conditions to maintain capacity for the purpose of water storage and substantially reduce the risk of dam failure. This design would include withstanding damage from earth displacements or a seiche caused by a seismic event, while maintaining stability of the dam structure to prevent breaching or overtopping. In addition, and as part of the proposed project, a new spillway would be installed to prevent the reservoir from overtopping and safely and efficiently release water to the nearby storm drain system.

To monitor for settlement and lateral movement, monuments, open wells, and/or piezometers would be installed to assess changes in groundwater pressure that would monitor the stability of the dam. The proposed dam's structure, seepage control components, and spillway would be designed and evaluated for structural integrity by geotechnical engineers.

IRWD would be required to continuously monitor subsurface conditions such as lateral movement, seismic stability, and groundwater pressure to evaluate changes that could compromise the integrity of the reservoir. New proposed dam security instrumentation would also be implemented to identify situations that may require intervention, such as an emergency release of water from the reservoir.

A detailed evaluation of risks to downstream communities was prepared as part of the proposed project's feasibility study to assess geographic areas that could potentially become inundated in the event of a hypothetical and improbable dam breach, overtopping, or emergency release (Stetson 2018). As part of DSOD requirements, a new proposed spillway would be included to provide direction for emergency release flows and prevent the reservoir from overtopping. All recycled water flowing into and out of the Syphon Reservoir for storage is controlled directly by IRWD. Consistent with DSOD requirements for dam safety and emergency planning, the proposed project's feasibility studies evaluated scenarios for a hypothetical and extremely unlikely breach of the proposed reservoir and prepared a map of the potential flow path and limits of inundation (see **Figure 3.9-4**) for the existing reservoir and for the proposed project. The results of these analyses determined that based on modeled conditions and terrain, a hypothetical and improbable breach of the new expanded Syphon Reservoir would flow overland, split at the I-5 Culver Drive Bridge, and continue through the defined channels of Trabuco Road Drainage and Peters Canyon Channel before reaching Upper Newport Bay and, ultimately, the Pacific Ocean (GEI 2012; Stetson 2018). Figure 3.9-4 provides cross sections of the timing and depth of inundation at various distances downstream of the reservoir, compared to the existing conditions for the current Syphon Dam and Reservoir. The depths depict the worst-case scenario of a dam collapse such that all of the water is released at once. A slower failure would allow IRWD to release some of the water to the improved spillway and storm drain system, reduce the rate at which water is released from the reservoir, and thus reduce the rate and amount of inundation. In addition, the maximum depth would not be uniform along the cross sections in Figure 3.9-4. The maximum depth is determined by existing topography and typically occurs near the center of the cross section, decreasing to zero at the ends of the cross sections. The risk-informed design approach for the Syphon Reservoir Improvement Project would result in a dam design that avoids failures and associated consequences to downstream communities that could occur in the hypothetical and improbable scenarios described above.

As previously noted, IRWD is an experienced reservoir operator with a strong track record in reservoir and facilities, construction, maintenance, performance, and safety. IRWD operates five reservoirs, including Syphon Reservoir, all of which are state-inspected by the DSOD and meet all requirements for safe use. IRWD goes above and beyond the required safety standards by monitoring its dams daily, and inspecting them monthly to measure and analyze drain flows, monitoring wells, groundwater and other fluid pressures. Additionally, IRWD retains dam safety experts to inspect its dams annually.

As part of the enhanced DSOD requirements for emergency preparedness, IRWD would be required to update the EAP for the Syphon Reservoir to account for the increased size of the new reservoir. This process would facilitate input from public safety agencies to mitigate risks for downstream communities. The updated EAP would include updated inundation maps and would be used by public safety agencies responsible for emergency response. As previously noted, the EAP is a plan for early identification of potential dam safety incidents and specifies pre-planned actions to help minimize risks to public safety should these conditions occur. The EAP contains procedures and exercises for dam operators to issue early warning and notifications to emergency management authorities. In accordance with the EAP, in the improbable event there is any determination of a dam safety issue or incident at Syphon Reservoir, the EAP notification, communication, and response responsibilities would be activated as previously described above in Section 3.9.2, *Regulatory Framework, California Department of Water Resources, Division of Safety of Dams*. IRWD would notify the City of Irvine Police Department, and both IRWD and the Irvine Police Department would immediately begin emergency response actions, as well as further notifications to other police departments, fire departments, public works, schools, Caltrans, and other responsible entities, all of whom would implement further notifications and evacuations, as appropriate. Local, county and state authorities have coordinating plans in place to address local emergency operations and/or warnings and evacuations.

The proposed new dam and reservoir would meet or exceed the current safety, design and construction requirements established by the DSOD and would ensure the risks to public safety are minimized. A new proposed spillway would provide direction for emergency release flows to prevent the reservoir from overtopping, and dam instrumentation would be implemented to identify situations that may require an emergency release of water from the reservoir to the storm drain system through the 48-inch discharge pipeline, thus further reducing risk of downstream flooding.

With compliance with existing regulations for the design and operation of the dam, and adherence to the procedures in the EAP, the impacts relative to the release of pollutants during seiches and flooding due to breaches of the dam would be less than significant, and would not require additional mitigation.

Syphon Reservoir Improvement Project

Figure 3.9-4
Existing and Enlarged Reservoir Inundation Area

This page intentionally left blank

Water Quality Control Plan or Sustainable Groundwater Management Plan

Impact 3.9-5: The proposed project would not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

Construction

The proposed project site is located in Basin 8-1, Coastal Plain of Orange County Groundwater Basin. IRWD, together with the Orange County Water District and the City of La Habra (Submitting Agencies), submitted the Basin 8-1 Alternative to the DWR in January 2017 in compliance with SGMA as an alternative to a sustainable groundwater management plan. The Basin 8-1 Alternative indicates that Basin 8-1 has operated within its sustainable yield over a period of at least 10 years (IRWD, et al., 2018). Syphon Reservoir is located at the fringes of Basin 8-1 and is managed within the requirements of SGMA by IRWD. Although the proposed project involves temporary dewatering during construction, the proposed project would not otherwise interfere with management of the basin. Site runoff during construction would be contained in settlement basins to prevent offsite impacts. Upon completion of construction, the water would be allowed to flow into the existing storm drain system, similar to existing conditions.

Additionally, and as previously discussed, the proposed project would comply with the terms of the NPDES Construction General Permit, the waste discharge requirements of the NPDES dewatering discharge permit, as well as conditions for discharge into the existing Portola Parkway storm drain, managed by Orange County Flood Control District. All of these require various measures discussed above in Impact 3.9-1 to prevent degradation of water quality, which would be consistent with the Basin Plan and the Basin 8-1 Alternative. Therefore, impacts relative to the Basin Plan and the alternative sustainable groundwater management plan would be less than significant.

Operation

Once operational, the new proposed reservoir would function as a closed system and would not interact with surface waters, eliminating any impact to surface waters and not conflicting with the Basin Plan and with SGMA. In addition, and as discussed under Impact 3.9-2, the proposed project would increase recharge to groundwater, which would be consistent with the goals of the Basin Plan and the Basin 8-1 Alternative, resulting in a beneficial impact.

Less than Significant Impact

Cumulative Impacts

This section presents an analysis of the cumulative effects of the proposed project in combination with other past, present, and reasonably foreseeable future projects that could cause cumulatively considerable impacts relative to hydrology and water quality. As previously discussed, the proposed project would have no impact with respect to tsunamis. Accordingly, the proposed project could not contribute to cumulative impacts related to tsunamis, which is not discussed further. Cumulative projects are listed on Table 3-1, Related Projects for Cumulative Analysis, and shown on Figure 3-1, Cumulative Project Locations. None of the cumulative projects are water storage projects and therefore could not cumulatively contribute to flooding (inundation) due to a breach in a water storage facility (e.g., a reservoir behind a dam). Accordingly, the cumulative projects could not contribute to cumulative impacts related to flooding due to the breach of a water storage facility, which is not discussed further.

The geographic area affected by the proposed project and its potential to contribute to cumulative impacts varies based on the environmental resource under consideration. The geographic scope of analysis for cumulative hydrology and water quality impacts encompasses the proposed project site and its surrounding drainages and underlying groundwater basin. The timeframe during which the proposed project could contribute to cumulative hydrology and water quality impacts includes both the construction and operations phases. For the proposed project, the operations phase is permanent. Note that impacts relative to hydrology and water quality are generally time-specific. Cumulative impacts could only be cumulative if two or more hydrology and water quality impacts occurred at the same time, as well as overlapping at the same location.

Impact 3.9-6: Concurrent construction and operation of the proposed project and related projects in the geographic scope would not result in cumulative impacts to hydrology and water quality.

Cumulative Impacts during Project Construction

As described in Table 3-1 and shown on Figure 3-1, there are various road improvement and other capital improvement projects proposed to occur in the vicinity of the proposed project that could be constructed within a similar timeframe as the proposed project. Several large development projects are also under review or approved for construction in the neighboring City of Irvine. If the proposed project and the cumulative projects are constructed at the same time, the erosion effects from construction activities or altering drainage patterns could be cumulatively significant. However, the state Construction General Permit would require each project to prepare and implement a SWPPP. The SWPPPs would describe BMPs to control runoff and prevent erosion for each project. Through compliance with this requirement, the potential for water quality impacts would be reduced. The Construction General Permit has been developed to address cumulative conditions arising from construction throughout the state, and is intended to maintain cumulative effects of projects subject to this requirement below levels that would be considered significant. For example, two adjacent construction sites would be required to implement BMPs to reduce and control the release of sediment and/or other pollutants in any runoff leaving their respective sites. The runoff water from both sites would be required to achieve the same action levels, measured as a maximum amount of sediment or pollutant allowed per unit volume of runoff water. Thus, even if the runoff waters were

to combine after leaving the sites, the sediments and/or pollutants in the combined runoff would still be at concentrations (amount of sediment or pollutants per volume of runoff water) below action levels. This protection for water quality would also be consistent with the Basin Plan and Basin 8-1 Alternative. Therefore, impacts would not be cumulatively considerable, and this impact would be less than significant.

Similar to the proposed project, cumulative projects that require dewatering would also be required to comply with the Santa Ana Regional Groundwater Dewatering Permit. The permit requirements include measures to prevent impacts to water quality due to discharging groundwater from dewatering actions. Therefore, this impact not be cumulatively considerable; this impact would be less than significant.

Cumulative Impacts during Project Operations

For maintaining water quality, cumulative projects would be required to comply with the requirements of the Orange County MS4 permit (Santa Ana Regional NPDES Permit, Order No. R8-2009-0030, as amended by Order No. R8-2010-0062), which covers the county and all of its cities. Operators of municipal separate storm sewer systems (MS4s) are required to develop a stormwater management program designed to prevent harmful pollutants from impacting water resources via stormwater runoff. Cumulative projects would be required to comply with the MS4 permit by including BMPs in the project designs to control runoff and remove pollutants, including sediments. BMPs include measures such as infiltration basins, vegetated swales, and other measures. With compliance with the requirements of this permit, the incremental impacts of the proposed project combined with impacts of other projects in the area would not cause a significant cumulative impact related to water quality. The contribution from cumulative projects would not be cumulatively considerable and this impact would be less than significant.

As discussed above for Impact 3.9-2, the proposed project would have a beneficial impact to groundwater supply and recharge. Therefore, the proposed project would not contribute impacts to groundwater that could be cumulatively considerable, and this impact would be less than significant.

The MS4 permit discussed above would also require the operation of cumulative projects to be designed to avoid adverse effects to the capacity of the local stormwater drainage system. As discussed above for Impact 3.9-3, DSOD regulations for dams require the spillways be designed to not adversely affect the stormwater drainage systems into which they drain. Similarly, the MS4 permit discussed above would also require cumulative projects to be designed to not adversely affect the capacity of the local stormwater drainage system. With compliance with these existing regulations, the contribution from cumulative projects would not be cumulatively considerable and this impact would be less than significant.

As discussed above for Impact 3.9.1, the proposed project would result in a less than significant increase to TDS concentrations in the recycled water produced at the Michelson WRP, which would be well below the RWQCB permit limitation of 720 mg/l. There are three cumulative projects (see Table 3-1) that could combine with the proposed project to have cumulative impacts to the TDS concentrations of recycled water produced at the Michelson WRP: Cumulative Projects 20, 21, and 22. Cumulative Projects 20 and 21 are groundwater projects that would increase the amount of groundwater supplied to IRWD's customers. The Orange County Water

District's Mid Basin Injection Project came online in 2020 and increased the availability of groundwater for water supply (Cumulative Project 20). In addition, Orange County Water District's GWRS Final Improvement Project is scheduled to be online in 2023 ahead of the construction of the Syphon Reservoir Improvement Project, which would further facilitate the use of groundwater (Cumulative Project 21). Groundwater from the Orange County Groundwater Basin is estimated to have a TDS concentration of approximately 236 mg/l, after the Mid Basin Injection and GWRS Final Improvement Projects are operational and blend with ambient groundwater quality, which is lower than imported surface water (IRWD 2021). As explained above for Impact 3.9-1, IRWD conducted a mass balance analysis of the proposed project, as well as Cumulative Projects 20, 21, and 22, and determined the cumulative result, with these new supplies after accretions and depletions by water users before discharging to the sewer system, would be an estimated TDS reduction of approximately 19.1 mg/l in recycled water (IRWD 2021). With the increase in use of high quality groundwater supply, the contribution from cumulative projects would not be cumulatively considerable, and this impact would be beneficial.

3.10 Noise

This section evaluates the potential for noise and groundborne vibration impacts that may result from construction and operation of the proposed project. This section includes: an overview of the fundamental principles of noise and vibration and describes the existing noise environment in the proposed project vicinity; a summary of applicable regulations related to noise and vibration; and an evaluation of the potential impacts of the proposed project related to noise and vibration in and around the proposed project site, including cumulative impacts.

3.10.1 Environmental Setting

Noise Principles and Descriptors

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air). Noise is generally defined as unwanted sound (i.e., loud, unexpected, or annoying sound). Acoustics is defined as the physics of sound. In acoustics, the fundamental scientific model consists of a sound (or noise) source, a receiver, and the propagation path between the two. The loudness of the noise source and obstructions or atmospheric factors affecting the propagation path to the receiver determines the sound level and characteristics of the noise perceived by the receiver. Acoustics primarily addresses the propagation and control of sound.

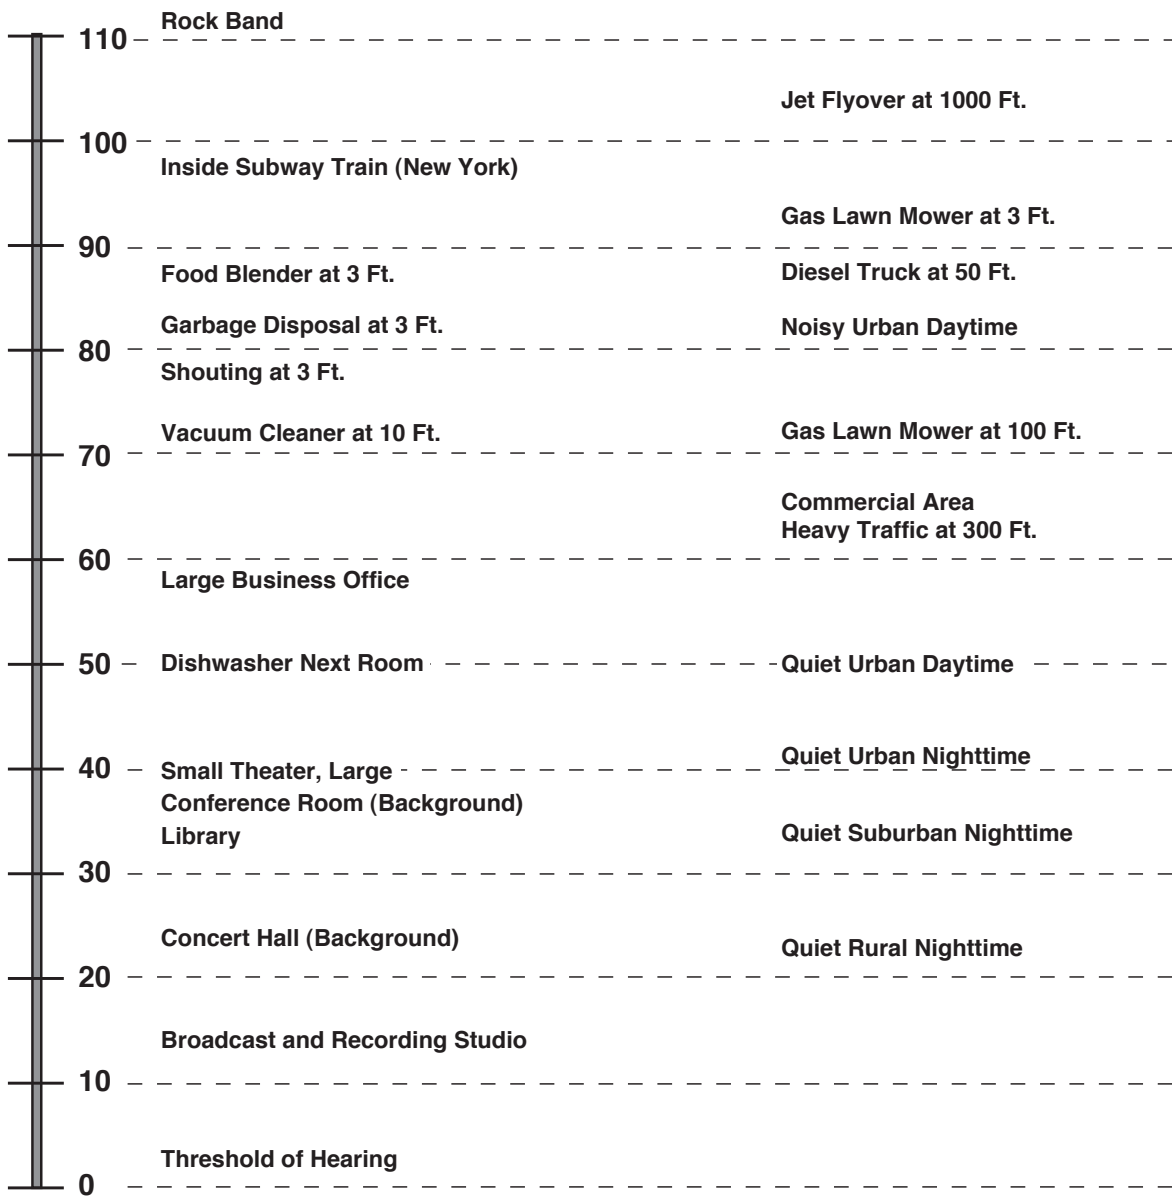

Sound, traveling in the form of waves from a source, exerts a sound pressure level (referred to as sound level) that is measured in decibels (dB), which is the standard unit of sound amplitude measurement. The dB scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound, with 0 dB corresponding roughly to the threshold of human hearing and 120 to 140 dB corresponding to the threshold of feeling and pain, respectively. Pressure waves traveling through air exert a force registered by the human ear as sound.

Sound pressure fluctuations can be measured in units of hertz (Hz), which correspond to the frequency of a particular sound. Typically, sound does not consist of a single frequency, but rather a broad band of frequencies varying in levels of magnitude, with audible frequencies of the sound spectrum ranging from 20 to 20,000 Hz. The typical human ear is not equally sensitive to this frequency range. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that deemphasizes the frequencies below 1,000 Hz and above 5,000 Hz in a manner corresponding to the human ear's decreased sensitivity to these extremely low and extremely high frequencies. This method of frequency filtering or weighting is referred to as A-weighting, expressed in units of A-weighted decibels (dBA), which is typically applied to community noise measurements. Some representative common outdoor and indoor noise sources and their corresponding A-weighted noise levels are shown in **Figure 3.10-1**.

Syphon Reservoir Improvement Project

Figure 3.10-1
Decibel Scale and Common Noise Sources

Noise Exposure and Community Noise

An individual's noise exposure is a measure of noise over a period of time; a noise level is a measure of noise at a given instant in time. However, noise levels rarely persist at that level over a long period of time. Rather, community noise varies continuously over a period of time with respect to the sound sources contributing to the community noise environment. Community noise is primarily the product of many distant noise sources, which constitute a relatively stable background noise exposure, with many of the individual contributors unidentifiable. The background noise level changes throughout a typical day, but does so gradually, corresponding with the addition and subtraction of distant noise sources, such as changes in traffic volume. What makes community noise variable throughout a day, besides the slowly changing background noise, is the addition of short-duration, single-event noise sources (e.g., aircraft flyovers, motor vehicles, sirens), which are readily identifiable to the individual.

