel economy for heavy-duty construction equipment was based on fuel consumption factors from the CARB OFFROAD emissions model, which is a state-approved model for estimating emissions from off-road heavy-duty equipment. The estimated fuel economy for haul trucks, vendor trucks, concrete trucks, and worker commute vehicles was based on fuel consumption factors from the CARB EMFAC2017 emissions model, which is a state-approved model for estimating emissions from on-road vehicles and trucks.

The estimated project fuel consumption and comparison to existing (2018) county usage are provided in **Table 3.5-2**. As shown, the limited construction time period results in a minimal amount of fuel consumption as compared to typical County usage. Furthermore, construction equipment and trucks would be required to comply with applicable provisions of regulations to improve fuel efficiency, including the Phase 1 and Phase 2 heavy-duty truck standards. Therefore, construction of the proposed project would not result in the wasteful, inefficient, or unnecessary consumption of transportation fuel resources and impacts would be less than significant.

**TABLE 3.5-2
 ESTIMATED PROJECT FUEL CONSUMPTION**

	Total Project Fuel Consumption (gallons)	
	Diesel	Gasoline
Total Project	838,360	59,088
Annual Average	279,453	19,696
County Usage	114,600,000	1,402,000,000
% County Usage	0.244%	<0.001%

NOTE:

Operation

Once construction is completed, operation of the proposed enlarged Syphon Reservoir would be controlled remotely by existing employees; no additional employees are required onsite daily for operation of Syphon Reservoir. Maintenance activities for the upkeep of the new dam and reservoir are anticipated to be similar to existing conditions, with daily safety/security checks, and water quality sampling performed by existing IRWD employees. The proposed project is anticipated to add passive recreational uses in the form of a walking trail that would be used by residents of adjacent communities. There is no available parking onsite, therefore recreation users would access the site on foot and would not result in additional vehicle trips that would create additional demand for transportation energy. During operation of the proposed project, electricity would be consumed for the operation of the Treatment Facility, which includes electricity for building lighting and electric-powered pumps and other equipment. Building lighting would be energy-efficient (i.e., light-emitting diode [LED]) and the pumps and other equipment installed would be new and designed to meet applicable current energy standards for such equipment.

Operation of the proposed project would also involve use of existing offsite pumps at Eastwood Recycled Water Pump Station. The Eastwood pump station is currently under construction and

can accommodate the proposed project. Installation of the equipment would be coordinated as a separate “equipping project” in parallel to the construction of the proposed Syphon Reservoir improvements. The existing Highline Canal would be abandoned in place and no longer used to deliver recycled water to Syphon Reservoir from Rattlesnake Reservoir. Under normal operating conditions, all flow in and out of Syphon Reservoir would be conveyed through the Eastwood Recycled Water Pump Station through the same 36-inch recycled water pipeline, for connection to IRWD’s recycled waters distribution system. The Treatment Facilities and use of the existing Eastwood Recycled Water Pump Station would result in the consumption of approximately 1,300,000 kWh of electricity annually for a net increase of 1,082,727 kWh relative to existing electricity consumption. The new total net operating electricity consumption represents approximately 0.006 percent of the county and 0.002 percent of SCE consumption for 2018. No natural gas would be used during operational activities. Given the minimal energy consumption of the proposed project and that the project would be designed with energy efficient lighting and equipment, the proposed project would not result in a substantial increase in energy consumption and would not result in the wasteful, inefficient, or unnecessary consumption of electricity resources; impacts would be less than significant.

Furthermore, the objectives of the proposed project include reducing the need to purchase supplemental imported untreated water from MWD by storing recycled water that is already being produced at the Michelson WRP. Conveying imported untreated water from the State Water Project (SWP) and the Colorado River to Orange County requires a tremendous amount of energy for pumping. Replacing imported water with locally generated recycled water reduces the overall energy associated with importing water since there would be less energy needed for conveyance. Approximately 1,890 kWh per acre foot is required for water supply and conveyance in the IRWD service area due to importing water from outside of the region from the SWP and Colorado River (IRWD 2019). Without the proposed project, approximately 4,500 AF of untreated water would be imported through MWD, resulting in approximately 8,505,000 kWh/year of electricity consumption district-wide. Treatment and transport of approximately 4,500 AF of locally-produced recycled water would result in approximately 4,806,000 kWh/year of district-wide electricity consumption, which is an approximate savings of 3,699,000 kWh annually. By providing IRWD customers with recycled water that is stored by the proposed project, electricity demand for water supply and conveyance of imported water would be reduced.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Consistency with Energy Plans

Impact 3.5-2: The proposed project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

The proposed project would be designed in a manner that is consistent with relevant energy conservation plans, such as Integrated Energy Policy Report, and the California Building Standards, designed to encourage development that results in the efficient use of water resources. The proposed project would increase the capacity of the reservoir, thereby providing a local, consistent supply of recycled water for the IRWD service area. This would reduce the energy consumption needed to provide water to IRWD's recycled water customers as described above under Impact 3.5-1.

The 2017 Climate Change Scoping Plan recognizes the nexus between water and energy consumption. The water-energy nexus provides opportunities for reducing energy demand and reducing emissions of greenhouse gases. The 2017 Climate Change Scoping Plan, states that “recycled water has the potential to reduce GHGs if it replaces, and not merely serves as an alternative to, an existing, higher-carbon water supply” (CARB 2017). Given the water-energy nexus, this means recycled water has the potential to reduce energy consumption if it replaces more energy-intensive water supplies. As discussed under Impact 3.5-1, replacing imported water with recycled water stored under the proposed project would reduce the electricity used for water supply and conveyance by approximately 3,699,000 kWh annually. Thus, the proposed project would be consistent with the Scoping Plan's strategy to reduce water-related energy consumption. As a result, the proposed project would not conflict with or obstruct a State or local plan for energy efficiency. The impact would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Cumulative Impacts

Impact 3.5-3: Concurrent construction and operation of the project and related projects in the geographic scope would not result in cumulative impacts to energy.

Electricity

The geographic context for the cumulative analysis of electricity is the SCE service area. Growth within this service area is anticipated to increase the demand for electricity and the need for infrastructure, such as new or expanded facilities.

Future development would result in the increased use of electricity resources. However, SCE has determined that the use of such resources would be minor compared to existing supply and infrastructure within the SCE service area and would be consistent with growth expectations (CEC 2018c). Furthermore, other cumulative developments would be required to incorporate

energy conservation features in order to comply with applicable mandatory regulations including CALGreen Code, State energy standards under Title 24, and incorporate mitigation measures, as necessary. The proposed project would reduce energy consumption needed to distribute water to IRWD's recycled water customers by replacing some imported water with a local supply. As discussed under Impact 3.5-1, replacing imported water with recycled water stored under the proposed project would reduce the electricity used for water supply and conveyance by approximately 3,699,000 kWh annually. Therefore, the proposed project's contribution to cumulative electricity impact would be less than significant.

Natural Gas

The geographic context for the cumulative analysis of natural gas is the SoCalGas service area. Growth within this service area is anticipated to increase the demand for natural gas and the need for infrastructure, such as new or expanded facilities. However, the proposed project would not require natural gas during construction or operational activities. Therefore the proposed project would result in no cumulative impacts to natural gas.

Transportation Energy

The geographic context for the cumulative analysis of transportation energy is the SCAG region. Growth within this region is anticipated to increase the demand for transportation and the need for infrastructure, such as new or expanded facilities. Construction of the proposed project would result in a temporary increase in VMT within the area; however, this short-term increase would last for only 36 to 41 months. Subsequent to the completion of construction, there would be no new vehicle trips to the proposed project site. Therefore, the proposed project's contribution to cumulative transportation energy impacts would be less than significant.

Mitigation Measures

None required

3.6 Geology and Soils

This section addresses the geology, soils, and paleontological resources impacts associated with construction and operation of the proposed project. This section includes: a description of the existing geology, soils, and paleontological resource conditions at the proposed project site; a summary of applicable regulations related to geology and soil hazards, and paleontological resources; and an evaluation of the potential impacts of the proposed project related to the geologic and soil conditions and the paleontological resources on the proposed project site and in the surrounding area, including cumulative impacts. Potential hazards from flooding associated with the construction and operation of the proposed project, including dam safety issues, are discussed in Section 3.9, *Hydrology and Water Quality*.

To inform the project design, the geotechnical investigations listed below have been conducted to investigate site conditions and identify potential geotechnical issues and provide recommendations to address those issues. The information provided in the listed reports are the primary source of information for this section.

3.6.1 Environmental Setting

Topography and Drainage

The proposed project site lies within a shallow valley, commonly referred to as Syphon Canyon, located between Bee and Hicks Canyons (GEI 2012). The canyon is situated along the southwestern flank of the Loma Ridge in the Santiago Hills portion of the Santa Ana Mountains. The canyon and the surrounding terrain drains onto the Tustin Plain, an alluvial plain that extends southwest from the Santa Ana Mountains to the San Joaquin Hills. The Tustin Plain is located at the eastern edge of the large sedimentary basin that incorporates most of the flat-lying areas of Orange and Los Angeles Counties.

The existing dam and reservoir are located within a bowl-shaped area, surrounded by State Route 133 along the southeast side, Portola Parkway along the southwest side, and the Bee Canyon Access Road along the northwest and north side, as shown on **Figure 3.6-1**. Moving from northeast to southwest in the general direction of drainage, elevations range from:

- 675 feet above mean sea level (amsl), based on North American Vertical Datum of 1988 [NAVD88]) on a knoll at the northeast corner of the bowl near where Bee Canyon Access Road and State Route (SR)133 come together to
- A little less than 350 feet amsl at the bottom of the existing reservoir to
- 387.7 feet amsl on the crest of the existing dam to
- Approximately 332 feet amsl at the strainer/disinfection facilities at the base of the dam to
- 319 feet amsl where the inlet and outlet pipelines drop to under Portola Parkway.

The existing embankment dam is a homogeneous earthfill dam that is 59 feet high and 843 feet long (HDR 2019). The existing spillway is located at the left (southeast) abutment of the dam, and a concrete lined channel extends a portion of the way to the downstream toe of the dam. The existing outlet consists of a 15-inch reinforced concrete pipe located beneath the dam and within its right (northwest) abutment. Historically, Syphon Reservoir was filled via gravity flows from Rattlesnake Reservoir (located about 1.3 miles to the north) through the Highline Canal that crosses the Syphon Reservoir dam near its right (northwest) abutment, as shown on Figure 3.6-1.

Natural drainage is from the sides of the bowl down into the reservoir. Water drawn from the reservoir enters the strainer/disinfection facilities for treatment at the foot of the dam and is then routed into IRWD's recycled water distribution pipeline. The dam has an overflow spillway on the southeastern end. Based on a review of performance records of the dam and reservoir, overflow discharge through the spillway has never occurred.

Regional Geology

The proposed project site lies within the geologically complex and seismically active region of California referred to as the Peninsular Ranges geomorphic province (CGS 2002a).¹ The province is characterized by a series of ranges separated by northwest trending valleys, subparallel to faults branching from the San Andreas Fault. The trend of topography is similar to the Coast Ranges (i.e., generally north-northwest to south-southeast ranges and valleys), but the geology is more like the Sierra Nevada, with granitic rock intruding the older metamorphic rocks. The Peninsular Ranges extend into lower California and are bound on the east by the Colorado Desert. The Los Angeles Basin and the island group (Santa Catalina, Santa Barbara, and the distinctly terraced San Clemente and San Nicolas Islands), together with the surrounding continental shelf (cut by deep submarine fault troughs), are included in this province.

¹ A geomorphic province is an area that possesses similar bedrock, structure, history, and age. California has 11 geomorphic provinces.

Syphon Reservoir Improvement Project

Figure 3.6-1
Site Plan of Existing Conditions

Local Geology and Soils

The geologic units at the proposed project site consist of road fill, lake bottom deposits, dam embankment, Quaternary² alluvium and slopewash, the Tertiary Vaqueros/Sespe Formations (Tvs) and Silverado Formation (Tsi), and the Cretaceous³ Williams Formation (at depth), as illustrated on **Figure 3.6-2** and **Figure 3.6-3** (AECOM 2020d). Alluvium, slopewash, and reservoir bottom sediments cover some of the underlying bedrock formations, mostly down the northeast–southwest axis of the canyon. The geologic units are summarized below from surface deposits to the bedrock formations. Additional information about surface soils can be found in Section 3.3, *Biological Resources*.

Road Fill

Engineered road fill is present along the eastern edge and northwestern side of the geologic map (AECOM 2020c, 2020e). The road fill on the eastern edge forms the abutments of a bridge that is part of the southbound State Route 133 toll road. The road fill at the northwestern side fills a low drainage area along Bee Canyon Road.

Lake Bottom Sediments

Geotechnical investigations of reservoir bottom sediments were conducted in 2015 and 2019 (GEI 2016; AECOM 2020a). The thickness of the reservoir bottom sediments ranges from zero at the edge of the reservoir (when full) to a maximum of 20 feet adjacent to the dam (AECOM 2020c). Most of the measured sediment thicknesses were less than five feet (GEI 2016). Geotechnical testing of selected samples indicate the lakebed sediments comprise sandy lean clay, sandy fat clay, and clayey sand, with some gravel present in places (AECOM 2020a). Roots, fibrous organic material, and shells were noted in some places. Alluvium or bedrock was encountered below the lakebed sediments. The total volume of lakebed sediments is estimated to be about 80,000 cubic yards. The geotechnical engineer noted that the vegetation and organic material in the lakebed sediments make them unsuitable for use as engineered fill (AECOM 2020a). Fat clays are susceptible to shrinking and swelling (expansion) with drying and wetting events, as discussed further below.

Dam Embankment Materials

The existing Syphon Dam is a homogenous earth dam without internal drainage layers (GEI 2012, 2016; AECOM 2020c). The dam was constructed in 1949 using onsite materials typically consisting of clayey sand with lesser amounts of sandy lean clay (AECOM 2020e).⁴ The embankment material was compacted in lifts, but compaction test records are not available. The dam materials are up to 65 feet thick when including the cutoff trench. The embankment material typically has low to moderate plasticity.

² Quaternary time is from the present to 1.6 million years ago.

³ Cretaceous time is from 66 million to 145 million years ago.

⁴ Lean clay is not expansive (i.e., subject to shrink-swell with drying and wetting); fat clay is expansive.

Syphon Reservoir Improvement Project

Figure 3.6-3
Geologic Cross Section C-C

Slopewash (Colluvium) and Alluvium

Most of the proposed project site is covered with slopewash (colluvium⁵) and/or alluvium (GEI 2012 2016; AECOM 2020c 2020e). Slopewash is present on the hillsides above the canyon bottom and under the reservoir bottom sediments. The slopewash is typically less than a foot thick on the upper portions of hillsides and thickens towards the canyon bottom where it transitions into alluvium up to approximately 35 feet thick in the canyon bottom areas near the existing dam.

The slopewash consists of interlayered silt, sand, and clay, typically with trace amounts of gravel. The gravel content typically increases where these soils develop on, or accumulate downslope from, conglomeratic layers contained within the formational materials discussed below. The plastic silts, clays, and clayey sands typically have low to high plasticity, and are stiff to very stiff. The sandy and non-plastic silty layers are typically loose to medium dense.

The alluvium consists of interlayered silt, sand, and clay with trace amounts of gravel and cobbles. Geotechnical laboratory testing classified the sampled materials as predominately low plasticity clayey sands with some sandy lean (low plasticity) clays with less abundant layers of silty sands, clayey gravels, and clayey and silty sands with gravel (AECOM 2020e). Some areas have materials susceptible to liquefaction. However, the dam would be excavated down to and seated in the underlying bedrock such that the new dam will be founded on bedrock to mitigate the potential for liquefaction.

Bedrock Formations

The inactive Center Valley Fault, discussed further below, crosses the proposed project site and the existing dam northeast to southwest, as shown on Figure 3.6-2 (AECOM 2020d). The fault has resulted in the Vaqueros/Sespe Formation being on the northwest side of the fault and the Silverado Formation being on the southeast side. The formations are summarized below.

Vaqueros and Sespe Formations

These two formations were formed 37 to 16 million years ago (mya), and are characterized by sediments deposited at the same time in adjacent environments – the Vaqueros being the marine and the Sespe being the nonmarine equivalents (GEI 2012, 2016; AECOM 2020e). These formations are recognized as being interbedded in the site area. Previous investigators have estimated the contact at different locations in the local area, and onsite field investigations performed to date have not delineated the contact location between the Vaqueros and Sespe Formations. Hence, the two formations have been given a dual classification for the purposes of the geotechnical investigations, as was done for previous regional studies, and are referred to as the Vaqueros/Sespe Formation (Tvs).

In general, the Vaqueros Formation typically consists of marine sandstone with siltstone and shale interbeds, and is moderately to locally well-indurated (hardened) where calcareous (i.e.,

⁵ Slopewash and colluvium are general names for loose, unconsolidated sediments that have been deposited at the base of hillslopes by either rainwash, sheetwash, slow continuous downslope creep, or a variable combination of these processes.

calcium carbonate) cementation is present. Some of the siltstone and shale interbeds are described as soft. The Sespe Formation consists of non-marine sandstone, claystone, siltstone, and conglomerate that are typically poorly to moderately indurated with local, well indurated, coarse-grained layers.

Silverado Formation

The Silverado Formation was formed 66 to 56 mya, and is thus older than the Vaqueros/Sespe Formation (GEI 2012, 2016: AECOM 2020e). The Silverado Formation typically consists of non-marine clayey to silty sandstone, siltstone, and a distinctive basal conglomerate. A thick conglomerate bed is interpreted as forming the left (southeast) abutment of the existing dam and is exposed in the cut bank above the graded pad southeast of the dam crest. The Silverado Formation is poorly to moderately indurated, although in select localities it can be well indurated.

Williams Formation

The upper Cretaceous age Williams Formation is exposed at the surface in the bedrock hills that are southeast of the project site (AECOM 2020d, e). The Williams Formation is a marine deposit encountered in several project borings beneath the Silverado Formation dominantly comprised of fine-grained clayey sandstone interbedded with less common medium- to coarse-grained sandstones.

Seismicity and Faults

This section characterizes the region's existing faults, describes historical earthquakes, estimates of the likelihood of future earthquakes, and describes probable groundshaking effects.

Earthquake Terminology and Concepts

Earthquake Mechanisms and Fault Activity

Faults are planar features within the earth's crust that have formed to release strain caused by the dynamic movements of the earth's major tectonic plates. An earthquake on a fault is produced when these strains overcome the inherent strength of the earth's crust, and the rock ruptures. The rupture causes seismic waves that propagate through the earth's crust, producing the groundshaking effect known as an earthquake. The rupture also causes variable amounts of slip along the fault, which may or may not be visible at the earth's surface.

Geologists commonly use the age of offset rocks as evidence of fault activity—the younger the displaced rocks, the more recently earthquakes have occurred. To evaluate the likelihood that a fault would produce an earthquake, geologists examine the magnitude and frequency of recorded earthquakes and evidence of past displacement along a fault. The California Geological Survey (CGS) defines an active fault as one that has had surface displacement within Holocene time (within the last 11,000 years; the U.S. Geological Survey (USGS) uses within the last 15,000 years). A Quaternary fault is defined as a fault that has shown evidence of surface displacement during the Quaternary period (the last 1.6 million years), unless direct geologic evidence demonstrates inactivity for all of the Holocene or longer. This definition does not mean that a fault lacking evidence of surface displacement is necessarily inactive. The term

“sufficiently active” is also used to describe a fault if there is some evidence that Holocene displacement has occurred on one or more of its segments or branches (CGS 2007).

The existing Syphon Dam is under the regulatory jurisdiction of the Division of Safety of Dams (DSOD). To provide a higher degree of protection from earthquake-induced dam failure, the DSOD classifications with regard to fault activity are as follows (DSOD 2018):

- **Active seismic sources** – A fault having ruptured within the last 35,000 years.
- **Conditionally active seismic sources** – A fault having ruptured in the Quaternary (up to 1.6 million years before present), but its displacement history during the last 35,000 years is unknown.
- **Inactive seismic sources** – Fault inactivity is demonstrated by a fault trace that is consistently overlain by unbroken geologic material older than 35,000 years. A fault that has no indication of Quaternary activity is presumed to be inactive, except in regions of sparse Quaternary cover.

Earthquake Magnitude

When an earthquake occurs along a fault, its size can be determined by measuring the energy released during the event (CGS 2002b). A network of seismographs records the amplitude and frequency of the seismic waves that an earthquake generates. The Richter magnitude (ML) of an earthquake represents the highest amplitude measured by the seismograph at a distance of 100 kilometers from the epicenter. Richter magnitudes vary logarithmically with each whole-number step, representing a tenfold increase in the amplitude of the recorded seismic waves and 32 times the amount of energy released. While Richter magnitude was historically the primary measure of earthquake magnitude, seismologists now use Moment Magnitude (Mw) as the preferred way to express the size of an earthquake. The Mw scale is related to the physical characteristics of a fault, including the rigidity of the rock, the size of fault rupture, and the style of movement or displacement across the fault. Although the formulae of the scales are different, they both contain a similar continuum of magnitude values, except that Mw can reliably measure larger earthquakes and do so from greater distances.

Peak Ground Acceleration and Spectral Acceleration

Common measures of ground motion at any particular site during an earthquake is the peak ground acceleration (PGA) and spectral acceleration (SA). The PGA for a given component of motion is the largest value of horizontal acceleration obtained from a seismograph. PGA is expressed as the percentage of the acceleration due to gravity (g), which is approximately 980 centimeters per second squared. In terms of automobile acceleration, one “g” of acceleration is equivalent to the motion of a car traveling 328 feet from rest in 4.5 seconds. For comparison purposes, the maximum PGA value recorded during the 1994 Northridge earthquake in the vicinity of the epicenter exceeded 1 g in several areas. Unlike measures of magnitude, which provide a single measure of earthquake energy, PGA varies from place to place and is dependent on the distance from the epicenter and the character of the underlying geology (e.g., hard bedrock, soft sediments, or artificial fills). The SA is also measured in g. However, SA describes the maximum acceleration in an earthquake on an object (in this case, the dam), as modeled by a

particle on a massless vertical rod having the same natural period of vibration as the building or structure.

Modified Mercalli Intensity Scale

The Modified Mercalli Intensity Scale assigns an intensity value based on the observed effects of ground shaking produced by an earthquake. Unlike measures of earthquake magnitude and PGA, the Modified Mercalli Intensity Scale is qualitative in nature in that it is based on actual observed effects rather than measured values. Similar to PGA, Modified Mercalli values for an earthquake at any one place can vary depending on the earthquake's magnitude, the distance from its epicenter, the focus of its energy, and the type of geologic material. The Modified Mercalli values for intensity range from I (earthquake not felt) to XII (damage nearly total), and intensities ranging from IV to X can cause moderate to significant structural damage. Because the Modified Mercalli scale is a measure of ground shaking effects, intensity values can be correlated to a range of average PGA values, as shown in **Table 3.6-1**.

Active Faults and Seismicity

Regionally, the proposed project site lies within a crustal block between active northwest-southeast-trending faults, the Elsinore Fault Zone to northeast and the Newport-Inglewood Fault Zone to the southwest, as shown on **Figure 3.6-4**. Numerous smaller faults displace the late Cretaceous through early Miocene⁶ sedimentary deposits that characterize the Loma Ridge. The sedimentary formations in the project site area include the relatively younger Vaqueros and Sespe Formations, and the relatively older Silverado Formation. These sediments were folded into a broad north-to-northwest-trending syncline⁷ with local variations caused by localized faulting and smaller folds.

The proposed project area is located in a seismically active region of California that contains both active (Holocene age) and potentially active (Quaternary age) faults. Throughout the proposed project region, there is the potential for damage resulting from movement along any one of a number of active faults, seismic shaking, and seismically induced ground failures (e.g., liquefaction). The Working Group on California Earthquake Probabilities (WGCEP), comprised of the USGS, the CGS, and the Southern California Earthquake Center, evaluates the probability of one or more earthquakes of Mw 6.7 or higher occurring in the state of California over the next 30 years (WGCEP 2015a). It is estimated that the Los Angeles region as a whole has a 60 percent chance of experiencing an earthquake of Mw 6.7 or higher over the next 30 years. Several active faults have been mapped close to the proposed project area as shown on **Figure 3.6-4** and listed below on **Table 3.6-2**.

⁶ Late Cretaceous through early Miocene time is 84 to 16 million years ago

⁷ A syncline is a trough or fold of stratified rock in which the strata slope upward from the axis.

**TABLE 3.6-1
MODIFIED MERCALLI INTENSITY SCALE**

Intensity Value	Intensity Description	Average Peak Ground Acceleration^a
I	Not felt	< 0.0017 g
II	Felt by people sitting or on upper floors of buildings	0.0017 to 0.014 g
III	Felt by almost all indoors. Hanging objects swing. Vibration like passing of light trucks. May not be recognized as an earthquake.	0.0017 to 0.014 g
IV	Vibration felt like passing of heavy trucks. Stopped cars rock. Hanging objects swing. Windows, dishes, doors rattle. Glasses clink. In the upper range of IV, wooden walls and frames creak.	0.014 to 0.039 g
V (Light)	Felt outdoors. Sleepers wakened. Liquids disturbed, some spilled. Small unstable objects displaced or upset. Doors swing. Pictures move. Pendulum clocks stop.	0.035 to 0.092 g
VI (Moderate)	Felt by all. People walk unsteadily. Many frightened. Windows crack. Dishes, glassware, knickknacks, and books fall off shelves. Pictures off walls. Furniture moved or overturned. Weak plaster, adobe buildings, and some poorly built masonry buildings cracked. Trees and bushes shake visibly.	0.092 to 0.18 g
VII (Strong)	Difficult to stand or walk. Noticed by drivers of cars. Furniture broken. Damage to poorly built masonry buildings. Weak chimneys broken at roof line. Fall of plaster, loose bricks, stones, tiles, cornices, unbraced parapets and porches. Some cracks in better masonry buildings. Waves on ponds.	0.18 to 0.34 g
VIII (Very Strong)	Steering of cars affected. Extensive damage to unreinforced masonry buildings, including partial collapse. Fall of some masonry walls. Twisting, falling of chimneys and monuments. Wood-frame houses moved on foundations if not bolted; loose partition walls thrown out. Tree branches broken.	0.34 to 0.65 g
IX (Violent)	General panic. Damage to masonry buildings ranges from collapse to serious damage unless modern design. Wood-frame structures rack, and, if not bolted, shifted off foundations. Underground pipes broken.	0.65 to 1.24 g
X (Very Violent)	Poorly built structures destroyed with their foundations. Even some well-built wooden structures and bridges heavily damaged and needing replacement. Water thrown on banks of canals, rivers, lakes, etc.	> 1.24 g
XI (Very Violent)	Few, if any, masonry structures remain standing. Bridges destroyed. Rails bent greatly. Underground pipelines completely out of service.	> 1.24 g
XII (Very Violent)	Damage nearly total. Practically all works of construction are damaged greatly or destroyed. Large rock masses displaced. Waves seen on ground surface. Lines of sight and level are distorted. Objects are thrown into the air.	> 1.24 g

NOTES:

^a Value is expressed as a fraction of the acceleration due to gravity (g). Gravity (g) is 9.8 meters per second squared. 1.0 g of acceleration is a rate of increase in speed equivalent to a car traveling 328 feet from rest in 4.5 seconds.

San Andreas Fault Zone	66.2 northeast	8.2	0.22	19.95

SOURCES: GEI 2012; WGCEP 2015b

Inactive Central Valley Fault

The Central Valley Fault is a regional U-shape fault with two main splays that extend northeast to southwest along the axis of the canyon and under the existing Syphon Dam, as shown on Figure 3.6-2 and Figure 3.6-3 (AECOM 2020d). The fault splays are concealed by the lake bottom sediments, alluvium, and slopewash/colluvium soils in the drainage. At the proposed project site, the down-to-the-southeast displacement (i.e., the southeast side has dropped relative to the northwest side) has resulted in different-aged geologic formations on the opposing ridges (i.e., the younger Vaqueros/Sespe Formation on the northwest side and the older Silverado Formation on the southeast side). The fault study concluded that the Central Valley Fault has not moved within Quaternary time (the last 1.6 million years) and has no potential for future movement. Based on the DSOD criteria of 35,000 years, this fault is considered inactive.

Geologic Hazards

Based on the geologic data reviewed during preparation of this Draft EIR, the potential geologic hazards at the proposed project site include erosion and expansive soil. These geologic hazards are discussed below. Liquefaction and lateral spreading, while possible without seismic shaking, are more commonly triggered by a seismic event, as discussed further below in seismic hazards.

Erosion and Landslides

The term landslide refers to the downward movement of large masses of rocks, soil, mud, and/or organic debris. Areas with steep slopes are particularly susceptible to landslide hazards. Most landslides are caused by one or more factors that act together to destabilize the slope. The primary driving force of slope failure is the influence of gravity acting on weakened materials that make up a sloping area of land. While some landslides occur slowly over time (e.g., land movement on the order of a few meters or yards per month), the most destructive landslides happen suddenly after a triggering event, such as heavy rainfall or an earthquake. Landslides can be triggered by human activities that weaken the stability of a slope. These actions may include excavation of the toe of a slope removing a restraining force to slope failure, the addition of water at the head of a slope increasing the weight of the materials within the upper slope area and adding a lubricant (i.e., water) to the materials, by construction activities that disturb soil conditions and create unstable slopes, and/or by water leaks or breaks in pipelines or pumps.