These successive additions of sound to the community noise environment change the community noise level from instant to instant, requiring the noise exposure to be measured over periods of time to legitimately characterize a community noise environment and evaluate cumulative noise impacts. The following noise descriptors are used to characterize environmental noise levels over time, which are applicable to the proposed project.

L_{eq} : The equivalent sound level over a specified period of time, typically, 1 hour ($L_{eq}(1)$). The L_{eq} may also be referred to as the average sound level.

L_{max} : The maximum, instantaneous noise level experienced during a given period of time.

L_{min} : The minimum, instantaneous noise level experienced during a given period of time.

CNEL: The Community Noise Equivalent Level (CNEL) is the average A-weighted noise level during a 24-hour day that includes an addition of 5 dB to measured noise levels between the hours of 7 a.m. to 10 p.m. and an addition of 10 dB to noise levels between the hours of 10 p.m. to 7 a.m. to account for noise sensitivity in the evening and nighttime, respectively.

Effects of Noise on People

Noise is generally loud, unpleasant, unexpected, or undesired sound that is typically associated with human activity that is a nuisance or disruptive. The effects of noise on people can be placed into four general categories:

- Subjective effects (e.g., dissatisfaction, annoyance)
- Interference effects (e.g., communication, sleep, and learning interference)
- Physiological effects (e.g., startle response)
- Physical effects (e.g., hearing loss)

Although exposure to high noise levels has been demonstrated to cause physical, psychological, and physiological effects, the principal human responses to typical environmental noise exposure are related to subjective effects and interference with activities. Interference effects interrupt daily activities and include interference with human communication activities, such as normal

conversations, watching television, telephone conversations, and interference with sleep. Sleep interference effects can include both awakening and arousal to a lesser state of sleep.

With regard to the subjective effects, the responses of individuals to similar noise events are diverse and influenced by many factors, including the type of noise, the perceived importance of the noise, the appropriateness of the noise to the setting, the duration of the noise, the time of day and the type of activity during which the noise occurs, and individual noise sensitivity. Overall, there is no completely satisfactory way to measure the subjective effects of noise, or the corresponding reactions of annoyance and dissatisfaction on people. A wide variation in individual thresholds of annoyance exists, and different tolerances to noise tend to develop based on an individual's past experiences with noise. Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted (i.e., comparison to the ambient noise environment). In general, the more a new noise level exceeds the previously existing ambient noise level, the less acceptable the new noise level will be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships generally occur¹:

- Except in carefully controlled laboratory experiments, a change of 1 dBA in ambient noise levels cannot be perceived.
- Outside of the laboratory, a 3 dBA change in ambient noise levels is considered to be a barely perceivable difference.
- A change in ambient noise levels of 5 dBA is considered to be a readily perceivable difference.
- A change in ambient noise levels of 10 dBA is subjectively heard as doubling of the perceived loudness.

These relationships occur in part because of the logarithmic nature of sound and the decibel scale. The human ear perceives sound in a non-linear fashion; therefore, the dBA scale was developed. Because the dBA scale is based on logarithms, two noise sources do not combine in a simple additive fashion, but rather logarithmically. Under the dBA scale, a doubling of sound energy corresponds to a 3 dBA increase. In other words, when two sources are each producing sound of the same loudness, the resulting sound level at a given distance would be approximately 3 dBA higher than one of the sources under the same conditions. For example, if two identical noise sources produce noise levels of 50 dBA, the combined sound level would be 53 dBA, not 100 dBA. Under the dBA scale, three sources of equal loudness together produce a sound level of approximately 5 dBA louder than one source, and ten sources of equal loudness together produce a sound level of approximately 10 dBA louder than the single source.²

Noise Attenuation

When noise propagates over a distance, the noise level reduces with distance depending on the type of noise source and the propagation path. Noise from a localized source (i.e., point source) propagates uniformly outward in a spherical pattern, referred to as “spherical spreading.”

¹ California Department of Transportation (Caltrans), Technical Noise Supplement (TeNS), Section 2.2.1, September, 2013.

² Caltrans, Technical Noise Supplement (TeNS), Section 2.2.1.1, September, 2013.

Stationary point sources of noise, including stationary mobile sources such as idling vehicles, attenuate (i.e., reduce) at a rate of between 6 dBA for acoustically “hard” sites and 7.5 dBA for “soft” sites for each doubling of distance from the reference measurement, as their energy is continuously spread out over a spherical surface (e.g., for hard surfaces, 80 dBA at 50 feet attenuates to 74 at 100 feet, 68 dBA at 200 feet, etc.). Hard sites are those with a reflective surface between the source and the receiver, such as asphalt or concrete surfaces or smooth bodies of water. No excess ground attenuation is assumed for hard sites and the reduction in noise levels with distance (i.e., distance loss) is simply the geometric spreading of the noise from the source. Soft sites have an absorptive ground surface, such as soft dirt, grass, or scattered bushes and trees, which in addition to geometric spreading, provides an excess ground attenuation value of 1.5 dBA (per doubling distance).³ Most sites are a combination of both hard and soft surfaces; therefore, using the hard site criteria of 6 dBA is the more conservative approach.

Roadways and highways consist of several localized noise sources on a defined path, and hence are treated as “line” sources, which approximate the effect of several point sources. Noise from a line source propagates over a cylindrical surface, often referred to as “cylindrical spreading.” Line sources (e.g., traffic noise from vehicles) attenuate at a rate between 3 dBA for hard sites and 4.5 dBA for soft sites for each doubling of distance from the reference measurement.⁴ Therefore, noise due to a line source attenuates less with distance than that of a point source with increased distance.

Additionally, receptors located downwind from a noise source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Atmospheric temperature inversion (i.e., increasing temperature with elevation) can increase sound levels at long distances (e.g., more than 500 feet). Other factors such as air temperature, humidity, and turbulence can also have significant effects on noise levels.⁵

Fundamentals of Vibration

Vibration can be interpreted as energy transmitted in waves through the ground or man-made structures, which generally dissipate with distance from the vibration source. Because energy is lost during the transfer of energy from one particle to another, vibration becomes less perceptible with increasing distance from the source.

As described in the Federal Transit Administration’s (FTA) *Transit Noise and Vibration Impact Assessment*, groundborne vibration can be a serious concern for nearby neighbors of a transit system route or maintenance facility, causing buildings to shake and rumbling sounds to be heard.⁶ In contrast to airborne noise, groundborne vibration is not a common environmental problem, as it is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads. Some common sources of groundborne vibration are trains, heavy trucks traveling on rough roads, and construction activities, such as blasting, pile-driving, and operation of heavy earth-moving equipment.

³ Caltrans, Technical Noise Supplement (TeNS), Section 2.1.4.2, September, 2013.

⁴ Caltrans, Technical Noise Supplement (TeNS), Section 2.1.4.1, September, 2013.

⁵ Caltrans, Technical Noise Supplement (TeNS), Section 2.1.4.3 September, 2013.

⁶ FTA, Transit Noise and Vibration Impact Assessment, Section 7.1.3, 2018.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal in inches per second (in/sec), and is most frequently used to describe vibration impacts to buildings.

Groundborne noise is a result of groundborne vibration and specifically refers to the rumbling noise emanating from the motion of building room surfaces due to the vibration of floors and walls; it is perceptible only inside buildings.⁷ The relationship between groundborne vibration and groundborne noise depends on the frequency content of the vibration and the acoustical absorption characteristics of the receiving room. For typical buildings, groundborne vibration that causes low frequency noise (i.e., the vibration spectrum peak is less than 30 Hz) results in a groundborne noise level that is approximately 50 decibels lower than the velocity level. For groundborne vibration that causes mid-frequency noise (i.e., the vibration spectrum peak is 30 to 60 Hz), the groundborne noise level will be approximately 35 to 37 decibels lower than the velocity level.⁸ Therefore, for typical buildings, the groundborne noise decibel level is lower than the groundborne vibration velocity level.

Project Area

Sensitive Receptors

Some land uses are considered more sensitive to noise than others due to the amount of noise exposure and the types of activities typically involved at the receptor location. Residences, schools, motels and hotels, libraries, religious institutions, hospitals, nursing homes, and parks are generally more sensitive to noise than commercial and industrial land uses. The distance of the noise sensitive receptor locations was calculated from the property line of the receptors to the closest proposed project site boundary. Existing noise sensitive uses within 500 feet of the proposed project site are shown in **Figure 3.10-2** and include the following:

- R1: The Crean Lutheran High School Athletic Complex, located between Portola Parkway and the toe of the existing dam, approximately 55 feet from the proposed project site.
- R2 and R3: Residential neighborhoods located on the southwest side of Portola Parkway, are as close as 180 feet from the proposed access road construction. Construction of the new proposed dam, reservoir and treatment facilities would occur farther away from these sensitive receptors, approximately 700 feet.
- R4: Crean Lutheran High School, located on the south side of Portola Parkway, east of Sand Canyon Road. This property line of the school is located approximately 140 feet from the proposed access road construction.

All other noise-sensitive uses are located at greater distances and/or shielded from activity at the proposed project by buildings closer to the project area and would experience lower noise levels associated with the proposed project. Therefore, additional sensitive receptors beyond those identified above are not evaluated in this analysis.

Syphon Reservoir Improvement Project

Figure 3.10-2
Noise Sensitive Receiver Locations

Vibration-Sensitive Receptor Locations

Activities associated with implementation of the proposed project have the potential to generate low levels of groundborne vibration due to the operation of equipment (i.e., rubber-tired dozer, drill rigs, and haul trucks). Groundborne vibrations propagate through the ground and rapidly diminish in intensity with increasing distance from the source. No high-impact activities, such as pile driving or blasting, would be used during construction of the proposed project. The nearest off-site buildings to the project site that could be exposed to vibration levels generated from project activities include residential uses located on the southwest side of Portola Parkway, located approximately 300 feet from the proposed project boundary.

Existing Conditions

The existing noise environment within the project area is comprised primarily of vehicle traffic including trucks, buses, etc. on Portola Parkway, Sand Canyon Avenue, Irvine Boulevard, and State Route 133 (SR-133). Secondary noise sources include nearby residential activities and activities associated with nearby schools. While the proposed project site is located within the jurisdiction of the Orange County, the residents and school that would be impacted by the noise from the proposed project are located within the jurisdiction of the City of Irvine. Therefore, the analysis uses the City of Irvine's noise thresholds. The Noise Element of the City of Irvine's General Plan provides estimated vehicular traffic noise levels for areas throughout the City for the year 2020. The General Plan does not have estimated traffic noise levels for the local roadways directly adjacent to the proposed project site. The closest roadway segment with estimated 2020 traffic noise levels is Irvine Boulevard between Yale Avenue and Jeffrey Road. Similar to the proposed project vicinity, this area consists primarily of residential land uses, where the noise environment is comprised primarily from vehicular traffic. The estimated 2020 traffic noise levels for this area is 71.7 dBA CNEL, 100 feet from the centerline of the roadway.

3.10.2 Regulatory Framework

Federal

Noise Standards

There are no federal noise standards that directly regulate environmental noise related to the construction or operation of the proposed project. With regard to noise exposure and workers, OSHA regulations safeguard the hearing of workers exposed to occupational noise. Federal regulations also establish noise limits for medium and heavy trucks (more than 4.5 tons, gross vehicle weight rating) under 40 Code of Federal Regulations, Part 205, Subpart B. The federal truck pass-by noise standard is 80 dBA at 15 meters from the vehicle pathway centerline. These controls are implemented through regulatory controls on truck manufacturers.

Vibration Standards

The effects of groundborne vibration include movement of the building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. In extreme cases, the vibration can cause damage to buildings. Building damage is not a factor for most Projects, with the occasional exception of blasting and pile-driving during construction. Annoyance from vibration often occurs when the vibration levels exceed the threshold of perception by only a small

margin. A vibration level that causes annoyance will be well below the damage threshold for normal buildings. The City does not address vibration either in the municipal code or in the Noise Element of the General Plan. The County does not address vibration the municipal code. However, the FTA's *Transit Noise and Vibration Impact Assessment* (FTA, 2018) has identified the human annoyance response to vibration levels as 80 VdB and building damage with a threshold of 0.2 in/sec PPV for non-engineered timber buildings.⁹

State

Noise Standards

The California Department of Health Services (DHS) has established guidelines for evaluating the compatibility of various land uses as a function of community noise exposure. These guidelines for land use and noise exposure compatibility are shown in **Table 3.10-1**. In addition, Section 65302(f) of the California Government Code requires each county and city in the state to prepare and adopt a comprehensive long-range General Plan for its physical development, with Section 65302(g) requiring a noise chapter to be included in the General Plan. The noise chapter must: (1) identify and appraise noise problems in the community, (2) recognize Office of Noise Control guidelines, and (3) analyze and quantify current and projected noise levels.

**TABLE 3.10-1
COMMUNITY NOISE EXPOSURE LEVEL (CNEL)**

Land Use	Normally Acceptable ^a	Conditionally Acceptable ^b	Normally Unacceptable ^c	Clearly Unacceptable ^d
Single-family, Duplex, Mobile Homes	50–60	55–70	70–75	above 75
Multi-Family Homes	50–65	60–70	70–75	above 75
Schools, Libraries, Churches, Hospitals, Nursing Homes	50–70	60–70	70–80	above 80
Transient Lodging – Motels, Hotels	50–65	60–70	70–80	above 80
Auditoriums, Concert Halls, Amphitheaters	—	50–70	—	above 65
Sports Arena, Outdoor Spectator Sports	—	50–75	—	above 70
Playgrounds, Neighborhood Parks	50–70	—	67–75	above 72
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50–75	—	70–80	above 80
Office Buildings, Business and Professional Commercial	50–70	67–78	above 75	—
Industrial, Manufacturing, Utilities, Agriculture	50–75	70–80	above 75	—

NOTES:

All CNEL measurements are expressed in dBA.

^a **Normally Acceptable:** Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

^b **Conditionally Acceptable:** New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice.

^c **Normally Unacceptable:** New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.

^d **Clearly Unacceptable:** New construction or development should generally not be undertaken.

SOURCE: OPR, 2003 (in coordination with the California DHS)

⁹ FTA, *Transit Noise and Vibration Impact Assessment*, Section 12.2.2, May, 2018.

The State of California also establishes noise limits for vehicles licensed to operate on public roads. For heavy trucks, the state pass-by standard is consistent with the federal limit of 80 dBA. The state pass-by standard for light trucks and passenger cars (less than 4.5 tons, gross vehicle rating) is also 80 dBA at 15 meters from the centerline. These standards are implemented through controls on vehicle manufacturers and by legal sanction of vehicle operators by state and local law enforcement officials.

Vibration Standards

There are no state vibration standards applicable to the proposed project. Moreover, according to the California Department of Transportation (Caltrans) *Transportation- and Construction- Induced Vibration Guidance Manual* (2013), there are no official Caltrans standards for vibration. However, this manual provides guidelines for assessing vibration damage potential to various types of buildings, ranging from 0.08 to 0.12 in/sec PPV for extremely fragile historic buildings, ruins, and ancient monuments to 0.50 to 2.0 in/sec PPV for modern industrial/commercial buildings.

Local

County of Orange

Section 4-6-4 and 4-6-5 of the Orange County Municipal Code provides exterior and interior noise standards, respectively, to the entire territory of Orange County, including incorporated and unincorporated territory. The County’s noise standards for exterior and interior noise levels are provided in **Table 3.10-2**.

**TABLE 3.10-2
 COUNTY OF ORANGE NOISE STANDARDS**

Noise Zone ^a	Location	Noise Level	Time Period
1	Exterior	55 dB(A)	7 a.m.–10 p.m.
		50 db(A)	10 p.m.–7 a.m.
	Interior	55 dB(A)	7 a.m.–10 p.m.
		45 dB(A)	10 p.m.–7 a.m.

NOTE:

^a The entire territory of Orange County, including incorporated and unincorporated territory, is hereby designated as "Noise Zone 1."

SOURCE: County of Orange, 2020.

The Orange County Municipal Code Section 4-6-7(e) exempts noise associated with construction, repair, remodeling, or grading of any real property, provided said activities take place between the hours of 7 a.m. to 8 p.m. on weekdays, including Saturday.

General Plan, Noise Element

The General Plan Noise Element of the County of Orange establishes noise/land use planning criteria for the unincorporated areas of the County. These noise guidelines and standards cover roadway noise, rail noise, and airport noise including military and civilian airports. The County has adopted noise standards for various land uses in terms of CNEL and L_{eq} . These standards are reproduced here as **Table 3.10-3** and **Table 3.10-4**. For residential land uses the County has established a maximum exterior noise level standard of 65 dB CNEL for private outdoor living areas and an interior standard of 45 dB CNEL. The County of Orange uses the 60 dB CNEL contour as a threshold for review of projects in order to screen projects and ensure that the 65 dB CNEL exterior and 45 dB CNEL interior criteria are met. In other words, projects located within the 60 dB CNEL contour are required to submit detailed acoustical studies ensuring compliance with the County noise standards.

**TABLE 3.10-4
 COUNTY OF ORANGE COMPATIBILITY MATRIX – EXPLANATIONS AND DEFINITIONS**

Action Required to Ensure Compatibility Between Land Use and Noise from External Sources	
1= Allowed if interior and exterior community noise levels can be mitigated. 2= Allowed if interior levels can be mitigated. 3= New residential uses are prohibited in areas within the 65 dB CNEL contour from any airport or air station; allowed in other areas of interior and exterior community noise levels can be mitigated. The prohibition against new residential development excludes limited "infill" development within an established neighborhood.	
Standards Required for Compatibility of Land Use and Noise	
a= Interior Standard: CNEL of less than 45 dB (habitable rooms only). b= Exterior Standard: CNEL of less than 65 dB from any source in outdoor living areas. c= Interior standard: Leq (H)=45 to 65 dB interior noise level, depending on interior use. d= Exterior Standard: Leq(h) of less than 65 dB in outdoor living areas. e= Interior Standard: As approved by the Board of Supervisors for sound events of short duration such as aircraft flyovers or individual passing railroad trains.	
Educational Facilities	
Schools K–12 Preschool, college, other Places of Worship	
Typical Use	Leq (h)*
Private Office, Church Sanctuary, College, Preschool, Schools (Grades K–12) Board Room, Conference Room, etc.	45
General Office, Reception, Clerical, etc.	50

City of Irvine

Table 3.10-5 summarizes Section 6-8-204, General Provisions, of the City’s Municipal Code, which provides interior and exterior noise standards that apply to all properties within a designated zone located in the City.

The City Municipal Code Section 6.8.205.A limits construction activities between the hours of 7 a.m. to 7 p.m. Mondays through Fridays, and 9 a.m. to 6 p.m. on Saturdays. No construction activities shall be permitted outside of these hours or on Sundays and federal holidays, unless a temporary waiver is granted by the Chief Building Official or his or her authorized representative. Trucks, vehicles, and equipment that are making or are involved with material deliveries, loading, or transfer of materials, equipment service, maintenance of any devices or appurtenances for or within any construction project in the City shall not be operated or driven on City streets outside of these hours or on Sundays and federal holidays unless a temporary waiver is granted by the City. Any waiver granted shall take impact upon the community into consideration. No construction activity will be permitted outside of these hours except in emergencies including maintenance work on the City rights-of-way that might be required.

**TABLE 3.10-5
 CITY OF IRVINE NOISE STANDARDS**

Zone	Location	Time Period	Noise Levels for a Period Not Exceeding (minutes/hour)				
			30	15	5	1	0 (anytime)
<i>Noise zone 1:</i> All hospitals, libraries, churches, schools, and residential properties.	Exterior	7 a.m.–10 p.m.	55	60	65 ^a	70	75
		10 p.m.–7 a.m.	50	55	60	65 ^a	70
	Interior	7 a.m.–10 p.m.	—	—	55	60	65
		10 p.m.–7 a.m.	—	—	45	50	55
<i>Noise zone 2:</i> All professional office and public institutional properties.	Exterior	Anytime	55	60	65	70	75
	Interior	Anytime	—	—	55	60	65
<i>Noise zone 3:</i> All commercial properties excluding professional office properties.	Exterior	Anytime	60	65	70	75	80
	Interior	Anytime	—	—	55	60	65
<i>Noise zone 4:</i> All industrial properties.	Exterior	Anytime	70	75	80	85	90
	Interior	Anytime	—	—	55	60	65

NOTES:

- ^a This standard does not apply to multifamily residence private balconies. Multifamily developments with balconies that do not meet the 65 CNEL are required to provide occupancy disclosure notices to all future tenants regarding potential noise impacts.
- ^b It shall be unlawful for any person at any location within the City to create any noise or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person which causes the noise level when measured on any property within designated noise zones either within or without the City to exceed the applicable noise standard.
- ^c Each of the noise standards specified above shall be reduced by five dB(A) for impact, or predominant tone noise or for noises consisting of speech or music.
- ^d In the event that the noise source and the affected property are within different noise zones, the noise standards of the affected property shall apply.

SOURCE: City of Irvine 2020

General Plan, Noise Element

As shown in **Table 3.10-6**, the City has established noise guidelines in the Noise Element of the City’s General Plan that are used for planning purposes. These guidelines are based, in part, on the community noise compatibility guidelines established by the California State Governor’s Office of Planning and Research and are intended for use in assessing the compatibility of various land use types with a range of noise levels. Page F-11 of the Noise Element provides the guidelines of land use compatibility for community noise sources. The CNEL noise levels for specific land uses are classified into four categories: (Zone A) “clearly compatible” (Zone B) “normally compatible” (Zone C) “normally incompatible” and (Zone D) “clearly incompatible.” A CNEL value of 70 dBA is considered the dividing line between a “normally compatible” and “normally incompatible” noise environment for noise sensitive land uses, including residences, transient lodgings, schools, and libraries.

**TABLE 3.10-6
 CITY OF IRVINE LAND USE NOISE COMPATIBILITY**

Land Use Categories	Uses	Energy Average (CNEL, dB)						
		≤	55	60	65	70	75	80>

AGRICULTURAL	Agriculture	A	A	A	A	A	A	A
NOTES:								
ZONE A Clearly Compatible	Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements							
ZONE B Normally Compatible	New construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.							
ZONE C Normally Incompatible	New construction or development should normally be discouraged. If new construction or development does proceed, a detailed analysis or noise reduction requirements must be made and needed noise insulation features must be included in the design.							
ZONE D Clearly Incompatible	New construction or development should generally not be undertaken.							
SOURCE: City of Irvine General Plan, Noise Element, 2015.								

Additionally, the Proposed Project is subject to the following policies provided in the Noise Element of the General Plan:

Mobile Noise

Policy (c): Ensure that all proposed development projects are compatible with the existing and projected noise level by using the Land Use Noise Compatibility Matrix (see Table 3.10-6).

Policy (d): Require noise studies to be prepared in accordance with the City’s environmental review procedure for all projects that are not “clearly compatible” with the future noise level at the site.

Policy (f): Require noise studies to identify all the mitigation measures necessary to reduce noise levels to meet the City’s Municipal Code CNEL standard (see **Table 3.10-5**) and Single Event Noise Standard.

Stationary Noise

Policy (a): Require any new construction to meet the City Noise Ordinance standards as a condition of building permit approval.

Policy (b): Require developers to depict, on any appropriate development application review (zone change, subdivisions, conditional use permit, site plan, and building plans), any potential noise sources known at the time of submittal and mitigation measures that ensure these noise sources meet the City Noise Ordinance standards. Such sources include, but are not limited to, the following:

- Truck pickup and loading areas.
- Mechanical and electrical equipment such as air conditioning, swimming pool pumps and filters, and spa pumps.
- Exterior nuisances such as speaker boxes and outdoor public address systems.

Policy (c): Condition subdivision approval of the projects adjacent to any developed/occupied uses by requiring the developer to submit a construction-related noise mitigation plan to the Director of Community Development for review and approval prior to issuance of grading permits. The plan must depict the location of construction equipment and how the noise from this equipment will be mitigated during construction of the project, through the use of such methods as following:

- Temporary noise attenuation fences.
- Preferential location of equipment.
- Use of current technology and noise suppression equipment.

Noise Abatement

Policy (a): Coordinate efforts to reduce noise impacts with appropriate public and government agencies.

3.10.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from CEQA Guidelines Appendix G are used as thresholds of significance to determine the impacts of the proposed project as related to noise and vibration. The proposed project would have a significant impact if it would:

1. Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.
2. Generate excessive groundborne vibration or groundborne noise levels.
3. Expose people residing or working in the project area to excessive noise levels for a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport.
4. Result in a cumulatively considerable impact to noise and vibration.

The proposed project site is located with the jurisdiction of the Orange County. However, the receptors that would be impacted by the construction and operation of the proposed project are located within the City of Irvine. Therefore, this analysis uses the City of Irvine's thresholds to determine significance.

Methodology

On-Site Construction Noise

On-site construction noise impacts were evaluated by determining the noise levels generated by the different types of construction activity anticipated, calculating the construction-related noise level at nearby sensitive receptor locations, and comparing these construction-related noise levels to existing ambient noise levels (i.e., noise levels without construction noise) at those receptors. More, specifically, the following steps were undertaken to assess construction-period noise impacts:

1. Typical noise levels for each type of construction equipment were obtained from the FHWA's Construction Noise Handbook (FHWA 2006);
2. Distances between construction site locations (noise sources) and surrounding sensitive receptors were measured using Project architectural drawings and site plans and Google Earth;
3. The construction noise level was then calculated, in terms of hourly Leq, for sensitive receptor locations based on the standard point source noise-distance attenuation factor of 6.0 dBA for each doubling of distance.

Off-Site Roadway Noise (Construction)

Roadway noise impacts have been evaluated using the Caltrans Technical Noise Supplement (TeNS) method based on the traffic data provided in the Project's Construction Transportation Impact Analysis (Fehr & Peers, 2020). The Caltrans TeNS method allows for the definition of roadway configurations, barrier information (if any), and receiver locations.

Groundborne Vibration (Construction and Operations)

Groundborne vibration impacts were evaluated by identifying potential vibration sources, measuring the distance between vibration sources and surrounding structure locations, and making a significance determination based on the significance thresholds described below.

Impact Analysis

Temporary or Permanent Increase of Ambient Noise Levels

Impact 3.10-1: The proposed project would not generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Construction

On-Site Construction Noise

Construction of the proposed project is estimated to require approximately 41 months (weather permitting) and would require the use of heavy equipment during the various construction phases at the proposed project site. During each stage of development, there would be a different mix of equipment. As such, construction activity noise levels at and near the proposed project area would fluctuate depending on the particular type, number, and duration of use of the various pieces of construction equipment. Construction is currently anticipated to begin in the fall of 2022 with the potential of overlap for a number of phases of construction.

Per Chapter 2, *Project Description*, additional geotechnical work may or may not occur, and the intensity of any geotechnical work is unknown at this time. There are three potential geotechnical tests that could occur: borings, test pits, or trenches. The geotechnical work would be associated with the dam upgrades and would most likely occur in the reservoir area, at a distance of 330 feet (100 meters) or more from the nearest sensitive uses. Because the intensity of any work that will occur is unknown, the analysis determines the maximum intensity of geotechnical work that can occur concurrently and independent from the reservoir work. The *Irvine Ranch Water District Syphon Reservoir Geotechnical Investigations Project Initial Study/Mitigated Negative Declaration* was used to determine the equipment and workers that would be used to conduct the additional geotechnical investigations.

Individual pieces of construction equipment anticipated during Project construction could produce maximum noise levels of 75 dBA to 85 dBA L_{max} at a reference distance of 50 feet from the noise source, as shown in **Table 3.10-7**. These maximum noise levels would occur when equipment is operating at full power. The estimated usage factor for the equipment is also shown in Table 3.10-7, which are based on FHWA's Construction Handbook (FHWA 2006). Typical or average construction noise levels account for the estimated usage factors as shown.

**TABLE 3.10-7
 CONSTRUCTION EQUIPMENT NOISE LEVELS**

Construction Equipment	Estimated Usage Factor %	Noise Level at 50 Feet (dBA, Lmax)
Backhoe	40%	78
Bore/Drill Rig	40%	78
Cement/Mortar Mixers	40%	79
Compactor	20%	83
Cranes	16%	81
Dozer	40%	82
Excavator	40%	81
Grader	40%	85
Pavers	50%	77
Pick-up Truck	40%	75
Pumps	50%	81
Roller	20%	80
Rubber Tired Dozer	40%	82
Rubber Tired Loader	40%	79
Rollers	20%	80
Scraper	40%	84
Support Truck	40%	76
Tractor/Loader/Backhoe	25%	80
Water Truck	10%	80

SOURCE: FHWA 2006

Construction activity would result in the loudest noise levels at ground-level sensitive land uses nearest to the proposed project area that have a direct line-of-sight to construction activities. This is because the first tier of buildings immediately surrounding the proposed project site would act as a noise barrier to other sensitive receptors located beyond these buildings. Therefore, construction-related noise levels are only presented for receptors closest to the proposed project site, as shown in Figure 3.10-2. Specifically, the nearest off-site noise sensitive receptors include the following:

- R1: The Crean Lutheran High School Athletic Complex, located between Portola Parkway and the toe of the existing dam, approximately 55 feet from the proposed project site.
- R2 and R3: Residential neighborhoods located on the southwest side of Portola Parkway, are as close as 180 feet from the proposed access road construction. Construction of the new proposed dam, reservoir and treatment facilities would occur farther away from these sensitive receptors, approximately 700 feet.
- R4: Crean Lutheran High School, located on the south side of Portola Parkway, east of Sand Canyon Road. This property line of the school is located approximately 140 feet from the proposed access road construction.

Noise from construction activities would be generated by the operation of vehicles and equipment involved during various stages of construction: site excavation, grading, facilities construction and paving. The noise levels generated by construction equipment would vary depending on factors such as the type and number of equipment, the specific model (horsepower rating), the construction activities being performed, and the maintenance condition of the equipment. Construction noise associated with the proposed project was analyzed using a mix of typical construction equipment, estimated durations, and construction phasing, based on construction equipment data provided by IRWD and assumptions derived from similar projects. **Table 3.10-8** shows the estimated construction noise levels that would occur at the nearest off-site sensitive uses during a peak day of construction activity at the proposed project site. Details are provided in **Appendix D**.

 SOURCE: ESA 2021

As shown in Table 3.10-8, construction noise levels are estimated to reach a maximum of 89 dBA L_{eq} at the nearest sensitive receptor (R1). Existing residences and school facilities in the vicinity of the proposed project area would be exposed to temporary and sporadic increased noise from nearby construction activities. Weather permitting, the overall construction would last for approximately 36 to 41 months. However, since equipment operates intermittently and moves around the site, noise from operation of construction equipment would be sporadic and temporary during the construction period. Construction noise would be noticeable during the operation of heavy grading equipment working at the site (sporadically over the duration of construction), especially during the vegetation clearing, excavation, and construction period.

The City has not established numerical thresholds for construction noise; however, per the City Municipal Code, Section 6-8-205, construction shall only occur between the hours of 7 a.m. to 7 p.m. Mondays through Fridays, and 9 a.m. to 6 p.m. on Saturdays. The proposed project construction activities would comply with the hours allowed by the City and the duration of construction would be short term. If the proposed project's construction work is needed to be conducted outside of the allowable hours, IRWD will work with the appropriate entity to secure a variance/waiver. Thus, a significant noise impact would not occur during project construction and construction noise impacts would be less than significant.

Off-Site Construction Noise

Delivery and haul truck trips would occur throughout the construction period. Trucks traveling to and from the project area would be required to travel along the haul route approved by the City for the proposed project. The following two haul routes are being proposed for the project:

- **Haul Route 1:** SR-133, north on Irvine Boulevard, and east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue and south on Irvine Boulevard to SR-133 for trucks traveling outbound.
- **Haul Route 2:** I-5, east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue to I-5 for trucks traveling outbound.

Table 3.10-9 shows the estimated construction traffic noise levels that would occur at the nearest off-site sensitive uses along the proposed haul routes. Details are provided in Appendix D. Sensitive noise receptors along the haul route are located approximately 40 to 80 feet from the edge of the roadways. Construction traffic noise levels generated by truck trips would range from approximately 57.5 dBA, L_{eq} to 72.7 dBA, L_{eq} . Detailed traffic noise calculations are provided in Appendix D. Construction truck trips would be required to comply with the City's allowable hours as described above and would be temporary in nature. Therefore, construction activities would comply with the City's noise standard, and impacts would be less than significant.

NOTES:
Construction schedule and truck traffic information provided by the project applicant.
Detailed traffic noise calculations are provided in Appendix D.
SOURCE: ESA 2021

Operation

Operation of the proposed project would not increase the average daily traffic (ADT) volumes along the major thoroughfares within the project vicinity. Additionally, the proposed inlet and outlet pipelines that would supply and drain the reservoir would be located underground and would not result in any operational noise. The primary pumps used for water distribution are already existing and located off-site. Operation of the proposed project would introduce small pumps located on the site within the proposed treatment facilities. A proposed masonry block wall building would house the storage tanks, metering pumps, and control system. The small pumps located on-site would not generate noise above ambient conditions at sensitive receptor property lines. Therefore, impacts from the operations of the proposed project would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Groundborne Vibration or Groundborne Noise Levels

Impact 3.10-2: The proposed project would not generate excessive groundborne vibration or groundborne noise levels.

Construction

Construction activities for the proposed project have the potential to generate low levels of groundborne vibration as the operation of heavy equipment (i.e., backhoe, dozer, grader, loader, and haul trucks, etc.) generates vibrations that propagate through the ground and diminish in intensity with distance from the source. No high-impact activities, such as pile driving or blasting, would be used during the proposed project's construction. In order to evaluate potential structural damage, the nearest off-site sensitive buildings to the project area were identified. The residential buildings located on the south side of Portola Parkway are approximately from 300 feet from the proposed project boundary line. Groundborne vibrations from construction activities very rarely reach the levels that can damage structures, but they may be perceived in buildings very close to a construction site.

The PPV vibration velocities for several types of construction equipment that can generate perceptible vibration levels are identified in **Table 3.10-10**. Based on the information presented in Table 3.10-10, vibration velocities could range from 0.0014 to 0.0083 in/sec PPV at 300 feet from the source of activity.

**TABLE 3.10-10
 VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT**

Equipment	Approximate PPV (in/sec)						
	25 Feet	50 Feet	60 Feet	75 Feet	100 Feet	200 Feet	300 Feet
Vibratory Roller	0.2100	0.0853	0.0673	0.0503	0.0346	0.0141	0.0083
Large Bulldozer	0.0890	0.0361	0.0285	0.0213	0.0147	0.0060	0.0035
Loaded Trucks	0.0760	0.0309	0.0244	0.0182	0.0125	0.0060	0.0035
Jackhammer	0.0350	0.0142	0.0112	0.0084	0.0058	0.0051	0.0030
Small Bulldozer	0.0030	0.0012	0.0010	0.0007	0.0005	0.0023	0.0014

SOURCE: FTA 2018; ESA 2021

Proposed construction activities would occur throughout the project area and would not be concentrated at the point closest to the nearest structure. Based on the vibration levels presented in Table 3.10-10, at a distance of 300 feet from the proposed project area, the maximum vibration level would be up to approximately 0.0083 in/sec PPV for a vibratory roller, which would not exceed the significance threshold of 0.2 in/sec PPV. The geotechnical work would be associated with the dam upgrades and would most likely occur in the reservoir area, at a distance of 330 feet (100 meters) or more from the nearest sensitive uses, which would generate vibration levels below 0.2 in/sec PPV at sensitive receptor locations. Therefore, the use of all construction equipment would not result in a groundborne vibration velocity level above 0.2 inches per second at the nearest off-site structure. Therefore, impacts would be less than significant.

With respect to human annoyance, the nearest residential buildings located within 300 feet from the proposed project site would be exposed to vibration levels below the 80 VdB threshold for human annoyance. Therefore, impacts would be less than significant.

Operation

Sources of groundborne vibration would be unchanged from the existing conditions. Additionally, operational vibration impacts of the improvements at the new proposed reservoir would be consistent with the existing vibration velocity levels and with the existing ambient vibration velocity levels. As such, operational vibration impacts of the proposed Syphon Reservoir improvements would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Excessive Noise Levels Near Airports

Impact 3.10-3: The proposed project would not expose people residing or working in the project area to excessive noise levels within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport.

The proposed project area is not located within the vicinity of a private airstrip. Further, the nearest airport to the project area is the John Wayne Airport, located approximately 7.7 miles to the southwest of the project area. The proposed project is not located within an airport land use plan or within 2 miles of a public airport or public use airport. Therefore, the proposed project would have no impact related to public or private airport/airstrip noise levels.

Mitigation Measures

None required

Significance Determination

No Impact

Cumulative Impacts

Impact 3.10-4: Concurrent construction and operation of the proposed project and related projects in the geographic scope would not result in cumulative impacts to noise and vibration.

CEQA Guidelines require a discussion of cumulative impacts of a project “when the project’s incremental effect is cumulatively considerable” (2011 CEQA Guidelines, Section 15130). As defined by Section 15065 (a)(3) “cumulatively considerable” means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (2011 CEQA Guidelines, Section 15065 (a)(3)). These cumulative impacts are defined as “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts” (CEQA Guidelines Section 15355).

Two cumulative projects within 1,000 feet of the proposed project site have been identified, which include the Gateway Community Park / City of Irvine Master Parks Plan and the Truck Route Roadway Rehabilitation (CIP 311902) Project. Should all three projects undergo construction at the same time, the projects would be required to comply with the construction hours allowed by the City or comply with City restrictions imposed if a variance to the allowable construction hours for either project is issued. As previously discussed, the proposed project construction and operation would comply with the City’s noise standard, and impacts would be less than significant. Therefore, the proposed project, when combined with the identified cumulative projects, would not cause a cumulatively considerable noise impact. With regard to groundborne vibration, the construction vibration levels generated by the proposed project would be substantially below the FTA thresholds. Vibration level diminish rapidly from the source and the range of vibration concern is usually limited to 50 feet from the vibration source; thus, the proposed project, when combined with the

identified cumulative projects, would not cause a cumulatively considerable vibration impact. As a result, cumulative impacts would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

3.11 Recreation

This section evaluates the potential for recreation impacts that may result from construction and operation of the proposed project. This section includes: the existing recreational opportunities and facilities in the proposed project vicinity; a summary of applicable regulations related to recreation; and an evaluation of the potential impacts of the proposed project related to recreation in and around the proposed project site, including cumulative impacts.