This page intentionally left blank

Erosion is the wearing away of soil and rock by processes such as mechanical or chemical weathering, mass wasting, and the action of water and wind. Excessive soil erosion can eventually damage infrastructure. In general, granular soils with relatively low cohesion and soils located on steep topography have a higher potential for erosion.

The CGS mapped several possible landslides shown on **Figure 3.6-5** (CGS 2001). However, the CGS considered them to be dormant/mature features, indicating a low potential to be reactivated. In addition, the onsite geotechnical investigations concluded that the morphology and geology of the slopes at the proposed project site suggest that there are no large deep seated landslides or unstable slopes that could potentially threaten proposed project facilities (GEI 2012, AECOM 2020e). Landslides were not observed at the current dam, the ridges that the current dam is seated into, or within the reservoir footprint. The only landslide the CGS indicated could be as thick as 10 to 50 feet is the one located just above the “Syphon Reservoir” label on Figure 3.6-5. The onsite investigations concluded that the evidence for a landslide at this location is very subtle and inconclusive. Road cuts for the SR-133 road along the southeast side of the proposed project site did not map landslides.

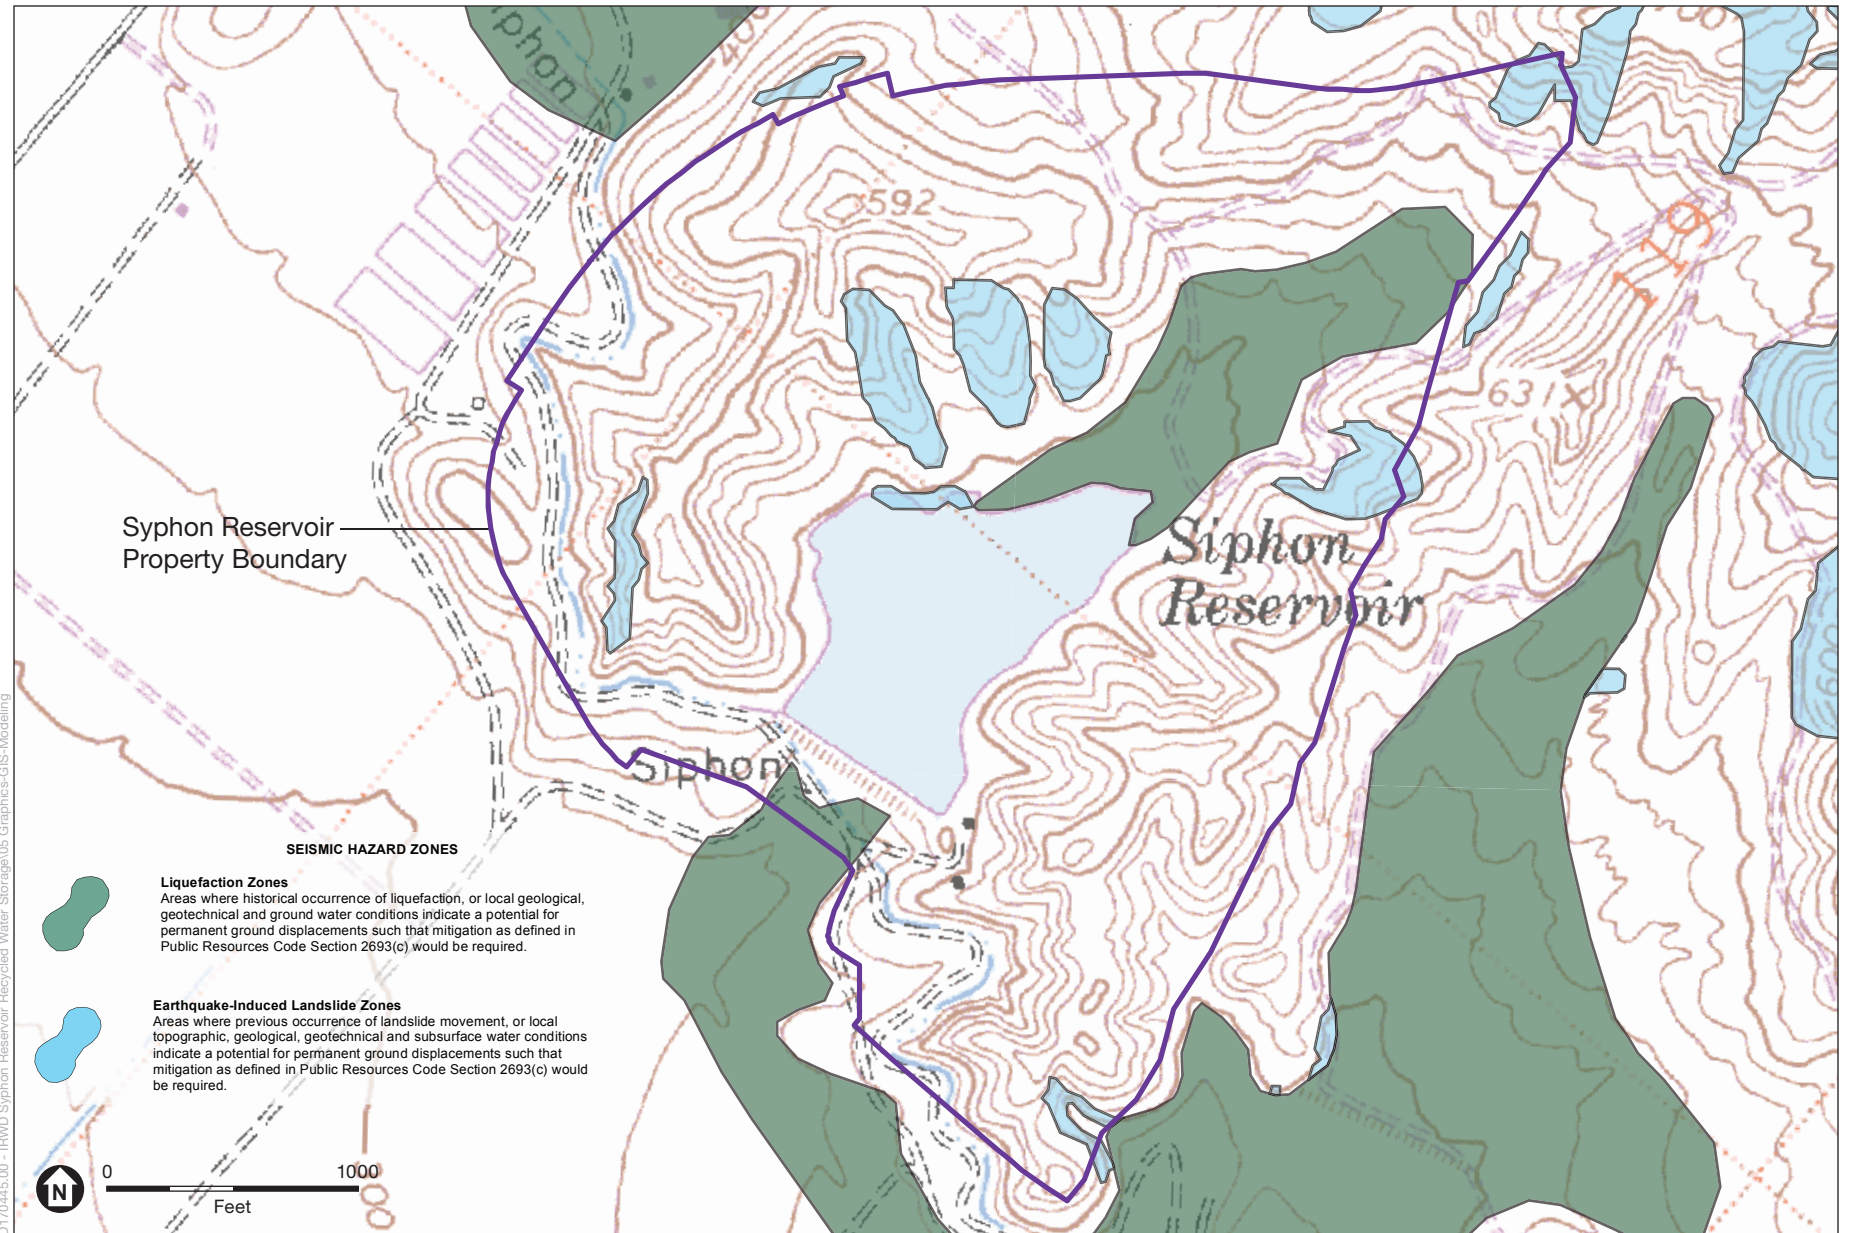

Expansive Soils

Expansive soils contain significant amounts of clay particles that have the ability to give up water (shrink) or take on water (swell). When these soils swell, the change in volume can exert significant pressures on loads that are placed on them and can result in structural distress and/or damage. Often, grading, site preparations, and backfill operations associated with subsurface structures can eliminate the potential for expansion.

As previously described, the alluvium, slopewash, and colluvium have a low to moderate plasticity, which would be less susceptible to expansion. The bedrock formation are mostly rock and would have no susceptibility to expansion. The lake bottom sediments are predominantly fat clays, which have a higher susceptibility to expansion.

Subsidence and Collapse

When oil and/or groundwater is extracted from the subsurface, subsidence of the overlying land surface can occur. Collapse is also typically associated with shallow groundwater withdrawal. Subsidence is usually associated with severe, long-term withdrawal in excess of recharge that eventually leads to overdraft of the aquifer. As oil and/or groundwater is pumped out, water and/or oil is removed from the soil pore spaces leading to a reduction in soil strength. The subsurface conditions more conducive to subsidence include clay or organic-rich soils. Sand- and gravel-rich soils are less prone to subsidence because the larger grains comprise a skeleton less dependent on water pressure for support. The subsidence can result in damage to infrastructure such as buildings or pipelines, or can result in a decrease in the volume of available aquifer storage. The proposed project does not include the extraction of oil or groundwater.

Siphon Reservoir Improvement Project

Figure 3.6-5
Landslide and Liquefaction Zones

Seismic Hazards

Seismic hazards are generally classified into two categories: primary seismic hazards (surface fault rupture and groundshaking) and secondary seismic hazards (liquefaction and other types of seismically induced ground failure, along with seismically induced landslides).

Surface Fault Rupture

Seismically induced ground rupture is defined as the physical displacement of surface deposits in response to an earthquake's seismic waves. The magnitude, sense, and nature of fault rupture can vary for different faults or even along different strands of the same fault. The highest potential for surface faulting is along existing fault traces that have had Holocene displacement. As previously discussed, no known active faults have been mapped through the proposed project site.

Seismic Ground Shaking

As discussed above, it is estimated that a major earthquake has a 60 percent chance of affecting the Los Angeles region in the next 30 years and would produce strong ground shaking throughout the region, including Orange County and the proposed project site. Earthquakes on active or potentially active faults, depending on magnitude and distance from the project area, could produce a range of ground shaking intensities at the project area. Historically, earthquakes have caused strong ground shaking and damage in the Los Angeles Basin. For example, the Mw 6.4 Long Beach earthquake in March 1933 produced very damaging ground shaking from Long Beach to the industrial section south of Los Angeles (Hauksson and Gross 1991). The intensity of shaking at different locations within the area can generally be expected to decrease with distance from an earthquake source.

The primary tool that seismologists use to describe the ground shaking hazard in an area is a probabilistic seismic hazard assessment (PSHA). The PSHA for the State of California takes into consideration the range of possible earthquake sources (including such worst-case scenarios as described above) and estimates their characteristic magnitudes to generate a probability map for groundshaking. The PSHA maps depict PGA values that have a 10 percent probability of being exceeded in 50 years (i.e., a 1 in 475 chance of occurring each year).

The groundshaking hazard estimated at the proposed project site using the 2008 USGS Interactive Deaggregations web site for the closest active fault, the San Joaquin Hills Blind Thrust Fault, estimates the highest calculated PGA at 0.69 g (GEI 2012). Based on the Modified Mercalli Intensity Scale (see Table 3.6-1), this PGA would result in an Intensity Value of IX, violent shaking, seismic event.

To further evaluate the ground shaking hazard at the dam, a site-specific PSHA and deterministic seismic hazard analyses (DSHA) was conducted to inform the design of the Syphon Reservoir site (AECOM 2020b). As discussed above, the goal of PSHA is to quantify the rate (or probability) of exceeding various ground-motion levels at a site, given all possible earthquakes. A PSHA considers all possible earthquakes and ground motion levels and computes the probability of each scenario. Each scenario is ranked in order of decreasing severity of shaking and the tabulated results summed up with ground motions above a specified level (i.e., magnitude of

earthquake). The project is then designed for a selected ground motion, referred to as the maximum considered earthquake for PSHAs. For this proposed project location, the site-specific PSHA concluded the earthquake hazard for the site is a PGA of 0.53 g with a 2 percent probability of being exceeded in a 50-year period.

The goal of a DSHA is to evaluate the site-specific seismic hazard (i.e., ground motion) based on the maximum hazard from the controlling sources affecting the specific study site. Controlling sources are the nearest active faults capable of producing the largest amount of ground motion. For the proposed project, the DSHA concluded the San Joaquin Hills Fault gives the largest ground motions and spectral accelerations. The DSHA considers the maximum considered earthquake, the distance to the fault, and the variability of the input data. The DSHA results are expressed as the SA, also measured in g, that describes the maximum acceleration in an earthquake on an object (in this case, the dam), as modeled by a particle on a massless vertical rod having the same natural period of vibration as the building or structure. For this proposed project location, the DSHA concluded that the earthquake hazard for the site is a SA of 0.70 g resulting from an earthquake of Mw 6.9 on the San Joaquin Fault at a distance of 6.3 km (4 miles) from the site.

Liquefaction and Lateral Spreading

Liquefaction is the rapid loss of shear strength experienced in saturated, predominantly granular soils below the groundwater level during strong earthquake groundshaking and occurs due to an increase in pore water pressure. Liquefaction-induced lateral spreading is defined as the finite, lateral displacement of gently sloping ground as a result of pore-pressure buildup or liquefaction in a shallow underlying deposit during an earthquake (VT 2013). The occurrence of this phenomenon is dependent on many complex factors, including the intensity and duration of groundshaking, particle-size distribution, and density of the soil.

The potential damaging effects of liquefaction include differential settlement, loss of ground support for foundations, ground cracking, heaving and cracking of structure slabs due to sand boiling, and buckling of deep foundations due to ground settlement. Dynamic settlement (i.e., pronounced consolidation and settlement from seismic shaking) may also occur in loose, dry sands above the water table, resulting in settlement of and possible damage to overlying structures. In general, a relatively high potential for liquefaction exists in loose, sandy soils that are within 50 feet of the ground surface and are saturated (below the groundwater table). Lateral spreading can move blocks of soil, placing strain on levees and roads that can lead to ground failure.

The geotechnical investigations concluded that most of the proposed project site materials are not susceptible to liquefaction (GEI 2012, AECOM 2020e). More importantly, the design would excavate the alluvium material such that the proposed new dam would be founded on bedrock to mitigate the potential for liquefaction. The excavated alluvium is suitable material for use as embankment fill in the proposed new dam.

Paleontological Resources

The Society of Vertebrate Paleontologist (SVP) has established standard guidelines (SVP 2010) that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. Although not regulations per se, most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements as specifically provided in its standard guidelines.

Paleontological sensitivity is defined as the potential for a geologic unit to produce scientifically significant fossils. This is determined by rock type, past history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific survey. The SVP guidelines define four categories of paleontological sensitivity (potential) for rock units: high, low, undetermined, and no potential.

Paleontological resources are the fossilized remains or impressions of plants and animals, including vertebrates (animals with backbones; mammals, birds, fish, etc.), invertebrates (animals without backbones; starfish, clams, coral, etc.), and microscopic plants and animals (microfossils). They are valuable, nonrenewable, scientific resources used to document the existence of extinct life forms and to reconstruct the environments in which they lived. Fossils can be used to determine the relative ages of the depositional layers in which they occur and of the geologic events that created those deposits. The age, abundance, and distribution of fossils depend on the geologic formation in which they occur and the topography of the area in which they are exposed. The geologic environments within which the plants or animals became fossilized usually were quite different from the present environments in which the geologic formations now exist.

A paleontological resources fossil locality search was conducted by the Natural History Museum of Los Angeles County (LACM) for the 2019 Initial Study/Mitigated Negative Declaration for the Syphon Reservoir Geotechnical Investigations Project at the project site (ESA 2019). The results indicate that while no recorded fossil specimens occur within the proposed project site, multiple specimens do occur nearby and within the same sedimentary deposits that occur within the proposed project site, including the Silverado and Sespe/Vaqueros Formations and the older Quaternary Alluvium. These units have a moderate to high paleontological sensitivity. Excavation in any of these formations may expose significant vertebrate fossils, and impacts to such fossils could constitute a significant impact on the environment.

3.6.2 Regulatory Framework

The proposed project shall be required to comply with the following laws, statutes, regulations, codes, and policies, which are defined as standard conditions for the proposed project.

Federal

Clean Water Act

The federal Clean Water Act (CWA) and subsequent amendments, under the enforcement authority of the U.S. Environmental Protection Agency (USEPA), was enacted “to restore and maintain the chemical, physical, and biological integrity of the Nation’s waters.” The purpose of the CWA is to protect and maintain the quality and integrity of the nation’s waters by requiring states to develop and implement state water plans and policies. The CWA gave the USEPA the authority to implement pollution control programs such as setting wastewater standards for industry. In California, implementation and enforcement of the National Pollutant Discharge Elimination System (NPDES) program is conducted through the California State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCBs). The CWA also sets water quality standards for surface waters and established the NPDES program to protect water quality through various sections of the CWA, including Sections 401 through 404 and 303(d) that are implemented and regulated by the SWRCB and the nine RWQCBs. NPDES and Section 402 of the CWA would apply to the proposed project because the project would be required to control discharges of pollutants from point sources, as discussed below.

National Pollutant Discharge Elimination System (NPDES) Permit and Section 402

The NPDES permit system was established under the CWA to regulate municipal and industrial point discharges to surface waters of the U.S. Each NPDES permit for point discharges contains limits on allowable concentrations of pollutants contained in discharges. Section 402 of the CWA contains general requirements regarding NPDES permits.

The CWA was amended in 1987 to require NPDES permits for non-point source (i.e., stormwater) pollutants in discharges. Stormwater sources are diffuse and originate over a wide area rather than from a definable point. The goal of NPDES stormwater regulations is to improve the quality of stormwater discharged to receiving waters to the “maximum extent practicable” through the use of structural and non-structural Best Management Practices (BMPs). BMPs can include the development and implementation of various practices including educational measures (workshops informing public of what impacts results when household chemicals are dumped into storm drains), regulatory measures (local authority of drainage facility design), public policy measures, and structural measures (filter strips, grass swales and detention ponds). In California, the stormwater portion of Section 402 is addressed through the state Construction General Permit, as described further below. Although the project site does not have waters of the U.S. within the project footprint, Section 4-2 applies to this project because runoff from the project site would have the potential to flow downslope to waters of the U.S. during construction if not controlled.

Public Resources Code Sections 5097.5 and 30244

California Public Resources Code (PRC) Sections 5097.5 and 30244 specify state requirements for paleontological resource management. These statutes prohibit the removal of any paleontological site or feature from public lands without permission of the jurisdictional agency,

defining their removal as a misdemeanor. PRC Sections 5097.5 and 30244 require reasonable mitigation of adverse impacts on paleontological resources from developments on public (state, county, city, district) lands.

State

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act was passed in 1972 to protect structures for human occupancy from the hazard of surface faulting. In accordance with the act, the State Geologist has established regulatory zones—called earthquake fault zones—around the surface traces of active faults, and has published maps showing these zones. Buildings for human occupancy cannot be constructed across surface traces of faults that are determined to be active. Because many active faults are complex and consist of more than one branch that may experience ground surface rupture, earthquake fault zones extend approximately 200 to 500 feet on either side of the mapped fault trace. This act does not apply to the proposed project because no active faults cross the proposed project site and no habitable structures would be constructed.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act was passed in 1990 following the Loma Prieta earthquake to reduce threats to public health and safety and to minimize property damage caused by earthquakes. This act requires the State Geologist to delineate various seismic hazard zones, and cities, counties, and other local permitting agencies to regulate certain development projects within these zones. For projects that would locate structures for human occupancy within designated Zones of Required Investigation, the Seismic Hazards Mapping Act requires project applicants to perform a site-specific geotechnical investigation to identify the potential site-specific seismic hazards and corrective measures, as appropriate, prior to receiving building permits. The *CGS Guidelines for Evaluating and Mitigating Seismic Hazards* (Special Publication 117A) provides guidance for evaluating and mitigating seismic hazards (CGS 2008). The CGS is in the process of producing official maps based on USGS topographic quadrangles. To date, the CGS has not completed a delineation for the USGS quadrangle in which project components are proposed. However, as discussed above in Section 3.6.1, *Environmental Setting*, a site-specific fault study has been conducted that indicated there are no active faults passing through the proposed project site (AECOM 2020d).

Division of Safety of Dams

In the state of California, dam safety is regulated by the Division of Safety of Dams (DSOD) under the authority granted by the California Water Code (Parts 1 and 2 of Division 3, *Dam and Reservoirs*). The DSOD provides oversight to the design, construction, and maintenance of over 1,200 jurisdictional sized dams in California, including the Syphon Reservoir Dam. Jurisdictional dams are dams that are more than 6 feet high and impound 50 acre-feet or more of water, or 25 feet or higher and impound more than 15 acre-feet of water. The jurisdictional height of a dam, as determined by DSOD, is the vertical distance measured from the lowest point at the downstream

toe of the dam to its maximum storage elevation, which is typically the spillway crest. The DSOD ensures dam safety by:

- Reviewing and approving dam enlargements, repairs, alterations, and removals to ensure that the dam appurtenant structures are designed to meet minimum requirements.
- Performing independent analyses to understand dam and appurtenant structures performance. These analyses can include structural, hydrologic, hydraulic, and geotechnical evaluations.
- Overseeing construction to ensure work is being done in accordance with the approved plans and specifications.
- Inspecting each dam on an annual basis to ensure it is safe, performing as intended, and is not developing issues. Roughly 1/3 of these inspections include in-depth instrumentation reviews of the dam surveillance network data.
- Periodically reviewing the stability of dams and their major appurtenances in light of improved design approaches and requirements, as well as new findings regarding earthquake hazards and hydrologic estimates in California.

The structural elements of the proposed project would undergo appropriate and final design-level geotechnical evaluations prior to final design and construction. Implementing the regulatory requirements in the DSOD regulations and ensuring that all structures constructed in compliance with the law is the responsibility of the project engineers and building officials. The design engineer, as a registered professional with the State of California, is required to comply with the DSOD and local codes while applying standard engineering practice and the appropriate standard of care for the particular region in California, which, in the case of the proposed project, is Orange County.⁸ The California Professional Engineers Act (Building and Professions Code Sections 6700-6799), and the Codes of Professional Conduct, as administered by the California Board of Professional Engineers and Land Surveyors, provides the basis for regulating and enforcing engineering practice in California. For a dam and reservoir expansion project, the DSOD is responsible for review and approval of the proposed design, and inspections during construction and annually during operations.

NPDES Construction General Permit

Construction associated with the proposed project would disturb more than one acre of land surface that have the potential to affect the quality of stormwater discharges into waters of the U.S. The proposed project would, therefore, be subject to the *NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities* (Order 2009-0009-DWQ, NPDES No. CAS000002; as amended by Orders 2010-0014-DWQ and 2012-006-DWQ). The Construction General Permit regulates discharges of pollutants in stormwater associated with construction activity to waters of the U.S. from construction sites that disturb one acre or more of land surface, or that are part of a common plan of development or sale that disturbs more than one acre of land surface. The permit regulates stormwater discharges associated with construction or demolition activities, such as clearing and excavation;

⁸ A geotechnical engineer (GE) specializes in structural behavior of soil and rocks. GEs conduct soil investigations, determine soil and rock characteristics, provide input to structural engineers, and provide recommendations to address problematic soils.

construction of buildings; and linear underground projects, including installation of water pipelines and other utility lines.

The Construction General Permit requires that construction sites be assigned a Risk Level of 1 (low), 2 (medium), or 3 (high), based both on the sediment transport risk at the site and the receiving waters risk during periods of soil exposure (e.g., grading and site stabilization). The sediment risk level reflects the relative amount of sediment that could potentially be discharged to receiving water bodies and is based on the nature of the construction activities and the location of the site relative to receiving water bodies. The receiving waters risk level reflects the risk to the receiving waters from the sediment discharge. Depending on the risk level, the construction projects could be subject to the following requirements:

- Effluent standards;
- Good site management “housekeeping;”
- Non-stormwater management;
- Erosion and sediment controls;
- Run-on and runoff controls;
- Inspection, maintenance, and repair; or
- Monitoring and reporting requirements.

The Construction General Permit requires the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) that includes specific BMPs designed to prevent sediment and pollutants from contacting stormwater from moving off site into receiving waters. The BMPs fall into several categories, including erosion control, sediment control, waste management and good housekeeping, and are intended to protect surface water quality by preventing the off-site migration of eroded soil and construction-related pollutants from the construction area. Routine inspection of all BMPs is required under the provisions of the Construction General Permit.

The SWPPP must be prepared before the construction begins. The SWPPP must contain a site map(s) that delineates the construction work area, existing and proposed buildings, parcel boundaries, roadways, stormwater collection and discharge points, general topography both before and after construction, and drainage patterns across the project area. The SWPPP must list BMPs and the placement of those BMPs that the applicant would use to protect stormwater runoff. Examples of typical construction BMPs include scheduling or limiting certain activities to dry periods, installing sediment barriers such as silt fence and fiber rolls, and maintaining equipment and vehicles used for construction. Non-stormwater management measures include installing specific discharge controls during certain activities, such as paving operations, vehicle and equipment washing and fueling. The Construction General Permit also sets post-construction standards (i.e., implementation of BMPs to reduce pollutants in stormwater discharges from the site following construction).

In the proposed project area, the Construction General Permit is implemented and enforced by the Santa Ana Regional Water Quality Control Board, which administers the stormwater permitting program. Dischargers must electronically submit a notice of intent and permit registration documents to obtain coverage under this Construction General Permit. Dischargers are to notify

the Santa Ana Regional Water Quality Control Board of violations or incidents of non-compliance, and submit annual reports identifying deficiencies in the BMPs and explaining how the deficiencies were corrected. The risk assessment and SWPPP must be prepared by a State Qualified SWPPP Developer, and implementation of the SWPPP must be overseen by a State Qualified SWPPP Practitioner. A legally responsible person, who is legally authorized to sign and certify permit registration documents, is responsible for obtaining coverage under the permit.

California Occupational Safety and Health Administration Regulations

Occupational safety standards exist in federal and state laws to minimize worker safety risks from both physical and chemical hazards in the workplace. In California, the California Division of Occupational Safety and Health (Cal/OSHA) and the federal OSHA are the agencies responsible for ensuring worker safety in the workplace.

The OSHA Excavation and Trenching standard (29 CFR 1926.650) covers requirements for excavation and trenching operations, which are among the most hazardous construction activities. OSHA requires that all excavations in which employees could potentially be exposed to cave-ins be protected by sloping or benching the sides of the excavation, supporting the sides of the excavation, or placing a shield between the side of the excavation and the work area. Cal/OSHA is the implementing agency for both state and federal OSHA standards.

Local

County of Orange General Plan

Safety Element

The following goals and policies from the Safety Element of the Orange County General Plan are relevant to the proposed project.

Goal 1: Provide for a safe living and working environment consistent with available resources.

Objective 1.1: To identify natural hazards and determine the relative threat to people and property in Orange County.

Goal 2: Minimize the effects of natural safety hazards through implementation of appropriate regulations and standards, which maximize protection of life and property.

Objective 2.1: To create and maintain plans and programs which mitigate the effects of natural hazards.

Objective 2.2: To support the development and utilization of technologies, which minimize the effects of natural hazards.

Policy 4: To implement ordinances, regulations, and procedures which mandate the review, valuation, and restriction of land use due to possible undue geologic threat.

Policy 5: To encourage establishment of seismic design criteria and standards for county facilities (e.g., transmission lines, water and sewage systems, and highways), any structures housing necessary mobile units and support equipment, and other vital resources which would be needed following an earthquake (e.g., "back-up" power generation facilities and water storage).

Resources Element

The following goals and policies from the Resources Element of the Orange County General Plan are relevant to the proposed project.

Goal 2: To encourage through a resource management effort the preservation of the county's cultural and historic heritage.

Objective 2.2: Take all reasonable and proper steps to achieve the preservation of archaeological and paleontological remains, or their recovery and analysis to preserve cultural, scientific, and educational values.

Paleontological Resources Policies:

1. To identify paleontological resources through literature and records research and surface surveys.
2. To monitor and salvage paleontological resources during the grading of a project.
3. To preserve paleontological resources by maintaining them in an undisturbed condition.

Orange County Grading Manual and Excavation Code, Section 7-1-801

The Orange County Grading Manual is a compilation of rules, procedures, and interpretations, necessary to carry out the provisions of the Orange County Grading Code. The Orange County Grading Manual is organized to follow the content of subarticles in the Orange County Grading and Excavation Code. The purpose of the Orange County Grading Manual is to assist users of the Orange County Grading Code by supplementing it with detailed information regarding rules, interpretations, standard specifications, procedures, requirements, forms and other information used to control excavation, grading and earthwork construction in unincorporated Orange County. The Manual sets forth rules and regulations to control excavation, grading, and earthwork construction, including fills and embankments, and establishes administrative requirements for issuance of permits and approval of plans and inspection of grading construction in accordance with the requirements for grading and excavation as contained in the California Building Code then in effect as adopted and modified by county ordinance.

Orange County Construction Runoff Guidance Manual

The 2012 Construction Runoff Guidance Manual (Manual) was prepared by Orange County, the cities within the County, and the Orange County Flood Control District, to enable projects to comply with the regulatory requirements for creek, river, stream and coastal water protection during the construction phase of new development and significant redevelopment projects. The Manual describes BMPs typically needed to be implemented at a construction site to ensure compliance with the NPDES Construction General Permit (see above) and local ordinances.

3.6.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from Appendix G of the CEQA Guidelines are used as thresholds of significance to determine the impacts of the proposed project as related to geology and soils. The proposed project would have a significant impact if it would:

1. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
 - a) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault.
 - b) Strong seismic ground shaking.
 - c) Seismic-related ground failure, including liquefaction.
 - d) Landslides.
2. Result in substantial soil erosion or the loss of topsoil.
3. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.
4. Be located on expansive⁹ soil creating direct or indirect substantial risks to life or property.
5. Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.
6. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.
7. Result in cumulatively considerable impacts to geology and soils.

Methodology

General

This environmental analysis of the potential impacts related to geology, soils, and paleontological resources is based on a review of the results of site-specific geotechnical investigations, feasibility and design reports, a review of literature and database research (geologic, seismic, and soils, and paleontological resources reports and maps), and the Orange County General Plan and County ordinances.

The proposed project would be regulated by the various laws, regulations, and policies summarized above in Section 3.6.2, *Regulatory Framework*. Compliance by the proposed project with applicable federal, state, and local laws and regulations is assumed in this analysis and local and state agencies would be expected to continue to enforce applicable requirements to the extent that they do so now. Note that compliance with many of the regulations is a condition of permit approval.

After considering the implementation of the proposed project described in Chapter 2, *Project Description*, and compliance with the required regulatory requirements, the environmental analysis

⁹ The CBC, based on the International Building Code and the now-defunct Uniform Building Code, no longer includes a Table 18-1-B. Instead, CBC Section 1803.5.3 describes the criteria for analyzing expansive soils.

below identifies if the defined significance thresholds are exceeded. For those impacts considered to be significant, mitigation measures are proposed to the extent feasible to reduce the identified impacts.

Geotechnical Design

The new engineered dam and reservoir would meet or exceed the current safety and design requirements established by the California Department of Water Resources (DWR), Division of Safety of Dams (DSOD), which is the governing state agency associated with this project. IRWD would exceed these current requirements by implementing state-of-the-art Risk-Informed Decision-Making (RIDM) processes that improve dam safety and substantially reduce the risk of dam failure. The design for the expanded reservoir would be based on rigorous standards, risk analysis and site-specific geotechnical investigations. The risk-informed design approach for the Syphon Reservoir Improvement Project would result in a dam design that avoids failures and associated consequences to downstream communities consistent with IRWD's priority of public safety. The design would be peer-reviewed through a rigorous process overseen by an independent Technical Advisory Group (TAG), comprised of nationally recognized industry experts, which may include the disciplines of dam geology/site characterization, seismic analysis, hydrology/hydraulics, dam construction, and potential failure mode analysis and RIDM. The purpose of the TAG is to provide an independent assessment of the design development including, but not limited to, review of design criteria, design details, technical approach, and other aspects of the design engineer's work to confirm the project design is in full compliance with or exceeds governing standards and requirements.

To inform the project design and as summarized in Section 3.6.1, *Environmental Setting*, various geotechnical investigations have been conducted to investigate site conditions and identify potential geotechnical issues (GEI 2012, 2016; HDR 2019; AECOM 2020a through e). To address potential geotechnical issues, the geotechnical investigations conducted to date provided the geotechnical recommendations listed below. Further details are provided in the geotechnical investigations, which include details of borrow material testing, and would be further developed in the final geotechnical design report.

- **Material Selection** – The geotechnical investigations indicate that primarily materials from the proposed site could be used to construct the dam embankment except for the filter, drain, riprap and riprap bedding zones, which require high-quality granular materials with soundness and durability characteristics similar to those required for concrete aggregates. These high-quality granular products would need to be imported from offsite sources. In addition, onsite materials do not appear to be suitable for concrete aggregate, which would also need to be imported from offsite sources if concrete is to be mixed onsite. The materials selected for construction of the proposed new dam would exclude topsoil and lake bottom sediments due to the presence of organic materials that could degrade over time.
- **Dam and Slope Stability** – The proposed new dam would be founded on competent bedrock that would be stronger than the dam itself. Of primary importance is that the existing alluvium below the footprint of the new dam would be removed because of its potential for strength loss during earthquake loading; this would include the sand layer susceptible to liquefaction discussed above in Section 3.6.1, *Environmental Setting, Liquefaction and Lateral Spreading*. In addition, relatively weak surficial materials on the abutments (topsoil, colluvium, and slopewash) would be removed from below the footprint of the dam. The location of the inactive fault below the dam would be overexcavated and replaced with compacted materials. The embankment slopes must be stable and resistant to deformation

under all loading conditions, including design earthquake loading and rapid reservoir drawdown conditions. The proposed new dam would be a homogenous earthfill embankment approximately 136 feet high with a 20-foot wide crest, and upstream and downstream slopes inclined at approximately 4H:1V (horizontal: vertical) and 3H:1V, respectively. The dam would be constructed primarily from onsite clayey sand materials, and some specialty imported materials for the internal seepage control system and slope protection. The total volume of all materials comprising the dam would be roughly 2.3 million cubic yards, with 2.2 million cubic yards derived from onsite materials. Dam materials would be placed in thin horizontal layers, and compacted with heavy equipment to achieve the strength required for dam stability. It should be noted that sizes and dimensions described above are based on feasibility-level evaluations and are subject to change during the design phase.

- **Seepage Control** – Seepage through the proposed new embankment and its abutments and foundation must be controlled so that piping (internal erosion) and sloughing do not occur. The internal seepage control drainage system would likely consist of a steeply inclined chimney drain and a gently sloping blanket drain on the downstream side of the dam. This system would capture seepage that enters the dam, and safely route it to a collection system on the downstream side of the dam.
- **Overtopping Protection** – The embankment must be safe from overtopping by both flood inflow and wave action, as well as from inadvertent “overfilling” of the reservoir from the IRWD recycled water system. The reservoir operations would require that the reservoir level not be allowed to rise above the high operational pool level of 455 amsl, or one foot below the spillway crest. This one foot of freeboard provides a buffer storage space for runoff to the reservoir and brief overfilling of the reservoir from the recycled water system, and also accommodates small increases in reservoir level due to wave action and wind set. In addition, the spillway for the dam would be a channel cut into the left abutment and designed to pass the probable maximum flood. The spillway channel would be lined with reinforced concrete and rip-rap to prevent erosion of the abutment and embankment materials during spillway discharges. Spillway discharges would be routed to the existing storm drain at Portola Parkway through a 48-inch conduit that would connect to the 42-inch emergency discharge conduit described above. This would minimize the potential for spillway flows to travel across the future athletic field area. Valves in the associated conduits would be used to route either reservoir drawdown releases or spillway flows to the storm drain, but not both at the same time.
- **Slope Protection** – The slopes would be made safe from excessive damage from wave action and rain. Protection against surface erosion would consist of rip-rap on the upstream slope and vegetation on the downstream slope.

American Water Works Association Standards for Proposed Pipelines

Pipelines are constructed to various industry standards. The AWWA is a worldwide nonprofit scientific and educational association that, among its many activities, establishes recommended standards for the construction and operation of public water supply systems, including standards for pipe and water treatment facility materials and sizing, installation, and facility operations. While the AWWA’s recommended standards are not enforceable code requirements, they nevertheless can dictate how pipelines for water conveyance are designed and constructed. IRWD has committed to requiring its contractors to incorporate AWWA Standards into the construction of the proposed pipelines.

Impact Analysis

Earthquake Fault Zone

Impact 3.6-1a: The proposed project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault zone.

Construction and Operation

As discussed above in Section 3.6.1, *Environmental Setting*, no active faults are known to cross the proposed project site. One inactive fault, the Central Valley Fault, is known to cross the proposed project site, passing under the existing and the proposed new dam, as shown on Figure 3.6-2. However, the site-specific fault study concluded this fault has not experienced movement in the last 1.6 million years and has no potential for future movement, which complies with the DSOD requirement of no movement within the last 35,000 years. Therefore, relative to active faults, the impact would be less than significant during both construction and operation.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Strong Seismic Ground Shaking

Impact 3.6-1b: The proposed project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic groundshaking.

As discussed above in Section 3.6.1, *Environmental Setting*, there is the potential for the occurrence of a large regional earthquake within the operational life of the proposed project. There is a potential for up to violent intensity groundshaking at the proposed project site that would be associated with such an earthquake. The intensity of such an event would depend on the causative fault and the distance to the epicenter, the magnitude, the duration of shaking, and the nature of the geologic materials on which the project components would be constructed. Intense groundshaking and high ground accelerations would affect the entire proposed project site, including the proposed new dam and associated infrastructure.

Construction

Construction activities would be temporary, and thus, are not anticipated to exacerbate the exposure of people or structures to substantial adverse effects involving seismic hazards. No habitable structures would be constructed and the reservoir would be completely drained and empty during construction. In addition, the proposed project would not exacerbate the potential for causing earthquakes because the project does not include the injection or extraction of

groundwater or oil. Therefore, relative to seismicity during construction, the proposed project would have a less than significant impact due to strong seismic groundshaking.

Operation

As discussed above in Section 3.6.2, *Regulatory Framework*, the DSOD, the regulatory agency with jurisdiction over dams and reservoirs, requires that the structural elements of the proposed project undergo appropriate design-level geotechnical evaluations prior to final design and construction. IRWD will exceed these requirements by implementing state-of-the-art RIDM processes that improve dam safety. The geotechnical investigations and design plans are to include any necessary recommendations for soils remediation and/or foundation systems necessary to reduce seismic-related hazards to less than significant. As summarized in Section 3.6.1, *Environmental Setting*, geotechnical investigations and feasibility studies have been prepared, which consider the maximum estimated seismic shaking the proposed new dam may experience. In particular, a site-specific seismic hazard analysis has been conducted that included both a Probabilistic Seismic Hazard Analysis (PSHA) and a Deterministic Seismic Hazard Analysis (DSHA) (AECOM 2020b). For this proposed project location, the site-specific PSHA concluded the earthquake hazard for the site is a peak ground acceleration (PGA) of 0.62 g with a 2 percent probability of being exceeded in a 50-year period (i.e. 2,475-year return period). For this proposed project location, the DSHA concluded that the earthquake hazard for the site is a PGA of 0.70 g at the 84th-percentile level resulting from an earthquake of Mw 6.9 on the San Joaquin Hills Fault at a distance of 6.3 km (4 miles) from the site. The DSOD would require the information be used by the design engineers to inform the design of the proposed new dam as a condition of their approval of the project.

Implementing the regulatory requirements of the DSOD that would ensure that the proposed new dam and reservoir are constructed and operated in compliance with DSOD regulatory requirements is the responsibility of the project engineers (i.e., IRWD's project engineers) and building officials, which in this case would be the DSOD. The DSOD regulations describe required standards for the construction and operation of every jurisdictional dam and reservoir throughout California. The standards include earthquake design requirements that determine the structural design requirements. The geotechnical and design engineers, as registered professionals with the State of California, are required to comply with the DSOD requirements, while applying standard engineering practice and the appropriate standard of care. The California Professional Engineers Act (Building and Professions Code Sections 6700–6799), and the Codes of Professional Conduct, as administered by the California Board of Professional Engineers and Land Surveyors, provides the basis for regulating and enforcing engineering practice in California. The DSOD would be responsible for the review and approval of design plans and conducting inspections during construction and operation to ensure compliance with DSOD requirements prior to approval of the construction permit.

As previously discussed, the geotechnical investigations and design plans would include recommendations to address geotechnical issues, including seismic shaking. Additional aspects relative to seismic-related ground failure are discussed in more detail below in Impact 3.6-1c. With compliance with the regulatory requirements and the implementation of geotechnical design

recommendations, impacts relative to strong seismic groundshaking during project operations would be less than significant.

Please refer to Section 3.9, *Hydrology and Water Quality*, for an analysis of the impacts relative to seiches and flooding due to dam failure (see Impact 3.9-4).

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Seismic-Related Ground Failure

Impact 3.6-1c: The proposed project would not directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction.

As discussed above in Section 3.6.1, *Environmental Setting*, and Impact 3.6-1b, there is potential for the occurrence of a large regional earthquake within the operational life of the proposed project. Intense groundshaking and high ground accelerations would affect the entire proposed project site, including existing geologic units susceptible to seismic-related ground failure, including liquefaction. The geotechnical investigations identified critical layers in the alluvium that are loose sand layers and lenses that can potentially lose strength (liquefy) as a result of seismic loading. At the downstream toe of the existing dam, the alluvium is predominantly a loose to medium dense sand between approximately 16 feet and 24 feet deep.

Construction

Construction activities would be temporary, and thus, are not anticipated to exacerbate the exposure of people or structures to substantial adverse effects involving seismic-related ground failure, including liquefaction and lateral spreading. No habitable structures would be constructed and the reservoir would be completely drained and empty during construction. Therefore, relative to seismic-related ground failure, including liquefaction and lateral spreading during construction, the impact would be less than significant.

Operation

As discussed above in Section 3.6.2, *Regulatory Framework*, and Impact 3.6-1b, the DSOD, the regulatory agency with jurisdiction over dams and reservoirs, requires that the structural elements of the proposed project undergo appropriate design-level geotechnical evaluations prior to final design and construction. The required geotechnical investigations and design plans are to include any necessary recommendations for soils remediation and/or foundation systems necessary to reduce seismic-related hazards to less than significant. This would include reducing or eliminating the risk of liquefaction from the previously described liquefaction-susceptible sand layers under the existing and the proposed new dam. As summarized in Section 3.6.1,

Environmental Setting, geotechnical investigations, feasibility studies, and design plans have been prepared that consider and address the presence of liquefaction-susceptible geologic units. The geotechnical investigations recommended removing the silty and sandy layers beneath the dam that would be susceptible to liquefaction.

As previously explained, implementing the regulatory requirements of the DSOD that would ensure that the dam and reservoir are constructed and operated in compliance with DSOD regulatory requirements is the responsibility of the IRWD project engineers and DSOD. In this case, the DSOD would require that the previously discussed liquefaction-susceptible layers be removed, which would eliminate the risk of liquefaction. The DSOD would be responsible for the review and approval of design plans and conducting inspections during construction to ensure compliance with DSOD requirements that would include the removal of the liquefaction-susceptible layers. With compliance with the regulatory requirements and the implementation of geotechnical design recommendations, impacts relative to seismic-related ground failure, including liquefaction during operations, would be less than significant.

Please refer to Section 3.9, *Hydrology and Water Quality*, for an analysis of the impacts relative to downstream flooding and inundation due to dam failure (see Impact 3.9-4).

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Soil Erosion or Topsoil Loss

Impact 3.6-2: The proposed project would not result in substantial soil erosion or the loss of topsoil.

As discussed above in Section 3.6.2, *Environmental Setting*, the proposed project site includes slopes that could be susceptible to erosion. The Vaqueros and Sespe Formations are rated as generally having very poor slope stability characteristics and are described as landslide-prone (and consequently also erosion prone) units. Several existing potential landslide areas are present, as shown on Figure 3.6-5. The landslides are described as debris flows with thicknesses of ten feet or less. As described in Chapter 2, Section 2.5.7, *Construction of Wetland Area*, topsoil excavated as part of the project would be used to construct the wetland area, and would not be lost.

Construction

Construction of the proposed project would have the potential to result in soil erosion during excavation, grading, and soil stockpiling. Because the overall footprint of construction activities would exceed one acre, the proposed project would be required to comply with the *NPDES General Permit for Discharges of Storm Water Runoff Associated with Construction and Land Disturbance*

Activities (Order 2009-0009-DWQ, NPDES No. CAS000002; as amended by Orders 2010-0014-DWQ and 2012-006-DWQ) (Construction General Permit) and the local Orange County stormwater ordinances, which are described above in Section 3.6.2, *Regulatory Framework*. These state and local requirements were developed to ensure that stormwater is managed and erosion is controlled on construction sites. The Construction General Permit requires preparation and implementation of a SWPPP, which requires applications of BMPs to control run-on and runoff from construction work sites. The BMPs would include, but would not be limited to, physical barriers to prevent erosion and sedimentation, construction of sedimentation basins, limitations on work periods during storm events, use of infiltration swales, protection of stockpiled materials, and a variety of other measures that would substantially reduce or prevent erosion from occurring during construction. With compliance with existing regulations, impacts associated with soil erosion during construction would be less than significant.

Operation

To expand the volume of the reservoir and provide materials to construct the proposed new earthen dam, approximately 2.2 million cubic yards of material would be excavated from within the Syphon Canyon. This will result in excavating onsite material on the northwest side of the canyon, which would consist of the Vaqueros and Sespe Formations.

As summarized in Section 3.6.2, *Regulatory Framework, Methodology*, the areas to be excavated would not be above the elevation of 456 amsl, the spillway crest elevation. This elevation was selected to provide 10 feet of freeboard to the top of the dam. In addition, this would avoid backing up water in the existing surface water drainpipe that passes under SR-133 and empties into the reservoir on the east side and would preserve as much of the existing conservation lands at the site as practical to reduce environmental impacts (see Figure 3.6-1).

The feasibility-level criterion used to develop the reservoir grading plan was to incline the cut slopes no steeper than 4H:1V to promote stability of the slopes that will be subjected to wide fluctuations in the reservoir level. The inclinations of the natural hillside slopes surrounding the reservoir are typically 4H:1V, and thus the inclination of cut slopes would be similar to that of the natural slopes. Essentially, the cut slopes would create a downward continuation of the natural hillside slopes to deepen the reservoir in the central canyon area. The floor of the expanded reservoir would be at 330 amsl, the same elevation as the natural ground surface on the downstream side of the dam in the canyon area. One cut slope extends above 456 amsl on the left (southeast) abutment near the dam. This cut is proposed to reduce the localized steepness of this hillside.

With the wide fluctuations in reservoir levels anticipated during operations, the slopes around the proposed new reservoir would undergo repeated cycles of wetting and drying. These fluctuations could result in some erosion and possible landsliding. However, the geotechnical investigations concluded that there are no active landslides within the proposed project site. In addition, the wetting process would be a low energy filling and emptying process of the reservoir and would not involve running water, such as the flow in a higher energy stream. Consequently, the process of filling and emptying the reservoir is not expected to cause erosion. Finally, given that the proposed new reservoir is in a canyon closed off by the presence of the dam, any sediment that

does collect inside the reservoir would not be able to escape the canyon and could be removed during periods when the reservoir has low water levels.

Finally, as shown on Figure 2-4, seepage through the proposed new dam would be controlled by a seepage control drainage system consisting of a steeply inclined chimney drain and a gently sloping blanket drain would be constructed on the downstream side of the dam. The purpose of the proposed new drainage system is to safely route seepage through the dam. This system would prevent water from seeping out onto the downstream side of the dam and potentially causing erosion of the dam surface.

In addition, the reservoir (i.e., upstream slope) side of the proposed new dam would be protected from wave action by the placement of rip-rap from the base of the dam to the crest. This would facilitate water level fluctuations along the entire height of the dam. The downstream slope of the proposed new dam would be protected with vegetation to protect the dam from erosion from rainfall runoff. These measures would protect the proposed new dam from erosion.

With compliance with existing regulations, particularly DSOD regulations, and the recommended geotechnical design, impacts associated with soil erosion, as well as landslides, during construction would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Unstable Geologic Units

Impact 3.6-3: The proposed project would not be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.

Landslides are analyzed above in Impact 3.6-2, which concluded a less than significant impact. Liquefaction and lateral spreading, more commonly triggered by seismic events, are analyzed above in Impact 3.6-1c, which concluded a less than significant impact. The proposed project does not include the injection or extraction of groundwater or oil, so there would be no impact relative to subsidence or collapse. The potential for subsidence due to settlement of the dam is analyzed below.

Construction

Construction activities associated with the proposed project would be temporary, and thus, are not anticipated to be affected by landslides, lateral spreading, subsidence, liquefaction, subsidence due to settlement, or collapse until after construction is complete. Therefore, relative to unstable geologic or soil units during construction, the impact would be less than significant.

Operation

The materials selected for construction of the proposed new dam would be placed and compacted in lifts, and would exclude organic materials that could degrade over time (e.g., topsoil or lake bottom sediments). The materials would be placed in thin horizontal layers, and compacted with heavy equipment to create a material with the required strength and compressibility characteristics. The process of compaction reduces the potential future subsidence due to settlement of the materials over time. The inclination of the upstream slope of the proposed new dam was selected to be 4H:1V to provide adequate stability during rapid drawdown loading conditions. The inclination of the downstream slope of the proposed new dam was selected to be 3H:1V to provide adequate stability for seismic loading conditions. Seepage through the dam would be controlled by a new proposed seepage control drainage system consisting of a steeply inclined chimney drain and a gently sloping blanket drain, which would be constructed on the downstream side of the new dam, as shown in Figure 2-4. The purpose of the drainage system is to safely route seepage through the new dam, and prevent a phreatic (i.e., water) surface from developing in the downstream slope of the new dam. The embankment fill and the underlying foundation materials have a relatively low permeability. Accordingly, seepage through the new dam, the abutments, and the foundation are anticipated to be low.

The reservoir (i.e., upstream slope) side of the proposed new dam would be protected from wave action by the placement of rip-rap from the base of the new dam to the crest. This would facilitate water level fluctuations along the entire height of the proposed new dam. The downstream slope of the dam would be protected with vegetation to protect the new dam from erosion from rainfall runoff. These measures would protect the stability of the new dam.

To monitor the proposed new dam for settlement or lateral movement, elevation monuments would be established on the dam crest. Open proposed wells and/or piezometers would be installed to monitor piezometric levels (groundwater pressures) in the dam embankment and foundation. A proposed seepage collection system would be installed at a low point at the downstream toe of the new dam to monitor embankment seepage. Seepage through dam materials can lead to settlement by rearranging grains into a closer-packed skeletal structure. New dam security instrumentation systems would be installed, as appropriate.

Finally, the proposed new outlet works of the new dam include provisions to discharge reservoir water to the existing storm drain in Portola Parkway, if necessary, to ensure dam safety. In the event that instability of the dam is observed (e.g., the elevation monuments indicate subsidence or excessive seepage is measured in the monitoring wells), the water levels in the new dam would be drawn down to facilitate repairs. The discharge rate of this system is in compliance with guidelines established by DSOD. The maximum outflow in the event of an emergency would be about 178 cubic feet per second, which would be capable of releasing one-half of the proposed new reservoir's capacity in ten days, with a starting water surface level at the spillway crest elevation. Once emptied, the reservoir would undergo corrective actions.

With compliance with DSOD requirements and the recommended geotechnical design, impacts associated with unstable geologic or soil units during operations, including settlement, would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Expansive Soil

Impact 3.6-4: The proposed project would not be located on expansive soil creating substantial direct or indirect risks to life or property.

Construction

Construction activities associated with the proposed project would be temporary, and thus, are not anticipated to be affected by expansive soils until after construction is complete. In addition, lake bottom sediments, which are known to contain expansive soils, would not be used as materials for construction of the proposed new dam. Therefore, relative to expansive soils during construction, the impact would be less than significant.

Operation

As discussed above in Section 3.6.1, *Environmental Setting*, Expansive Soils, the only soils known to have a high susceptibility to expansion are the lake bottom sediments. The other onsite soils do not have a high susceptibility to expansion. The geotechnical investigations have recommended that the reservoir bottom sediments not be used as construction materials for the proposed new dam. The proposed project would not use expansive soils in the construction of the proposed new dam, and would not create a substantial direct or indirect risk to life or property. Therefore, with the implementation of the geotechnical recommendation and the DSOD regulations requiring implementation of geotechnical recommendations, the impact relative to expansive soils would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Septic Tanks

Impact 3.6-5: The proposed project would not have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

The proposed project would not use septic tanks or other onsite wastewater disposal systems. Therefore, there would be no impact related to the adequacy of soils to support such systems. This significance criterion is not applicable to the proposed project and is not discussed in detail.

Mitigation Measures

None required

Significance Determination

No Impact

Paleontological Resources

Impact 3.6-6: The proposed project could directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

Construction

As discussed above in Section 3.6.1, *Environmental Setting*, in *Paleontological Resources*, the Silverado and Sespe/Vaqueros Formations and the older Quaternary Alluvium have a moderate to high paleontological sensitivity. Excavation in any of these formations may expose significant vertebrate fossils, and impacts to such fossils could constitute a significant impact on the environment. **Mitigation Measures GEO-1** through **GEO-4** would ensure that impacts to paleontological resources are reduced to less than significant levels.

Operation

Once constructed, no new materials would be disturbed, resulting in no impact during operations.

Mitigation Measures

GEO-1: Appoint a Qualified Paleontologist. A qualified paleontologist meeting the Society of Vertebrate Paleontology (SVP) Standards (SVP 2010) (Qualified Paleontologist) shall be retained prior to the start of ground disturbing activities. The Qualified Paleontologist shall provide technical and compliance oversight of all work as it relates to paleontological resources, shall attend the project kick-off meeting and project progress meetings on a regular basis, and shall report to the site in the event potential paleontological resources are encountered.

GEO-2: Worker Sensitivity Training. The Qualified Paleontologist shall conduct construction worker paleontological resources sensitivity training prior to the start of ground disturbing activities (including vegetation removal, pavement removal, etc.). This can occur in coordination with Cultural Resources Worker Sensitivity Training (Mitigation Measure CR-1). In the event construction crews are phased, additional trainings shall be conducted for new construction personnel. The training session shall focus on the recognition of the types of paleontological resources that could be encountered within the project site and the procedures to be followed if they are found. Documentation shall be retained demonstrating that all construction personnel attended the training.

GEO-3: Paleontological Monitoring. Paleontological resources monitoring shall be conducted for ground disturbing activities occurring in previously undisturbed sediments with high paleontological sensitivity, including any areas containing the Silverado Formation or Sespe/Vaqueros Formation, very old Quaternary Alluvium, and deeper

layers of younger Quaternary Alluvium (which overly sensitive older Quaternary Alluvium). Ground disturbing activities include vegetation removal, grading, excavation, pavement removal, roadway improvements, or other similar activities within these sensitive formations. For undisturbed sediments mapped as the Silverado Formation, Sespe/Vaqueros Formation, or very old Quaternary Alluvium, monitoring of all ground disturbance is initially required. A depth of 5 feet bgs is established as the depth at which high sensitivity and paleontological monitoring should begin in the younger Quaternary Alluvium. The Qualified Paleontologist shall evaluate ground disturbing activities on an intermittent basis and consult with IRWD on whether the depth or frequency of required monitoring should be revised or may cease.

Paleontological resources monitoring shall be performed by a qualified paleontological monitor (meeting the standards of the SVP 2010) under the direction of the Qualified Paleontologist, and in conjunction with IRWD. Monitors shall have the authority to temporarily halt or divert work away from exposed fossils in order to recover the fossil specimens. Any significant fossils collected during project-related excavations shall be salvaged and prepared to the point of identification following the standards of the SVP (2010). Monitors shall prepare daily logs detailing the types of activities and soils observed, and any discoveries. The Qualified Paleontologist shall prepare a final monitoring and mitigation report to document the results of the monitoring effort. Any salvaged fossils shall be offered for donation to an accredited repository with a scientific interest in the materials. If no accredited repository accepts the donation, then the fossils may be donated to a local museum, historical society, school, or other institution for educational purposes.

GEO-4: Fossil Discovery. If personnel or workers discover any potential fossils during project implementation, regardless of the depth of work or location, work at the discovery location shall cease in a 50-foot radius of the discovery until the Qualified Paleontologist has assessed the discovery, consulted with IRWD, and made recommendations as to the appropriate treatment. If the find is deemed significant, the qualified paleontologist shall salvage the resource following the standards of the SVP (2010). Any salvaged fossils shall be offered for donation to an accredited repository with a scientific interest in the materials. If no accredited repository accepts the donation, then the fossils may be donated to a local museum, historical society, school, or other institution for educational purposes.