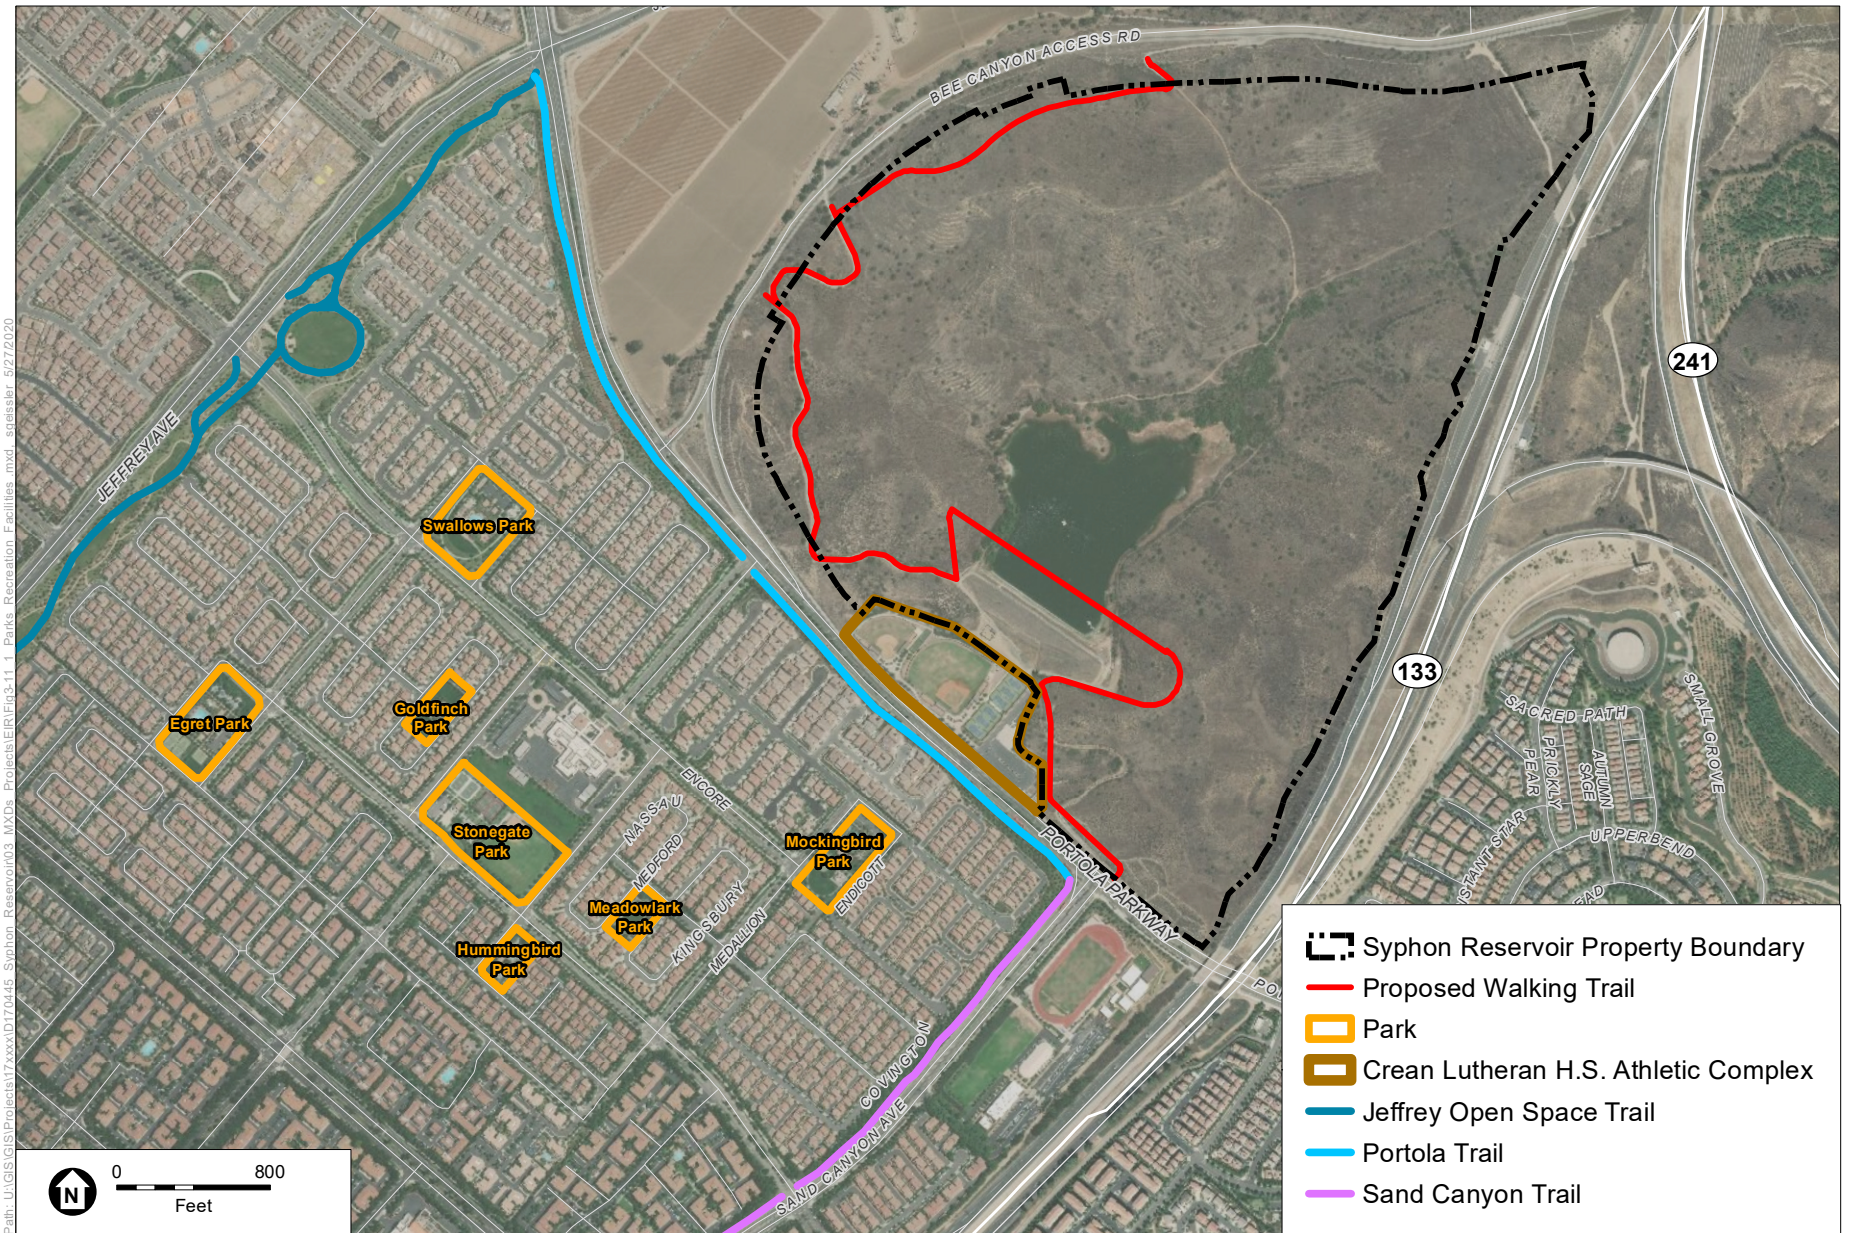

3.11.1 Environmental Setting

The proposed project site is located in unincorporated County of Orange, within the City of Irvine's sphere of influence. The City and County recreational facilities below characterize the environmental setting of the proposed project area.

Local Parks and Recreation Facilities

The City of Irvine recreational facilities and services include public parks, private parks, an aquatic center, athletic complexes, a nature center, a fine arts center and landscaped recreational trails. Regional parks and open space areas within the City are also available to Irvine residents. Other recreation opportunities within a short traveling distance for Irvine residents include golf courses, bikeways, public beaches, local mountains, natural parks, and deserts (City of Irvine 2015).

The City of Irvine General Plan Parks and Recreation Element categorizes City park facilities into five categories: regional and open space, regional parks, community parks, public neighborhood parks, and private neighborhood parks (City of Irvine 2015). Private neighborhood parks are identified in the Parks and Recreation Element as "able to serve the immediate development or specific planned community in which they are located. Private parks are owned and maintained by homeowner associations or maintenance district" (City of Irvine 2015). The majority of park facilities in the proposed project vicinity are public and private neighborhood parks located in a neighborhood known as Stonegate, which begins southwest of the proposed project site across Portola Parkway and extends to Irvine Boulevard (**Figure 3.11-1**). The City of Irvine maintains Stonegate Park in the project vicinity (City of Irvine 2019a). Private neighborhood parks in the vicinity of the proposed project include Mockingbird Park, Egret Park, Goldfinch Park, Meadowlark Park, Hummingbird Park and Swallows Park (City of Irvine 2017; Villages of Irvine 2020). All public neighborhood parks are available to the public, while private neighborhood parks have varying degrees of public access. **Table 3.11-1** describes the amenities that are available at parks and recreation facilities in the vicinity of the proposed project. Additionally, the Crean Lutheran High School Athletic Complex is located in close proximity to the proposed project site at 6301 Portola Parkway, Irvine CA and is privately owned and operated. The athletic complex is not available to the public.

Meadowlark Park*	Medford, Irvine	Shade structures, barbecues and picnic areas
Hummingbird Park*	Majesty, Irvine	Lap pool with spa and wading pool, shade structures, barbecues and picnic areas, child play area
Swallows Park*	Encore, Irvine	Jr. Olympic pool with spa and wading pool, shade structures, barbecues and picnic areas, child play area
Orange County Great Park	8000 Great Park Blvd, Irvine	Great Park Sports Complex, Great Park Balloon and Carousel rides, outdoor agricultural classes, playgrounds, 1.5 miles of walking/biking space
Limestone Canyon Nature Preserve	Silverado	Scenic wilderness area with guided tours and open access days for hiking and mountain biking.
Whiting Ranch Wilderness Park	26701 Portola Parkway, Foothill Ranch	23 trails totaling approximately 17 miles of graded roads and single-track trails for hikers, mountain bikers and equestrians. Connectivity to other trails in the OC Parks Regional Trails system.

NOTE:

* These private neighborhood parks are privately maintained and have varying degrees of public accessibility.

SOURCE: City of Irvine 2019; Villages of Irvine 2020; OC Parks 2020

Orange County Parks also maintains several regional parks in the proposed project area. The nearest regional parks include the Orange County Great Park (OCGP), the Limestone Canyon Nature Preserve and Whiting Ranch Wilderness Park. The OCGP, located approximately 3.5 miles to the south of the proposed project site, is the largest park in the City. Currently, the OCGP includes 1,300 acres, 450 acres of which are developed and more than 230 acres that are funded and in progress of development. The OCGP currently includes recreation facilities to support the arts, gardening, agriculture, sports and fitness, and events and festivals (City of Irvine 2017; City of Irvine 2020).

Limestone Canyon Nature Preserve is located approximately 2 miles northeast of the proposed project site within the County of Orange Open Space Reserve (OSR) lands. Whiting Ranch Wilderness Park is located approximately 4.2 miles southeast of the proposed project in areas north of the Foothill Ranch community. While there is an extensive network of trails within both Limestone Canyon Nature Preserve and Whiting Ranch Wilderness Park, the trails in the Limestone Canyon Nature Preserve and Whiting Ranch Wilderness Park do not connect to trails in the vicinity of Syphon Reservoir and the proposed project site (County of Orange 2015; City of Irvine 2017).

Interconnected City bikeways in the vicinity of the proposed project are used for recreation and commuting. City bikeways in the vicinity of the proposed project include the Portola Trail Bikeway, the Sand Canyon Trail Bikeway and the Jeffrey Open Space Trail Bikeway (see Figure 3.11-1). Bikeways are discussed in further detail in Chapter 3.12, Transportation, of this EIR.

3.11.2 Regulatory Framework

Federal

No federal regulations related to recreation are applicable to the proposed project.

State

No state regulations related to recreation are applicable to the proposed project.

Local

County of Orange

General Plan, Land Use Element

The Land Use Element included in the County of Orange General Plan contains official County policies on the location and character of land uses necessary for orderly growth and development. The Land Use Element has a 2025 horizon year and describes objectives, policies, and land use patterns for all unincorporated territory in the County of Orange. The Land Use Plan further establishes development criteria and standards including population density and building intensity. The Land Use Element complements the Recreation Element by incorporating its land use recommendations in policies and programs, however the Land Use Element does not supersede the Recreation Element.

The County of Orange Land Use Element Map designates lands within the proposed project site as Open Space Reserve (OSR) and Public Facilities (4). The OSR land use designation identifies “lands of scenic and natural attraction, and areas of ecological, cultural, historical and recreational significance that are permanently preserved as and restricted to open space and compatible uses.” Permitted uses within OSR lands include riding and hiking trails (County of Orange 2015). The Public Facilities (4) land use designation identifies “major facilities built and maintained for public use.” Permitted uses include water facilities.

General Plan, Recreation Element

The Recreation Element outlines a comprehensive strategy for meeting Orange County’s existing and future recreation needs, set forth in an integrated framework of recreation goals, objectives, policies and programs, as well as a “master plan” for each of three components: The Local Parks Component, the Regional Riding and Hiking Trails Component; and the Regional Recreation

Facilities Component (County of Orange 2012). Goals and objectives that are applicable to existing and planned recreation facilities that are in the proposed project area are as follows:

Local Parks Goal 2: Develop local park sites to provide recreational facilities designed to meet the active recreational needs and preserve natural resources of each community within unincorporated Orange County.

City of Irvine

City of Irvine General Plan, Parks and Recreation Element

The Parks and Recreation Element (Element K) of the City of Irvine General Plan includes an inventory and categorizations for all public recreational facilities within the City, and provides objectives and policies related to the provision and use of recreation facilities (City of Irvine 2015). The current Parks and Recreation Element contains the following objectives and policies that are applicable to the proposed project:

Objective K-1 Recreational Opportunities: Provide for a broad spectrum of recreational opportunities and park facilities, in either public or private ownership, to accommodate a variety of type and sizes of functions.

Policy K-1(b): Encourage the development of special areas in community parks that will enhance recreational and leisure opportunities in the City.

Objective K-3 Park Location: Locate park and recreation facilities for safe and easy access by their intended users.

Policy K-3(c): Use the latest adopted Community Parks Master Plan as a guideline for future siting of community parks ... Link parks and trails to other open space.

City of Irvine General Plan, Conservation and Open Space Element

The 2015 update to the City of Irvine Conservation and Open Space Element (Element L) provides long-term guidance for the preservation of significant natural resources and open space areas (City of Irvine 2015). Included in the Conservation and Open Space Element are specific objectives and policies for preserving, managing, and using natural and manmade resources. The following objectives and policies are applicable to the proposed project:

Objective L-9 Recreation Areas: Develop and maintain a network of recreational areas that provide a variety of recreational opportunities, and which link and integrate other conservation and open space areas into the land use fabric of the City.

City of Irvine Parks Master Plan

The Parks Master Plan provides guidance for development and maintenance of public parks, which include community parks, neighborhood parks and special use sites accounting for more than 530 acres of park land, in addition to other recreation resources that affect park planning and use. Other recreation resources for which guidance is outlined in the Parks Master Plan include more than 6,500 acres of open space wetlands, oak woodlands, grasslands and coastal sage scrub, on-street and off-street bikeways, and hundreds of private city parks.

The 2017 update to the Parks Master Plan shifts focus away from new development, as was emphasized in the 1988 Community Parks Master Plan, toward the ongoing maintenance and enhancement of park resources in the City of Irvine. The goal of the Parks Master Plan is to help the City continue to provide its residents with high-quality parks, recreation facilities, open spaces, programs and services over the coming decade and beyond (City of Irvine 2017).

3.11.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from Appendix G of the CEQA Guidelines are used as thresholds of significance to determine the impacts of the proposed project as related to recreation. The proposed project would have a significant impact if it would:

1. Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.
2. Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.
3. Result in a cumulatively considerable impact to recreation.

Methodology

Recreation information for the proposed project area was derived from various sources and compiled in this chapter to develop a comprehensive understanding of existing park and recreational opportunities as well as constraints that could occur as a result of the proposed project. Information sources include the County of Orange General Plan, City of Irvine General Plan, and the City of Irvine Parks Master Plan.

Impact Analysis

Increase in Use of Recreational Facilities

Impact 3.11-1: The proposed project would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

The nearest public recreational facilities to the proposed project include Stonegate Park, located approximately 1,800 feet from the project site, and the Portola Trail Bikeway located on the western portion of Portola Parkway, approximately 500 feet from the project site. Additionally, there are 7 private neighborhood parks that are available to the immediate Stonegate community. The nearest regional parks to the proposed project are the Orange County Great Park, Limestone Canyon Nature Preserve, and Whiting Ranch Wilderness Park. The closest of the three regional parks is Limestone Canyon Nature Preserve, approximately two miles from the project site. As stated previously above, trails at Limestone Canyon Nature Preserve do not connect to the proposed project site. No other regional parks are considered to be close enough to the proposed project to be affected by its recreational visitors. The proposed project does not include any

increase in residential units that would increase the permanent residential base of the City of Irvine or larger Orange County. Since demand for parks is typically based on the permanent residential population, and because no population increase would occur as part of the proposed project, the proposed project would not result in an increase in demand/use on existing parks that could result in substantial physical deterioration.

As stated in Chapter 2, *Project Description*, during project design, IRWD will consider passive recreational facilities compatible with the project site. Recreational facilities may include a proposed walking trail along existing access roads at the project site. A potential trail extension may be installed east from the existing Highline Canal and would be located on ridges or other relatively gradual-sloped terrain as shown on Figure 2-2. The new proposed walking trail would have the potential to draw local residents to the area that could indirectly increase the use of public parks in the vicinity of the proposed project. While use of existing bicycle paths would not increase as a result of the proposed project since bicycles are not allowed on the proposed project site, pedestrians could increasingly use bike paths to access the proposed recreation facilities at the project site. Nonetheless, it is assumed that implementation of passive recreation opportunities at the proposed project site would only draw users from the local community in and around the project area, mostly from the Stonegate community and other adjacent neighborhoods. Additionally, IRWD would moderate the use of a recreation trail at Syphon Reservoir by restricting entrance to daily or seasonal use, further reducing the potential for nearby public recreation facilities to be impacted by an increase in visitors to the project site. The nearest private recreational facility is the Crean Lutheran High School Athletic Complex. While private users of the Athletic Complex could use the proposed recreation trail, the private Athletic Complex would not be available to new users of the proposed recreation trail. Thus, the Athletic Complex facilities would not be indirectly impacted by any increase in visitors that may occur as a result of the proposed project. As a result, impacts related to physical deterioration of nearby recreational facilities would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Expansion of Recreational Facilities

Impact 3.11-2: The proposed project could include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

Construction

Construction of the proposed project could involve implementation of a passive recreation trail in a manner that is compatible with the project site, as shown in Figure 3.11-1. A large portion of the proposed walking trail would follow the existing dirt access road along the Highline Canal in

the south and southwest portions of the proposed project site. The proposed walking trail traverses through coastal sage scrub and disturbed coastal sage scrub communities. The existing Highline Canal would be backfilled for installation of the proposed walking trail. Construction of a trail would occur through grading and compacting of native material. No existing vegetation would be impacted by installation of a trail along existing roads or the Highline Canal. A potential trail extension may be installed east from the existing Highline Canal and would be located on ridges or other relatively gradual-sloped terrain. This area contains coastal sage scrub and disturbed coastal sage scrub communities. The potential impacts related to constructing passive recreation facilities are evaluated throughout this Draft EIR, with notable impacts summarized below.

As described in Section 3.3, *Biological Resources*, construction of the proposed project would result in impacts to special-status species and sensitive natural communities that would be potentially significant. In 2019, habitat areas immediately adjacent to the existing Highline Canal and associated dirt access road were surveyed for sensitive biological species occurrences. The surveys recorded three least Bell's vireo territories, three California gnatcatcher occurrences, and one yellow-breasted chat occurrence during 2019 surveys in the vicinity of the Highline Canal. Surveys conducted in the vicinity of the north-northwest areas of the project site, where the proposed trail would extend from the Highline Canal to an existing northern access road, observed one least Bell's vireo territory, one California gnatcatcher occurrence, and one yellow-breasted chat occurrence. Implementation of Mitigation Measure BIO-1 through BIO-5 would ensure that impacts to special-status species would be reduced to less than significant levels; implementation of Mitigation Measure BIO-6 would reduce impacts to sensitive natural communities and riparian habitat to less than significant levels; and implementation of Mitigation Measures BIO-3 and BIO-5 would reduce impacts to wildlife movement and nursery sites to less than significant levels. The proposed project would not conflict with the provisions of the NCCP/HCP, or local policies and ordinances with implementation of Mitigation Measures BIO-1 and BIO-2. Final design would determine the appropriateness and location of the proposed walking trail on existing access roads and any other optional recreational facilities. Operation and maintenance of the proposed walking trail would be included in the Resource Management Plan required as part of Mitigation Measure BIO-5. Coordination and approval from regulatory agencies, including USFWS and CDFW, would be required for onsite recreational components.

As described in Section 3.4, *Cultural Resources*, construction of the proposed walking trail along the Highline Canal would occur in close proximity to a historic-period archaeological site. Although the archaeological site has not been evaluated for eligibility for listing in the California Register, impacts to potentially significant cultural resources as a result of construction of recreational facilities would be potentially significant. Implementation of Mitigation Measure CR-1 would result in avoidance of this resource, and Mitigation Measure CR-2 through CR-4 would ensure that construction activities are monitored and assessed for unanticipated discoveries. With implementation of Mitigation Measures CR-1 through CR-4, impacts would be reduced to less than significant levels. Construction of the proposed recreational facilities would not otherwise have an adverse physical effect on the environment. Therefore, impacts would be less than significant with mitigation.

Operation

Operation of the proposed project could result in use of a proposed recreational trail shown on Figure 3.11-1. The potential impacts of operating the proposed passive recreational facilities are evaluated throughout this Draft EIR, with notable impacts summarized below. Impacts to biological resources during operation and maintenance activities related to the proposed walking trail could result in indirect impacts to special-status wildlife species and local wildlife movement (see Section 3.3, *Biological Resources*). With implementation of Mitigation Measure BIO-5, impacts would be reduced to less than significant levels. Further, implementation of Mitigation Measure CR-4 would ensure that any cultural resources encountered during maintenance of the proposed recreational facilities are not significantly impacted. Operation and maintenance of the proposed recreational facilities would not otherwise have an adverse physical effect on the environment. Therefore, impacts would be less than significant with mitigation.

Mitigation Measures

Implement Mitigation Measures BIO-1 through BIO-6 and CR-1 through CR-4

Significance Determination

Less than Significant Impact with Mitigation

Cumulative Impacts

Impact 3.11-3: Concurrent construction and operation of the proposed project and related projects in the geographic scope would not result in cumulative impacts to recreation.

The cumulative projects to be considered in the analysis of cumulative impacts are listed in Table 3-1, Related Projects for Cumulative Analysis, and illustrated on Figure 3-1, Cumulative Project Locations, in Chapter 3 of this Draft EIR. The only cumulative projects that could have impacts to recreation when combined with the proposed project, and that could result in cumulatively considerable impacts, are large scale development projects or other proposed uses that may conflict with recreation policies within the City of Irvine and County of Orange. Since there are no major plans for development at the recreation facilities described in Table 3.11-1, it is assumed that any operation and maintenance at the facilities included in Table 3.11-1 would be small-scale. Therefore, the existing facilities do not meet the criteria for cumulative projects.