Significance Determination

Less than Significant Impact with Mitigation

Cumulative Impacts

This section presents an analysis of the cumulative effects of the proposed project in combination with other past, present, and reasonably foreseeable future projects that could cause cumulatively considerable impacts. As previously discussed, the proposed project would have no impact with respect to septic tanks and alternate wastewater disposal systems. Accordingly, the proposed project could not contribute to cumulative impacts related to this topic and is not discussed further.

The geographic area affected by the proposed project and its potential to contribute to cumulative impacts varies based on the environmental resource under consideration. The geographic scope of analysis for cumulative geologic impacts encompasses and is limited to the proposed project site and its immediately adjacent area. This is because impacts relative to geologic hazards are generally site-specific. For example, the effect of erosion would tend to be limited to the localized area of a project and could only be cumulative if erosion occurred as the result of two or more adjacent projects that spatially overlapped.

The timeframe during which the proposed project could contribute to cumulative geologic hazards includes both the construction and operations phases. For the proposed project, the operations phase is permanent. However, similar to the geographic limitations discussed above, it should be noted that impacts relative to geologic hazards are generally time-specific. Geologic hazards could only be cumulative if two or more geologic hazards occurred at the same time, as well as overlapping at the same location.

Impact 3.6-7: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to geology, soils, and paleontological resources.

Cumulative Impacts during Project Construction

Significant cumulative impacts related to geologic hazard could occur if the incremental impacts of the proposed project combined with the incremental impacts of one or more of the cumulative projects identified in Table 3-2 to substantially increase risk that people or the environment would be exposed to geologic hazards. The only cumulative projects that could be geographically adjacent or overlap components of the proposed project would be cumulative project Number 3, Gateway Community Park, and Number 9, Truck Route Roadway Rehabilitation, shown on Figure 3-1. Cumulative project Number 3 would involve the construction of a new community park adjacent to the north side of the proposed project. Cumulative project Number 9 would involve the rehabilitation and paving of streets including Portola Parkway just west of the proposed project.

If the proposed project and the cumulative projects are constructed at the same time, the erosion effects could be cumulatively significant. However, the state Construction General Permit would require each proposed project to prepare and implement a SWPPP. The SWPPPs would describe BMPs to control runoff and prevent erosion for each project. Through compliance with this requirement, the potential for erosion impacts would be reduced. The Construction General Permit has been developed to address cumulative conditions arising from construction throughout the state, and is intended to maintain cumulative effects of projects subject to this requirement below levels that would be considered significant. For example, two adjacent construction sites would be required to implement BMPs to reduce and control the release of sediment and/or other pollutants in any runoff leaving their respective sites. The runoff water from both sites would be required to achieve the same action levels, measured as a maximum amount of sediment or pollutant allowed per unit volume of runoff water. Thus, even if the runoff waters were to combine after leaving the sites, the sediments and/or pollutants in the combined runoff would still be at concentrations

(amount of sediment or pollutants per volume of runoff water) below action levels and would not be cumulatively considerable; this impact would be less than significant.

Seismically-induced groundshaking, landslides, and liquefiable soils could cause structural or utility damage, leaks, or ruptures. State and local building regulations and standards, described in Section 3.6.2, *Regulatory Framework*, have been established to address and reduce the potential for such impacts to occur. The proposed project and cumulative projects would be required to comply with applicable provisions of these laws and regulations. Through compliance with these requirements, the potential for impacts would be reduced. As explained in the Regulatory Framework, the purpose of the CBC and local ordinances (or the DSOD in the case of the proposed project) is to regulate and control the design, construction, quality of materials, use/occupancy, location, and maintenance of all buildings and structures within their jurisdictions. By design, it is intended to reduce the cumulative risks from buildings and structures. Therefore, based on compliance with regulatory requirements and implementation of mitigation measures to ensure appropriate design, the incremental impacts of the proposed project combined with impacts of other cumulative projects in the area would not cause a significant cumulative impact related to seismically-induced groundshaking, erosion and loss of topsoil, landslides, or liquefiable soils. The proposed project's contribution to cumulative effects would not be cumulatively considerable, and this impact would be less than significant.

As discussed above in Section 3.6.1, *Environmental Setting, Paleontological Resources*, the local area does have geologic units that have paleontological resources. The proposed project and local cumulative projects that excavate down to the Silverado and Sespe/Vaqueros Formations and the older Quaternary Alluvium may encounter paleontological resources. To mitigate for this potential impact, Impact 3.6.5 includes the implementation of Mitigation Measures GEO-1 through GEO-4. Cumulative projects that would encounter these geologic units would also be required to implement similar mitigation measures. With implementation of these mitigation measures, impacts to the proposed project's contribution to cumulative effects would not be cumulatively considerable, and this impact would be less than significant with mitigation.

Cumulative Impacts during Project Operations

Seismically induced groundshaking, liquefaction and lateral spreading, and liquefiable soils could cause structural damage or pipeline leaks or ruptures. State and local building regulations and standards, described in the Regulatory Framework, have been established to address and reduce the potential for such impacts to occur. The proposed project and cumulative projects would be required to comply with applicable provisions of these laws and regulations. Through compliance with these requirements, the potential for impacts would be reduced. As explained in the Regulatory Framework, the purpose of the CBC and local ordinances (or the DSOD in the case of the proposed project) is to regulate and control the design, construction, quality of materials, use/occupancy, location, and maintenance of all buildings and structures within their jurisdictions. By design, it is intended to reduce the cumulative risks from buildings and structures. Therefore, based on compliance with these requirements, the incremental impacts of the proposed project combined with impacts of other projects in the area would not cause a significant cumulative impact related to seismically induced groundshaking, liquefaction and

lateral spreading, or liquefiable soils and the proposed project's contribution to cumulative effects would not be cumulatively considerable and this impact would be less than significant.

Mitigation Measures

Implement Mitigation Measures GEO-1 through GEO-4

3.7 Greenhouse Gas Emissions

This section provides a discussion of existing climate conditions and global climate change, existing regulations pertaining to global climate change, and potential greenhouse gas (GHG) emissions resulting from construction and operation of the proposed project, including cumulative impacts. Details regarding the GHG assumptions and calculations are provided in the Air Quality and Greenhouse Gas Technical Report prepared by ESA for this proposed project and included as **Appendix B** of this Draft EIR.

3.7.1 Environmental Setting

Greenhouse Gas Fundamentals

Greenhouse Gases

Global climate change refers to changes in average climatic conditions on Earth as a whole, including changes in temperature, wind patterns, precipitation and storms. Historical records indicate that global climate changes have occurred in the past due to natural phenomena; however, current data increasingly indicate that the current global conditions differ from past climate changes in rate and magnitude. Global climate change attributable to anthropogenic (human) GHG emissions is currently one of the most important and widely debated scientific, economic and political issues in the United States and the world. The extent to which increased concentrations of GHGs have caused or will cause climate change and the appropriate actions to limit and/or respond to climate change is the subject of significant and rapidly evolving regulatory efforts at the federal and state levels of government.

GHGs are compounds in the Earth's atmosphere that play a critical role in determining temperature near the Earth's surface. More specifically, these gases allow high-frequency shortwave solar radiation to enter the Earth's atmosphere, but retain some of the low frequency infrared energy that otherwise is radiated back from the Earth towards space, resulting in a warming of the atmosphere.

Not all GHGs possess the same capacity to induce atmospheric warming; as a result, the warming contribution of a GHG is commonly quantified in the common unit of carbon dioxide equivalent (CO₂e) over a 100-year period, by applying the appropriate global warming potential (GWP) value.¹ By using the applicable GWP for each GHG, Project-related emissions can be tabulated in the common unit of metric tons per year CO₂e. GWP ratios are provided by the Intergovernmental Panel on Climate Change (IPCC). Historically, GHG emission inventories were calculated using the GWPs from the IPCC's Second Assessment Report (SAR), published in 1996. The IPCC has since updated the GWP values based on the latest science in its Fourth Assessment Report (IPCC AR4) and Fifth Assessment Report (IPCC AR5), published in 2007 and 2014, respectively (IPCC 2007; IPCC 2014). California Air Resources Board (CARB) uses

¹ GWPs and associated CO₂e values were developed by the IPCC, and published in its Second Assessment Report (SAR) in 1996. Historically, GHG emission inventories have been calculated using the GWPs from the IPCC's SAR. The IPCC updated the GWP values based on the latest science in its AR4. The CARB reports GHG emission inventories for California using the GWP values from the IPCC AR4.

the AR4 GWPs in the statewide GHG emissions inventory, in the current Climate Change Scoping Plan, and in the current version of the California Emissions Estimator Model (CalEEMod®) that is used to calculate CO₂e values for construction as well as operations for existing and proposed project build-out conditions. Compounds that are regulated as GHGs are discussed below (CARB 2019; CARB 2017a; CAPCOA 2017).

Carbon Dioxide (CO₂): CO₂ is the most abundant anthropogenic GHG in the atmosphere and is primarily generated from fossil fuel combustion from stationary and mobile sources. CO₂ is the reference gas (GWP of 1) for determining the GWPs of other GHGs. CO₂ accounted for approximately 83 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Methane (CH₄): CH₄ is emitted from biogenic sources (i.e., resulting from the activity of living organisms), incomplete combustion in forest fires, anaerobic decomposition of organic matter in landfills, manure management, and leaks in natural gas pipelines. The GWP of CH₄ is 25 in the IPCC AR4. CH₄ accounted for approximately 9 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Nitrous Oxide (N₂O): N₂O produced by human-related sources including agricultural soil management, animal manure management, sewage treatment, mobile and stationary combustion of fossil fuel, adipic acid production, and nitric acid production. The GWP of N₂O is 298 in the IPCC AR4. N₂O emissions accounted for approximately 3 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Hydrofluorocarbons(HFCs): HFCs are fluorinated compounds consisting of hydrogen, carbon, and fluorine. They are typically used as refrigerants in both stationary refrigeration and mobile air conditioning systems. The GWPs of HFCs range from 124 for HFC-152a to 14,800 for HFC-23 in the IPCC AR4. HFCs and PFCs (see below) combined accounted for approximately 5 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Perfluorocarbons (PFCs): PFCs are fluorinated compounds consisting of carbon and fluorine. They are primarily created as a byproduct of aluminum production and semiconductor manufacturing. The GWPs of PFCs range from 7,390 to 17,700 in the IPCC AR4.

Sulfur Hexafluoride (SF₆): SF₆ is a fluorinated compound consisting of sulfur and fluoride. It is a colorless, odorless, nontoxic, nonflammable gas. It is most commonly used as an electrical insulator in high voltage equipment that transmits and distributes electricity. SF₆ has a GWP of 22,800 in the IPCC AR4. SF₆ emissions accounted for less than 1 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Effects of Climate Change

The scientific community's understanding of the fundamental processes responsible for global climate change has improved over the past decade, and its predictive capabilities are advancing. However, there remain scientific uncertainties in, for example, predictions of local effects of climate change, occurrence, frequency, and magnitude of extreme weather events, effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, and changes in

oceanic circulation. Due to the complexity of and inability to accurately model Earth's climate system, the uncertainty surrounding climate change may never be completely eliminated. Nonetheless, the IPCC's AR5 states that it is extremely likely that the dominant cause of the observed warming since the mid-20th century is the anthropogenic increase in GHG concentrations (IPCC 2014). A report from the National Academy of Sciences concluded that 97 to 98 percent of the climate researchers most actively publishing in the field support the tenets of the IPCC in that climate change is very likely caused by human (i.e., anthropogenic) activity (Anderegg 2010).

The IPCC's AR4, found that the potential impacts in California due to global climate change include: loss in snow pack; sea-level rise; more extreme heat days per year; more high ozone days; more extreme forest fires; more severe droughts punctuated by extreme precipitation events; increased erosion of California's coastlines and sea water intrusion into the Sacramento and San Joaquin Deltas and associated levee systems; and increased pest infestation (OPR 2018). The Fourth Assessment's findings are consistent with climate change studies published by the California Natural Resources Agency (CNRA) since 2009, starting with the *California Climate Adaptation Strategy* as a response to the Governor's Executive Order S-13-2008. In 2014, the CNRA rebranded the first update of the 2009 adaptation strategy as the *Safeguarding California Plan* (CNRA 2009; CNRA 2014). The 2018 update to *Safeguarding California Plan* identifies hundreds of ongoing actions and next steps state agencies are taking to safeguard Californians from climate impacts within a framework of 81 policy principles and recommendations (CNRA 2018).

In 2016, the CNRA released *Safeguarding California: Implementation Action Plans* in accordance with Executive Order B-30-15, identifying a lead agency to lead adaptation efforts in each sector. In accordance with the 2009 *California Climate Adaptation Strategy*, the California Energy Commission (CEC) was directed to develop a website on climate change scenarios and impacts that would be beneficial for local decision makers. The website, known as Cal-Adapt, became operational in 2011 (Cal-adapt 2020). The information provided on the Cal-Adapt website represents a projection of potential future climate scenarios comprised of local average values for temperature, sea-level rise, snowpack and other data representative of a variety of models and scenarios, including potential social and economic factors. A more detailed description of the effects of climate change can be found in Appendix B of this Draft EIR.

Global Emissions Inventory

Global GHG estimates are based on country inventories developed as part of programs of the United Nations Framework Convention on Climate Change (UNFCCC). Worldwide man-made emissions of GHGs were approximately 49 billion metric tons CO₂e in 2010, including ongoing emissions from industrial and agricultural sources and emissions from land use changes (e.g., deforestation). Emissions of CO₂, primarily from fossil fuel use and industrial processes, account for 76 percent of total GHG (CO₂e) emissions. Methane emissions account for 16 percent and N₂O emissions for 6.2 percent. For comparison, worldwide emissions of GHGs in 1970 were 27 billion metric tons of CO₂e per year (IPCC 2014).

United States Emissions Inventory

In 2018, the United States emitted about 6,677 million metric tons (MMT) of CO₂e, with 75.4 percent of those emissions coming from fossil fuel combustion. Of the major sectors nationwide, transportation accounts for the highest amount of GHG emissions (approximately 28 percent), followed by electricity (27 percent), industry (22 percent), agriculture (10 percent), commercial and residential buildings (12 percent) (. Between 1990 and 2018, total US GHG emissions rose by 3.7 percent, but emissions have generally decreased since peaking in 2005. GHG emissions in 2018 are approximately 10 percent below 2005 levels. Since 1990, US emissions have increased at an average annual rate of 0.2 percent, however have been decreasing at an average annual rate of 0.7 percent since 2005 (USEPA 2020).

California Greenhouse Gas Emissions Inventory

CARB compiles GHG inventories for the state. Based on the 2017 GHG inventory data (i.e., the latest year for which data are available from CARB), California emitted 424 MMTCO₂e including emissions resulting from imported electrical power (CARB 2019). CARB's 2017 statewide inventory indicated that California's net GHG emissions in 2017 were 7 MMTCO₂e below 1990 levels, which is the 2020 GHG reduction target codified in AB 32. The overall trends in the inventory demonstrate that the carbon intensity of California's economy is declining and has decreased by 41 percent from 2001 peak emissions while increasing the gross domestic product (GDP) by 52 percent (CARB 2019).² The GDP grew 3.6 percent in 2017 while emissions per GDP declined by 4.5 percent compared to 2016. **Table 3.7-1** identifies and quantifies statewide anthropogenic GHG emissions and sinks (e.g., carbon sequestration due to forest growth) in 1990 and 2017. As shown in the table, the transportation sector is the largest contributor to statewide GHG emissions at approximately 40 percent (CARB 2019).

Existing Site Emissions

The existing Syphon Reservoir activities result in minimal mobile source emissions from maintenance trips. The number of maintenance trips are not anticipated to change with the proposed improvements to the reservoir, therefore existing emissions were not modeled and the proposed project's GHG emissions would be considered net new emissions. The existing operations on the site result in annual electrical consumption of 217,273 kilowatt hours (kWh) annually. Because the current facility at the site would be removed, the electricity would no longer be consumed. Emissions associated with the existing electrical consumption onsite were not quantified, instead net new electrical consumption was analyzed.

² Carbon intensity of California's economy is the amount of carbon pollution per million dollars of gross domestic product.

TABLE 3.7-1
STATE OF CALIFORNIA GREENHOUSE GAS EMISSIONS

Category	Total 1990 Emissions Using IPCC SAR (MMTCO ₂ e)	Percent of Total 1990 Emissions	Total 2017 Emissions Using IPCC AR4 (MMTCO ₂ e)	Percent of Total 2017 Emissions
Transportation	150.7	35%	169.9	40%
Electric Power	110.6	26%	62.4	15%
Commercial Use	14.4	3%	15.1	4%
Residential	29.7	7%	26.0	6%
Industrial	103.0	24%	89.4	21%
Recycling and Waste ^a	—	—	8.9	2%
High GWP/Non-Specified ^b	1.3	<1%	20.0	5%
Agriculture/Forestry	23.6	6%	32.4	8%
Forestry Sinks	-6.7	-2%	— ^c	—
Net Total (IPCC SAR)	426.6	100%^e	—	—
Net Total (IPCC AR4)^d	431	100%^e	424.1	100%^e

NOTES:

^a Included in other categories for the 1990 emissions inventory.

^b High GWP gases are not specifically called out in the 1990 emissions inventory.

^c Revised methodology under development (not reported for 2012).

^d CARB revised the state's 1990 level GHG emissions using GWPs from the IPCC AR4.

^e Total of individual percentages may not add up to 100% due to rounding

3.7.2 Regulatory Framework

Federal

This section provides a summary of pertinent federal, State, and local statutes, regulations, plans, and policies that have been adopted that address GHG.

Clean Air Act

The 1963 CAA was the first federal legislation regarding air pollution control and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990. At the federal level, USEPA is responsible for implementation of certain portions of the CAA including mobile source requirements.

In *Massachusetts v. Environmental Protection Agency*, 549 U.S. 497 (2007), twelve states and cities, including California, together with several environmental organizations, sued to require the USEPA to regulate GHGs as pollutants under the CAA. The United States Supreme Court ruled that GHGs fit within the CAA's definition of a pollutant and the USEPA had the authority to regulate GHGs.

On December 7, 2009, the USEPA Administrator signed two distinct findings regarding GHGs under CAA section 202(a):

- **Endangerment Finding:** The current and projected concentrations of the six key GHGs—CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆—in the atmosphere threaten the public health and welfare of current and future generations.
- **Cause or Contribute Finding:** The combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

These findings did not, by themselves, impose any requirements on industry or other entities. However, these actions were a prerequisite for implementing GHG emissions standards for motor vehicles.

On-Road Vehicle Rules

Heavy-Duty Vehicles

GHG emissions and fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by the USEPA and the National Highway Traffic Safety Administration (NHTSA). For vocational vehicles, which consist of a variety of work vehicles including dump trucks, the Phase 1 Heavy-Duty Vehicle Greenhouse Gas Regulation started with model year 2014 and the standard requires up to a 10 percent reduction in CO₂ emissions by model year 2017 over the 2010 baseline. The Phase 2 standards start in model year 2021 and require the phase-in of a 12 to 24 percent reduction in CO₂ emission reduction from vocational vehicles by model year 2027 over the 2017 baseline.

Light-Duty Vehicles

In August 2018, the USEPA and NHTSA proposed the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule that would, if adopted, maintain the CAFE and CO₂ standards applicable in model year 2020 for model years 2021 through 2026. The estimated CAFE and CO₂ standards for model year 2020 are 43.7 mpg and 204 grams of CO₂ per mile for passenger cars and 31.3 mpg and 284 grams of CO₂ per mile for light trucks, projecting an overall industry average of 37 mpg, as compared to 46.7 mpg under the standards issued in 2012. In September 2019, the USEPA published the final rule in the Federal Register (Federal Register, Vol. 84, No. 188, Friday, September 27, 2019, Rules and Regulations, 51310-51363). The USEPA also published the final rule for the One National Program on Federal Preemption of State Fuel Economy Standards that finalizes critical parts of the SAFE Vehicles Rule and makes clear that federal law preempts state and local tailpipe GHG emissions standards as well as zero emission vehicle (ZEV) mandates. In November 2019, California and 23 other states, environmental groups, and the cities of Los Angeles and New York, filed a petition with the U.S. Court of Appeals for the District of Columbia Circuit, for the EPA to reconsider the published rule. On March 31, 2020, USEPA and NHTSA issued the SAFE Vehicles Rule, setting fuel economy and carbon dioxide standards that increase 1.5 percent in stringency each year from model years 2021 through 2026 (see 85 Federal Register 24174). On February 8, 2021, the United States Court of Appeals for the District of Columbia Circuit issued an order granting the Biden Administration's motion to stay litigation over Part 1 of SAFE Rule. Consistent with President Biden's executive order on Protecting Public

Health and the Environment and Restoring Science to Tackle the Climate Crisis, USEPA and NHTSA are now evaluating whether and how to replace the SAFE Rule.

State

California Greenhouse Gas Reduction Targets

Through executive order, California governors have established long-term GHG reduction goals for the state.

Executive Order S-3-05

On June 1, 2005, Governor Schwarzenegger announced Executive Order S-3-05, which established the following GHG emission reduction targets:

- By 2010, California shall reduce GHG emissions to 2000 levels;
- By 2020, California shall reduce GHG emissions to 1990 levels; and
- By 2050, California shall reduce GHG emissions to 80 percent below 1990 levels.

Executive Order B-30-15

On April 29, 2015, Governor Brown issued Executive Order B-30-15, in which, the Governor:

- Established a new interim statewide reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030;
- Ordered all state agencies with jurisdiction over sources of GHG emissions to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 reduction targets; and
- Directed CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent.

California Health and Safety Code, Division 25.5 – California Global Warming Solutions Act of 2006 (AB 32)

Following the issuance of Executive Order S-3-05, in 2006, the California State Legislature adopted the California Global Warming Solutions Act of 2006 (passed as Assembly Bill [AB] 32 and codified in the California Health and Safety Code [HSC], Division 25.5), which focuses on reducing GHG emissions in California to 1990 levels by 2020. HSC Division 25.5 defines GHGs as CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆ and represents the first enforceable statewide program to limit emissions of these GHGs from all major industries with penalties for noncompliance. The law further requires that reduction measures be technologically feasible and cost effective.

Under HSC Division 25.5, CARB has the primary responsibility for reducing GHG emissions. CARB is required to adopt rules and regulations directing state actions that would achieve GHG emissions reductions equivalent to 1990 statewide levels by 2020.

Senate Bill 32

In 2016, Senate Bill (SB) 32 and its companion bill AB 197, augmented AB 32 and amended HSC Division 25.5, establishing a new climate pollution reduction target of 40 percent below

1990 levels by 2030 and including provisions to ensure the benefits of state climate policies reach into disadvantaged communities.

2008 and 2014 Climate Change Scoping Plans

A specific requirement of AB 32 was the preparation of a Climate Change Scoping Plan for achieving the maximum technologically feasible and cost-effective GHG emission reduction by 2020. CARB developed and approved the initial Scoping Plan in 2008, outlining the regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs that would be needed to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the state's long-range climate objectives (CARB 2008).

The First Update to the Scoping Plan was approved by CARB in May 2014 and built upon the initial Scoping Plan with new strategies and recommendations. In 2014, CARB revised the target using the GWP values from the IPCC AR4 and determined that the 1990 GHG emissions inventory and 2020 GHG emissions limit is 431 million metric tons of carbon dioxide equivalents (MMT_{CO₂e}). CARB also updated the state's 2020 emissions estimate to account for the effect of the 2007–2009 economic recession, new estimates for future fuel and energy demand, and the reductions required by regulation that were adopted for motor vehicles and renewable energy (CARB 2014).

2017 Climate Change Scoping Plan Update

In response to SB 32 and the 2030 GHG reduction target, CARB approved the 2017 Climate Change Scoping Plan Update (2017 Scoping Plan Update) in December 2017 (CARB 2017a). The 2017 Scoping Plan Update outlines the proposed framework of action for achieving the 2030 GHG target of 40 percent reduction in GHG emissions relative to 1990 levels (CARB 2017a). The 2017 Scoping Plan Update identifies key sectors of the state's implementation strategy, which includes improvements in low-carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. Through a combination of data synthesis and modeling, CARB determined that the target statewide 2030 emissions limit is 260 MMT_{CO₂e}, and that further commitments will need to be made to achieve an additional reduction of 50 MMT_{CO₂e} beyond current policies and programs. The cornerstone of the 2017 Scoping Plan Update is an expansion of the Cap-and-Trade Program (discussed further below) to meet the aggressive 2030 GHG emissions goal and ensure achievement of the 2030 limit set forth by E.O. B-30-15.

The 2017 Scoping Plan Update's strategy for meeting the state's 2030 GHG target incorporates the full range of legislative actions and state-developed plans that have relevance to the year 2030, including the following, described elsewhere in this section:

- Extending the low-carbon fuel standard (LCFS) beyond 2020 and increasing the carbon intensity reduction requirement to 18 percent by 2030;
- SB 350, which increases the Renewables Portfolio Standard (RPS) to 50 percent by 2030 and requires the CEC to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by 2030. These targets may be achieved through energy efficiency savings and demand reductions from a variety of

programs, including but not limited to appliance and building energy efficiency standards and a comprehensive program to achieve greater energy efficiency standards in existing buildings;

- The 2016 Mobile Source Strategy is estimated to reduce emissions from mobile sources including an 80 percent reduction in smog-forming emissions and a 45 percent reduction in diesel particulate matter from 2016 levels in the Air Basin, a 45 percent reduction in statewide GHG emissions (from both on-road and off-road mobile sources) and a 50 percent reduction in statewide consumption of petroleum-based fuels;
- The Sustainable Freight Action Plan to improve freight efficiency and transition to zero emission freight handling technologies (described in more detail below);
- SB 1383, which requires a 50 percent reduction in anthropogenic black carbon and a 40 percent reduction in hydrofluorocarbon and methane emissions below 2013 levels by 2030; and
- AB 398, which extends the state Cap-and-Trade Program through 2030.

In the 2017 Scoping Plan Update, CARB recommends statewide targets of no more than six MT CO₂e per capita by 2030 and no more than two metric tons CO₂e per capita by 2050. CARB acknowledges that because the statewide per capita targets are based on the statewide GHG emissions inventory that includes all emissions sectors in the state (including large industrial sources covered under the state's cap and trade program), they are not applicable for use at the local level. Rather, it is appropriate for local jurisdictions to derive evidence-based local per-capita goals based on local emissions sectors and growth projections.

To demonstrate how a local jurisdiction can achieve their long-term GHG goals at the community plan level, CARB recommends developing a geographically specific GHG reduction plan (i.e., climate action plan) consistent with the requirements of CEQA Guidelines section 15183.5(b). A so-called "CEQA-qualified" GHG reduction plan, once adopted, can provide local governments with a streamlining tool for project-level environmental review of GHG emissions, provided there are adequate performance metrics for determining project consistency with the plan. Absent conformity with such a plan, CARB recommends "that projects incorporate design features and GHG reduction measures, to the degree feasible, to minimize GHG emissions. Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development (CARB 2017a)."

On-Road and Off-Road Vehicle and Equipment Rules

Light-Duty Vehicles

In 2002, Governor Davis signed AB 1493 (Pavley), which required CARB to set GHG emission standards for passenger vehicles, light duty trucks, and other vehicles whose primary use is non-commercial personal transportation manufactured in and after 2009. Because the Pavley standards (named for the bill's author, state Senator Fran Pavley) would impose stricter standards than those under the CAA, California applied to the USEPA for a waiver under the CAA. In 2009, the USEPA granted the waiver. The waiver has been extended consistently since 2009; however, in 2018 the USEPA and NHTSA indicated their intent to revoke California's waiver, and prohibit future state emissions standards enacted under the CAA. In response to the Federal SAFE Vehicles Rules and the One National Program on Federal Preemption of State Fuel Economy Standards, in November 2019 California and 23 other states, environmental groups, and the cities of Los Angeles and New

York, filed a petition with the U.S. Court of Appeals for the District of Columbia Circuit, for the EPA to reconsider the published rule. As noted above, consistent with President Biden’s executive order on Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis, USEPA and NHTSA are now evaluating whether and how to replace the SAFE Rule.

Low Carbon Fuel Standard

In January 2007, Governor Schwarzenegger enacted Executive Order S-01-07, which mandates that the state: (1) establish a statewide goal to reduce the carbon intensity of California’s transportation fuels by at least 10 percent by 2020; and (2) adopt a Low Carbon Fuel Standard (LCFS) for transportation fuels in California. The overall goal of the LCFS is to lower the carbon intensity of California transportation fuel. The 2017 Scoping Plan Update calls for the LCFS to reduce fuel carbon intensity by at least 18 percent by 2030. In September 2018, CARB extended the LCFS program to 2030, making significant changes to the design and implementation of the Program including a doubling of the carbon intensity reduction to 20 percent by 2030.