The City is in the process of conceptual planning for large scale development of a new recreation facility, Gateway Community Park (Cumulative Project 3 in Table 3-1), on land adjacent to the western boundary of the project site. Conceptual planning and community outreach for the Gateway Community Park have been ongoing since the year 2003, and the current goal for completion is 2021 (City of Irvine 2019b). Plans include the potential development of a 70-acre park at the terminus of the Jeffrey Open Space Trail that could include a community center, gymnasium, hiking trails, an 18-hole disc golf course, a dog park, picnic areas, and other amenities (City of Irvine 2017). Due to the proximity and size of the project, construction and operation of Gateway Community Park in combination with the proposed project would have the potential to result in cumulatively considerable impacts to recreation.

Construction and Operation

The City of Irvine designates the site of Gateway Community Park project for Open Space (Recreation) land use, and City zoning designates the site for recreation (City of Irvine 2014; City of Irvine 2015). As such, construction of the Gateway Community Park alone would not conflict with recreation policies within the City. In fact, Gateway Community Park would achieve City plans and policies related to linking trails to open space areas and providing a range of recreation facilities in the City. The proposed project would implement the recreation trail, including the potential connections to Gateway Community Park, in compliance with City and County plans and policies related to recreation. Gateway Community Park would attract new recreation visitors. However, since attracting new recreation visitors is the intention of the project, Gateway Community Park components would be developed with the capacity to provide for the additional visitors and would not be impacted by any physical deterioration. The proposed project itself would not attract new visitors other than from the local community. As a result, there would be no deterioration of recreational facilities. Further, the proposed project and the Gateway project would not combine to create cumulative effects regarding deterioration of recreational facilities. Therefore, when considered together with Cumulative Project 3, the proposed project would not impact City plans and policies for recreation and would not have cumulatively considerable impacts on recreation.

Mitigation Measures

3.12 Transportation

This section evaluates the potential for impacts related to transportation generated by construction and operation of the proposed project. This section includes: a description of the existing transportation and circulation conditions regionally and in and around the proposed project site; a summary of applicable regulations related to transportation; and an evaluation of the potential impacts of the proposed project related to transportation and traffic in and around the project site, including cumulative impacts. The analysis in this section is based in part on the Transportation Impact Analysis prepared for the proposed project (Fehr & Peers 2020a) and included as **Appendix E** to this Draft EIR.

3.12.1 Environmental Setting

Regional Setting

The proposed project would be implemented at the existing Syphon Reservoir site located in unincorporated County of Orange just northeast of the City of Irvine, California. The regional transportation system is comprised of an interconnected network of roadways, local transit systems, and pedestrian and bicycle facilities. Freeways and toll roads in the general vicinity of the proposed project site include the Laguna Freeway/Eastern Transportation Corridor East Leg (State Route [SR-] 133) directly east of the project site, the Eastern Transportation Corridor West Leg (SR-261) to the northwest, the Foothill Transportation Corridor (SR-241) to the east and north, and the Santa Ana Freeway (Interstate [I-] 5). Major arterials include Portola Parkway directly south of the project site, Sand Canyon Avenue to the south, and Irvine Boulevard to the southwest (City of Irvine 2015). A series of major arterial roads within the community connect to collector roads that function to link neighboring land uses. **Figure 3.12-1** depicts regional highways and arterial roads in the vicinity of the proposed project.

SR-133 is a 14-mile-long north–south state highway that provides regional access to the project area, running between Laguna Beach and Irvine in the vicinity of the proposed project. SR-133 has an on- and off-ramp at Irvine Boulevard approximately 0.7 miles south of the proposed project site.

SR-261 is a 6-mile-long north–south state highway that provides regional access to the project area, running between Anaheim Hills and Irvine in the vicinity of the proposed project. SR-261 has an on- and off-ramp at Portola Parkway approximately 2.6 miles northwest of the proposed project site.

SR-241 is a 24-mile-long north–south state highway that provides regional access to the project area, running between Ladera Ranch and Irvine in the vicinity of the proposed project. SR-241 has an on- and off-ramp approximately 2 miles southeast of the project site and connects to SR-133 approximately 0.5 miles east of the proposed project site.

I-5 is a major north–south interstate highway that provides regional access to the project area, running through Irvine in the vicinity of the proposed project. I-5 connects to SR-133 approximately 2.9 miles south of the proposed project site.

Syphon Reservoir Improvement Project

Figure 3.12-1
Regional and Local Roadways

Local Roadways

The proposed project site is located on the northeast side of Portola Parkway between Bee Canyon Access Road and Sand Canyon Avenue. Various roadways surrounding the proposed project site provide local access as identified in Figure 3.12-1. The following roadways provide both local access to the proposed project site and connect to the regional arterials and highways described above:

Portola Parkway is designated as both a Primary Highway and a Major Highway in the City of Irvine Master Plan of Arterial Highways. This four- to six-lane split roadway traverses in a northwest/southeast direction along the southern boundary of the proposed project site. The portion of the roadway that is directly south of the proposed project site has four lanes (two in each direction). There is no on-street parking allowed on this portion of the roadway. The posted speed limit on Portola Parkway ranges from 50 to 55 miles per hour, and 25 miles per hour near the Crean Lutheran Athletic Complex. Notable features along Portola Parkway include bike lanes on both the northbound and southbound sides of the roadway, and a separated sidewalk, known as the Portola Side Path, on the southbound side of the roadway. There is no sidewalk on the northbound side.

Sand Canyon Avenue is designated as both a Primary Highway and Major Highway in the City of Irvine Master Plan of Arterial Highways. This four- to six-lane split roadway traverses in northeast/southwest direction and is one of the major roads in Orange County, running from the existing Syphon Reservoir to I-5. There is no on-street parking allowed on either side of Sand Canyon Avenue. The posted speed limit is 55 miles per hour and 25 miles per hour near Crean Lutheran High School south of Portola Parkway. Sand Canyon Avenue includes bike lanes and sidewalks on both the northbound and southbound sides.

Irvine Boulevard is designated as a Major Highway in the City of Irvine Master Plan of Arterial Highways. This six-lane split roadway traverses in northwest/southeast direction, running from SR-55 to the City of Lake Forest. The posted speed limit is 55 miles per hour. The roadway includes bike lanes and sidewalks on both the northbound and southbound sides.

Traffic Volumes

Orange County Transportation Authority (OCTA) collects information on average daily traffic counts on arterial roadways and freeways from the County, the 34 cities within the County, and the California Department of Transportation (Caltrans) on an annual basis. OCTA reviews the traffic volumes and adjusts the data as necessary to reflect weekday traffic. This information is published on an annual basis on a Traffic Flow Map (OCTA 2019a) that shows Average Daily Traffic (ADT) in thousands of vehicles per day. ADT for the major arterial roadways and freeways in the immediate vicinity of the proposed project is shown in **Table 3.12-1**.

**TABLE 3.12-1
EXISTING ROADWAY VOLUMES IN THE PROJECT AREA ('000S OF VEHICLES PER DAY)**

Roadway Segment	ADT
Portola Parkway (Between Jeffrey Rd and Sand Canyon Ave)	19,000
Sand Canyon Avenue (Between Irvine Blvd and Portola Pkwy)	16,000
Irvine Boulevard (Between Jeffrey Rd and Sand Canyon Avenue)	25,000
I-5 (SR-133 Junction)	201,000
SR-133 (SR-241 Junction)	46,700
SR-261 (Portola Parkway Exits)	37,900
SR-241 (SR-133 Junction)	39,200

ADT = Average Daily Traffic
SOURCE: Caltrans 2018; OCTA 2019a

Public Transportation

The City of Irvine is served by Metrolink train service and the OCTA bus service. Metrolink is a commuter rail service operated by the Southern California Regional Rail Authority. Multiple stops during the morning and evening commuting period are provided at stations located in Irvine, Laguna Niguel, Tustin and San Juan Capistrano. The nearest train station to the proposed project site is the Irvine Metrolink, approximately 3.6 miles south of the proposed project site. The nearest bus route that services the project area is OCTA Community Route 167, which runs northwest and southeast on Irvine Boulevard (OCTA 2020). The nearest bus stop is the Irvine-Jeffrey stop at the intersection of Irvine Boulevard and Jeffrey Road approximately 0.9 miles southwest of the project site. Regular service hours for OCTA Community Route 167 are from approximately 5 a.m. to 8:30 p.m. Monday through Friday, with hourly service times at each stop.

Bicycle and Pedestrian Transportation

The City of Irvine has an extensive trail system that includes pedestrian and bike trails within open space corridors and along regional trails. The County maintains a coordinated system of trails, including bikeways, equestrian trails and hiking trails within the cities. Bikeways comprise the most extensive part of the City's trail network. The biking network in Irvine connects with other trails and paths in adjacent communities and throughout Orange County. The three categories of bikeways are:

- Class I (Bicycle Path): provides a completely separated right-of-way for the exclusive use of bicycles and pedestrians with crossflow by motorists minimized;
- Class II (Bicycle Lane): provides a striped lane for one-way bicycle travel on a street or highway; and
- Class III: (Bicycle Route): provides for shared use with pedestrian or motor vehicle traffic.

The City of Irvine contains 54 miles of off-street Class I bicycle trails and 301 miles of on-street Class II bicycle lanes within the City. The closest bike paths to the proposed project site include the Portola Trail Bikeway (Class I), the Sand Canyon Trail Bikeway (Class I), and the Jeffrey

Open Space Trail Bikeway (Class I) as shown on Figure 3.11-1 in Section 3.11, Recreation (City of Irvine 2011; City of Irvine 2015a).

3.12.2 Regulatory Framework

The development and regulation of the transportation network in the vicinity of the proposed project primarily involves state and local jurisdictions. All roads within the proposed project area are under the jurisdiction of state and local agencies. Applicable state and local laws and regulations related to traffic and transportation issues are discussed below.

Federal

There are no federal regulations applicable to the proposed project.

State

California Department of Transportation (Caltrans)

Caltrans manages interregional transportation, including management and construction of the California highway system. In addition, Caltrans is responsible for permitting and regulation of the use of state roadways. The project area includes four highways that fall under Caltrans' jurisdiction: SR-133, SR-261, SR-241, and I-5.

Caltrans' construction practices require temporary traffic control planning "when the normal function of a roadway, or private road open to public travel, is suspended" (FHWA 2012). In addition, Caltrans requires that permits be obtained for transportation of oversized loads and licenses be obtained for transportation of certain materials.

Senate Bill No. 743

Approved in 2013, Senate Bill (SB) 743 amended the CEQA Guidelines to provide an alternative to level of service (LOS) for evaluating transportation impacts. In accordance with Senate Bill (SB) 743, the new CEQA Guidelines Section 15064.3, subdivision (b) was adopted in December 2018 by the California Natural Resources Agency. These revisions to the CEQA Guidelines criteria for determining the significance of transportation impacts are primarily focused on projects within transit priority areas and shift the focus from automobile delay to reduction of greenhouse gas emissions, creation of multimodal networks, and promotion of a mix of land uses. Automobile delay, as measured by LOS and other similar metrics, generally no longer constitutes a significant environmental effect under CEQA. The intent of this legislation is to balance the need for traffic LOS standards with the need to build infill housing and mixed-use commercial developments within walking distance of mass transit facilities, downtowns, and town centers. In doing so, this legislation aims to provide greater flexibility to local governments to balance these sometimes competing needs. However, a jurisdiction may still adopt LOS as a performance standard for analyzing traffic conditions and maintaining throughput on its highway system. The Governor's Office of Planning and Research (OPR) has adopted changes to the CEQA Guidelines that identify vehicle miles traveled (VMT) as the most appropriate metric to evaluate a project's

transportation impacts. Vehicle miles traveled, or VMT, is a measure of the total number of miles driven to or from a development and is sometimes expressed as an average per trip or per person. OPR stated that lead agencies, including the City of Irvine, had until July 1, 2020 to implement the new VMT requirements. On June 23, 2020, the City of Irvine adopted the *CEQA VMT Impact Analysis Guidelines* (City of Irvine 2020), which identifies the screening criteria, analysis requirements, thresholds, and mitigation options for VMT analysis associated with the operation of new projects in the City of Irvine. According to the City of Irvine's adopted *Guidelines*, projects generating fewer than 250 weekday daily trips do not meet the daily trip screening threshold and are excluded from further VMT impact analysis. Neither OPR nor the City of Irvine have adopted specific VMT metrics or thresholds of significance for construction-related traffic. Many jurisdictions in Southern California consider construction-related traffic to cause adverse but not lasting intersection deficiencies because, while sometimes inconvenient, construction-related traffic efforts are temporary.

Local

County of Orange

Orange County Congestion Management Plan

OCTA is the County's Congestion Management Agency. OCTA is responsible for developing the Orange County Congestion Management Program (CMP). The CMP contributes to federal Congestion Management Process requirements, which is a systematic and regionally-accepted approach for managing congestion. The federal Congestion Management Process provides accurate, up-to-date information on transportation system performance and assesses alternative strategies for congestion management that meet state and local needs. The CMP is also intended to serve as a systematic process that provides for consistent and effective integrated monitoring and management of the multimodal transportation system.

The goals of Orange County's CMP are to support regional mobility objectives by reducing traffic congestion, to provide a mechanism for coordinating land use and development decisions that support the regional economy, and to support gas tax funding eligibility. To meet these goals, the CMP contains a number of policies designed to monitor and address system performance issues. OCTA developed the policies that makeup Orange County's CMP in coordination with local jurisdictions, Caltrans, and the South Coast Air Quality Management District (SCAQMD).

The CMP requires that a traffic impact analysis be conducted for any project generating 2,400 or more daily trips, or 1,600 or more daily trips for projects that directly access the CMP Highway System. Per the CMP guidelines, this number is based on the need to analyze any impacts that will be three percent or more of the existing CMP highway system facilities' capacity. The CMP Highway System includes specific roadways, which include State Highways and Super Streets, which are now known as Smart Streets, and CMP arterial monitoring locations/intersections. The CMP Highway System arterial in the vicinity of the proposed project includes Irvine Boulevard. The CMP arterial monitoring locations/intersections in the vicinity of the project area include SR-133 Northbound/Irvine Boulevard, SR-133 Southbound/Irvine Boulevard, SR-261 Northbound/Irvine Boulevard, and SR-261 Southbound/Irvine Boulevard (OCTA 2019b). The

proposed project would not generate 1,600 or more daily trips, or increase daily trips by three percent or more, on the CMP Highway System.

Orange County Commuter Bikeways Strategic Plan

OCTA adopted the 2009 Commuter Bikeways Strategic Plan (CBSP) on May 22, 2009 to encourage the enhancement of Orange County's regional bikeways network, in order to make bicycle commuting a more viable and attractive travel option. The CBSP is intended to create a comprehensive blueprint of the existing bikeways in the county, as well as propose new facilities to complete a network of bikeways. The CBSP identifies Class I Bikeways along Portola Parkway, Sand Canyon Boulevard, and Jeffrey Road. The projects described in the CBSP are a compilation of projects planned by Orange County Cities and the County of Orange. The CBSP is a long-range, financially unconstrained planning document (OCTA 2012).

Southern California Association of Governments

In April 2016, the Southern California Association of Governments (SCAG) adopted its 2016 Regional Transportation Plan (RTP)/Sustainable Communities Strategy (SCS). The 2016 RTP/SCS presents the transportation vision for the SCAG region through the year 2040 and provides a long-term investment framework for addressing the region's transportation and related challenges. The RTP/SCS focuses on maintaining and improving the transportation system through a balanced approach and discusses long-term emission reduction strategies for rail and trucks, expanding the region's high speed and commuter rail systems, expanding active transportation, leveraging technological advances for transportation, addressing further regional reductions in greenhouse gas emissions, and making the region more resilient to climate change. The plan is subject to numeral performance measures to monitor its progress toward achieving social equity and environmental justice; these measures include accessibility to parks and natural lands, roadway noise impacts, air quality impacts and public health impacts (SCAG 2016).

City of Irvine

General Plan, Circulation Element

The City of Irvine's current General Plan was last amended in 2015. The Circulation Element describes the nature and extent of the existing circulation network, and identifies trends, issues, and public policies relating to the development of a balanced, multi-modal circulation system for the City. The circulation system has been designed to create a hierarchy of roadways, reinforce boundaries of planning areas, respond to conservation, noise, air pollution, and wildlife preservation policies, and satisfy General Plan and Strategic Business Plan objectives.

The Circulation Element classifies Arterial Highways in the City primarily by the number of lanes within the roadway. The Arterial Highways in the vicinity of the proposed project site are classified as either Major Highways, which have six to eight lanes, or Primary Highways, which have four lanes (City of Irvine 2015b). The roadway portions that are in the vicinity of the project site are as follows: Portola Parkway is designated as a Primary Highway; Sand Canyon Avenue is designated as a Primary Highway; and Irvine Boulevard is designated as a Major Highway.

The following objectives and policies in the Circulation Element would be applicable to the proposed project's intersection improvements:

Objective B-2 Roadway Design: Develop a vehicular circulation system consistent with high standards of transportation engineering safety and with sensitivity to adjoining land uses.

Policy (g): Include mitigation measures in the approval of all proposed developments to minimize negative impacts of the automobile.

Policy (h): Properly space and interconnect traffic signals in order to minimize the number of traffic signals, and the acceleration/deceleration that produces significantly higher vehicular emissions and noise levels.

Policy (i): Utilize traffic control device systems that are understandable, attractive, simple, uniform, and visible.

Objective B-3 Pedestrian Circulation: Establish a pedestrian circulation system to support and encourage walking as a mode of transportation.

Policy (b): Require development to provide safe, convenient, and direct pedestrian access to surrounding land uses and transit stops. Issues such as anticipated interaction between pedestrians and vehicles, proposed infrastructure improvements and design standards shall be considered.

Policy (c): Design and locate land uses to encourage access to them by nonautomotive means.

Objective B-4 Bicycle Circulation: Plan, provide and maintain a comprehensive bicycle trail network that together with the regional trail system, encourages increased use of bicycle trails for commuters and recreational purposes.

Policy (d): Require bicycle trail linkages between residential areas, employment areas, schools, parks, community facilities, commercial centers, and transit facilities.

Policy (g): Require traffic control devices and traffic signal phasing for bicycle crossing, turning, and through movements.

City of Irvine Active Transportation Plan and Bicycle Transportation Plan

The 2015 Active Transportation Plan provides an integrated set of recommendations for increasing the levels of walking and bicycling in the City of Irvine. The plan also discusses adopted plans and policies related to bicyclists and pedestrians in the city of Irvine, such as municipal codes and the City's Bicycle Transportation Plan, describes the existing pedestrian bicycle network, and provides opportunity areas for growing the active transportation network.

The Bicycle Transportation Plan includes a collision analysis to assess bicycle patterns and trends in the City. The City determined that safety is a major concern for bicyclists and pedestrians, as there was an average of 58.6 bicycle-related collisions per year and an average of 38.8 pedestrian-related collisions per year in the City from 2008 to 2012 (City of Irvine 2015a). In general, bicycle and pedestrian collisions occurred most frequently from Tuesday to Friday during daylight hours. A summary of the collision data includes a list of key City roadways where a

higher number of bicycle and pedestrian collisions have occurred. Portola Parkway, which is the southern adjacent road to the proposed project site, is not included in the list of roadways, which have had the most collision occurrences. However, the Portola Parkway/Sand Canyon Avenue and Portola Parkway/Jeffrey Road intersections are identified as High Stress Segments. In the 5-year data period, the collision map indicates that approximately 4 bicycle collisions occurred at the Portola Parkway/ Sand Canyon Avenue intersection and approximately 2 bicycle collisions occurred at the Portola Parkway/ Jeffrey Road intersection. No collisions involving pedestrians occurred in close proximity to the proposed project site (City of Irvine 2011; City of Irvine 2015a).

City of Irvine Municipal Code

Section 6-3-565 of the City of Irvine’s Municipal Code designates streets and portions of streets within the City as truck routes. In the vicinity of the proposed project, truck routes are designated on Sand Canyon Avenue, Laguna Freeway (all SR-133 designated portions), Irvine Boulevard (from Culver Drive to the eastern City limit), and I-5.

Pursuant to Section 5-10-203 of the City of Irvine Municipal Code, under Chapter 2 Encroachment Regulations, the proposed project would be required to obtain a Traffic/Hauling permit from the Chief Building Official, unless explicitly exempted by conditions outlined under Section 5-10-204, “Exemptions from Permit Requirements.” The proposed project would include construction activities that may cause, place or maintain an encroachment in a public street, which warrants the above mentioned permit and approval from the City.