Title 24 Building Energy Efficiency Standards

CCR Title 24 establishes California’s Building Energy Efficiency Standards; Part 11 is referred to as the California Green Building Standards (CALGreen) Code. The purpose of the CALGreen Code is to “improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a positive environmental impact and encouraging sustainable construction practices in the following categories: (1) planning and design; (2) energy efficiency; (3) water efficiency and conservation; (4) material conservation and resource efficiency; and (5) environmental air quality (CBSC 2010).” In 2016, the CALGreen Code was updated to include new mandatory measures for residential and nonresidential buildings, and the new measures took effect on January 1, 2017. The CALGreen Code was most recently updated in 2018 with new measures taking effect on January 1, 2020 (CBSC 2019).SB 1383 (Short-lived Climate Pollutants)

Senate Bill 1383, passed in 2016, requires statewide reductions in short-lived climate pollutants across various industry sectors. The short-lived climate pollutants covered under AB 1383 include methane, fluorinated gases, and black carbon—all GHGs with a much higher warming impact than carbon dioxide and with the potential to have detrimental effects on human health. SB 1383 requires the CARB to adopt a strategy to reduce methane by 40 percent, hydrofluorocarbon gases by 40 percent, and anthropogenic black carbon by 50 percent below 2013 levels by 2030. The methane emission reduction goals include a 75 percent reduction in the level of statewide disposal of organic waste from 2014 levels by 2025.

Regional

South Coast Air Quality Management District

SCAQMD has jurisdiction over air quality planning for all of County of Orange, Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The Air Basin is a subregion

within SCAQMD jurisdiction. While air quality in the Air Basin has improved, the Air Basin requires continued diligence to meet the air quality standards.

SCAQMD adopted a “Policy on Global Warming and Stratospheric Ozone Depletion” on April 6, 1990. The policy commits SCAQMD to consider global impacts in rulemaking and in drafting revisions to the Air Quality Management Plan. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives:

- Phase out the use and corresponding emissions of chlorofluorocarbons, methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995;
- Phase out the large quantity use and corresponding emissions of hydrochlorofluorocarbons by the year 2000;
- Develop recycling regulations for hydrochlorofluorocarbons (e.g., SCAQMD Rules 1411 and 1415);
- Develop an emissions inventory and control strategy for methyl bromide; and
- Support the adoption of a California GHG emission reduction goal.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds (SCAQMD 2008). Within its October 2008 document, SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/residential projects that emit greater than 3,000 metric tons of carbon dioxide equivalents (MTCO_{2e}) per year. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for stationary source/industrial projects where SCAQMD is the lead agency. However, SCAQMD did not adopt a GHG significance threshold for land use development projects (e.g., mixed-use/commercial projects) and formed a GHG Significance Threshold Working Group to further evaluate potential GHG significance thresholds. This Working Group has been inactive since 2011 and SCAQMD has not formally adopted any GHG significance threshold guidance for land use development projects.

Air Quality Guidance Documents

SCAQMD’s CEQA guidelines are voluntary initiatives recommended for consideration by local planning agencies. The *CEQA Air Quality Handbook* (Handbook) published by SCAQMD provides local governments with guidance for analyzing and mitigating project-specific air quality impacts (SCAQMD 1993). SCAQMD is currently updating some of the information and methods in the Handbook, such as the screening tables for determining the air quality significance of a project and the on-road mobile source emission factors. While this process is underway, SCAQMD recommends using other approved models to calculate emissions from land use projects, such as CalEEMod (SCAQMD 2020).

Rules and Regulations

The SCAQMD has adopted many rules and regulations to regulate sources of air pollutant emissions in the Air Basin. With respect to GHG emissions, the proposed project may be subject to the following SCAQMD rule and regulation. While the focus of the rule and regulation are on

criteria air pollutants and toxic air contaminants, they would nonetheless control GHG emissions as co-benefits:

Regulation XIV – Toxics and Other Non-Criteria Pollutants: Regulation XIV sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other non-criteria pollutants. The following rule may apply to the proposed project:

Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines: This rule applies to stationary compression ignition engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

Southern California Association of Governments

The Southern California Association of Governments (SCAG) is the Metropolitan Planning Organization for the region in which the County of Orange and City of Irvine are located. In May 2020, SCAG adopted the *2020-2045 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS), also referred to as *ConnectSoCal*, which is an update to the previous 2016-2040 RTP/SCS (SCAG 2020).

The 2020-2045 RTP/SCS provides a vision for transportation throughout the region for the next several decades by considering the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address mobility needs. The 2020-2045 RTP/SCS describe how the region can attain the GHG emission-reduction targets set by CARB by achieving an 8 percent reduction in per capita transportation GHG emissions by 2020 and a 19 percent reduction in per capita transportation GHG emissions by 2035 compared to the 2005 level on a per capita basis. Compliance with and implementation of the 2020-2045 RTP/SCS policies and strategies would have co-benefits of reducing per capita criteria air pollutant emissions (e.g. nitrogen dioxide, carbon monoxide, etc.) associated with reduced per capita vehicle miles traveled (VMT) (SCAG 2020).

Local

Local jurisdictions, such as the County of Orange (County) and the City of Irvine (City) have the authority and responsibility to reduce GHG emissions through their land use decision-making authority.

Orange County General Plan

The County is responsible for the assessment and mitigation of pollutant emissions resulting from its land use decisions. The County's General Plan Resource Element sets forth the goals, objectives, and policies which guide the County in its implementation of its air quality improvement programs and strategies. A number of these goals, objectives, and policies are relevant to the proposed project, and relate to minimizing particulate emissions from construction

activities, managing traffic congestion during peak hours, and increasing energy efficiency in private developments.

The Resource Element establishes the following goal pertaining to the proposed project's energy use: Goal 3: Maximize the conservation of energy resources in all future land use and transportation planning decisions.

City of Irvine General Plan

The City is responsible for the assessment and mitigation of pollutant emissions resulting from its land use decisions. The City's General Plan Energy Element sets forth the objectives and policies which guide the City in its implementation of its energy improvement programs and strategies. Reduction of energy use results in a reduction in GHG emissions and therefore is relevant to the GHG analysis. The Energy Element establishes the following objectives pertaining to the proposed project energy use: Goal I-1: Maximize energy efficiency through land use and transportation planning.

3.7.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from Appendix G of the CEQA Guidelines are used as thresholds of significance to determine the impacts of the proposed project as related to greenhouse gas emissions. The proposed project would have a significant impact if it would:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.
3. Result in cumulatively considerable impacts to greenhouse gas emissions.

Greenhouse Gas Emissions Thresholds

CEQA Guidelines section 15064.4 gives lead agencies the discretion to determine whether to assess the significance of GHG emissions quantitatively or qualitatively. Section 15064.4 recommends considering certain factors, among others, when determining the significance of a project's GHG emissions, including the extent to which the proposed project may increase or reduce GHG emissions as compared to the existing environment; whether the proposed project exceeds an applicable significance threshold; and extent to which the proposed project complies with regulations or requirements adopted to implement a reduction or mitigation of GHGs. None of the amendments establishes a threshold of significance; rather, so long as any threshold selected is supported by substantial evidence (see section 15064.7(c)), lead agencies are granted discretion to establish significance thresholds for their respective jurisdictions, including by looking to thresholds developed by other public agencies, such as air districts, or suggested by experts, such as the California Air Pollution Control Officers Association (CAPCOA).

The California Natural Resources Agency's *Final Statement of Reasons for Regulatory Action* from December 2009 similarly provides that project-level quantification of emissions should be

conducted where it would assist in determining the significance of emissions, even where no numeric threshold applies. In such cases, CNRA’s guidance provides that qualitative thresholds can be utilized to determine the ultimate significance of project-level impacts based on a project’s consistency with plans, which can include applicable regional transportation plans. Even when using a qualitative threshold, quantification can inform “the qualitative factors” and indicate “whether emissions reductions are possible, and, if so, from which sources (CNRA 2009).”

Neither CARB nor the County of Orange has adopted quantitative significance thresholds for assessing project-level impacts related to GHG emissions. As a method for determining significance under CEQA, SCAQMD developed a draft tiered flowchart in 2008 for determining significance thresholds for GHGs for industrial projects where SCAQMD is acting as the lead agency. In December 2008, SCAQMD adopted a 10,000 MTCO₂e/year threshold for industrial facilities, but only with respect to for projects in which SCAQMD is the lead agency. SCAQMD has not adopted a threshold of significance for residential or commercial projects. Additionally, SCAQMD formed a GHG Significance Threshold Working Group to evaluate potential GHG significance thresholds and had proposed, but not adopted, a 3,000 MTCO₂e/year screening level for land use development projects. However, the aforementioned Working Group has been inactive since 2011 and no screening levels drafted by the Working Group have been formally adopted for land use development projects. Nonetheless, while the proposed project is an infrastructure project and does not fit neatly into a category (industrial, commercial, or residential/), in the absence of a formally adopted threshold applicable to this proposed project, the more stringent of the two quantitative thresholds discussed above (i.e., 3,000 MTCO₂e/year) is used to evaluate the significance for this proposed project.

Greenhouse Gas Reduction Plans, Policies and Regulations

A significant impact would occur if the proposed project would conflict with applicable regulations, plans and policies that were adopted to reduce GHG emissions that contribute to global climate change. For the proposed project, as an infrastructure project, this analysis considers the proposed project’s potential to conflict with the following applicable plans, policies and regulations to reduce GHG emissions:

- The 2017 Climate Change Scoping Plan Update, CARB’s plan for achieving a 40 percent reduction on GHG emissions from 1990 levels by 2030, statewide, as mandated by SB 32; and
- The SCAG 2020-2045 RTP/SCS, the regional plan for achieving sustainable land use patterns that reduce passenger vehicle GHG emissions, as mandated by SB 375.

Methodology

Construction

The evaluation of potential impacts to GHG emissions that may result from the construction of the proposed project is consistent with CEQA Guidelines section 15064.4(a) and recent related guidance from OPR. This analysis considered GHG emissions resulting from construction activities associated with the proposed project as detailed under Regional Construction Emissions above. Because potential impacts resulting from GHG emissions would be long-term rather than

acute, GHG emissions were calculated on an annual basis. In accordance with SCAQMD guidance, GHG emissions from construction have been amortized (i.e., averaged annually) over the lifetime of the proposed project. SCAQMD defines the lifetime of a project as 30 years. Therefore, the proposed project's total construction GHG emissions are divided by 30 to determine an annual construction emissions estimate comparable to operational emissions.

GHG quantification methods rely on guidance from State and regional agencies with scientific expertise in quantifying GHG emissions, including CARB and SCAQMD. Along with the air quality emissions, GHG emissions were estimated using CalEEMod Version 2016.3.2 for off-road construction equipment and Safe Rule 1 adjusted EMFAC2017 emissions for on-road vehicles as detailed above. Emissions calculations and modeling output are included in Appendix B of this Draft EIR.

Operation

Existing operations at the proposed project site generate GHG emissions from electrical consumption. The proposed project would not result in new or increased use of motor vehicles, water or natural gas consumption, or wastewater or solid waste generation. The proposed project would result in the consumption of 1,300,000 kWh annually. The existing operations consist of approximately 217,273 kWh annually, therefore the annual increase in electrical consumption is approximately 1,082,727 kWh. The increase in electrical consumption was used to quantify annual operational GHG emissions. Emissions from annual electrical consumption are added to the amortized construction emissions and compared to the SCAQMD's quantitative screening level. For further explanation, please see Appendix B of this Draft EIR.

Impact Analysis

Greenhouse Gas Emissions

Impact 3.7-1: The proposed project would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.

Construction

According to SCAQMD methodology, because GHG emissions are a cumulative impact, project significance is determined by the combined amortized construction and operational emissions. The proposed project's total estimated GHG emissions during construction are identified in **Table 3.7-2**. As shown, estimated GHG emissions would be approximately 9,567 MTCO_{2e} over the entire lifetime of the project. This would equal approximately 319 MTCO_{2e} per year after amortization over 30 years per SCAQMD methodology.

**TABLE 3.7-2
 AMORTIZED ANNUAL CONSTRUCTION GHG EMISSIONS**

Source	MTCO₂e

Operation

Operational GHG emissions result from area sources and the increased electrical use as a result of daily activities once the proposed improved reservoir is operational. **Table 3.7-3** shows the total annual GHG emissions associated with the combined construction and operation of the proposed project. As shown in Table 3.7-3, operational emissions result in 161 MTCO₂e annually, which is attributed almost exclusively to increased electrical use.

**TABLE 3.7-3
 ANNUAL OPERATIONAL GHG EMISSIONS**

Source	MTCO₂e

Total Project Emissions	480
District-wide energy savings	535
Total Net Emissions	(55)
Screening Level	3,000
Exceed Screening Level?	No
SOURCE: ESA, 2020	

Furthermore, the objectives of the proposed project include reducing the need to purchase supplemental imported untreated water from MWD by storing recycled water that is already produced. Conveying imported untreated water from the State Water Project (SWP) and the Colorado River to Orange County requires a tremendous amount of energy for pumping. Replacing imported water with locally generated recycled water reduces the overall energy associated with imported water since there would be less energy needed for conveyance. Approximately 1,890 kWh per acre foot is required for water supply and conveyance in the IRWD service area due to importing water from outside of the region from the SWP and Colorado River (IRWD 2019). Without the proposed project, approximately 4,500 AF of untreated water would be imported through MWD, resulting in approximately 8,505,000 kWh/year of electricity consumption. Under the proposed project, the provision of approximately 4,500 AF of locally-produced recycled water would result in approximately 4,806,000 kWh/year of electricity consumption, which is an approximate savings of 3,699,000 kWh annually.

The combined annual construction and operational emissions from the proposed project result in approximately 480 MTCO₂e. The district-wide savings in approximately 3,699,000 kWh annually results in a reduction in district emissions of approximately 535 MT CO₂e annually and results in a district wide reduction in GHG emissions of approximately 55 MTCO₂e annually.³ As the proposed project’s annual GHG emissions would not exceed the threshold of significance, emissions impacts with respect to the generation of GHGs would be less than significant.

³ 1,082,727 kWh of net increase in electrical use results in 157 MTCO₂e annually. 3,699,000 kWh of electric use results in approximately 535 MTCO₂e annually. Project emissions (480 MTCO₂e) minus the district emissions (535 MTCO₂e) equals a 55 MTCO₂e annual reduction in district emissions from the implementation of the project.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Plan, Policy or Regulation

Impact 3.7-2: The proposed project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Consistency with the Climate Change Scoping Plan

The CARB Climate Change Scoping Plan was designed to reduce GHG emissions from new land use projects. The proposed project would be subject to the Scoping Plan requirements. The majority of the Scoping Plan measures target measures that reduce energy and transportation emissions from residential and commercial/industrial development and therefore the majority of the Scoping Plan measures are not applicable to the proposed project. Out of the Recommended Actions contained in CARB's Scoping Plan, the actions that are most applicable to the proposed program would be reducing diesel-fueled commercial motor vehicle idling, and reducing energy associated with water use. The proposed project would be designed to comply with the California regulations to limit idling of onsite vehicles to 5 minutes or less per location.

The objectives of the proposed project include reducing the need to purchase imported water from MWD by storing and using additional recycled water stored by the proposed project and maximize the use of recycled water produced by IRWD for the benefit of IRWD customers. Once operational, the proposed project would increase the amount of recycled water available within IRWD and therefore would reduce the emissions associated with the transport of non-potable water from other sources. Replacing purchased imported water with locally generated recycled water for use by local customers reduces the overall energy-related GHG emissions associated with the purchase of imported water since there would be less GHG emissions from water supply and conveyance. Approximately 1,890 kWh per acre foot is required for water supply and conveyance in the IRWD service area due to importing water from outside of the region from the SWP and Colorado River (IRWD 2019). Without the proposed project approximately 4,500 AF of untreated water would be imported through MWD, resulting in approximately 8,505,000 kWh/year of electricity consumption district-wide. Treatment and transport of approximately 4,500 AF of locally-produced recycled water would result in approximately 4,806,000 kWh/year of district-wide electricity consumption, which is an approximate savings of 3,699,000 kWh annually. By providing IRWD customers with recycled water stored under the proposed project, electricity used for water supply and conveyance from imported water would be offset by the recycled water, thus reducing district-wide GHG emissions. The 2017 Climate Change Scoping Plan recognizes the nexus between water and energy consumption. The water-energy nexus provides opportunities for reducing energy demand and reducing emissions of GHGs. The 2017 Climate Change Scoping Plan, states that "recycled water has the potential to reduce GHGs if it replaces, and not merely serves as an alternative to, an existing, higher-carbon water supply"

(CARB 2017a). Thus, the proposed project would be consistent with the Scoping Plan’s strategy to reduce water-related GHG emissions.

As the proposed project would not increase traffic within the region, and would reduce the overall energy-related GHG emissions associated with the use of imported water, the proposed project would not conflict with the Scoping Plan. That combined with the reduction in vehicle idling, the proposed project would be consistent with the Scoping Plan measures applicable to the project. Therefore, the proposed project would result in less than significant impacts.

Consistency with SB 375

The key goal of the Sustainable Communities Standard is to achieve GHG emission reduction targets through integrated land use and transportation strategies. The focus of these reductions is on transportation and land use strategies that influence vehicle travel. The proposed project would not significantly or permanently increase vehicle traffic within the County or the region. While the proposed project would result in an increase in short-term employment compared to existing conditions, the project would not result in long-term employment growth in excess of regional projections by SCAG. Therefore, the proposed project would not conflict with the implementation of SB 375 nor the 2020-2045 RTP/SCS and impacts would be less than significant.

Consistency with Applicable Regulations

The Heavy-Duty Vehicle and Light-Duty vehicle rules have been established to reduce CO₂ emissions from the combustion of fossil fuels. The proposed project would not involve the manufacture of vehicles or production of vehicle fuels. However, vehicles that are purchased and used within the project site would comply with any vehicle and fuel standards that the CARB adopts or has adopted. Therefore, the construction and operation of the proposed project would not conflict with these regulations.

CARB’s ATCM limits heavy-duty diesel motor vehicle idling to reduce DPM and other TACs and applies to all the haul trucks, heavy duty vendor trucks, and construction equipment that would be used on the project site. CARB also implemented the Truck and Bus Regulation to further reduce NO_x, PM₁₀ and PM_{2.5} from on-road diesel operating vehicles. CARB has also promulgated emissions standards for off-road diesel construction equipment greater than 24 horsepower to reduce criteria pollutant emissions. The proposed project would operate both on- and off-road trucks and construction equipment. These vehicles would comply with all of the CARB regulations and onsite trucks and equipment would be monitored to ensure that idling would occur for only five minutes at any given time. Therefore, the proposed project would be consistent with the applicable regulations for heavy-duty, light-duty and off-road vehicles and equipment and impacts would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Cumulative Impacts

Impact 3.7-3: Concurrent construction and operation of the proposed project and related projects in the geographic scope would not result in cumulative impacts regarding greenhouse gas emissions.

The GHG emissions of the proposed project alone would not cause a direct physical change in the environment. According to CAPCOA, “GHG impacts are exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. (CAPCOA 2008)” It is global GHG emissions in their aggregate that contribute to climate change, not any single source of GHG emissions alone. The impact analysis of the project’s GHG emissions and consistency with existing plans and policies related to GHG emissions provided above for the proposed project serves as a cumulative impact analysis. Therefore, as discussed above, the proposed project would be consistent with applicable plans, policies or regulations adopted for the purpose of reducing GHG emissions and the proposed project would not generate GHG emissions that would have a significant impact on the environment. As such, the proposed project would result in a less than cumulatively considerable impact related to applicable GHG emissions and GHG reduction plans and policies and cumulative impacts would be less than significant.

Mitigation Measures

3.8 Hazards and Hazardous Materials

This section evaluates the potential hazards and hazardous materials impacts associated with construction and operation of the proposed project. This section includes: a description of the existing hazards and hazardous materials at the proposed project site; a summary of applicable regulations related to hazards and hazardous materials; and an evaluation of the potential impacts of the proposed project related to the hazard conditions on the proposed project site and in the surrounding area, including cumulative impacts. Potential hazards from flooding associated with the construction and operation of the proposed project, including dam safety issues, are discussed in Section 3.9, *Hydrology and Water Quality*.

3.8.1 Environmental Setting

This discussion of the potential presence of hazardous materials at the proposed project site is based on the results of the sampling of lake bottom sediments provided in the *Syphon Reservoir, Dry Lakebed Geotechnical Exploration* by GEI Consultants (GEI 2016), the *Phase I Environmental Site Assessment, Syphon Canyon Dam and Reservoir* by URS Corporation (URS 2009), and a search of regulatory agency databases using the California State Water Resources Control Board (SWRCB) GeoTracker database and the California Department of Toxic Substances Control (DTSC) EnviroStor database, which are discussed further below.

Definitions

Definitions of terms used in the characterization of baseline conditions, regulatory framework, and impact analysis for hazards and hazardous materials are provided below:

- **Hazardous Material:** The term “hazardous material” can have varying definitions depending on the regulatory programs. For the purposes of this EIR, the term refers to both hazardous materials and hazardous wastes. The California Health and Safety Code Section 25501(n) defines hazardous material as: Hazardous material means any material that because of its quantity, concentrations, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous materials include, but are not limited to, hazardous substances, hazardous waste, and any material that a handler or the administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.
- **Hazardous Waste:** A “hazardous waste” is a waste that because of its quantity, concentration, or physical, chemical, or infectious characteristic, causes or significantly contributes to an increase in mortality or illness or poses substantial or potential threats to public health or the environment (42 U.S.C. 6903(5)). Hazardous wastes are further defined under the Resource Conservation and Recovery Act (RCRA) as substances exhibiting the characteristics of ignitability, reactivity, corrosivity, or toxicity. Chemical-specific concentrations used to define whether a material is a hazardous, designated, or nonhazardous waste include Total Threshold Limit Concentrations (TTLCs), Soluble Threshold Limit Concentrations (STLCs), and Toxic Characteristic Leaching Procedure (TCLPs), listed in California Code of Regulations (CCR) Title 22, Chapter 11, Article 3, Section 66261, and are used as waste acceptance criteria for landfills. Waste materials with chemical concentrations above TTLCs, STLCs, and TCLPs

must be sent to Class I disposal facilities, may be sent to Class II disposal facilities depending on the waste material, and may not be sent to Class III disposal facilities.¹

- **Acutely Hazardous Waste:** Waste that has been found to be fatal to humans in low doses, or is otherwise capable of causing or significantly contributing to an increase in serious irreversible, or incapacitating reversible illness (40 CFR §261.11(2)).
- **Screening Levels for Hazardous Materials in Soil, Soil Gas, or Groundwater:** The U.S. Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs) and San Francisco Bay Area Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs) are guidelines used to evaluate the potential risk associated with chemicals found in soil or groundwater where a release of hazardous materials has occurred. Although developed and maintained by the San Francisco Bay Area RWQCB, ESLs are used by regulatory agencies throughout the state. Screening levels have been established for both residential and commercial/industrial land uses, and for construction workers. Residential screening levels are the most restrictive. Soil with chemical concentrations below these screening levels generally would not require remediation and would be suitable for unrestricted uses if disposed of offsite.

Commercial/industrial screening levels are generally less restrictive than residential screening levels because they are based on potential worker exposure to hazardous materials in the soil (and these are generally less than residential exposures). Screening levels for construction workers are also less restrictive than for commercial/industrial workers because construction workers are only exposed to the chemical of concern during the duration of construction, while industrial workers are assumed to be exposed over a working lifetime. Chemical concentrations below these screening levels generally would not require remediation and would be suitable for unrestricted uses. In addition, there are other more specific but similar screening levels used more narrowly focused human health or ecological risk assessment considerations

Onsite Hazardous Materials

Recycled water currently is dechlorinated with sodium hypochlorite added prior to re-introduction of the stored water into IRWD's recycled water distribution system. The chemical is stored inside the existing strainer and disinfection facility onsite at the existing Syphon Reservoir. Sodium hypochlorite is not designated as acutely hazardous materials per 40 CFR §261.11(2).

Prior to the construction of the existing Syphon Reservoir, the proposed project site was in agricultural use (GEI 2016). Given the configuration of Syphon Canyon at the project site, residual agricultural chemicals, if any, would be expected to accumulate in the lake bottom sediments. Sediment samples were collected and analyzed for chlorinated herbicides, organochlorine pesticides, organophosphorus pesticides, metals, and organic compounds (GEI 2016, AECOM 2020a). Various metals were detected at concentrations below their respective RSLs and ESLs, except for arsenic. However, arsenic is a naturally occurring metal. The DTSC conducted a study of arsenic in southern California and concluded that the naturally occurring concentration of arsenic in southern California is about 12 milligrams per kilogram (mg/kg) (DTSC 2018). The reported

¹ Class I disposal facilities are designed specifically for hazardous waste, as defined by CCR Title 22. Class II facilities are "designated" waste facilities and must acquire special permitting to accept designated types of hazardous materials. Class III disposal facilities are strictly for non-hazardous waste (CCR Title 23, Division 3, Chapter 15).

arsenic concentrations in the sediment samples from the proposed project site were 13, 9.5, and 11 mg/kg (GEI 2016) and 3.4 and 5.2 mg/kg (AECOM 2020a). Based on the five samples, the average detected concentration of arsenic in the lake bottom sediments is 8.42 mg/kg. Therefore, the average arsenic concentration is below the naturally occurring background level.

Herbicides and pesticides were detected at low concentrations that are several orders of magnitude below RSLs. Diesel range organic compounds were also detected at low concentrations that are several orders of magnitude below RSLs. Semi-volatile or volatile organic compounds were not detected. Based on available data, the existing Syphon Reservoir lakebed sediments do not contain metals, herbicides, pesticides, or other organic compounds, at levels that would classify them as impacted soils.

The Phase I environmental site assessment (URS 2009) for the proposed project site noted that the existing site structures, as of 2009, (i.e., strainer and disinfection facilities structures) predated the nationwide ban on the use of asbestos-containing materials (ACM) and lead-based paint (LBP) in building materials in the mid-1970s. However, IRWD replaced and upgraded the facility in 2013 to its current configuration. The 2013 building materials post-date the ban on ACM and LBP and the current facility would not contain these hazardous materials. The Phase I Environmental Site Assessment concluded that polychlorinated biphenyls (PCBs) are not present in any of the existing building materials.

Hazardous Materials Database Search

The hazardous materials database search included as part of the Phase 1 environmental site assessment indicated no Recognized Environmental Conditions² in connection with current site activities, and no recorded environmentally sensitive sites were observed on or immediately adjacent to the proposed project site (URS 2009).

The GeoTracker database, maintained by the SWRCB and the EnviroStor database, maintained by the DTSC, were checked for nearby hazardous materials sites. The GeoTracker database includes the following hazardous materials site lists: leaking underground storage tank (LUST) cleanup sites; spills, leaks, investigation and cleanup (SLIC) sites; permitted underground storage tank (UST) facilities; land disposal sites; military cleanup sites; and other cleanup sites. The EnviroStor database includes federal Superfund, state response, voluntary cleanup, school cleanup, and hazardous waste corrective action. The DTSC is also responsible for updating the Hazardous Waste and Substances Site List (Cortese List). The list is a planning document used by state and local agencies and developers to comply with CEQA requirements by providing location information for hazardous material release sites.

The search of the GeoTracker and EnviroStor databases identified one nearby hazardous materials site. The Frank R. Bowerman Landfill is located at 11002 Bee Canyon Access Road in unincorporated area of Orange County near Irvine, California, approximately one mile to the northeast of the project site

² As per ASTM 1527-13, the industry standard for conducting Phase I assessments, a Recognized Environmental Condition is defined as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment.

(Geosyntec 2020). This landfill is an active Class III municipal waste landfill and has been in operation since 1990. The County owns the 725-acre site, where 534 acres are permitted for landfill activities. The site accepts an annual average of 8,500 tons per day of refuse with the peak daily tonnage of 11,500 tons per day. The facility is owned and operated by Orange County Waste and Recycling. There are 17 monitoring wells onsite to assess the quality of the groundwater in order to identify any release of pollutants from the landfill. The site is regulated under waste discharge requirements R8-2010-0017. Groundwater beneath the site is flowing in a south-southwest direction, which would be cross gradient to the proposed project site. In other words, groundwater from the landfill is not anticipated to flow beneath the Syphon Reservoir project site. The groundwater monitoring program indicates that there has not been a release of landfill leachate chemicals to groundwater from the landfill.

Schools

The Crean Lutheran High School Athletic Complex is located southwest and adjacent to the existing Syphon Dam. The Crean Lutheran High School is located at 12500 Sand Canyon Avenue, across Portola Parkway, about 1,300 feet (about 0.25 mile) south of the Syphon Dam. Stonegate Elementary School is located at 100 Honors, about 2,000 feet (0.37 mile) west of the Syphon Dam.

Airports

Airport Environs Land Use Plans (AELUP) exist for each of the airports in Orange County, which include John Wayne Airport, Fullerton Municipal Airport, and Joint Forces Training Base Los Alamitos. The project site is not located within any Airport Planning Areas as depicted in the AELUP (ALUC for Orange County 2005). The closest airport to the project site is John Wayne Airport, approximately 7.7 miles southwest of the proposed project site. The proposed project site is within 2 miles of the former Marine Corps Air Station (MCAS) El Toro, which was approximately 1.9 miles south of the project Site. The El Toro MCAS was decommissioned in 1999 (BRAC PMO 2017) and would not be able to affect or be affected by the proposed project.