Section 5-10-246 of the City’s Municipal Code outlines restrictions and procedures for Construction Traffic Control. Notably, all detours caused by project construction within the City streets shall have a detour plan approved by the City prior to construction. Detours shall be defined as the closure of any part of the traveled right-of-way.

Chapter 5, Vehicular Traffic, Parking Regulations, Section 6-3-569 of the City’s Municipal Code, outlines permit conditions and procedures for project construction vehicles exceeding allowable load restrictions. The Extra Large Legal Size Transportation Permit, in accordance with California Vehicle Code Sections 35780 and 35784, must be approved by the Director of Public Works to authorize operation of a vehicle exceeding the maximum load on restricted use roadways. The permit may be for such lengths of time, up to a 12 months, and for such number of operations, limited or unlimited, as the Director of Public Works may deem advisable.

Section 6-3-567(A) of the City’s Municipal Code outlines the restricted use of certain streets for vehicles in excess of 14,000 pounds gross weight. Jeffrey Road, which intersects with Portola Parkway northwest of the proposed project site, is designated as a restricted use roadway. Due to this restriction and the fact that other unrestricted parallel local roadways would provide more direct access to the project site (e.g., Sand Canyon Avenue), this segment of Jeffrey Road would not be used or affected during project construction.

Section 6-3-567(B) of the City's Municipal Code outlines the restricted use of certain streets for vehicles in excess of 6,000-pound gross weight. No roads in the vicinity of the proposed project site are designated as a restricted roadway in Section 6-3-567(B).

City of Irvine Transportation Design Procedures

The *City of Irvine Transportation Design Procedures* (TDPs) establish uniform policies and procedures to assist with the design and review of transportation-related features of development projects in the City of Irvine (City of Irvine 2007). At the request of the City of Irvine, the proposed intersection improvements at Sand Canyon Avenue and Portola Parkway were evaluated for consistency with the following TDPs: TDP 1, which recommends lengths of left-turn pockets; TDP 14, which identifies recommended lengths for driveways to projects based on the number of peak hour trips entering a project site; and TDP 15, which identifies recommendations for vehicle stacking and gate-stacking at project sites.

3.12.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from CEQA Guidelines Appendix G are used as thresholds of significance to determine the impacts of the proposed project as related to transportation and traffic. The proposed project would have a significant impact if it would:

1. Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.
2. Conflict or be inconsistent with CEQA Guidelines Section 15064.3(b).
3. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
4. Result in inadequate emergency access.
5. Result in cumulatively considerable impacts to transportation and traffic.

Methodology

Analysis of traffic-related impacts of the proposed project rely on methodologies and analysis included in detail in the Transportation Impact Analysis (TIA) prepared for this proposed project (Fehr & Peers 2020a). The TIA includes an operational analysis of eight intersections along Sand Canyon Avenue and Irvine Boulevard that would be used by construction-related traffic to access the project site. However, that analysis is based on transportation performance metrics (i.e., delay, LOS) that are no longer used to determine a CEQA transportation impact per SB 743 and CEQA Guidelines Section 15064.3, subdivision (b), and therefore is not included in the impact discussion. Operational considerations at the intersection of Sand Canyon Avenue and Portola Parkway, which would be modified as part of the proposed project, are included in the impact discussion to disclose whether any hazardous conditions would be introduced as a result of project modifications. Additionally, in order to comply with SB 743, the TIA includes a VMT analysis. The TIA is included as Appendix E to this document.

Due to existing settings associated with the COVID-19 pandemic and closures of schools in the project area in 2020, intersection counts for the proposed project were estimated using previous intersection counts from the year 2018, as provided by the City of Irvine. A growth factor of 2 percent per year was applied to these previous 2018 counts to develop 2020 intersection volumes for the AM and PM peak hours. Information included in the Transportation Impact Analysis includes lane configurations, signal phasing, land uses in the study area, existing pedestrian and bicycle facilities, and transit services.

Impact Analysis

Circulation Programs, Plans, Ordinances, and Policies

Impact 3.12-1: The proposed project could conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities.

Construction

As described in Section 2.4.4 of this Draft EIR, the proposed project would involve improvements at the Sand Canyon Avenue/Portola Parkway intersection to allow for vehicle access to the proposed project site by construction and maintenance workers. Construction at the intersection would occur over approximately four to five months prior to the new proposed reservoir improvements and would require up to 42 daily vehicle trips. While the proposed intersection work would not involve closure of any roadways, temporary lane closures could create delays and/or detours for bikers and pedestrians traveling along the Portola Trail and for vehicles traveling through the intersection. To ensure that impacts related to the circulation system do not occur as a result of the proposed project, IRWD would implement **Mitigation Measure TRA-1**, which would require the preparation and implementation of a Traffic Control Plan. The Traffic Control Plan would include, but not be limited to, signage, striping, delineated detours, flagging operations, changeable message signs, delineators, arrow boards, and K-Rails that will be used during construction to guide motorists, bicyclists, and pedestrians safely through the construction area and allow for adequate emergency access and circulation to the satisfaction of the City. The Traffic Control Plan would be coordinated with the City of Irvine, as necessary, as well as with emergency responders, which include fire departments, police departments, and ambulances that have jurisdiction within the proposed project area. Therefore, with implementation of Mitigation Measure TRA-1, impacts to circulation system during the initial intersection improvement phase of the proposed project would be reduced to a less-than-significant level.

Construction of the remaining components of proposed project would increase the number of vehicles using local roadways on a daily basis and could affect performance of the circulation system. After the proposed intersection improvements and access road construction is complete as described above, construction of the proposed project is expected to occur over approximately 36 months, weather permitting. The primary impacts from the movement of construction vehicles would include short-term and intermittent impacts on roadway capacities due to slower moving

vehicles. Traffic-generating construction activities would consist of the daily arrival and departure of construction workers, trucks hauling equipment and materials to the construction site, the hauling of excavated soils, and importing of new fill and concrete. Trucks leaving roadways onto construction sites would slow traffic and could result in hazards to fast moving traffic.

On any given work day, between 10 and 46 workers would be required onsite for construction of the proposed project. The total number of workers would vary depending on the construction schedule developed by the construction contractors. Excavation of soils/materials and the removal of the existing dam from the project site would require up to 74 daily vehicle trips for a period of approximately 7 to 9 months. Weather permitting, construction of the new proposed dam, spillway and expanded reservoir would be completed within approximately 14 months. Up to approximately 232 daily trips per day for approximately 3 to 4 months would be required for haul trucks, equipment delivery, and employee vehicles during this construction phase. This 3- to 4-month period represents the heaviest period of daily construction vehicle trips that would be generated by the proposed project. Approximately 0.1 million cubic yards of rock, gravel, and other materials would be imported to the site during this construction phase. Weather permitting, construction of the new proposed treatment facilities would last approximately 12 months and would require an estimated peak of 104 construction vehicle trips per day. Installation of proposed wetlands and riparian habitat would occur over a period of 12 months and would include up to 50 construction vehicle trips during peak days. Installation of proposed recreation facilities would occur over a period of 3 months and would require up to 30 construction vehicle trips per day. Demobilization activities would occur over approximately 1 month and would require up to 44 construction vehicle trips during peak days (Fehr & Peers 2020b).

As described above, peak construction trip generation would occur during construction of the new proposed dam, spillway and reservoir (up to 232 daily construction vehicle trips). Trip generation outside of this phase would be greatly reduced with approximately 30 daily to 104 daily trips being generated. Thus, during construction the number of daily round trips on local roadways would not be expected to exceed 232 total construction vehicle trips per day. As shown in Table 3.12-1, workers and haul/delivery trips are likely to use main arterial roadways with existing daily roadway volumes ranging from 16,000 ADT to 25,000 ADT, such as Portola Parkway between Jeffrey Boulevard and Sand Canyon Avenue (19,000 ADT), Sand Canyon Avenue between Irvine Boulevard and Portola Parkway (16,000 ADT), and Irvine Boulevard between Jeffrey Road and Sand Canyon Avenue (25,000 ADT). Relative to the numbers of vehicles that travel on local roadways and freeways during weekdays as shown in Table 3.12-1, an additional 232 vehicle trips would represent a temporary increase of 1.2 percent in ADT on Portola Parkway, 1.5 percent on Sand Canyon Avenue, and 0.9 percent on Irvine Boulevard. Similarly, workers and haul/delivery trips are likely to use nearby freeways with daily freeway volumes ranging from 37,900 ADT to 46,700 ADT, such as SR-261 at Portola Parkway on- and off-ramps (37,900 ADT), SR-241 at the SR-133 junction (39,200 ADT), and SR-133 at the SR-241 junction (46,700 ADT). An additional 232 vehicle trips would represent a temporary increase of 0.6 percent in ADT on SR-261, 0.5 percent on SR-241, and 0.5 percent on SR-133. Further, the above estimates and calculated percentages assume that all construction vehicles would use each roadway/freeway. In reality, trips would be somewhat dispersed depending on which routes are

actually followed by trucks and employees during construction. Therefore, impacts would be less than significant on local circulation system performance from construction-related trips.

Operation

Operation of the new proposed reservoir would involve daily safety and maintenance checks of the site, similar to existing conditions (see Chapter 2, Project Description). As a result, operation of the project would not introduce new permanent trips to the project site. Maintenance of the proposed wetland/riparian area would be required for approximately 5 years after construction is complete to ensure success of the vegetated areas, and would result in infrequent trips to the project site. In the first two years, approximately 2 crews of 6 workers would be required for 40 days of maintenance. In years 3 through 5, maintenance would taper off and would require approximately 1 crew of 6 people over 30 days. As a result, operational vehicle trips during the first five years of maintenance would equal 12 to 24 round trips for 30 to 40 days per year. After the new proposed wetland/riparian area is established, operation would consist of daily trips which would not add any additional trips to the existing condition. The increased traffic volume that would result from operating the proposed project would have a nominal impact on local circulation system performance. As a result, impacts would be considered a less-than-significant impact on circulation system performance.

Mitigation Measures

TRA-1: Traffic Control Plan. Prior to the start of construction, IRWD shall require the construction contractor to prepare and have approved a Traffic Control Plan. The Traffic Control Plan will show all signage, striping, delineated detours, flagging operations, and any other devices that will be used during installation of the improvements at the intersection of Sand Canyon Avenue and Portola Parkway to guide motorists, bicyclists, and pedestrians safely through the construction area and allow for adequate access and circulation to the satisfaction of the City of Irvine, as applicable. The Traffic Control Plan shall be prepared in accordance with the City of Irvine's traffic control guidelines and will be prepared to ensure that emergency access will not be restricted. Additionally, the Traffic Control Plan will ensure that congestion and traffic delays are not substantially increased as a result of the construction activities. Further, the Traffic Control Plan will include detours or alternative routes for bicyclists using on-street bicycle lanes as well as for pedestrians using adjacent sidewalks.

IRWD shall also notify local emergency responders of any planned partial or full lane closures required for project construction. Emergency responders include fire departments, police departments, and ambulances that have jurisdiction within the project area. Written notification and disclosure of lane closure location must be provided at least 30 days prior to the planned closure to allow emergency response providers adequate time to prepare for lane closures.

Significance Determination

Less than Significant Impact with Mitigation

Compliance with CEQA Guidelines Section 15064.3

Impact 3.12-2: The proposed project would not conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b).

Construction

As explained above, neither OPR nor the City of Irvine have adopted specific VMT metrics or thresholds of significance for construction-related traffic. Temporary construction-related traffic impacts, while inconvenient, are generally considered to cause adverse but less than significant impacts. However, the City of Irvine VMT thresholds were applied to the proposed project in the TIA in an effort to document the potential impacts that may occur. It was determined in the TIA that all phases of construction would generate fewer than 250 daily weekday trips. Screening criteria in the City of Irvine's adopted *CEQA VMT Impact Analysis Guidelines* exclude projects generating fewer than 250 weekday daily trips from further VMT impact analysis. Therefore, construction of the proposed project would meet the City of Irvine's daily trip screening threshold, and the proposed project requires no further VMT impact analysis. Impacts are considered less than significant.

Operation

The City's identified significance criteria is for the operation of new projects to generate 15 percent less VMT per capita (or per employee) compared to existing conditions, which is consistent with the OPR Technical Advisory recommendations. If the project VMT rate would exceed the respective thresholds adopted by the City, then the proposed project would create a significant impact. However, as described above for Impact 3.12-1, trips generated during the first 5 years of operation and maintenance activities would be minimal and would generate fewer than 250 daily weekday trips. Therefore, screening criteria in the City of Irvine's adopted *CEQA VMT Impact Analysis Guidelines* exclude the project from further VMT impact consideration. Impacts are considered less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Design Hazards

Impact 3.12-3: The proposed project would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).

The proposed project would construct a two-lane private roadway from the northern side of the Sand Canyon Avenue and Portola Parkway intersection on the project site to allow vehicle access during project construction and maintenance/operations. This improvement assumes the

northbound approach at Sand Canyon Avenue and Portola Parkway would be modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach would be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal operation that gives a green phase for all vehicle movements of one direction followed by a green phase for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations. The proposed lane and signal changes would be implemented in a manner that is consistent with City of Irvine traffic control regulations to ensure that intersection modifications do not create additional hazards impacts for vehicles traveling on the northbound, eastbound, or westbound roadways

In an effort to identify whether the proposed intersection modification would result in hazardous conditions for vehicles entering the proposed private roadway, the TIA evaluated the proposed intersection improvements for consistency with the City of Irvine TDPs' recommended design features for left-turn lane pocket lengths (TDP 1), driveway lengths (TDP 14), and vehicle stacking and gate-stacking at project sites (TDP 15). The TIA determined that TDP 1 is not applicable to the proposed project. The analysis for TDP 14 and TDP 15 is provided below.

TDP 14

TDP 14 identifies recommended lengths for driveways to projects based on the number of peak hour trips entering a project site. The proposed project would construct a 2-lane private access road from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the project site. The access road would exceed 1,500 feet from the Sand Canyon Avenue and Portola Parkway intersection to the project site. Signage indicating the use as a private road would be installed at the intersection and along the roadway. As a private road, access control would be maintained with a gate at least 500 feet away from the intersection. During the construction period, this gate would remain open during hours of construction and closed when no construction is occurring. Following construction, the gate would remain closed and only IRWD staff would have access to open the gate. The gate location would provide an area for vehicles to turn around if they do not have access beyond the gate. Based on peak hour traffic into the project site, TDP 14 recommends a driveway of at least 50 feet. The access road length (greater than 1,500 feet) and distance to the gate (at least 500 feet) would exceed the recommendation of 50 feet based on TDP 14.

TPD 15

TPD 15 provides recommendations for vehicle stacking and gate-stacking at project sites based on different types of land uses. The proposed access road gate would remain open during hours of construction and closed when no construction is occurring. With an open gate, the private roadway and internal staging on-site would accommodate vehicle queuing that may be associated with a peak construction activity day. Following construction, the gate would remain closed and only IRWD staff would have access to open the gate. Since trips by IRWD staff would be nominal and are not considered to have a significant effect on the future intersection operations, the proposed gate location and gate operations would meet the nominal inbound traffic volume during future operations.

In addition to the TPD analysis presented above, the TIA includes an evaluation of whether the proposed intersection modification would result in any hazardous conditions for pedestrians, bicyclists, and public transit. The proposed project would reconstruct pedestrian and bicycle facilities to maintain existing access while following City of Irvine requirements to ensure that no additional hazards are created. No new pedestrian facilities or bicycle facilities are planned at the project site that would be affected by the proposed project. No transit routes currently run through the Sand Canyon Avenue and Portola Parkway intersection. Additionally, the proposed project would not affect existing bus pullouts along any roadways in the TIA study area. The proposed intersection modification was found to be consistent with the policies identified in the City of Irvine General Plan Objective B-3: Pedestrian Circulation and Objective B-4: Bicycle Circulation, as well as with plans, guidelines, and policies related to transit.

Therefore, impacts related to potential design hazards due to implementation of the proposed access road and intersection modifications at Sand Canyon Avenue and Portola Parkway would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Emergency Access

Impact 3.12-4: The proposed project could result in inadequate emergency access.

Construction

The proposed project is located approximately 2.5 miles from Orange County Fire Station 27 (Portola Springs Station), which is located at 12400 Portola Springs in the City of Irvine (OCFA 2020). As described in Section 2.4.4 of this Draft EIR, the primary access point for construction traffic is proposed to occur from the Portola Parkway/Sand Canyon Avenue intersection. The existing intersection consists of a “tee” intersection, where Sand Canyon Avenue ends at the intersection with Portola Parkway. Proposed construction would modify the existing intersection to allow for construction vehicles and future IRWD operation and maintenance vehicles to access the project site through the northern side of the intersection onto IRWD property. The proposed 2-lane roadway would be graded north of the intersection and would connect to the northern side of the intersection. Proposed modifications within the intersection would include construction of traffic signals, lane striping, and signage to accommodate the northern access road. Cross walks and associated pedestrian signals would also be modified to facilitate safe pedestrian crossing in both directions. The proposed intersection improvements would not require closure of either Sand Canyon Avenue or Portola Parkway; however, temporary lane closures may be required. The proposed intersection improvements and construction of the access road would be completed first, prior to other construction phases, and construction activity would occur for approximately

4 to 5 months, weather permitting. It is anticipated that up to 42 total vehicle trips per day would occur to and from the project site during peak construction activity related to the access road and intersection (Fehr & Peers 2020b).

As described in Impact 3.12-1, construction of the proposed project would not substantially increase traffic amounts in the surrounding circulation systems, as peak daily vehicle trips generated during construction would be temporary, and minor in comparison to existing traffic amounts. While the proposed intersection work described above would not involve closure of any roadways, temporary lane closures could interfere with emergency access. To ensure that impacts related to emergency access do not occur as a result of the proposed project, IRWD would implement Mitigation Measure TRA-1 as described previously. Implementation of Mitigation Measure TRA-1 would require IRWD to prepare a Traffic Control Plan, which would be coordinated with the City of Irvine, as necessary, as well as with emergency responders, which include fire departments, police departments, and ambulances that have jurisdiction in the proposed project area. The mitigation measure also requires that IRWD notify emergency responders of any partial or full lane closures at least 30 days prior to impacts. With implementation of Mitigation Measure TRA-1, impacts would be reduced to a less-than-significant level.

Operation

As described above in Impact 3.12-1, the proposed project would not include operation and maintenance activities that would generate a substantial amount of vehicle trips that would impact the surrounding circulation system. Due to the relatively limited amount of vehicle trips associated with operation and maintenance of the proposed project facilities, it is reasonable to assume these trips would not interfere with emergency access. Additionally, at completion of the proposed modifications to the Portola Parkway/Sand Canyon Avenue intersection, the proposed project would result in an improvement to emergency access to the proposed project site compared to existing conditions. Since the proposed project site currently only has two access points, Bee Canyon Access Road and the driveway to Crean Lutheran Athletic Complex, implementation of the new access road would allow emergency vehicles to access the project site in the event that the two existing access points are inaccessible. Further, the new proposed access road, constructed as a result of project implementation, would allow emergency vehicles to access the project site, in the event that emergency access is needed for users of the proposed walking trail or any other area where employees are accessing the site. Therefore, the project would provide a benefit to onsite emergency access, and as a result, no impacts related to inadequate emergency access would occur.

Mitigation Measures

Implement Mitigation Measure TRA-1

Significance Determination

Less than Significant Impact with Mitigation

Cumulative Impacts

Impact 3.12-5: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to transportation.

The cumulative projects to be considered in the analysis of cumulative projects are listed in Table 3-1 and illustrated on Figure 3-1 in Section 3 of this Draft EIR. Cumulative projects 4, 6, 7, 18 and 19 have the potential to temporarily affect transportation in the vicinity of the proposed project.

Construction and Operation

The potential for cumulative transportation impacts exists where there are multiple projects proposed in common geographic area that have overlapping construction schedules and/or project operations that together could result in a substantial contribution to increased traffic levels (due to material delivery and worker commutes) throughout the surrounding roadway network. The construction-related traffic trips associated with all of the cumulative projects would be short-term and temporary in nature. One public facility project, the Eastwood Recycled Water Pump Stations Project (Cumulative Project 18) has a construction schedule that would overlap with construction of the proposed project. Cumulative Project 18 is considered an “equipping project” that would primarily install additional pumps to accommodate the proposed improvements at Syphon Reservoir. Construction of Cumulative Project 18 would not require substantial amounts of construction equipment or vehicle trips and would not affect transportation routes or the circulation system. Some of the larger developments, including Cumulative Projects 4, 6 and 7 which are ongoing residential developments and would involve an additional 587, 1,146, and 1,060 units/condominiums, respectively, would permanently affect traffic in the area due to a greater number of people living in the area and traveling to/from the residences in their cars. The permanent increase in daily trips associated with new large-scale residential development (Cumulative Projects 4, 6 and 7) are part of the planned growth within the City of Irvine and would not be expected to increase stress on traffic systems and transportation routes that would reduce the effectiveness of the circulation system.