Emergency Response

The City of Irvine Office of Emergency Management (OEM) maintains the Evacuation Plan for the City (City of Irvine 2019). The Evacuation Plan identifies Evacuation Management Zones (EMZ), which include primary evacuation routes within each zone. The proposed project site is within Zone 6A; State Route 133 to the southeast and Portola Parkway to the west are labelled as possible evacuation routes (City of Irvine 2020).

All dams under DSOD jurisdiction are required to have an Emergency Action Plan (EAP) to establish the response in the event of a failure of the dam. The current Emergency Action Plan (EAP) for the Syphon Reservoir (Stetson Engineers 2021) and has been reviewed by the California Office of Emergency Services, Dam Safety Planning Division (CalOES-DSPD), which approved of the EAP in March 2021 (CalOES-DSPD 2021). The EAP describes the existing dam and reservoir; identifies notification, communication, and response responsibilities of IRWD and impacted jurisdictions/public safety agencies; surveillance, monitoring, and response procedures; estimated inundation depths and arrival times; and training procedures. Please refer to Section 3.9, *Hydrology and Water Quality*, for additional information about the Syphon Reservoir EAP.

Wildfire

The California Department of Forestry and Fire Protection publishes Fire Hazard Severity Zone (FHSZ) maps, for both state and Local Responsibility Areas. The proposed project site is mapped as being within a Moderate FHSZ (CAL FIRE 2011). However, the surrounding area to the east is mapped as a Very High FHSZ (VHFHSZ) (CAL FIRE 2011). Please refer to Section 3.14, *Wildfire*, and Figure 3.14-1, Fire Hazard Severity Zones, for additional details.

3.8.2 Regulatory Framework

Federal

The primary federal agencies with responsibility for hazardous materials management include the U.S. Environmental Protection Agency (USEPA), U.S. Department of Labor Occupational Safety and Health Administration (Fed/OSHA), and the U.S. Department of Transportation (USDOT). Federal laws, regulations, and responsible agencies are summarized in **Table 3.8-1**.

**TABLE 3.8-1
FEDERAL LAWS AND REGULATIONS RELATED TO HAZARDOUS MATERIALS MANAGEMENT**

Classification	Law or Responsible Federal Agency	Description
Hazardous Materials Management	Community Right-to-Know Act of 1986 (also known as Title III of the Superfund Amendments and Reauthorization Act (SARA))	Imposes requirements to ensure that hazardous materials are properly handled, used, stored, and disposed of, and to prevent or mitigate injury to human health or the environment in the event that such materials are accidentally released.
Hazardous Waste Handling	Resource Conservation and Recovery Act of 1976 (RCRA)	Under RCRA, the USEPA regulates the generation, transportation, treatment, storage, and disposal of hazardous waste from “cradle to grave.” ^a
	Hazardous and Solid Waste Act	Amended RCRA in 1984, affirming and extending the “cradle to grave” system of regulating hazardous wastes. The amendments specifically prohibit the use of certain techniques for the disposal of some hazardous wastes.
Hazardous Materials Transportation	U.S. Department of Transportation (USDOT)	USDOT has the regulatory responsibility for the safe transportation of hazardous materials. The USDOT regulations govern all means of transportation except packages shipped by mail (49 CFR).
	U.S. Postal Service (USPS)	USPS regulations govern the transportation of hazardous materials shipped by mail.
Occupational Safety	Occupational Safety and Health Act of 1970	Fed/OSHA sets standards for safe workplaces and work practices, including the reporting of accidents and occupational injuries (29 CFR 1910).
Structural and Building Components (Lead-based paint, polychlorinated biphenyls, and asbestos)	Toxic Substances Control Act	Regulates the use and management of polychlorinated biphenyls in electrical equipment, and sets forth detailed safeguards to be followed during the disposal of such items.
	USEPA	The USEPA monitors and regulates hazardous materials used in structural and building components and their effects on human health.

NOTES:

^a “Cradle-to-grave” is used by the USEPA in this context to mean that it (the USEPA) regulates hazardous waste from its generation to its disposal (USEPA 2017).

State and local agencies often have either parallel or more stringent rules than federal agencies. In most cases, state law mirrors or overlaps federal law and enforcement of these laws is the responsibility of the state or of a local agency to which enforcement powers are delegated. For these reasons, the requirements of the law and its enforcement are discussed under either the state or local agency section.

State

The primary state agencies with responsibility for hazardous materials management in the region include the DTSC and the RWQCB within the California Environmental Protection Agency (Cal EPA), California Occupational Safety and Health Administration (Cal/OSHA), California Department of Health Services (CDHS), California Highway Patrol (CHP), and the California Department of Transportation (Caltrans). State laws, regulations, and responsible agencies are summarized in **Table 3.8-2**.

**TABLE 3.8-2
 STATE LAWS AND REGULATIONS RELATED TO HAZARDOUS MATERIALS MANAGEMENT**

Classification	Law or Responsible State Agency	Description
Hazardous Materials Management	Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program); CUPA (Health and Safety Code Sections 25404 et seq.)	In January 1996, Cal EPA adopted regulations, which implemented a Unified Program at the local level. The agency responsible for implementation of the Unified Program is called the Certified Unified Program Agency (CUPA), which for the Orange County, is the Orange County Environmental Health Division (OCEHD). The following programs are consolidated under the unified program: <ul style="list-style-type: none"> • Hazardous Materials Release Response Plans, and Inventory (also referred to as Hazardous Materials Business Plans) • California Accidental Release Program (CalARP) • Underground Storage Tanks • Aboveground Petroleum Storage Spill Prevention Control and Countermeasures • Hazardous Waste Generation and Onsite Treatment • Uniform Fire Code Plan and Inventory Requirements
	State Hazardous Waste and Substances List ("Cortese List"); DTSC, RWQCB, SC EHD.	The oversight of hazardous materials sites often involves several different agencies that may have overlapping authority and jurisdiction. For the onsite hazardous materials cases and issues, the RWQCB is the lead agency. Other cases may be overseen by the DTSC, the RWQCB, Orange County, or other agencies.
Hazardous Waste Handling	California Hazardous Materials Release Response Plan and Inventory Law of 1985; CUPA	The California Hazardous Materials Release Response Plan and Inventory Law of 1985 (Business Plan Act) requires that businesses that store hazardous materials onsite prepare a Hazardous Materials Business Plan (HMBP) and submit it to the local CUPA, which in this case is the OCEHD.

**TABLE 3.8-2
STATE LAWS AND REGULATIONS RELATED TO HAZARDOUS MATERIALS MANAGEMENT**

Classification	Law or Responsible State Agency	Description
	California Hazardous Waste Control Act; DTSC	Under the California Hazardous Waste Control Act, California Health and Safety Code, Division 20, Chapter 6.5, Article 2, Section 25100, et seq., DTSC regulates the generation, transportation, treatment, storage, and disposal of hazardous waste in California. The hazardous waste regulations establish criteria for identifying, packaging, and labeling hazardous wastes; dictate the management of hazardous waste; establish permit requirements for hazardous waste treatment, storage, disposal, and transportation; and identify hazardous wastes that cannot be disposed of in landfills. DTSC is also the administering agency for the California Hazardous Substance Account Act. California Health and Safety Code, Division 20, Chapter 6.8, Sections 25300 et seq., also known as the State Superfund law, providing for the investigation and remediation of hazardous substances pursuant to State law.
	California Fire Code	The California Fire Code regulates the storage and handling of hazardous materials, including the requirement for secondary containment, separation of incompatible materials, and preparation of spill response procedures.
Hazardous Materials Transportation	Titles 13, 22, and 26 of the California Code of Regulations	Regulates the transportation of hazardous waste originating in and passing through the state, including requirements for shipping, containers, and labeling.
	CHP and Caltrans	These two state agencies are primary responsibility for enforcing federal and state regulations and responding to hazardous materials transportation emergencies.
Workplace Safety	Cal/OSHA	Cal/OSHA has primary responsibility for developing and enforcing workplace safety regulations in California. Because California has a federally approved OSHA program, it is required to adopt regulations that are at least as stringent as those found in Title 29 of the Code of Federal Regulations (CFR). Cal/OSHA standards are generally more stringent than federal regulations.
	Cal/OSHA regulations (Title 8 CCR)	Concerning the use of hazardous materials in the workplace require employee safety training, safety equipment, accident and illness prevention programs, hazardous substance exposure warnings, and emergency action and fire prevention plan preparation.
Construction Storm Water General Permit (Construction General Permit; Order 2009-0009-DWQ, NPDES No. CAS000002; as amended by Orders 2010-0014-DWQ and 2012-006-DWQ)	RWQCB	Dischargers whose project disturbs one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the <i>NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities</i> (Construction General Permit; Order 2009-0009-DWQ, NPDES No. CAS000002; as amended by Orders 2010-0014-DWQ and 2012-006-DWQ). Construction activity subject to this permit includes clearing, grading, grubbing, and other disturbances to the ground such as excavation and stockpiling, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of a facility. The Construction General Permit requires the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) that includes specific Best Management Practices (BMPs) designed to prevent sediment and pollutants from contacting stormwater from moving offsite into receiving waters. The BMPs fall into several categories, including erosion control, sediment control, waste management and good housekeeping, and are intended to protect surface water quality by preventing the off-site migration of eroded soil and construction-related pollutants from the construction area.

**TABLE 3.8-2
 STATE LAWS AND REGULATIONS RELATED TO HAZARDOUS MATERIALS MANAGEMENT**

Classification	Law or Responsible State Agency	Description
Underground Infrastructure	California Code of Regulations Sections 4216–4216.9	Sections 4216–4216.9 “Protection of Underground Infrastructure” requires an excavator to contact a regional notification center (e.g., Underground Services Alert or Dig Alert) at least two days prior to excavation of any subsurface installations. Any utility provider seeking to begin a project that could damage underground infrastructure can call Underground Service Alert, the regional notification center for southern California. Underground Service Alert will notify the utilities that may have buried lines within 1,000 feet of the project. Representatives of the utilities are then notified and are required to mark the specific location of their facilities within the work area prior to the start of project activities in the area.

Local

County of Orange

General Plan, Safety Element

General Goals and Objectives – Public Safety

Goal 1: Provide for a safe living and working environment consistent with available resources.

Objective 1.1: To identify public safety hazards and determine the relative threat to people and property in Orange County

Goal 2: Minimize the effects of public safety hazards through implementation of appropriate regulations and standards which maximize protection of life and property.

Objective 2.1: To create and maintain plans and programs which mitigate the effects of public safety hazards.

Objective 2.2: To encourage the development and utilization of technologies that minimize the effects of public safety hazards.

General Goals and Objectives - Wildfire

Goal 1: Provide a safe living environment, ensuring adequate fire protection facilities and resources to prevent and minimize the loss of life and property fire.

Policy 2: To establish improved development standards for location of new construction, structural design, emergency vehicular access, and detection hardware.

Policy 3: To improve building code regulations to provide increased built-in fire protection.

Policy 5: To continue to improve the minimum water system design requirements for fire protection.

Policy 9: To encourage improvement of fire defense systems in hazardous areas.

Implementation Measures:

Hazardous Materials Services: Orange County enacted the Hazardous Material Disclosure Ordinance after the 1985 Fricker Chemical Fire, which was followed by state and federal law, requiring companies to disclose the hazardous materials they used and stored. Information from the disclosure and business plan program is provided to both emergency responders during hazardous materials incidents and the public upon request, and is used for regional emergency planning. The Orange County Fire Authority (OCFA) targets the greatest frequency and more in-depth inspection efforts to the highest hazard occupancies, to insure compliance with codes and recommended Best Management Practices (BMPs).

California Accidental Release Program (CalARP): CalARP is intended to result in an increased level of safety for the public and environment surrounding facilities using certain highly toxic and flammable materials. It is also intended to increase the level of communication among hazardous materials users, the public, and emergency responders.

City of Irvine

General Plan, Safety Element

Objective J-1: Hazard Occurrence. Identify actions that the City, in concert with other jurisdictions, must take to reduce the probability of hazard occurrence.

Policy (c): Establish criteria for land development in hillside areas with emphasis on fire retardant materials, minimization of exposure risk to wildfire and adjacent structure fires, provision on access for firefighting personnel and equipment, and removal of combustible vegetation.

Objective J-2: Disaster Response. Identify actions that the City, in conjunction with other jurisdictions, must take to reduce the severity of disasters.

Policy (b): Ensure that each development will have adequate emergency ingress and egress.

Policy (d): Continue to maintain and implement the City of Irvine Emergency Plan

3.8.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from CEQA Guidelines Appendix G are used as thresholds of significance to determine the impacts of the proposed project as related to hazards and hazardous materials.

The proposed project would have a significant impact if it would:

1. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials; or create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.
2. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

3. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.
4. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area.
5. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.
6. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.
7. Result in cumulatively considerable impacts to hazardous materials and wildfire.

Methodology

Information for this assessment of impacts relative to hazards and hazardous materials is based on a review of literature research (e.g., fire severity zone maps provided by CAL FIRE), the DTSC EnviroStor database, SWRCB's GeoTracker database, the Cortese List, and the General Plans for the County of Orange and the City of Irvine. This information was used to identify potential impacts to workers, the public, or the environment.

The proposed project would be regulated by the various laws, regulations, and policies summarized in Section 3.8.2, *Regulatory Framework*. Compliance by the proposed project with applicable federal, state, and local laws and regulations is assumed in this analysis, and local and state agencies would be expected to continue to enforce applicable requirements to the extent that they do so now. Note that compliance with many of the regulations is a condition of permit approval.

A significant impact would occur if, after considering the features described in Chapter 2, Project Description, and the required compliance with regulatory requirements, an impact would still occur. For those impacts considered to be potentially significant, mitigation measures are proposed to reduce the identified impacts.

Impact Analysis

Hazardous Materials

Impact 3.8-1: The proposed project would not create a significant hazard to the public or the environment through the routine transport, use, disposal, or the accidental release of hazardous materials.

Construction

During the demolition and new construction phases, construction equipment and materials may include fuels, oils and lubricants, solvents and cleaners, cements and adhesives, paints and thinners, degreasers, cement and concrete, and asphalt mixtures, which are all commonly used in construction. The proposed project site currently stores water treatment chemicals (sodium hypochlorite) that would be temporarily stored offsite while the new proposed treatment facility

is constructed. The routine use or an accidental spill of hazardous construction-related materials could result in inadvertent releases, which could adversely affect construction workers, the public, and the environment, resulting in a potentially significant impact.

Construction activities would be required to comply with numerous hazardous materials regulations designed to ensure that hazardous materials are transported, used, stored, and disposed of in a safe manner to protect worker safety, and to reduce the potential for a release of construction-related fuels or other hazardous materials into the environment. Contractors would be required to prepare and implement Hazardous Materials Business Plans (HMBPs) that would require that hazardous materials used for construction would be used properly and stored in appropriate containers with secondary containment to contain a potential release. The California Fire Code would also require measures for the safe storage and handling of hazardous materials.

As discussed in Section 3.6, *Geology and Soils*, construction contractors would be required to prepare a Stormwater Pollution Prevention Plan (SWPPP) for construction activities according to the National Pollutant Discharge Elimination System (NPDES) General Construction Permit requirements. The SWPPP would list the hazardous materials proposed for use during construction; describe spill prevention measures, equipment inspections, equipment and fuel storage; protocols for responding immediately to spills; and describe BMPs for controlling site runoff.

In addition, the transportation of hazardous materials would be regulated by the USDOT, Caltrans, and the CHP. Together, federal and state agencies determine driver-training requirements, load labeling procedures, and container specifications designed to minimize the risk of accidental release.

Workers handling hazardous materials are required to adhere to OSHA and Cal/OSHA health and safety requirements. Hazardous materials must be transported to and from the proposed project area in accordance with RCRA and USDOT regulations, managed in accordance with the OCEHD regulations, and disposed of in accordance with RCRA and the CCR at a facility that is permitted to accept the waste. Since compliance with existing hazardous materials regulations and programs are mandatory, the proposed project's construction activities are not expected to create a potentially significant hazard to construction workers, the public, or the environment.

Finally, in the event of a spill that releases hazardous materials at the proposed project site, a coordinated response would occur at the federal, state, and local levels, including the OCFA, which is the local hazardous materials response team. In the event of a hazardous materials spill, the OCFA and local police department would be simultaneously notified and sent to the scene to assess and respond to the situation.

As discussed in Section 3.8.1, *Environmental Setting*, the chemical testing of onsite lake bottom sediments indicated no residual agricultural chemicals at concentrations above regulatory standards. Given that that primary location for the accumulation of pesticides, herbicides, and metals would be the lake bottom sediments, the surrounding alluvium and bedrock materials that would be used to provide materials to construct the new proposed dam are not expected to have residual agricultural chemicals at concentrations above regulatory standards.

The required compliance with the numerous laws and regulations discussed above that govern the transportation, use, handling, and disposal of hazardous materials during construction of the proposed project would limit the potential for creation of hazardous conditions due to the routine use or accidental release of hazardous materials. The impact to the public and the environment would be less than significant.

Operation

As discussed in Section 2.4.3, *Treatment Facilities*, recycled water would be dechlorinated with sodium bisulfite prior to entering the reservoir for storage. Approximately 11,000 gallons of sodium bisulfite would be stored onsite and proposed metering pumps would be used to facilitate the dechlorination process. Sodium bisulfite would be stored within two tanks inside a new proposed building adjacent to the proposed filtration facility. A proposed masonry block wall building would house the storage tanks, metering pumps, and control system and would also serve as secondary containment system for the tanks. Spill containment pads would be located within the proposed facility. The proposed treatment facility would add sodium hypochlorite prior to re-introduction into IRWD's recycled water distribution system, similar to existing operations at the reservoir. The hypochlorite system would pump metered sodium hypochlorite to achieve an approximate 5-part-per-million chlorine residual in the recycled water. Approximately 17,000 gallons of sodium hypochlorite would be stored onsite and metering pumps would be used to facilitate the chlorination process. Sodium hypochlorite would be stored within two tanks inside the same building as the dechlorination system, either of which would incorporate secondary containment into the structure. The routine use or an accidental spill of hazardous materials could result in inadvertent releases, which could adversely affect workers, the public, and the environment and result in a potentially significant impact.

As required by the State's Hazardous Materials Management Program, IRWD, as the operator of the proposed facility would be required to prepare and submit a HMBP to the OCEHD, the local CUPA for the facility prior to the start of operations. The HMBP is required to include information on hazardous material handling and storage, including site layout, storage in appropriate containers with secondary containment to contain a potential release, and emergency response and notification procedures in the event of a spill or release. In addition, the plan requires annual employee health and safety training. The plan must be approved by the CUPA prior to commencement of project construction, and the proposed project would be subject to post-construction compliance inspections. The HMBP would also provide the OCEHD and OCFA emergency response personnel with the information they need to plan appropriately for a chemical release, fire, or other incident, which would reduce the potential for an accidental release to cause harmful health effects to workers or the public or substantial degradation to soil or water quality. All hazardous materials are required to be stored and handled according to manufacturer's directions and local, state and federal regulations. The California Fire Code would also require measures for the safe storage and handling of hazardous materials, including secondary containment.

Transportation and/or disposal of sodium bisulfite, sodium hypochlorite, and wastes, such as spent cleaning solutions, would also be subject to regulations for the safe handling, transportation, and disposal that would include appropriate containerization and labeling, transportation by licensed hazardous materials haulers, and disposal at licensed facilities permitted to accept the waste.

The required compliance with the numerous laws and regulations discussed above that govern the transportation, use, handling, and disposal of hazardous materials during operation of the proposed project would limit the potential for creation of hazardous conditions due to the routine use or accidental release of hazardous materials. The impact to the public and the environment would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Hazardous Materials near Schools

Impact 3.8-2: The proposed project would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.

Construction

Construction of the proposed project would require the short-term use of various hazardous materials, as discussed above in Impact 3.8-1. The transport of the hazardous materials could use haul routes that pass by schools, particularly the Crean Lutheran High School Athletic Complex, located just below the dam. In addition, the Crean Lutheran High School is located at 12500 Sand Canyon Avenue, across Portola Parkway, about 1,300 feet (about 0.25 mile) south of the Syphon Dam. During the demolition and new construction phases at the proposed project site, construction equipment and materials may include fuels, oils and lubricants, solvents and cleaners, cements and adhesives, paints and thinners, degreasers, cement and concrete, and asphalt mixtures, which are all commonly used in construction. The construction materials, which are not considered acutely hazardous, would be transported, used, and disposed of during construction. In addition, the proposed site currently stores water treatment chemicals (specifically sodium bisulfite and sodium hypochlorite) that would be temporarily transported and stored offsite while the new proposed treatment facilities are constructed. The routine use or an accidental spill of hazardous materials could result in inadvertent releases in proximity to nearby schools, which could adversely affect students, staff, and the general public.

As described above under Impact 3.8-1, construction activities would be required to comply with numerous hazardous materials regulations designed to ensure that hazardous materials are transported, used, stored, and disposed of in a safe manner to protect worker safety, and to reduce the potential for a release of construction-related fuels or other hazardous materials into the environment, including in proximity to schools.

In addition, as described in Section 2.4.4, *Access and Maintenance Roads*, a new proposed access road will be constructed into the project site starting from the intersection of Portola Parkway and Sand Canyon Avenue before any other proposed project component. Consequently, no construction

or operational traffic would access the site through the Athletic Complex, which is currently how IRWD accesses the project site.

The required compliance with the numerous laws and regulations discussed above that govern the transportation, use, handling, and disposal of hazardous materials during operation of the proposed project would reduce the potential risks to schools within 0.25 miles of the project site, related to emitting and handling hazardous substances; the impact would be less than significant.

Operation

The operation of the project would result in the routine use and transport of some hazardous materials associated with water treatment (specifically sodium bisulfite and sodium hypochlorite). As described above under Impact 3.8-1, the use of water treatment chemicals would be regulated under the HMBP, as well as various other regulations, that would be required for the operation of the proposed facility. In addition, the chemicals would be stored within containers that are themselves within secondary containment.

The required compliance with the numerous laws and regulations discussed above that govern the transportation, use, handling, and disposal of hazardous materials during operation of the proposed project would reduce the impact to schools within one-quarter mile of the project site to less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Hazardous Material Site Listing

Impact 3.8-3: The proposed project would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would not create a significant hazard to the public or the environment.

Construction and Operation

The proposed project site is not included on a list of hazardous materials sites (Cortese List) compiled pursuant to Government Code Section 65962.5; therefore, there would be no impact.

Mitigation Measures

None required

Significance Determination

No Impact

Safety Hazards Near Airport

Impact 3.8-4: The proposed project is not located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport; the proposed project would not result in a safety hazard or excessive noise for people residing or working in the project area.

Construction and Operation

The proposed project site is outside of the Airport Planning Areas for the operational airports in Orange County. The project site is located within 2 miles of the former El Toro MCAS; however, the former El Toro MCAS was decommissioned in 1999, is not operational and is not a public airport or public use airport. Therefore, the proposed project construction and operation would not result in an airport-related safety hazard or airport-related noise for people residing or working in the area. There would be no impact.

Mitigation Measures

None required

Significance Determination

No Impact

Emergency Response Plan

Impact 3.8-5: The proposed project could impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Construction

The Evacuation Plan for the City of Irvine indicates the proposed project site is bounded by two evacuation routes: Portola Parkway to the west and SR-133 to the southeast. Construction of the proposed project involves intersection improvements at the Portola Parkway/Sand Canyon Avenue intersection. All other project construction would be located onsite and not on public rights-of-ways. The proposed project would modify the existing intersection and associated traffic lights to allow construction access through the intersection directly into the proposed project site. Cross walks and associated pedestrian signals would also be modified to facilitate safe pedestrian crossing in all directions. All proposed modifications would be implemented in accordance with the City of Irvine requirements, including traffic control to ensure emergency access is maintained on both rights-of-ways. The intersection modification would not involve closure of any roadways; however, temporary lane closures could be required, for example to allow for restriping of lanes or creating the curb cut and entrance to the proposed access road. As explained in Section 3.12, *Transportation*, to ensure that impacts related to the circulation system do not occur as a result of the proposed project, IRWD would implement **Mitigation Measure TRA-1**, which would require the preparation and implementation of a Traffic Control Plan. The Traffic Control Plan would include, but not be limited to, signage, striping, delineated detours, flagging operations, changeable message signs, delineators, arrow boards, and K-Rails that would be used

during construction to guide motorists, bicyclists, and pedestrians safely through the proposed construction area and allow for adequate emergency access and circulation to the satisfaction of the City of Irvine. The Traffic Control Plan would be coordinated with the City of Irvine, as necessary, as well as with emergency responders, which include fire departments, police departments, and ambulances that have jurisdiction within the proposed project area. Therefore, with implementation of Mitigation Measure TRA-1, impacts to circulation system during the initial intersection improvement phase of the proposed project would be reduced to a less than significant level, and project construction would not impair or physically interfere with emergency response teams or an evacuation plan. Impacts would be less than significant with mitigation.

Operation

Operation and maintenance activities for the proposed project would be substantially similar to current conditions respective to emergency response and evacuation. No operation-related activities would occur within surrounding rights-of-ways or along evacuation routes. Once the proposed improvements at Portola Parkway/Sand Canyon Avenue intersection are complete, site access for operation and maintenance vehicles would be through the intersection into IRWD property. The proposed project would not impair implementation of or physically interfere with the City of Irvine Evacuation Plan. As a result, no impact would occur.

As discussed in Section 3.8.1, *Environmental Setting, Emergency Response*, all dams under DSOD jurisdiction are required to have an Emergency Action Plan (EAP) to establish the response in the event of a failure of the dam. The Syphon Reservoir EAP describes the existing dam and reservoir; identifies notification, communication, and response responsibilities of IRWD and impacted jurisdictions/public safety agencies; surveillance, monitoring, and response procedures; estimated inundation depths and arrival times; and training procedures. Implementation of the proposed project would require an update to the Syphon Reservoir EAP and approval of the updated EAP by DSOD. Please refer to Section 3.9, *Hydrology and Water Quality*, for a more detailed discussion of the Syphon Reservoir EAP.

Mitigation Measures

Implement Mitigation Measure TRA-1: Traffic Control Plan (see Section 3.12, *Transportation*, for details)

Significance Determination

Less than Significant Impact with Mitigation

Wildland Fires

Impact 3.8-6: The proposed project could expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires.

Construction

As discussed in Section 3.8.1, *Environmental Setting*, the proposed project site is located within a State Responsibility Area, Moderate Fire Hazard Severity Zone (FHSZ) and is adjacent to areas mapped as a Very High FHSZ. As discussed in Impact 3.14-2 in Section 3.14, *Wildfire*, the proposed project site includes slopes surrounding the existing reservoir that are susceptible to prevailing winds. Brush and grassland habitats within the proposed project site are highly flammable. The primary fire hazards from project construction would involve the use of vehicles and equipment. Heat or sparks from construction vehicles and equipment could ignite dry vegetation and cause a fire, particularly during the dry, hot conditions from June to September and from September to December when dry, Santa Ana winds are more likely to occur. Additionally, construction activities that could result in sparks have a greater likelihood of creating a source of ignition. Therefore, depending on the time of year (as seasonality may affect climate conditions, prevailing winds, and vegetation/fuels) and the location of construction activities, the increase in sources of potential ignition associated with project construction could exacerbate the risk of wildfire at the project site and in the surrounding area. Project construction could increase the risk of exposure of people or structures to significant loss, injury, or death involving wildland fires, which would result in a potentially significant impact.

As explained for Impact 3.14-2 in Section 3.14, *Wildfire*, all personnel on the proposed project site would have to comply with Public Resources Code (PRC) Sections 4427, 4428, 4431, and 4442, which include regulations relating to the handling of combustible fuels and equipment that can exacerbate fire risks. During construction, strict adherence to these PRC sections would ensure that contractors are responsible for all monitoring and safety measures ensuring that any risk to exacerbate wildfire would be reduced. Additionally, all construction must comply with fire protection and prevention requirements specified by the California Code of Regulations (CCR) and Cal/OSHA. This includes various measures such as easy accessibility of firefighting equipment, proper storage of combustible liquids, no smoking in service and refueling areas, and worker training for firefighter extinguisher use. Furthermore, implementation of **Mitigation Measure WDF-1** would be required to ensure fire hazard reduction measures are implemented during proposed project activities to further reduce the potential for wildfire impacts on project workers. As a result, the potential impact would be reduced to a less than significant level with mitigation.

Operation

Operation of the proposed project would not include any activities that would exacerbate wildfire risk relative to existing conditions. The proposed project site would continue to operate as a recycled water storage reservoir. The proposed project would only require periodic maintenance. The new proposed filtration and disinfection facilities would require monthly or bi-monthly chemical deliveries, similar to existing conditions. IRWD Operations and Maintenance staff would continue to conduct daily safety and security checks of the site, similar to existing

conditions. There would be a less than significant impact due to wildland fires during operation of the proposed project.

As discussed above, the proposed project site includes slopes susceptible to prevailing winds, and brush and grassland habitats within the project site are highly flammable. The proposed project would involve expansion of the existing reservoir which would result in increased water storage capacity and water levels. This would effectively create more inundated area and fewer steep slopes susceptible to prevailing winds within the proposed project area in winter and spring months when the reservoir is full. The reduction of flammable surface area within the Moderate FHSZ could prevent or reduce uncontrolled spread of wildfire. As the reservoir is drawn down in the summer months to satisfy recycled water needs in IRWD's service area, the surface area susceptible to wildfire risk would increase. However, the flammable vegetation removed during construction would continue to be absent within the limits of the high water elevation, reducing the risk of wildfire. Operation-related activities would involve a limited number of maintenance trucks for inspections and material delivery. These trucks would be limited to established access roads and would have a low potential of producing sparks, fire, or flame that could result in uncontrolled spread of wildfire. Nevertheless, due to the site topography and wildfire risk, operators of the project site would comply with PRC Sections 4427, 4428, 4431, and 4442, which include regulations relating to the handling of combustible fuels and equipment that can exacerbate fire risks, and IRWD would require implementation of Mitigation Measure WDF-1. As a result, impacts would be reduced to a less than significant level with mitigation.

Mitigation Measure

Implement Mitigation Measure WDF-1: Fire Hazard Reduction Measures (see Section 3.14, *Wildfire*, for details)

Significance Determination

Less than Significant Impact with Mitigation

Cumulative Impacts

This section presents an analysis of the cumulative effects of the proposed project in combination with other past, present, and reasonably foreseeable future projects that could cause cumulatively considerable impacts relative to hazards and hazardous materials. As previously discussed, the proposed project would have no impact with respect to being located on a hazardous materials site listed on Government Code Section 65962.5 or being located within two miles of an airport. Accordingly, the proposed project could not contribute to cumulative impacts related to these topics and are not discussed further.

The geographic area affected by the proposed project and its potential to contribute to cumulative impacts varies based on the environmental resource under consideration. The geographic scope of analysis for cumulative hazardous materials impacts encompasses and is limited to the proposed project site and its immediately adjacent area. This is because impacts relative to hazardous materials are generally site-specific and depend on the nature and extent of the hazardous materials

release, and existing and future soil and groundwater conditions. For example, hazardous materials incidents tend to be limited to a smaller more localized area surrounding the immediate spill location and extent of the release, and could only be cumulative if two or more hazardous materials releases spatially overlapped.

The timeframe during which the proposed project could contribute to cumulative hazards and hazardous materials effects includes both the construction and operations phases. For the proposed project, the operations phase is permanent. However, similar to the geographic limitations discussed above, it should be noted that impacts relative to hazardous materials are generally time-specific. Hazardous materials events could only be cumulative if two or more hazardous materials releases occurred at the same time, as well as overlapping at the same location.

Impact 3.8-7: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative short-term and long-term impacts to hazards, hazardous materials, and wildfires.

Cumulative Impacts during Project Construction

Significant cumulative impacts related to hazards and hazardous materials could occur if the incremental impacts of the proposed project combined with the incremental impacts of one or more cumulative projects identified in Table 3-1, Related Projects for Cumulative Analysis, to substantially increase risk that people or the environment would be exposed to hazards and hazardous materials. The only cumulative projects that could be geographically adjacent or overlap components of the proposed project would be cumulative project Number 3, Gateway Community Park, and Number 9, Truck Route Roadway Rehabilitation, shown on Figure 3-1, Cumulative Project Locations. Cumulative project Number 3 would involve the construction of a new community park adjacent to the north side of the proposed project. Cumulative project Number 9 would involve the rehabilitation and paving of streets including Portola Parkway just west of the proposed project.

Cumulative projects would be subject to the same regulatory requirements discussed for the proposed project, including the implementation of HMBPs and compliance with existing regulations for the transport, use, storage, and disposal of hazardous materials. That is, cumulative projects involving releases of or encountering hazardous materials also would be required to manage their hazardous materials to the same established regulatory standards and, in the case of spills or accidents, remediate their respective sites to the same established regulatory standards.

This would be the case regardless of the number, frequency, or size of the release(s), or the residual amount of chemicals present in the soil from previous spills. While it is possible that the proposed project and cumulative projects could result in releases of hazardous materials at the same time and in overlapping locations, the responsible party associated with each spill would be required to remediate site conditions to the same established regulatory standards. The residual less-than-significant effects of the proposed project that would remain after remediation would not combine with the potential residual effects of cumulative projects to cause a potential significant cumulative impact because residual impacts would be highly site-specific.

Accordingly, no significant cumulative impact with respect to the use or release of hazardous materials would result. For the above reasons, the combined effects of the construction of the proposed project in combination with cumulative projects would not have a cumulatively considerable contribution to a cumulative impact relative to the use of hazardous materials.

The construction of the cumulative projects could require the temporary closure of traffic lanes, which could impact emergency access. Similar to the proposed project, other cumulative construction projects would be required to provide appropriate traffic control and emergency access for their projects similar to Mitigation Measure TRA-1. Implementation of traffic control plans would reduce the cumulatively considerable contribution to a cumulative impact relative to emergency access.

Finally, cumulative projects in areas susceptible to wildfires would also be required to implement wildfire prevention measures to prevent wildfire, such as the proposed project's Mitigation Measure WDF-1. For the above reasons, the combined effects of the proposed project and cumulative projects would not result in a cumulatively considerable effect, and impacts would be less than significant.

Cumulative Impacts during Project Operations

Significant cumulative impacts related to operational hazards could occur if the incremental impacts of the proposed project combined with those of one or more of the cumulative projects to cause a substantial increase in risk that people or the environment would be exposed to hazardous materials used or encountered during the operations phase.

The only cumulative projects that could be geographically adjacent or overlap components of the proposed project would be cumulative project Number 3, Gateway Community Park, and Number 9, Truck Route Roadway Rehabilitation, shown on Figure 3-1. Cumulative project Number 3 would involve the construction of a new community park adjacent to the north side of the proposed project. Once constructed, the community park may use fertilizers, pesticides, and/or herbicides, a change from existing conditions. Cumulative project Number 9 would involve the rehabilitation and paving of streets including Portola Parkway just west of the proposed project. Once constructed, the roadway rehabilitation project would not result in an increase of the use of hazardous materials during operations and is not considered further.

Similar to the proposed project, the cumulative project activities involving the handling, storage, and disposal of hazardous materials would be required to prepare and implement an HMBP and comply with applicable regulations, including those governing the use, storage, transportation, and disposal of hazardous materials, including emergency response and notification procedures in the event of a spill or release. Specifically, the use of pesticides for cumulative project Number 3 would be required to comply with regulations enforced by the California Department of Pesticide Regulation, which regulates the sale, use, and disposal of pesticides within California.

Transportation and disposal of wastes, such as spent cleaning solutions (for the proposed project) or spent pesticides (for cumulative project Number 3) would also be subject to regulations for the safe handling, transportation, and disposal of chemicals and wastes. As noted previously, such regulations include standards to which parties responsible for hazardous materials releases must

return spill sites, regardless of location, frequency, or size of release, or existing background contaminant concentrations to their original conditions. Compliance with existing regulations regarding hazardous materials use would reduce the risk of environmental or human exposure to such materials would reduce the cumulatively considerable contribution to a cumulative impact relative to hazardous materials.

Finally, cumulative projects in areas susceptible to wildfires would also be required to implement wildfire prevention measures to prevent wildfire, such as the proposed project's Mitigation Measure WDF-1, which would require all spark arrestors on construction equipment to be in good working order, and all vehicles and crews to have access to functional fire extinguishers at all times. With compliance with existing regulations and implementation of mitigation measures to require spark arrestors and fire extinguishers, the combined effects of the proposed project and cumulative projects would not result in a cumulatively considerable effect, and impacts would be less than significant relative to wildfires.

Mitigation Measures

Implement Mitigation Measure TRA-1: Traffic Control Plan (see Section 3.12, *Transportation*, for details)

Implement Mitigation Measure WDF-1: Fire Hazard Reduction Measures (see Section 3.14, *Wildfire*, for details)

3.9 Hydrology and Water Quality

This section evaluates the potential hydrology and water quality impacts associated with construction and operation of the proposed project. This section includes a description of the existing hydrologic conditions in and around the proposed project site; a summary of applicable regulations related to hydrology and water quality; and an evaluation of the potential impacts of the proposed project related to hydrology in and around the project site, including cumulative impacts.

To inform the project design, the investigations listed below have been conducted to investigate site conditions and identify potential hydrological issues and provide recommendations to address those issues. The information provided in the listed reports are the primary source of information for this section.

3.9.1 Environmental Setting

Regional and Local Hydrology

IRWD's Syphon Reservoir is located northeast of Portola Parkway, between Bee Canyon Access Road and State Route 133 in unincorporated Orange County, just east of the Irvine city limits. The existing Syphon Reservoir is an enclosed water body located in the bowl-shaped Syphon Canyon, at the foothills of the Santa Ana Mountains, between Bee Canyon to the north and Hicks Canyon south of the site. The Syphon Reservoir is located within the lower Santa Ana Basin, whose surface waters include the San Diego Creek Drainage and its tributaries including Rattlesnake Canyon Wash, Peters Canyon Wash, Hicks Canyon Wash, Bee Canyon Wash, and two ephemeral¹ drainages in the vicinity of the project site, as depicted on **Figure 3.9-1**. San Diego Creek and its tributaries drain into Newport Bay at the Pacific Ocean about 11.5 miles southwest of Syphon Reservoir. Land uses surrounding the proposed project site generally consist of open space (including lands under conservation plans), agriculture, residential, and the Crean Lutheran High School Athletic Complex, located immediately north of Portola Parkway and southwest of the existing dam. With the exception of the Highline Canal, which would be abandoned with the project, and two unnamed ephemeral drainages, no surface streams flow in the Syphon Canyon.

¹ Ephemeral drainages only flow for short periods of time in direct reaction to rainfall. Intermittent or seasonal drainages flow for weeks to months of the year when it receives ample runoff water from the surrounding watershed, springs, groundwater discharge, or melting snow.

Syphon Reservoir Improvement Project

Figure 3.9-1
Surface Waters and Drainages
in the Vicinity of Syphon Reservoir

Site Drainage and Topography

The Syphon Canyon tributary basin to the existing reservoir encompasses about 204 acres or 0.32 square miles. The topography in Syphon Canyon surrounding the existing reservoir is hilly with ridges and terraced slopes. Ground surface elevations range from 675 above mean sea level (amsl, based on North American Vertical Datum of 1988 [NAVD88]) at the northwest corner of the drainage basin to 319 amsl at Portola Parkway just downstream of the existing dam. The drainage basin has been historically used for agriculture, consisting of citrus orchards on the hillsides and field crops in the valley. Drainage from the existing reservoir occurs through an outlet works, which serves the dual purpose of low level outlet for recycled water distribution, and for emergency drawdown per the California Department of Water Resources, Division of Safety of Dams (DSOD) criteria. The DSOD is the state agency with jurisdiction over the design, construction, and safety of dams. The existing spillway was constructed for emergency purposes but has never been used during its 62-year history, including during IRWD's ownership and operation of the existing Syphon Reservoir (GEI 2012).

Storm water falling on the area southwest of the existing dam and outside of the catchment area of the reservoir flows into an existing concrete-lined channel that runs parallel to Portola Parkway on the north side of the roadway and discharges into an existing 7-foot high by 10-foot wide concrete box culvert (see **Figure 3.9-2**).

Syphon Reservoir is a constructed reservoir with wetland features, not considered to be waters of the United States (ESA 2018). Generally speaking, Syphon Reservoir is a "closed system," meaning that the facility, used to store tertiary-treated recycled water, is contained and managed in a manner discrete from the watershed, within which it is located. Although the project proposes to expand the capacity of the current reservoir, no modifications to offsite conveyance infrastructure would be required as part of the proposed project. Under normal operating conditions all flow out of Syphon Reservoir is conveyed back to Eastwood Recycled Water Pump Station through an existing 36-inch recycled water pipeline. The exception to this involves periodic storm flows from the area southwest of the dam and outside of the reservoir catchment area, which are collected through an existing concrete channel and discharged to the existing Portola Parkway stormdrain through an existing concrete box culvert depicted in Figure 3.9-2.

Surface Water

As previously discussed, the proposed project site is an artificially constructed reservoir and thus has no naturally occurring surface water flow. As discussed in Section 3.3.1, *RWQCB Wetlands and Waters of the State*, the proposed project site is considered to have some areas along the edges of the existing reservoir that are considered to be Waters of the State due to the presence of established but artificial (i.e., man-made) wetlands. The state regulates artificially constructed wetlands if the wetland is specifically identified in a Basin Plan as a wetland or other Waters of the State. A review of the Basin Plan indicates that the Syphon Reservoir is designated as a Water of the State (SARWQCB 2019). Therefore, the RWQCB could regulate the project activities under Porter-Cologne Water Quality Control Act.

Syphon Reservoir Improvement Project

Figure 3.9-2
Portola Parkway Storm Drain

Groundwater

The project overlies the Irvine subbasin at the eastern fringes of the Coastal Plain of Orange County Groundwater Basin, which is identified by the California Department of Water Resources (DWR) under the Sustainable Groundwater Management Act (SGMA) as a medium-priority basin (DWR, 2018). SGMA is discussed further under Section 3.9.2, *Regulatory Framework, Sustainable Groundwater Management Act*. Subsurface inflow from the foothills into the Irvine subbasin provides an estimated 14,000 acre feet per year of groundwater recharge into the greater Orange County Groundwater Basin (OCWD, 2017). As noted in the Water Quality Control Plan for the Santa Ana Region (Basin Plan), beneficial uses for this groundwater basin include municipal and domestic supply, agricultural supply, industrial services supply, and industrial process supply (Santa Ana RWQCB, 2019). One of the geotechnical analyses completed for the proposed project determined that groundwater levels below the project site range from 3 feet below ground surface (bgs) at the toe of the existing dam, to 44 feet bgs at the embankment (GEI 2012).

Water Quality

As discussed in Section 2.2, *Project Purpose and Need*, the expansion of Syphon Reservoir would assist in meeting projected demands within the service area by allowing the storage of additional recycled water produced at the Michelson WRP during periods of low demand (winter months) for use during periods of high demand (summer months). The recycled water is used to maintain community landscaping, as well as agricultural, business and industrial uses, such as cooling tower applications and toilet flushing in dual-plumbed commercial buildings. The existing water quality of the recycled water produced from the Michelson WRP as described by total dissolved solids (TDS) averaged 663 milligrams per liter (mg/l) from 2010 to 2019 (IRWD, 2021). The concentrations of TDS in IRWD's recycled water is limited to 720 mg/l under its permit from the Regional Water Quality Control Board (RWQCB).

Flood Hazards

Flood hazards in an urban environment are influenced by development patterns, as storm events contribute to rapid runoff over impervious surfaces and can flood local drainages. In addition, flood hazards can occur due to emergency releases from dams that lead to local or regional inundation. The existing Syphon Reservoir is in Zone A, which is a special flood hazard area without base flood elevation.² However, given that the existing reservoir is within a closed basin (i.e., the reservoir basin is closed off by the dam), the Syphon Reservoir would not be considered to be at risk from flooding due to a 100-year storm event. Lands surrounding the existing reservoir are in Zone X, defined by FEMA as an area of minimal flood hazard (FEMA 2009). Issues with flood hazards associated with the proposed project are related to dam safety and inundation areas, as described in more detail below.

² Zone A means that FEMA has determined that the area may be subject to a 100-year flood event but has not prepared a detailed hydraulic analysis to quantify the base flood elevation or potential flood depth.

Dam Safety

The DSOD refers to the Syphon Reservoir as the Syphon Canyon Reservoir. The existing Syphon Dam is a homogeneous earthen embankment with observed seepage at the downstream toe of the dam (GEI 2012). The surface area of Syphon Reservoir is approximately 28 acres. The holding capacity is 578 acre feet of water at the spillway crest elevation of 380.4 feet (Stetson 2018). The existing reservoir is under the jurisdiction of the DSOD, which requires preparation of inundation maps, for areas downstream of dams that could be subject to flooding in the event of a dam failure, as discussed further in Section 3.9.2, *Regulatory Framework*.

DSOD hazard potential classifications are based on Federal guidelines published by the Federal Emergency Management Agency (FEMA). FEMA recommends a three-step rating system that defines low, significant, and high hazard potential classifications, determined from factors including potential loss of life, economic loss, and environmental damage resulting from a *hypothetical* dam failure scenario. DSOD further subdivides FEMA's High classification to an Extremely High classification in order to identify dams upstream of highly populated areas or extensive development dams with short evacuation waiting times. When the population within the inundation area consists of 1,000 persons or more, the dam is generally assigned an "Extremely High" risk classification (IRWD 2020). The mapped inundation area for the existing Syphon Reservoir is provided in **Figure 3.9-3** (Stetson 2018). As depicted on the figure, under existing conditions, the potential area of inundation extends into residential Irvine before reaching defined channels downstream, such as Peters Canyon Wash and San Diego Creek. The area downstream of Syphon Dam is highly populated, thus the downstream hazard for the existing Syphon Reservoir is classified by DSOD as extremely high (DWR 2019a). Note that the cited maximum depths at each cross section in Figure 3.9-3 are determined by existing topography and typically occur near the centerline of the designated flood area; the depths would decrease to zero at the edges of the designated area.

Tsunami and Seiche Hazards

Tsunamis are ocean waves generated by vertical movement of the sea floor, normally associated with earthquakes or volcanic eruptions. Seiches are oscillations of enclosed or semi-enclosed bodies of water that result from seismic events, wind stress, volcanic eruptions, underwater landslides, and local basin reflections of tsunamis. The proposed project site is not located in a coastal area subject to tsunamis (Cal OES, 2019). Seiches due to seismic and wind-driven wave activity have potential to occur within the Syphon Reservoir.

3.9.2 Regulatory Framework

Federal

Clean Water Act

The Federal Water Pollution Control Act, commonly referred to as the Clean Water Act (CWA) was enacted in 1948, and expanded in 1972 as a basic structure for regulating discharges of pollutants into the waters of the United States and regulating water quality standards for surface waters (USEPA 2019). The United States Environmental Protection Agency (USEPA) is the federal agency responsible for water quality management pursuant to the CWA. The purpose of the CWA is to protect and maintain the quality and integrity of the Nation's waters by requiring states to develop and implement state water plans and policies. The relevant sections of the CWA are summarized below.

CWA Section 402: National Pollutant Discharge Elimination System

The National Pollutant Discharge Elimination System (NPDES) permit program under Section 402 of the CWA is one of the primary mechanisms for controlling water pollution through the regulation of sources that discharge pollutants into waters of the United States. USEPA has delegated authority of issuing NPDES permits in California to the State Water Resources Control Board (SWRCB), which has nine Regional Water Quality Control Boards (RWQCBs). The Santa Ana RWQCB regulates water quality in the proposed project area. The NPDES permit program is discussed in detail below under State Regulations.

National Flood Insurance Program

FEMA determines flood elevations and floodplain boundaries based on U.S. Army Corps of Engineers' studies. FEMA also distributes the Flood Insurance Rate Maps (FIRM) used in the National Flood Insurance Program. FIRMs identify the locations of special flood hazard areas, including 100-year floodplains. The proposed project site is located in an identified FIRM flood hazard area (FEMA 2009) as described above in Section 3.9.1, *Environmental Setting, Flood Hazards*. The existing Syphon Reservoir is in Zone A, which is a special flood hazard area without base flood elevation.³ However, given that the existing reservoir is within a closed basin (i.e., the reservoir basin is closed off by the dam), the Syphon Reservoir would not be considered to be at risk from flooding due to a 100-year storm event. Lands surrounding the existing reservoir are in Zone X, defined by FEMA as an area of minimal flood hazard, which is the lowest possible rating for flood risk (FEMA 2009). Therefore, the federal government does not require flood insurance for any properties due to Syphon Reservoir in its current or proposed form.

Federal Guidelines for Dam Safety and Emergency Action Planning

The Water Resources Development Act of 1996 (Public Law 104-303), directed the FEMA to establish a National Dam Safety Program and formally established the National Dam Safety

³ Zone A means that FEMA has determined that the area may be subject to a 100-year flood event but has not prepared a detailed hydraulic analysis to quantify the base flood elevation or potential flood depth.

Review Board and the Interagency Committee on Dam Safety as its authorized permanent advisory body. Through this Act, FEMA developed guidelines for dam owners to improve conditions for preparedness for foreseeable emergencies. The guidelines are intended to encourage development of comprehensive and consistent emergency action planning to protect lives and reduce property damage and involve participation of emergency management authorities and dam owners in emergency action planning (FEMA 2013). Emergency action plans (developed for a given dam location) outline actions to be taken to alleviate dam problems, and outline responsibilities and procedures for warning/notification, and notably, the development of inundation maps to identify critical infrastructure and at-risk population sites that may require protective measures, warning, and evacuation planning.

State

California Department of Water Resources, Division of Safety of Dams

The DSOD, through Division 3 of the California Water Code, is entrusted with regulatory authority and oversight for dam safety. The DSOD provides oversight of the design, construction, and maintenance of over 1,200 jurisdictional sized dams in California. Jurisdictional dams are dams that are more than 6 feet high and impound 50 acre-feet or more of water, or 25 feet or higher and impound more than 15 acre-feet of water. The jurisdictional height of a dam, as determined by DSOD, is the vertical distance measured from the lowest point at the downstream toe of the dam to its maximum storage elevation, which is typically the spillway crest. The Syphon Reservoir is considered a jurisdictional dam. The DSOD ensures dam safety by:

- Reviewing and approving dam enlargements, repairs, alterations, and removals to ensure that the dam appurtenant structures are designed to meet minimum requirements.
- Performing independent analyses to understand the performance of the dam and appurtenant structures. These analyses can include structural, hydrologic, hydraulic, and geotechnical evaluations.
- Overseeing construction to ensure work is being done in accordance with the approved plans and specifications.
- Inspecting each dam on an annual basis to ensure it is safe, performing as intended, and is not developing issues. Roughly 1/3 of these inspections include in-depth instrumentation reviews of the dam surveillance network data.
- Periodically reviewing the stability of dams and their major appurtenances in light of improved design approaches and requirements, as well as new findings regarding earthquake hazards and hydrologic estimates in California.

The California Office of Emergency Services Dam Safety Program was enhanced through passage of SB 92 (2017). The bill required preparation of Emergency Action Plans (EAPs) (except for dams designated as low-hazard) and brings inundation mapping under the jurisdiction of the California DWR. This legislation set forth additional provisions for EAPs including compliance requirements, exercises of the plan and coordination with local public safety agencies.

EAPs are written documents that identify potential emergency conditions at a dam and specify pre-planned actions to help minimize property damage and loss of life should these conditions

occur. EAPs contain procedures and information that instruct dam owners to issue early warning and notification messages to downstream emergency management authorities. EAPs also provide assistance and guidance to local jurisdictions on their emergency planning for a dam failure event to ensure effective dam incident emergency response procedures and planning. SB 92 also requires EAPs be updated (at minimum) every 10 years or when there are significant changes at the dam, its critical appurtenant structures, or downstream hazard classification (DWR 2019b).

Consistent with Federal Guidelines for Dam Safety, IRWD prepared an EAP for Syphon Reservoir (Stetson Engineers 2021). The EAP was reviewed by the California Office of Emergency Services, Dam Safety Planning Division (CalOES-DSPD), which approved the EAP in March 2021 (CalOES-DSPD 2021). In addition, the City of Irvine Police Department, as the primary public safety agency for the Syphon Reservoir EAP, has reviewed and approved the emergency notification processes and procedures described in the EAP (IRWD 2020c). The Syphon Reservoir EAP would be required to be updated and recirculated for agency review and comment in the event of approval of the proposed project.

The Syphon Reservoir EAP describes the existing dam and reservoir; identifies notification, communication, and response responsibilities of IRWD and impacted jurisdictions/public safety agencies; surveillance, monitoring, and response procedures; estimated inundation depths and arrival times; and training procedures. Although highly improbable, in the event of a potential and imminent dam failure, the observer of the potential failure would immediately contact IRWD's 24-hour operations stand-by number and 911. IRWD would then notify the City of Irvine Police Department, and together they would immediately begin emergency response actions, as well as further notifications to other police departments, fire departments, public works, schools, Caltrans, and other responsible entities, all of whom would implement further notifications and evacuations, as appropriate. Concurrently, IRWD would begin emergency drawdown of the reservoir through the storm drain system, and implement appropriate stabilization actions. In parallel, IRWD would initiate the sequential notification of the DWR Flood Operations Center, CalOES Warning Center, and the DSOD. All of these entities have pre-established response actions designed to rapidly drain the reservoir to the nearby storm drain system, stabilize the dam and reservoir, and minimize impacts to the downstream areas.

California Fish and Game Code Section 1602

Pursuant to Division 2, Chapter 6, Section 1602 of the state Fish and Game Code, CDFW regulates diversion obstructions, or alterations to the natural flow or bed, channel, or bank of any river, stream or lake which supports fish or wildlife. According to the Syphon Reservoir Jurisdictional Delineation, there are waters of the state on the project site that could be subject to CDFW jurisdiction including Syphon Reservoir, wetland and riparian vegetation and two ephemeral drainages, which drain into the existing reservoir (ESA 2018). Therefore, the proposed project would be required to apply for a Lake and Streambed Alteration Agreement through CDFW.

Construction General Permit

The *NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities* (Order 2009-0009-DWQ, NPDES No. CAS000002; as amended by Orders 2010-0014-DWQ and 2012-006-DWQ; Construction General Permit) regulates discharges of pollutants in stormwater associated with construction activity to waters of the U.S. from construction sites that disturb one or more acres of land surface, or that are part of a common plan of development or sale that disturbs more than 1 acre of land surface. As previously discussed, the proposed project site does not have waters of the U.S. However, during construction of the new proposed dam, stormwater falling on the project site could become runoff that could flow downslope to the City of Irvine and possibly affect offsite waters of the U.S. if not properly controlled. The Construction General Permit regulates stormwater discharges associated with construction or demolition activities, such as clearing and excavation; construction of buildings; and linear underground projects, including the installation of water pipelines and other utility lines.

The Construction General Permit requires the development and implementation of a Stormwater Pollution Prevention Plan (SWPPP) that includes specific best management practices (BMPs) designed to prevent pollutants from contacting stormwater and keep all products of erosion from moving off site into receiving waters. The SWPPP BMPs are intended to protect surface water quality by preventing the off-site migration of eroded soil and construction-related pollutants from the construction area. Routine inspection of all BMPs is required under the provisions of the Construction General Permit. The Construction General Permit is discussed in more detail in Section 3.6, *Geology and Soils*.

NPDES Municipal Separate Storm Sewer System Permit (MS4)

In 1987, amendments to the Clean Water Act expanded the NPDES permit program to regulate discharges from storm drains owned and operated by municipalities, such as the County of Orange and the City of Irvine.⁴ In November 1990, USEPA published regulations that established application requirements for stormwater permits for municipal stormwater discharges. In California, the NPDES stormwater permit program is administered and enforced by the SWRCB through the nine RWQCBs by issuing Waste Discharge Requirements and NPDES permits. These permits are reissued approximately every five years and also include applicable provisions of the state Porter-Cologne Act, which is the principal legislation for controlling stormwater pollutants in California. The permit establishes regulations covering discharge prohibitions, receiving water limitations, municipal operations, new development, construction site controls (construction site runoff), and other regulations to regulate surface water quality.

The discharge prohibitions prohibit the discharge of non-stormwater (materials other than stormwater) into storm drain systems and watercourses. The municipal operations regulations include a number of requirements to control and reduce non-stormwater discharges and polluted stormwater to storm drains and watercourses during operation, inspection, and routine repair and maintenance activities of municipal facilities and infrastructure, such as the proposed project. The

⁴ The project site is located within the County of Orange. Stormwater from the project site drains into the City of Irvine.

requirements include source control, site design, and stormwater treatment requirements, such as minimizing disturbance of natural infiltration areas and the addition of impervious surfaces, controlling and directing runoff, and the use of infiltration and bioretention measures, among other measures. The MS4 Permit for the proposed project area is discussed further below in the section on local regulations.

Groundwater Dewatering Permit for the Santa Ana Region

Discharge of groundwater would require coverage under the General Discharge Permit for Discharges to Surface Waters of Groundwater resulting from Groundwater Dewatering Operations and/or Groundwater Cleanup Activities at Sites within the San Diego Creek/ Newport Bay Watershed Polluted by Petroleum Hydrocarbons, Solvents, Metals, and/or Salts (Dewatering Permit for Santa Ana Region). It is anticipated that if groundwater were to be encountered during the proposed project's excavation, groundwater would be dewatered and conveyed to proposed onsite settling ponds or discharged to the existing storm drain, if necessary, pursuant to the conditions and requirements in Order Number: R8-2007-041; NPDES Number: CAG918002 (Santa Ana RWQCB 2009).