Construction of the proposed project, along with the identified related projects in the geographic scope, could affect traffic and circulation in the region. These projects could be constructed simultaneously in areas proximate to or overlapping geographically with the proposed project. This proposed project has the potential to result in a cumulative impact to traffic due to the proposed intersection modification and the number of construction-related vehicle traffic on roadways in proximity to the proposed project site. As required by Mitigation Measure TRA-1, IRWD would implement a Traffic Control Plan for the proposed project as necessary to reduce construction-related effects of the project to less-than-significant levels. The Traffic Control Plan should also take into consideration the effects other construction activities occurring simultaneously in the same geographic area. Mitigation Measure TRA-1 would require IRWD to coordinate all construction activities with emergency service providers to ensure adequate access to emergency services is maintained during construction. As a result, the proposed project’s incremental contribution to traffic and transportation would not be cumulatively considerable with implementation of mitigation measures.

The proposed project would only contribute to local traffic during the construction phase of the project, as operation- and maintenance-related traffic would be minimal as explained above. Therefore, the proposed contribution to cumulative transportation and traffic impacts would not be cumulatively considerable and would be considered less than significant.

Mitigation Measures

Implement Mitigation Measure TRA-1

Significance Determination

Less than Significant Impact with Mitigation

3.13 Tribal Cultural Resources

This section addresses the tribal cultural resources impacts associated with construction and operation of the proposed project. This section includes: a description of the tribal cultural resources in the proposed project area; a summary of applicable regulations related to tribal cultural resources; and an evaluation of the potential impacts of the proposed project related to the tribal cultural resources on the proposed project site and in the surrounding area, including cumulative impacts. The results of the Native American consultation conducted by IRWD for purposes of compliance with CEQA requirements prompted by Assembly Bill (AB) 52 are located in **Appendix F** of this Draft EIR.

3.13.1 Environmental Setting

Prehistoric Setting

The chronology of coastal Southern California is typically divided into three general time periods: Early Holocene (11,000 to 8,000 before present [B.P.]), Middle Holocene (8,000 to 4,000 B.P.), and Late Holocene (4,000 B.P. to A.D. 1769). Within this general timeframe, the archaeology of Southern California is generally described in terms of cultural “complexes.” A complex is a specific archaeological manifestation of a general mode of life, characterized archaeologically by technology, particular artifacts, economic systems, trade, burial practices, and other aspects of culture.

Early Holocene (11,000 to 8,000 B.P.)

While it is not certain when humans first came to California, their presence in Southern California by about 11,000 B.P. has been well documented. At Daisy Cave, on San Miguel Island, cultural remains have been radiocarbon dated to between 11,100 and 10,950 years B.P. (Byrd and Raab 2007). On the mainland, radiocarbon evidence confirms occupation of the Orange County and San Diego County coasts by about 9,000 B.P., primarily in lagoon and river valley locations (Gallegos 2002). During the Early Holocene, the climate of Southern California became warmer and more arid and the human population, residing mainly in coastal or inland desert areas, began exploiting a wider range of plant and animal resources (Horne and McDougall 2003).

The primary Early Holocene cultural complex in coastal Southern California was the San Dieguito Complex. The people of the San Dieguito Complex (approximately 10,000 to 8,000 B.P.) inhabited the chaparral zones of southwestern California, exploiting the plant and animal resources of these ecological zones (Moratto 1984; Warren 1968). Leaf-shaped and large-stemmed projectile points are typical of San Dieguito Complex material culture.

Middle Holocene (8,000 to 4,000 B.P.)

During the Middle Holocene, there is evidence for the processing of acorns for food and for the increased importance of hunting (Horne and McDougall 2003). The processing of plant foods, particularly acorns, increased, a wider variety of animals were hunted, and trade with neighboring regions intensified (Horne and McDougall 2003). Major technological changes

appeared as well, particularly with the advent of the bow and arrow, which largely replaced the use of the dart and atlatl.

The Middle Holocene La Jolla Complex (approximately 8,000 to 4,000 B.P.) is essentially a continuation of the San Dieguito Complex. La Jolla groups lived in chaparral zones or along the coast, often migrating between the two. Coastal settlement focused around the bays and estuaries of coastal Orange and San Diego counties. La Jolla peoples produced large, coarse stone tools, but also produced well-made projectile points, and milling slabs. The La Jolla Complex represents a period of population growth and increasing social complexity, and it was also during this time period that the first evidence of the grinding of seeds for flour appears, as indicated by the abundance of millings in the archaeological record (Horne and McDougall 2003).

Late Holocene (4,000 B.P. to A.D. 1769)

During the Late Holocene, native populations of Southern California were becoming less mobile and populations began to gather in small sedentary villages with satellite resource-gathering camps. Evidence indicates that the overexploitation of larger, high-ranked food resources may have led to a shift in subsistence, towards a focus on acquiring greater amounts of smaller resources, such as shellfish and small-seeded plants (Byrd and Raab 2007). In coastal Southern California, conditions became drier and many lagoons were transformed into saltwater marshes. Because of this, populations abandoned mesa and ridge tops to settle nearer to permanent freshwater resources (Gallegos 2002). Trading reached its zenith during this time period, with asphaltum (tar), seashells and steatite being exchanged from Southern California to the Great Basin.

Ethnographic Setting

According to Bean and Smith (1978), the Gabrielino, with the exception of the Chumash to the north, “were the wealthiest, most populous, and most powerful ethnic nationality in aboriginal Southern California.” Prior to European colonization, the Gabrielino occupied a diverse area that included: the watersheds of the Los Angeles, San Gabriel, and Santa Ana rivers; the Los Angeles basin; and the islands of San Clemente, San Nicolas, and Santa Catalina (Kroeber 1925). The Gabrielino language was part of the Takic branch of the Uto-Aztecan language family (Kroeber 1925). The Gabrielino subsisted on a variety of resources in several ecological zones. Acorns, sage, and yucca were gathered throughout the inland areas whereas shellfish, fish, as well as a variety of plants and animals were exploited within the marshes and along the coast. Deer and various kinds of small mammals were hunted on an opportunistic basis. Their material culture reflected the subsistence technology. Lithic tools such as arrow points and modified flakes were used to hunt and process animals. A variety of ground stone grinding implements, such as the mortar, pestle, mano, and metate, were used to process both plant and animal remains for food (Bean and Smith 1978).

The settlement patterns of the Gabrielino, and other nearby groups, such as the Juaneño and Luiseño, were similar and they often interacted through marriage, trade and warfare. The seasonal availability of water and floral and faunal resources dictated seasonal migration rounds with more permanent villages and base camps being occupied primarily during winter and spring months. In the summer months, the village populations divided into smaller units that occupied seasonal food

procurement areas. The more permanent settlements tended to be near major waterways and food sources and various secular and sacred activities, such as food production and storage and tool manufacturing, were conducted at these areas (Bean and Smith 1978).

3.13.2 Regulatory Framework

Federal

There are no applicable federal regulations for this issue area.

State

Native American Heritage Commission

Public Resources Code (PRC) Section 5097.91 established the Native American Heritage Commission (NAHC), the duties of which include inventorying places of religious or social significance to Native Americans and identifying known graves and cemeteries of Native Americans on private lands. PRC Section 5097.98 specifies a protocol to be followed when the NAHC receives notification of a discovery of Native American human remains from a county coroner.

Assembly Bill 52 and Related Public Resources Code Sections

AB 52 was approved by California State Governor Edmund Gerry “Jerry” Brown, Jr. on September 25, 2014. The act amended California PRC Section 5097.94, and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3.

The primary intent of AB 52 is to include California Native American Tribes early in the environmental review process and to establish a new category of resources related to Native Americans that require consideration under CEQA, known as tribal cultural resources. PRC Section 21074(a)(1) and (2) defines tribal cultural resources as “sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American Tribe” that are either included or determined to be eligible for inclusion in the California Register or included in a local register of historical resources, or a resource that is determined to be a tribal cultural resource by a lead agency, in its discretion and supported by substantial evidence. On July 30, 2016, the California Natural Resources Agency adopted the final text for tribal cultural resources update to CEQA Guidelines Appendix G, which was approved by the Office of Administrative Law on September 27, 2016.

PRC Section 21080.3.1 requires that within 14 days of a lead agency determining that an application for a project is complete, or a decision by a public agency to undertake a project, the lead agency provide formal notification to the designated contact, or a tribal representative, of California Native American Tribes that are traditionally and culturally affiliated with the geographic area of the project (as defined in PRC Section 21073) and who have requested in writing to be informed by the lead agency (PRC Section 21080.3.1(b)). Tribes interested in consultation must respond in writing within 30 days from receipt of the lead agency’s formal

notification and the lead agency must begin consultation within 30 days of receiving the tribe's request for consultation (PRC Sections 21080.3.1(d) and 21080.3.1(e)).

PRC Section 21080.3.2(a) identifies the following as potential consultation discussion topics: the type of environmental review necessary; the significance of tribal cultural resources; the significance of the project's impacts on the tribal cultural resources; project alternatives or appropriate measures for preservation; and mitigation measures. Consultation is considered concluded when either: (1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or (2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached (PRC Section 21080.3.2(b)).

If a California Native American tribe has requested consultation pursuant to Section 21080.3.1 and has failed to provide comments to the lead agency, or otherwise failed to engage in the consultation process, or if the lead agency has complied with Section 21080.3.1(d) and the California Native American tribe has failed to request consultation within 30 days, the lead agency may certify an EIR or adopt an MND (PRC Section 21082.3(d)(2) and (3)).

PRC Section 21082.3(c)(1) states that any information, including, but not limited to, the location, description, and use of the tribal cultural resources, that is submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public without the prior consent of the tribe that provided the information. If the lead agency publishes any information submitted by a California Native American tribe during the consultation or environmental review process, that information shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public.

Local

There are no applicable local regulations for this issue area.

3.13.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from Appendix G of the CEQA Guidelines are used as thresholds of significance to determine the impacts of the proposed project as related to tribal cultural resources. The proposed project would have a significant impact if it would:

1. Cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:
 - a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k), or

- b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.
2. Result in cumulatively considerable impacts to tribal cultural resources.

Methodology

Potential impacts to tribal cultural resources were assessed on the basis of a cultural resources assessment prepared for the project, which included a records search at the South Central Coastal Information Center (SCCIC) and pedestrian field survey (summarized in Section 3.4, *Cultural Resources*; ESA 2019); a search of the Sacred Lands File (SLF) at the NAHC; and Native American consultation conducted under AB 52.

The NAHC maintains a confidential SLF which contains sites of traditional, cultural, or religious value to the Native American community. The NAHC was contacted on May 21, 2018 to request a search of the SLF. The NAHC responded to the request in a letter dated May 23, 2018 indicating negative results.

In compliance with AB 52, on May 24, 2019, IRWD submitted outreach letters to the tribes on their AB 52 Master List. Contacted tribes included the Gabrieleño Band of Mission Indians – Kizh Nation, the Juaneño Band of Mission Indians – Acjachemen Nation, and the Torres-Martinez Desert Cahuilla Indians. The letters included a description of the proposed project and an invitation to consult under AB 52. Two responses were received.

By letter dated June 6, 2019, Mr. Michael Mirelez, Cultural Resources Coordinator for the Torres-Marinez Desert Cahuilla Indians, indicated that they would defer to tribes closer to the proposed project area.

Via email and letter, Mr. Andrew Salas, Chairman of the Gabrieleño Band of Mission Indians – Kizh Nation, indicated that the tribe wished to engage in consultation. On June 27, 2019, IRWD conducted consultation via telephone with the tribe. Mr. Salas provided historic maps, documents, and other reference materials confirming the tribe’s association with the proposed project area. He also discussed tribal ancestry in the broader vicinity of the proposed project, and indicated that the proposed project area falls along a prominent travel route for the tribe. Given the sensitivity of the project area to the tribe, Mr. Salas requested Native American monitoring during ground disturbing activities.

Impact Analysis

Tribal Cultural Resource Identified in the CRHR

Impact 3.13-1a: The proposed project could cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code Section 5020.1(k).

Construction

A records search at the SCCIC, an archaeological field survey, a SLF search at the NAHC, and consultation with the Gabrieleño Band of Mission Indians – Kizh Nation, conducted pursuant to AB 52, did not identify any tribal cultural resources that are listed in or eligible for listing in the California Register, or in a local register of historical resources as defined in PRC Section 5020.1(k). However, through consultation, the Gabrieleño Band of Mission Indians – Kizh Nation indicated that the area is sensitive for resources important to the tribe and requested Native American monitoring of ground disturbing activities. Archaeological and Native American monitoring are included as Mitigation Measure CR-3 in Section 3.4, *Cultural Resources*. With implementation of Mitigation Measure CR-3, potential impacts to tribal cultural resources would be reduced to a less-than-significant level during project construction.

Operation

While potential impacts to tribal cultural resources are most likely to occur during project construction, operation and maintenance activities, particularly those activities that involve ground disturbance, do have the potential to encounter previously undocumented archaeological resources. Unanticipated encounters with archaeological resources that are tribal cultural resources could result in potentially significant impacts. Mitigation Measure CR-4 in Section 3.4, *Cultural Resources*, which requires appropriate treatment of unanticipated discoveries, would ensure that any resources encountered during operation and maintenance of the proposed project are not significantly impacted. As a result, potential impacts to tribal cultural resources during operation and maintenance of the proposed project would be reduced to a less-than-significant level.

Mitigation Measures

Implement Mitigation Measures CR-3 and CR-4

Significance Determination

Less than Significant Impact with Mitigation

Tribal Cultural Resource Determined to be Significant

Impact 3.13-1b: The Proposed Project could cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe that is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.

Construction

As indicated above, a records search at the SCCIC, an archaeological field survey, a Sacred Lands File search at the NAHC, and consultation with the Gabrieleño Band of Mission Indians – Kizh Nation, conducted pursuant to AB 52, did not identify any tribal cultural resources determined by a lead agency to be significant as outlined in PRC Section 50204.1. However, through consultation, the Gabrieleño Band of Mission Indians – Kizh Nation indicated that the area is sensitive for resources important to the tribe and requested Native American monitoring of ground disturbing activities. Archaeological and Native American monitoring are included as Mitigation Measure CR-3 in Section 3.4, *Cultural Resources*. With implementation of Mitigation Measure CR-3, potentially significant impacts to tribal cultural resources would be reduced to a less-than-significant level during project construction.

Operation

While potential impacts to tribal cultural resources are most likely to occur during project construction, operation and maintenance activities, particularly those activities that involve ground disturbance, do have the potential to encounter previously undocumented archaeological resources. Mitigation Measure CR-4 in Section 3.4, *Cultural Resources*, which requires appropriate treatment of unanticipated discoveries, would ensure that any resources encountered during operation and maintenance of the proposed project are not significantly impacted. As a result, potentially significant impacts to tribal cultural resources during operation and maintenance of the proposed project would be reduced to a less-than-significant level.

Mitigation Measures

Implement Mitigation Measures CR-3 and CR-4

Significance Determination

Less than Significant Impact with Mitigation

Cumulative Impacts

Impact 3.13-2: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to tribal cultural resources.

The cumulative projects to be considered in the analysis of cumulative impacts are listed in Table 3-1, Related Projects for Cumulative Analysis, and illustrated on Figure 3-1, Cumulative Project Locations, in Chapter 3 of this Draft EIR. The geographic area of analysis of cumulative impacts for tribal cultural resources includes the area bounded by those projects listed in Table 3-1 and generally corresponds to the portion of Orange County along the front of the Santiago Hills in the vicinity of the project, as well as adjacent mountains and lowlands to the east and west, respectively. This geographic scope of analysis is appropriate because the resources within this area are expected to be similar to those that occur on the proposed project area because of their proximity, their similarities in environments and landforms, and their location within the same Native American tribal territories. The projects listed in Table 3-1 include a range of project types, including residential and commercial development, and park construction and improvements, that could contain tribal cultural resources. Of particular note is the proposed Gateway Community Park, which is to the west and directly adjacent to the project. Cumulative impacts to tribal cultural resources could occur if other related projects, in conjunction with the proposed project, had or would have impacts on cultural resources that, when considered together, would be significant.

Construction and Operation

No tribal cultural resources were identified as part of the district's government-to-government notification and consultation efforts with interested Native American groups conducted pursuant to AB 52. Given that no tribal cultural resources have been identified within or immediately adjacent to the project site, the proposed project would not cause a substantial adverse change in the significance of a known tribal cultural resource. However, project related ground-disturbing activities have the potential to encounter previously unknown archaeological resources, some of which may have significance to Native American tribes. Mitigation measures provided in Section 3.4, *Cultural Resources*, which include Mitigation Measure CR-3 for archaeological and Native American monitoring, and Mitigation Measure CR-4 for appropriate treatment of unanticipated discoveries, will ensure that impacts to tribal cultural resources, if encountered, would be less than significant. Given the required mitigation for the current project, and required adherence to state and local laws for other projects in the cumulative region, cumulative impacts to tribal cultural resources would be less than significant.

Mitigation Measures

Implement Mitigation Measures CR-3 and CR-4

Significance Determination

Less than Significant Impact with Mitigation

3.14 Wildfire

This section addresses the wildfire impacts associated with construction and operation of the proposed project. This section includes: a description of the wildfire history and conditions in the proposed project area; a summary of applicable regulations related to wildfire; and an evaluation of the potential impacts of the proposed project to wildfire, including cumulative impacts.