Sustainable Groundwater Management Act

The Sustainable Groundwater Management Act (SGMA) of 2014, effective January 1, 2015, authorizes local agencies to manage groundwater in a sustainable manner and allows limited state intervention when necessary to protect groundwater resources.

The SGMA defined "sustainable groundwater management"; established a framework for local agencies to develop plans and implement strategies to sustainably manage groundwater resources; prioritized the basins with conditions of overdraft (ranked as high and medium priority); and set a 20-year timeline for implementation. Basins were initially prioritized under the SGMA by the California Department of Water Resources in 2014 under the California Statewide Groundwater Elevation Monitoring Program.

The proposed project site is within the Coastal Plain of Orange County Groundwater Basin (Basin 8-1), designated as a medium priority basin due to the heavy reliance of the basin's groundwater as a source of drinking water supply (OCWD 2017). The Groundwater Sustainability Agencies for this basin (collectively) include Orange County Water District, IRWD and the City of La Habra. Together the three agencies ("Submitting Agencies") submitted an Alternative to a Groundwater Sustainability Plan (GSP), or the "Basin 8-1 Alternative," which is "functionally equivalent" to a GSP for management of groundwater resources in the basin. Under SGMA, the Basin 8-1 Alternative should demonstrate how water managers have already achieved or will achieve sustainable groundwater management of the basin. An alternative, per Water Code Section 10733.6 (b), may be: an existing groundwater management plan; groundwater management pursuant to an adjudication; or, as in the case of the Basin 8-1 Alternative, an analysis of basin conditions that demonstrates that the basin has operated within its sustainable yield over a period of at least 10 years.

Local

Santa Ana Water Quality Control Plan

The proposed project site is located within the region under the jurisdiction of the Santa Ana RWQCB, which establishes regulatory standards and objectives for water quality in the region in the *Water Quality Control Plan, Santa Ana River Basin*, commonly referred to as the Basin Plan. The Basin Plan identifies existing and potential beneficial uses for surface water and groundwater and provides numerical and narrative water quality objectives designed to protect those uses. Syphon Reservoir, spelled as Siphon Reservoir in the Basin Plan, has the following surface water beneficial uses:

AGR - Agricultural Supply waters are used for farming, horticulture or ranching. These uses may include, but are not limited to, irrigation, stock watering, and support of vegetation for range grazing.

REC1 - Water Contact Recreation (Primary Contact Recreation) waters are used for recreational activities involving body contact with water where ingestion of water is reasonably possible. These uses may include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, whitewater activities, fishing and use of natural hot springs. Note that although the Syphon Reservoir is listed with a REC1 beneficial use, IRWD does not permit primary contact recreation because the reservoir waters are used for water supply.

REC2 - Non-contact Water Recreation (Secondary Contact Recreation) waters are used for recreational activities involving proximity to water, but not normally involving body contact with water where ingestion of water would be reasonably possible. These uses may include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing and aesthetic enjoyment in conjunction with the above activities.

WARM - Warm Freshwater Habitat waters support warmwater ecosystems that may include, but are not limited to, preservation and enhancement of aquatic habitats, vegetation, fish and wildlife, including invertebrates.

WILD - Wildlife Habitat waters support wildlife habitats that may include, but are not limited to, the preservation and enhancement of vegetation and prey species used by waterfowl and other wildlife.

RARE - Rare, Threatened or Endangered Species waters support the habitats necessary for the survival and successful maintenance of plant or animal species designated under state or federal law as rare, threatened or endangered.

As previously discussed, the proposed project site is an artificially constructed reservoir and thus has no naturally occurring surface water flow. As discussed in Section 3.3.1, *RWQCB Wetlands and Waters of the State*, the proposed project site is considered to have some areas along the edges of the reservoir that are considered to be Waters of the State due to the presence of

established but artificial (i.e., man-made) wetlands. The state regulates artificially constructed wetlands if the wetland is specifically identified in a Basin Plan as a wetland or other water of the State. A review of the Basin Plan indicates that the Syphon Reservoir is designated as a Water of the State (SARWQCB 2019). Therefore, the RWQCB could regulate the proposed project activities under Porter-Cologne Water Quality Control Act.

As discussed above in Section 3.9.1, *Environmental Setting, Groundwater*, the proposed project site overlies the Irvine subbasin at the eastern fringes of the Coastal Plain of Orange County Groundwater Basin. Beneficial uses identified in the Basin Plan for this groundwater basin include the following:

MUN - Municipal and Domestic Supply waters are used for community, military, municipal or individual water supply systems. These uses may include, but are not limited to, drinking water supply.

AGR - Agricultural Supply waters are used for farming, horticulture or ranching. These uses may include, but are not limited to, irrigation, stock watering, and support of vegetation for range grazing.

IND - Industrial Service Supply waters are used for industrial activities that do not depend primarily on water quality. These uses may include, but are not limited to, mining, cooling water supply, hydraulic conveyance, gravel washing, fire protection and oil well repressurization.

PROC - Industrial Process Supply waters are used for industrial activities that depend primarily on water quality. These uses may include, but are not limited to, process water supply and all uses of water related to product manufacture or food preparation.

Orange County Municipal Storm Water Permit [MS4]

The Orange County Municipal Storm Water Permit (MS4) applies to the proposed project (Municipal NPDES Permit No. CAS 618030, Order No. R8-2009-0030 - NPDES Waste Discharge Requirements for the County of Orange, Orange County Flood Control District and the Incorporated Cities of Orange County within the Santa Ana Region, Areawide Urban Storm Water Runoff, Orange County). The NPDES municipal general permits issued by the RWQCB establish regulations covering discharge prohibitions, receiving water limitations, municipal operations (such as the proposed project), new development, construction site controls (construction site runoff), and other regulations to regulate surface water quality (RWQCB 2009). The discharge prohibitions prohibit the discharge of non-stormwater (materials other than stormwater) into storm drain systems and watercourses and includes a tiered categorization of non-stormwater discharges based on potential for pollutant content that may be discharged upon adequate assurance that the discharge contains no pollutants of concern at concentrations that will impact beneficial uses or cause exceedances of water quality standards. The receiving water limitations provide narrative and numeric water quality standards. The municipal operations regulations include a number of requirements to control and reduce non-stormwater discharges and polluted stormwater to storm drains and watercourses during

operation, inspection, and routine repair and maintenance activities of municipal facilities and infrastructure. The requirements include source control, site design, and stormwater treatment requirements, such as minimizing disturbance of natural infiltration areas and the addition of impervious surfaces, controlling and directing runoff, and the use of infiltration and bioretention measures, among other measures. To more efficiently address the requirements, the permittees within the County of Orange, which includes the City of Irvine, developed the Drainage Area Management Plan (DAMP), described below. The MS4 permit applies to the proposed project because (1) the area downgradient (west) of the dam would drain stormwater to the County of Orange.

Drainage Area Management Plan (DAMP)

The DAMP is a programmatic document developed and enforced by the Permittees (which includes the County of Orange and the City of Irvine) and approved by the Santa Ana RWQCB that translates the MS4 Permit requirements into Permittee programs and implementation plans (Orange County 2007). The DAMP is used by the Permittees in the development of their Local Implementation Plans (LIPs), individual ordinances, plans, policies and procedures to manage urban runoff.

Relative to the proposed project, the DAMP would require that the project control sediment and other pollutants from entering the municipal stormwater system. The DAMP describes best management practices (BMPs) in their Model Water Quality Management Plan (WQMP) for Source Control, Site Design, and Treatment Control BMPs that should be considered to guide the design and implementation of the BMPs, with further details provided in DAMP Appendix A-7, and briefly summarized below.

Structural Source Control BMPs are low-technology practices designed to prevent pollutants from contacting stormwater runoff or to prevent discharge of contaminated runoff to the storm drainage system. Site-specific Structural Source Control BMPs include designing and constructing outdoor material and waste storage areas to reduce pollution introduction; use of efficient irrigation systems and landscape design, water conservation, smart controllers, and source control; and protection of slopes and channels and providing energy dissipation measures.

Site Design BMPs aim to minimize impervious areas, maximize permeable areas, minimize directly connected impervious areas, create reduced or zero discharge areas (runoff volume reduction), and conserve natural areas. BMPs include infiltration swales, detection basins, and vegetation. Site Design BMPs reduce direct runoff and increase infiltration onsite, reducing the transport mechanism for moving pollutants offsite.

Treatment Control BMPs are engineered technologies designed to remove pollutants from stormwater runoff. Treatment Control BMPs depend on the type of pollutants in the stormwater runoff, volume or flow of stormwater runoff to be treated, project site conditions, receiving water conditions, and General Industrial Permit requirements, when applicable. Treatment Control BMPs include vegetated strips and swales, dry or wet detention basins, constructed wetlands,

detention basins/sand filters, porous pavement, porous landscape, infiltration basins and trenches, media filter, and other proprietary control measures.

County of Orange

General Plan, Resources and Land Use Elements

The following goals and policies from the Resources Element of the Orange County General Plan are relevant to the proposed project's consideration of water resources (Orange County, 2005).

Goal 1: Ensure an adequate dependable supply of water of acceptable quality for all reasonable uses.

Policies

- 1. Water Supply:** To ensure the adequacy of water supply necessary to serve existing and future development as defined by the General Plan.
- 2. Conservation:** To reduce per capita and total water consumption through conservation and reclamation programs and the support of new technologies.
- 3. Groundwater Resources:** To support groundwater management efforts that are conducted by County water agencies.
- 4. Shortage Planning:** To ensure that Orange County will not be severely impaired by any potential future water shortages.
- 5. Water Quality:** Protect and improve water quality through continued management, enforcement, and reporting requirements.

Encourage an integrated water resources approach for stormwater management that considers water supply, water quality, flood control, open space, and native habitats.

Promote coordination between the County, cities, and other stakeholders in the identification and implementation of watershed protection and Low Impact Development (LID) principles.

Consider implementation of LID principles to conserve natural features (trees, wetlands, streams, etc.), hydrology, drainage patterns, topography, and soils.

Encourage the creation, restoration, and preservation of riparian corridors, wetlands, and buffer zones. Continue to educate the public about protecting water resources.

The following policies from the Land Use Element of the Orange County General Plan (as updated in 2015) establish a framework for managing urban and stormwater runoff (Orange County 2015).

Encourage, support and require all new development and redevelopment projects to identify opportunities for implementation of Low Impact Development (LID) principles in the early stages of the development planning process.

Promote, support, and require innovative site planning and development techniques that allow for implementation of LID principles while taking into consideration specific hydrology and geology conditions.

Encourage, support and require the use of LID as part of an overall strategy to mitigate stormwater impacts from new development and redevelopment projects consistent with current NPDES permit requirements.

Encourage and support, where applicable, the use of buffer zones to protect natural water bodies, including but not limited to, wetlands and riparian corridors. Where infeasible, require other measures to protect natural water bodies.

City of Irvine

General Plan, Conservation and Open Space Element

Objective L-12: Water. Coordinate land planning efforts with the appropriate federal, state, and local agencies, and landowners to encourage the integration of existing and future water sources (reservoirs, lakes, and drainage courses) into development (City of Irvine, 2015).

General Plan, Safety Element

Goal: Minimize the danger to life and property from manmade and natural hazards, including fire hazards, flood hazards, on-seismic geologic hazards, and air hazards.

City of Irvine Municipal Code Control of Stormwater/ Urban Runoff

Irvine Municipal Code Section 6-8-303 contains requirements for control of stormwater and urban runoff including submittal of a Water Quality Management Plan (WQMP) for priority development projects. The WQMP shall be undertaken in accordance with a drainage area management plan; the City (of Irvine's) local implementation plan; and any conditions and requirements established by the community development department reasonably related to the reduction or elimination of pollutants in runoff from the project site. Specific requirements for litter control, implementation of BMPs, and provisions for construction site inspection shall be incorporated into the WQMP.

3.9.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from CEQA Guidelines Appendix G are used as thresholds of significance to determine the impacts of the proposed project as related to hydrology and water quality. The proposed project would have a significant impact if it would:

1. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.
2. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.

3. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
 - a) Result in substantial erosion or siltation on- or off-site;
 - b) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;
 - c) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff;
or
 - d) Impede or redirect flood flows.
4. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.
5. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.
6. Result in a cumulatively considerable impact to hydrology and water quality.

Methodology

The environmental analysis of potential impacts to hydrology and water quality is based on a review of regional literature and water resources data and the site-specific geotechnical investigation, including dam safety and inundation analysis, the feasibility study, design reports and constructability analysis prepared for the proposed project.

The analysis assumes that the proposed project would comply with the various laws and regulations pertaining to water quality, dam safety, and others described in Section 3.9.2, *Regulatory Framework*. For example, as the project would disturb more than one acre, compliance with the Construction General Permit would be required along with implementation of BMPs and conditions of a SWPPP to limit impacts during construction.

Following consideration of the proposed project, as described in the Project Description, and the project's assumed implementation and compliance with regulatory requirements, this impact analysis evaluates whether a significant impact would occur based on the CEQA Appendix G thresholds of significance outlined herein. For potential impacts considered to be significant, mitigation is proposed to reduce the severity of such impacts to less than significant levels.

Impact Analysis

Water Quality

Impact 3.9-1: The proposed project would not violate water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality.

Construction

Implementation of the proposed project would include construction of access roads, clearing of vegetation and other ground disturbing activities to expand the reservoir and construct the

proposed dam, such as trenching, disking, grading and excavation of more than 2 million cubic yards of soil, most of which would be used to re-contour the site. These proposed construction-related activities would result in large stockpiles of soils, and would require the use of hazardous materials that could be mobilized and transported off site by stormwater run-off (nonpoint-source pollution), potentially degrading the water quality of surface waters such as Peter's Canyon Wash and San Diego Creek (as receiving waters via the Portola Parkway storm drain) and the groundwater in Basin 8-1 during construction.

In the absence of planned management for stormwater runoff, soil-disturbing activities, such as excavation and site clearing, could result in erosion of soils from exposed ground surfaces and the migration of soil and sediment in stormwater run-on and run-off to downstream water bodies and storm drains. As part of the proposed project, lined stormwater runoff settling basins would be constructed to contain runoff and stormwater during construction. The proposed settling basins would collect sediment-laden water in the event of a storm; the collection would remove the erosive energy of the flowing water, thus preventing erosion. The basins would then allow the sediment to settle at the bottom of the basin, rather than flowing offsite, which would prevent contaminants, in this case sediment, from leaving the site in stormwater runoff and degrading surface or groundwater quality in the areas west of the project site.

Construction of the proposed project requires maintenance of stockpiled spoils, which could migrate off site during precipitation events and increase sedimentation in downstream receiving water bodies. In addition, fuels, oils and lubricants, and other hazardous materials associated with construction equipment also could adversely affect water quality if spilled or stored improperly and transported offsite by stormwater runoff or allowed to percolate into the underlying groundwater basin. Because the proposed project's construction would disturb more than 1 acre, compliance with the General Construction Permit and development of a SWPPP would be required.

As discussed in Section 3.6, *Geology and Soils*, the Construction General Permit will require the preparation of a SWPPP. Settling basins would be constructed to collect any stormwater runoff from the site during construction and would be one of the BMPs described in and required by the Construction General Permit and its SWPPP. In addition, the SWPPP would require specific BMPs designed to prevent sediment and pollutants from contacting stormwater and from moving offsite into receiving waters. The BMPs fall into several categories, including erosion control, sediment control, waste management and good housekeeping, and are intended to protect surface water quality by preventing the offsite migration of eroded soil and construction-related pollutants from the construction area. As previously discussed, settling basins would be constructed and would be one of the BMPs. In addition, the SWPPP would include typical construction BMPs such as scheduling or limiting certain activities to dry periods, installing sediment barriers such as silt fence and fiber rolls, and maintaining equipment and vehicles used for construction. Non-stormwater management measures include installing specific discharge controls during certain activities, such as paving operations, and vehicle and equipment washing and fueling.

Dewatered groundwater would be discharged in a manner consistent with the terms of the Groundwater Discharge Permit for the Santa Ana Region. Adherence to the terms of the applicable NPDES permits would ensure that water quality violations would not occur as conditions in the

discharge permits, a SWPPP, and BMPs would be implemented to ensure that there would not be a resulting degradation of surface or ground water quality. With compliance with existing regulations, impacts relative to water quality during construction would be less than significant.

Operation

As described in Section 2.4.2, *Reservoir Enlargement*, a proposed seepage control system would be installed and implemented to regulate discharges, effectively intercepting recycled water, while routing seepage into an internal seepage collection system. The seepage control system would consist of a steeply inclined chimney drain and gently sloping blanket drain, which would be installed at a low point at the downstream toe of the new proposed dam to prevent erosion in the embankment area and ensure slope stability. The seepage control system would prevent erosion, which would prevent sediment-laden water from flowing offsite and impacting the water quality of receiving waters to the west.

During reservoir operations, water would be discharged in the event of an emergency into the existing Portola Parkway storm drain through a dissipation channel to allow for controlled discharge. This controlled discharge would be into the existing storm drain system at a rate within the storm drain's capacity per the IRWD Emergency Action Plan as required by the DSOD. With controlled discharge, there would be no uncontrolled erosion that could result in sediment-laden water entering receiving waters west of the proposed project.

Stormwater falling on the west side of the new proposed dam would be routed into the municipal stormwater system and therefore would be required to comply with the MS4 and DAMP requirements discussed in Section 3.9.2, *Regulatory Framework, Local, MS4 and DAMP*. In addition, in the event of an emergency drawdown of water in the new proposed reservoir, some of the new reservoir's water would be routed to the municipal stormwater system and would be required to comply with MS4 and DAMP requirements. MS4 and DAMP BMPs would include Structural Source Control BMPs (e.g., contained outdoor material and waste storage areas; efficient irrigation systems; and protection of slopes), Site Design BMPs (e.g., minimize impervious areas, maximize permeable areas, minimize directly connected impervious areas, create reduced or zero discharge areas (runoff volume reduction), and conserve natural areas), and Treatment Control BMPs (e.g., vegetated strips and swales, dry or wet detention basins, constructed wetlands, detention basins/sand filters, porous pavement, porous landscape, infiltration basins and trenches, media filter, and other proprietary control measures). These BMPs would control the release of sediment and other pollutants into the municipal stormwater system.

The creation of additional storage space for recycled water at Syphon Reservoir would result in changing the composition of recycled water supplied by IRWD to users within their service area (IRWD 2021). The volume of recycled water used within the service area would increase, which would in turn enable IRWD to reduce the volume of water imported from outside of the service area. As a result, there would be an increase in the amount of recycled water available to dual-plumbed commercial buildings for toilet flushing and cooling towers. Since the sewage from toilet flushing and cooling towers returns as influent to the Michelson WRP, the proposed project could affect the TDS concentrations in the recycled water produced at the Michelson WRP. To

evaluate this impact to recycled water quality, IRWD conducted a mass balance analysis of its recycled water supply to estimate the change in TDS loading produced by the Michelson WRP as a result of the proposed project. The TDS concentration of recycled water produced by the Michelson WRP is a complex, interdependent result of flow and TDS loads contributed to and discharged from the Michelson WRP's sewer-sheds. Rather than evaluate these complex processes that can change by day, seasons, and year, the analysis used a simple mass balance to estimate the impact of a change in TDS loading on the TDS load produced by the Michelson WRP.

The mass balance analysis indicated that the increased use of recycled water in dual-plumbed buildings and cooling towers is expected to increase TDS concentration from the average of 663 mg/l (as measured from 2010 to 2019) by 1.6 mg/l for a total TDS concentration of 665 mg/l. This is considered a less than significant increase because it is still well below the permit limitation of 720 mg/l TDS.

The proposed project would comply with existing water quality regulations, and impacts relative to water quality during operations would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Groundwater Supplies

Impact 3.9-2: The proposed project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.

Construction

During the three-year duration of construction, the existing reservoir would be empty, so there may be a temporary decrease in groundwater infiltration during this time. As noted in the geotechnical investigation for the proposed project, groundwater levels in the immediate area around the reservoir fluctuate with reservoir levels, which indicates that groundwater levels are partially supported by surface water infiltration from the reservoir under existing conditions (GEI 2012). As construction of the proposed project is anticipated to encounter groundwater during excavation of the new proposed reservoir, dewatering of this groundwater would be necessary to enable construction of the new dam. Dewatering would take place as described in Section 2.5.3, *Excavation of Material/Existing Dam and Dewatering*. As groundwater depth at the downstream toe of the existing dam is approximately three feet below the ground surface, groundwater relief trenches for dewatering would be installed in sediments and into the alluvium during excavation. The area downstream of the toe of the dam would also be dewatered. Flows from dewatering operations would be routed to the runoff settling basins proposed to be constructed for the project

or discharged to the storm drain. In the event that offsite discharge would be necessary, such discharge would occur in a manner consistent with the terms of the Santa Ana Regional Groundwater Dewatering Permit, pursuant to the conditions and requirements in Order Number: R8-2007-041; NPDES Number: CAG918002. Impacts associated with construction dewatering would be negligible because the Syphon Canyon basin is a relatively small portion of the greater Orange County Coastal Plain Groundwater Basin and dewatering during construction would not have a long-term effect with respect to groundwater levels or supplies. Therefore, construction of the proposed project would not impede sustainable management of the basin, and the impact would be less than significant.

Operation

Operation of the proposed project would result in direct alteration of the landscape that would impact the site's capacity for groundwater recharge. The proposed project would expand Syphon Reservoir over a broader extent of acreage from a surface area footprint of 28 acres up to approximately 82 acres projected at the spillway crest. The existing footprint of the reservoir would continue to be a source of recharge to groundwater because the reservoir is not lined. The expanded footprint of the new proposed reservoir would also not be lined. With the saturation in the expanded reservoir area, the volume of recharge to groundwater would increase, resulting in a beneficial impact to groundwater supplies. As discussed in Section 3.9.1, *Environmental Setting*, Basin 8-1 is designated under SGMA as a medium priority basin, due to the heavy reliance of the basin's groundwater as a source of drinking water supply. The increase in the new reservoir's storage capacity under the proposed project would provide for enhanced recharge to groundwater resources, consistent with strategies for sustainable management of groundwater. Thus, relative to groundwater supplies and sustainable management of the basin, the proposed project would result in a beneficial impact.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Alteration of Drainage Patterns

Impact 3.9-3: The proposed project would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation onsite or offsite; or substantially increase the rate or amount of surface runoff in a manner which would result in flooding onsite or offsite; or create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or impede or redirect flood flows.

Construction

The proposed project would not significantly alter the existing drainage pattern of the project site during construction. During construction of the proposed project, over 2 million cubic yards of sediment is proposed to be excavated from the project site comprised of topsoil, alluvium, colluvium, slopewash, formational materials, and materials from the existing dam. Over-excavation would occur and replacement with compacted embankment fill. Excavated materials would be processed in the stockpile areas; approximately 2.2 million cubic yards of compacted material would be reused onsite for construction of the new dam (excluding topsoil and lake bottom sediments, not suitable for embankment fill). As discussed under Impact 3.9-1, site alteration through movement of substantial quantities of soil and earth materials has the potential to result in erosion or siltation within the site during construction.

However, due to the bowl-shaped topography of the site and the project's planned settlement basins and other required BMPs, drainage within the proposed project site area east of the existing and proposed dam would continue to flow into the reservoir basin, as it does now. That water would be directed to and captured by the settlement basins, and not allowed to leave the proposed project site in an uncontrolled fashion, thus preventing impacts to drainage systems west of the proposed project site. This would prevent offsite erosion or siltation because no uncontrolled flow from the proposed project site could occur. This would also prevent any onsite or offsite flooding, and impedance or redirection of flood flows due to the project construction because all runoff would be controlled so as to not exceed the capacity of the existing drainage systems west of the project site. As discussed above in Impact 3.9-1, compliance with the state Construction General Permit would require the preparation of a SWPPP, which would describe the BMPs, including the settlement basins, required to control runoff and prevent polluted runoff. Therefore, impacts related to altering drainage patterns during construction would be less than significant.

Operation

Once constructed, the drainage pattern of the proposed project site would be substantially the same as the existing conditions. The change from existing conditions relative to drainage would be that the volume of water in the new proposed reservoir would be larger than it is now. The increase in the volume of water could have an adverse impact on the area west of the reservoir if the water were to be released at a volume that causes erosion, siltation, flooding, exceedance of drainage system capacities, or additional pollution.

Consideration of the volume of discharge to the storm water system is important for several reasons. According to the projected capacity of the expanded reservoir, per DSOD emergency release requirements, the outlet facilities must be capable of draining 2,479 AF of water in ten days, which translates to a discharge rate of 178 cfs into the storm drain system. In consultation with IRWD, a design for multiple intakes in the reservoir column would allow for flexibility in management, while meeting the emergency release criteria. IRWD has an established reservoir level monitoring program to ensure that the reservoir maintains sufficient freeboard to handle heavy storm events without overflowing into the spillway. The existing spillway was constructed for emergency purposes but has never been used during its 62-year history, including during IRWD's ownership and operation of the existing Syphon Reservoir (GEI 2012). As standard operating practice, IRWD would continue to monitor weather and lower the water levels in the new proposed reservoir in advance of an anticipated storm event to prevent overtopping the reservoir or exceeding the stormwater drainage capacity west of the reservoir.

Discharge capacity to the existing Portola Parkway storm drain was evaluated in the *Supplemental Spillway and Outlet Design Layout Evaluation*, prepared for the proposed project (HDR 2019). The existing Portola Parkway storm drain has been identified as the only means available for transferring storm flows from within the basin containing Syphon Reservoir to the local stormwater drainage system west of the dam and reservoir. This existing storm drain consists of a 10-foot by 7-foot concrete box culvert, sized to accommodate a 100-year storm with a peak flow of approximately 640 cfs. As previously noted, given that the existing reservoir is within a closed basin (i.e., the reservoir basin is closed off by the dam), the Syphon Reservoir is not considered to be at risk from flooding due to a 100-year storm event. This is largely because the drainage basin is very small and the reservoir's area makes up a large area of the tributary basin. Under normal operating procedures, where the proposed reservoir would be maintained at a minimum of 2 feet below the spillway crest elevation, the enlarged reservoir would capture all of the 100-year storm inflow from the tributary basin upstream of the reservoir with no spillway outflow. The residual 100-year storm flow into and through the existing Portola Parkway storm drain would be substantially less than its estimated design capacity. Per the evaluation, this leaves ample capacity to accommodate DSOD's required drawdown outflow of 178 cfs, well below the existing storm drain capacity of 640 cfs.

As designed, a proposed baffled concrete dissipation structure and short rip-rap channel would be installed to reduce velocities to safe levels to control the release of water through the discharge pipeline and into the storm drain. Operation of the proposed project would be managed in a manner that would not result in erosion, siltation, or excessive runoff. Settlement and groundwater pressure monitoring, utilization of dissipation controls, and other site monitoring would maintain the new expanded reservoir in sound order. As required under DSOD regulations, regular monitoring and reporting would occur. An enlarged reservoir would continue to capture all stormwater within Syphon Canyon drainage basin; therefore, the proposed project would not impede or redirect flood flows. Impacts pertaining to erosion and runoff would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Flood Hazard, Tsunami, or Seiche

Impact 3.9-4: The proposed project would not result in a flood hazard, tsunami, or seiche, and risk release of pollutants due to project inundation.

As discussed in Section 3.9.1, *Environmental Setting*, in *Flood Hazards*, the project site is not located in an area subject to tsunamis, resulting in no impact. Impacts relative to the release of pollutants associated with flood hazards are analyzed above in Impacts 3.9-1 and 3.9-2, which concluded a less than significant impact. Impacts relative to seiches and flooding due to dam failure are analyzed below.

Construction

Prior to construction, the existing reservoir would be drained. The reservoir would not be operational during construction, and therefore, seiches and flooding due to dam breach, overtopping or emergency release would not be possible. Therefore, relative to seiches and flooding during construction, there would be no impact.

Operation

The new engineered dam and reservoir would meet or exceed the current safety and design requirements established by the DSOD, which is the governing state agency that has jurisdiction over the design, construction, and operation of dams. IRWD would exceed these current requirements by implementing state-of-the-art Risk-Informed Decision-Making (RIDM) processes that improve dam safety and substantially reduce the risk of dam failure. The risk-informed design approach for the Syphon Reservoir Improvement Project would result in a dam design that avoids failures and associated consequences to downstream communities consistent with IRWD's priority of public safety. The design for the expanded reservoir would be based on specific rigorous design standards, risk analysis, and site-specific geotechnical investigations to inform the design, as discussed in Section 3.6, *Geology and Soils*. The design would be peer-reviewed through a rigorous process overseen by an independent Technical Advisory Group (TAG), comprised of nationally recognized industry experts, which may include the disciplines of dam geology/site characterization, seismic analysis, hydrology/hydraulics, dam construction, and potential failure mode analysis and RIDM. The purpose of the TAG is to provide an independent assessment of the design development including, but not limited to, review of design criteria, design details, technical approach, and other aspects of the design engineer's work to confirm the project design is in full compliance with or exceeds governing standards and requirements.

Following review by the TAG, the design would then be submitted to the DSOD for their review and approval. As such, the new proposed dam would be constructed to withstand a variety of site