3.14.1 Environmental Setting

Fire Environment

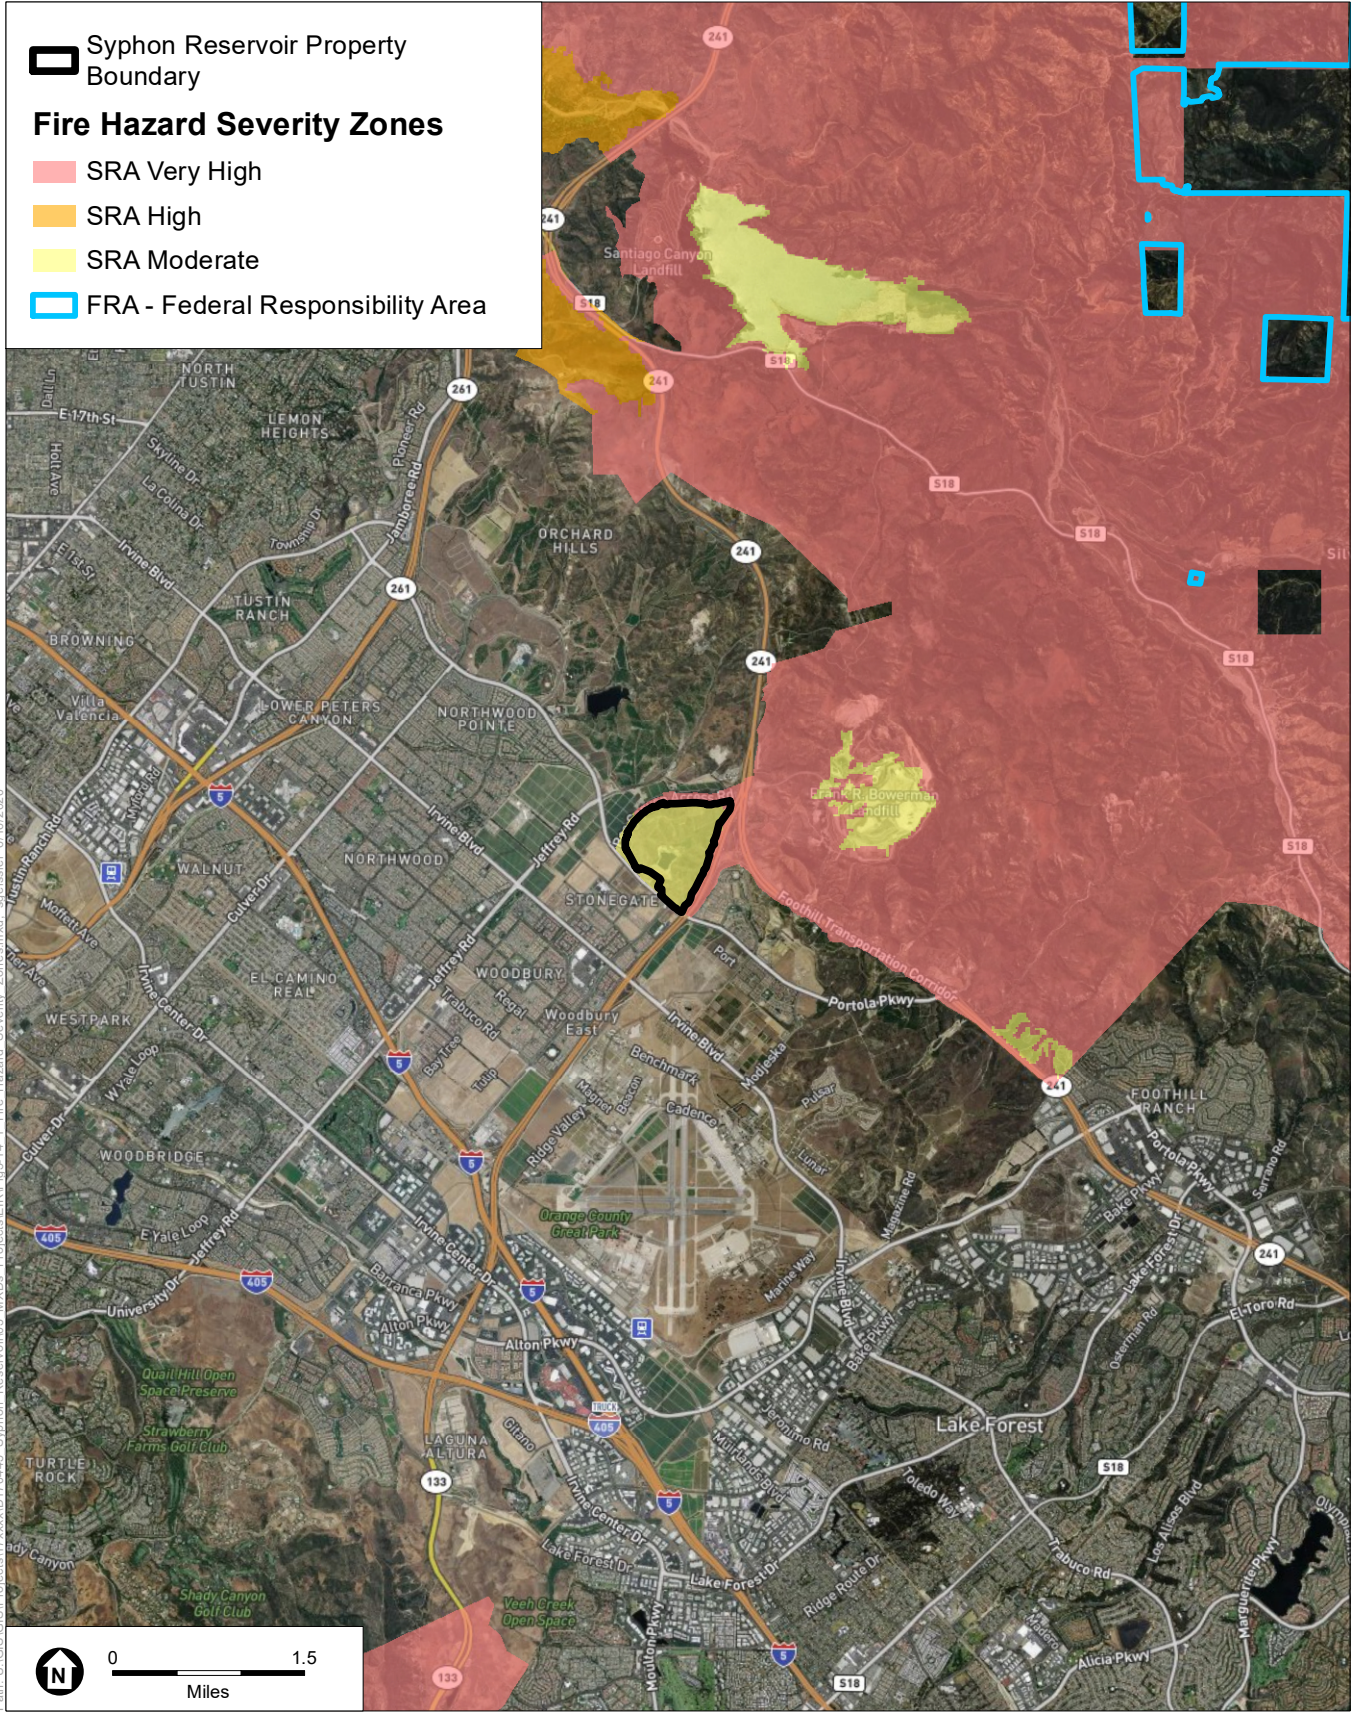

Fire environments are dynamic systems and include many types of environmental factors and site characteristics. Fires can occur in any environment where conditions are conducive to ignition and fire movement. The three major components of fire environment are vegetation (fuels), climate, and topography. The state of each of these components and their interactions with each other determines the potential characteristics and behavior of a fire at any given moment. It is important to note that wildland fire may transition to urban fire if structures are receptive to ignition. Understanding the existing wildland vegetation and fuel conditions on and around the project site is necessary to understand the fire environment.

The climate of Southern California, including the project site, has been characterized by fire climatologists as the worst fire climate in the United States with high winds (Santa Ana) occurring during autumn after a six-month drought period each year (J.E. Keeley 2004).

As defined by the Public Resources Code (PRC) 4126, State Responsibility Areas are State and privately owned forest, watershed, and rangeland for which the primary financial responsibility of preventing and suppressing wildland fires rests with the State. State Responsibility Areas, by definition, do not include any lands within city limits. The proposed project lies entirely within a State Responsibility Area. Adjacent to the project site is the City of Irvine which is located in a Local Responsibility Area.

For State Responsibility Areas, CAL FIRE maps fire hazard severity zones based on factors such as fuel, slope, and fire weather to identify the degree of fire hazard throughout California (e.g., moderate, high, or very high). CAL FIRE also provides recommendations for fire hazard severity zones within Local Responsibility Areas but the responsibility for mapping Local Responsibility Areas lies within the local jurisdiction responsible for fire management and control within the Local Responsibility Area. While fire hazard severity zones do not predict when or where a wildfire will occur, they do identify areas where wildfire hazards could be more severe and therefore are of greater concern.

Fire hazard severity zones in and around the proposed project site are shown on **Figure 3.14-1**. According to the mapping completed by CAL FIRE, the proposed project site is located in an area determined to be a Moderate Fire Hazard Severity Zone, immediately surrounded by a Very High Fire Hazard Severity Zone as shown in Figure 3.14-1. The area west of the proposed project site in the City of Irvine does not include fire hazard areas while a portion of the undeveloped land northeast of the proposed project site is a Local Responsibility Area Very High Fire Hazard Severity Zone (CAL FIRE 2020a).

SOURCE: CalFire, 2008; Open Street Map, 2020.

Syphon Reservoir Improvement Project

Figure 3.14-1
Fire Hazard Severity Zones

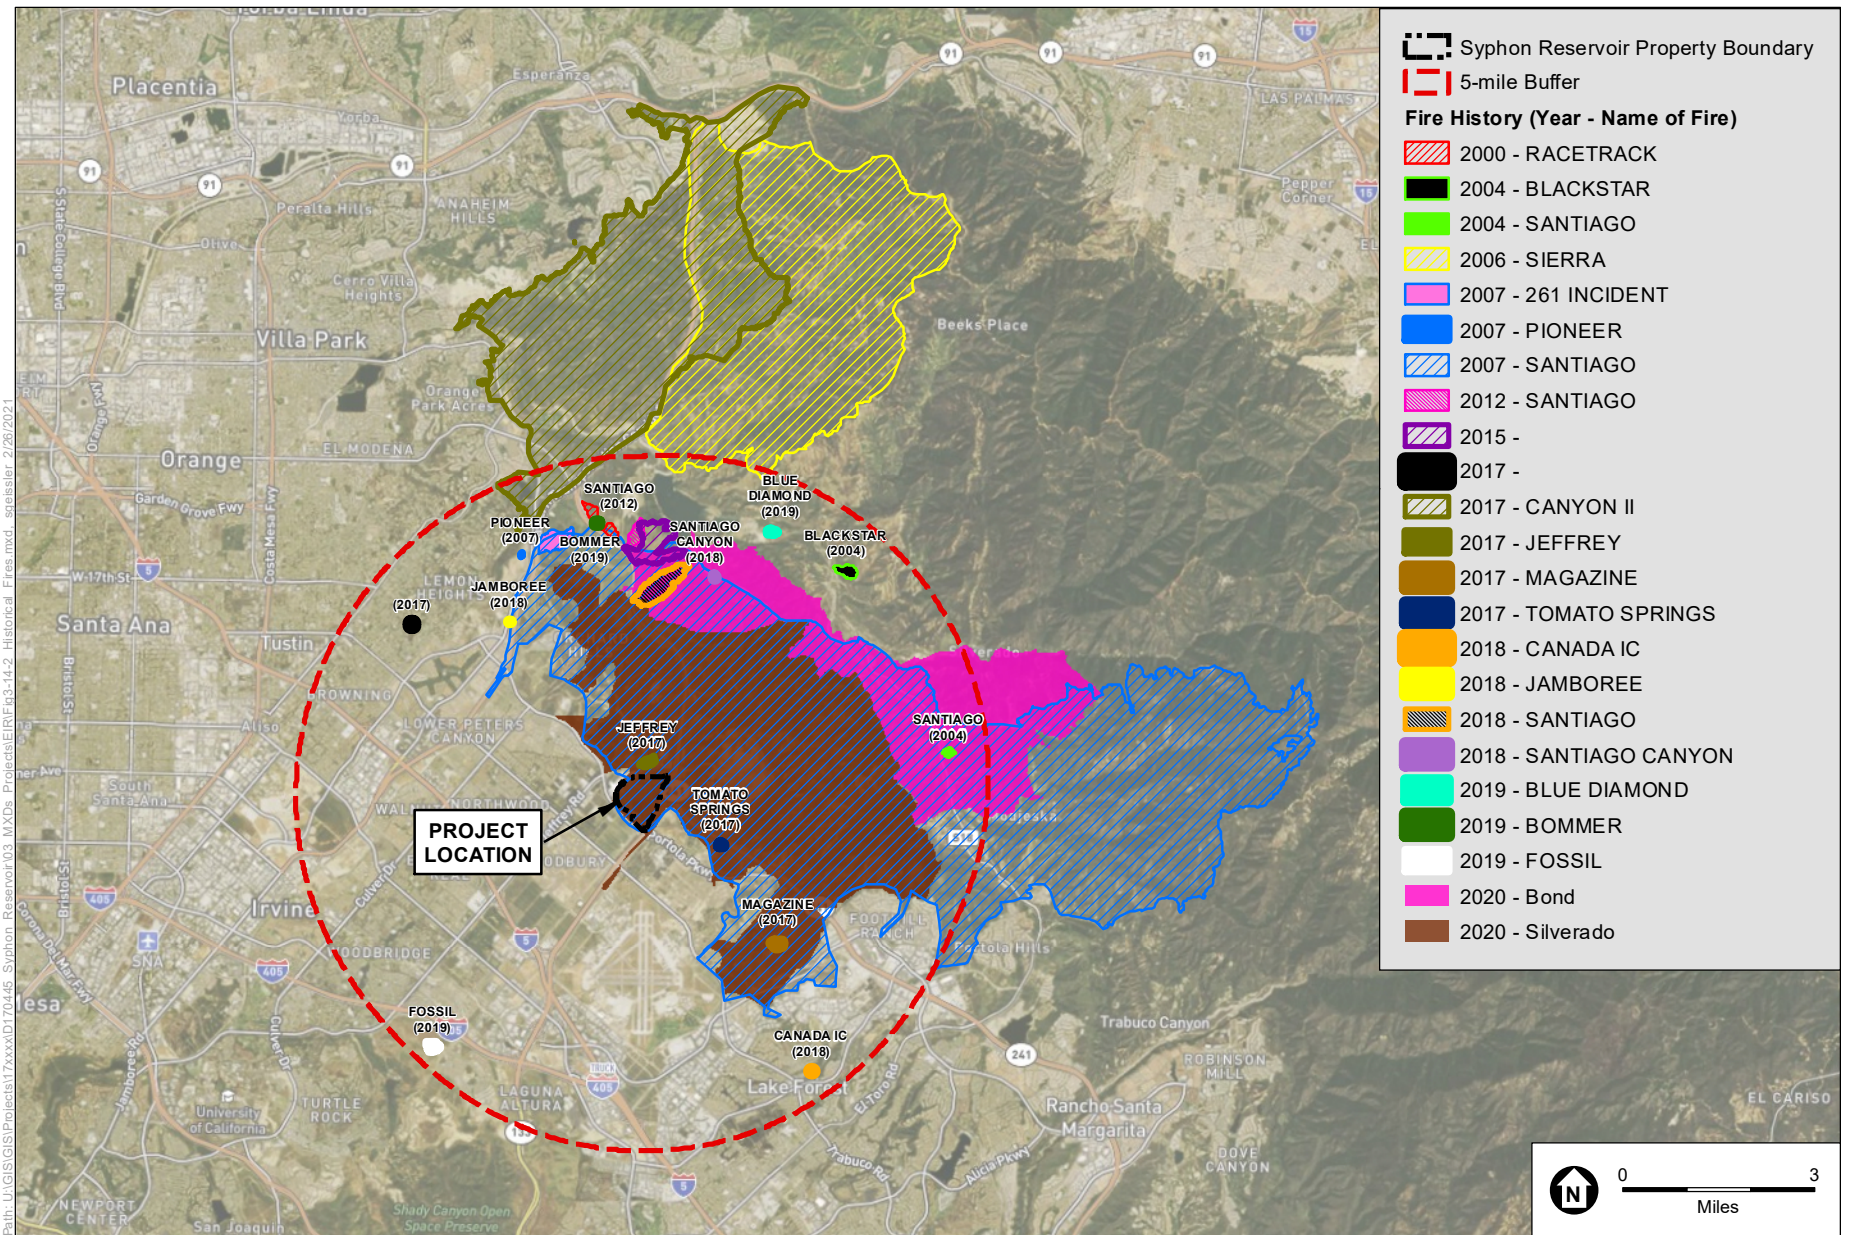

Site Characteristics

The proposed project site terrain is hilly with ridgelines and terraced slopes, leading downwards towards the reservoir bottom. The land on the proposed project site is currently zoned as general agriculture and includes upland and wetland vegetation communities. The proposed project site is located within a wildland-urban interface: the zone between developed and undeveloped areas. The proposed project site represents the easternmost boundary of the City of Irvine, with open space, native vegetated areas, and the Cleveland National Forest to the east. Significant regional geographic features around the area include the Santa Ana Mountains to the northeast. The climate in the region is Mediterranean, with dry summers and moderately wet winters (City of Irvine 2015a). However, the region has experienced severe drought conditions in recent years.

Fire History

Fire history information can provide an understanding of fire frequency, fire type, most vulnerable locations, and significant ignition sources. The fire history data for the area surrounding the project site is based on CAL FIRE's California Statewide Fire Map that displays fires through 1950 and CAL FIRE's Fire Resource Assessment Program (FRAP) database that assesses the amount and extent of California's forests and rangelands, analyzes their conditions and identifies alternative management and policy guidelines (CAL FIRE 2020b). These tools show there is significant wildfire potential in the region and the potential for the proposed project site to be subject to occasional wildfire encroachment, most likely originating from the open space areas near the proposed project site. According to data available from CAL FIRE's California Statewide Fire Map, there have been 18 fires within a five-mile radius of the proposed project site since 2000, as seen in **Figure 3.14-2**. Of these, the largest include the Santiago Fire of 2007, the Silverado Fire of 2020, and the Sierra Fire of 2006 (CAL FIRE 2020c). The Santiago Fire of 2007 covered an area of 28,517 acres and burned through the proposed project site. At the time it was the most disastrous fire to occur in Orange County in the past 30 years (OCFA 2007). From October 26, 2020 to November 7, 2020, the Silverado Fire burned 12,466 acres predominantly within the same footprint that was burned during the 2006 Santiago Fire. The fire spread throughout the project site and some portions of the fire reached as far south as Irvine Boulevard, prompting area-wide emergency evacuations. One month following the Silverado fire, the Bond Fire burned 6,686 acres northeast of the project site in Silverado Canyon. The December 2020 Bond Fire is the most recent wildfire to occur within a five-mile radius of the project site. The fire lasted 15 days and did not spread as far west as the project site (CAL FIRE 2020c).

Syphon Reservoir Improvement Project

Figure 3.14-2
Historical Fires

Vegetation (Fuels)

Approximately 18 vegetation and land cover types were identified onsite as part of the biological resources analysis in this Draft EIR (see Section 3.3 *Biological Resources*, Table 3.3-1). The upland portions of the proposed project area primarily exhibit forms of coastal sage scrub and non-native herbaceous communities with variable levels of native versus non-native plant species cover. The most prevalent forms include the California sagebrush alliance and non-native herbaceous cover/California sagebrush alliance (i.e., communities intermixed with both native and non-native species) in the upland areas. Woody riparian vegetation (e.g., arroyo willow and mule fat) and patches of tules occur around the open water in the existing reservoir in areas that are occasionally inundated. Brush and grassland habitats are highly flammable while other vegetation, such as riparian communities or forest understory, are less flammable due to their perennially higher plant moisture content, fuel arrangement, ignition resistance, compact structure, and available shading from overstory tree canopies.

The majority of the proposed project site was burned in the October 2020 Silverado Fire, and much of the vegetation on-site was destroyed by the fire. Since native natural communities such as coastal sage scrub are adapted to fire, it is anticipated most of the vegetation should regrow to pre-fire conditions or similar, though it is possible the habitat quality may be degraded by opportunistic non-native invasive plant species. To provide a conservative assessment, this analysis presents the wildfire conditions at the time the Notice of Preparation (NOP) was published and analyzes proposed project impacts to wildfire against those conditions.

Emergency Response

The City of Irvine Office of Emergency Management maintains the Evacuation Plan for the City (City of Irvine 2019a). The Evacuation Plan identifies Evacuation Management Zones, which include primary evacuation routes within each zone. The project site is within Zone 6A; State Route 133 to the southeast and Portola Parkway to the west are labelled as possible evacuation routes (City of Irvine 2020). However, these routes would not necessarily be used during an evacuation as the circumstances may dictate alternate routes (City of Irvine 2019a).

3.14.2 Regulatory Framework

Federal

No federal regulations related to wildfire are applicable to the proposed project.

State

California Fire Code (California Code of Regulations Title 24, Part 9)

The California Fire Code is found in Title 24, Part 9 of the CCR, as a subset of the California Building Code (CBC). The California Fire Code combines the Uniform Fire Code with amendments necessary to address California's unique needs. The California Fire Code (Title 24, Part 9 of the CCR) establishes regulations to safeguard against the hazards of fire, explosion, or dangerous conditions in new and existing buildings, structures, and premises. The California Fire Code also establishes

requirements intended to provide safety for and assistance to firefighters and emergency responders during emergency operations. The provisions of the California Fire Code apply to the construction, alteration, movement, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal, and demolition of every building or structure throughout California. The California Fire Code includes regulations regarding fire-resistance-rated construction, fire protection systems such as alarm and sprinkler systems, fire service features such as fire apparatus access roads, means of egress, fire safety during construction and demolition, and wildland-urban interface areas.

Typical fire safety requirements of the California Fire Code include: the installation of sprinklers in all high-rise buildings; the establishment of fire resistance standards for fire doors, building materials, and particular types of construction; and, the clearance of debris and vegetation within a prescribed distance from occupied structures in wildfire hazard areas. The California Fire Code applies to all occupancies in California, except where more stringent standards have been adopted by local agencies.

Cal/Occupational Safety and Health Administration (OSHA) Regulations (CCR Title 8)

Cal/OSHA has primary responsibility for developing and enforcing workplace safety regulations in California. Because California has a federally approved OSHA program, it is required to adopt regulations that are at least as stringent as those found in Title 29 of the Code of Federal Regulations (CFR). Cal/OSHA standards are generally more stringent than federal regulations. The use of hazardous materials in the workplace require employee safety training, safety equipment, accident and illness prevention programs, hazardous substance exposure warnings, and emergency action and fire prevention plan preparation.

California Public Resources Code

The California Public Resources Code (PRC) was established in 1939 by the California Code Commission. The PRC contains law relating to natural resources, the conservation, utilization, and supervision thereof, along with mines and mining, oil and gas, and forestry. The following sections of the PRC are relevant to the proposed project:

PRC 4427

During any time of the year when burning permits are required in an area pursuant to this article, no person shall use or operate any motor, engine, boiler, stationary equipment, welding equipment, cutting torches, tarpots, or grinding devices from which a spark, fire, or flame may originate, which is located on or near any forest-covered land, brush-covered land, or grass-covered land, without doing both of the following:

- (a) First clearing away all flammable material, including snags, from the area around such operation for a distance of 10 feet.
- (b) Maintain one serviceable round point shovel with an overall length of not less than forty-six (46) inches and one backpack pump water-type fire extinguisher fully equipped and ready for use at the immediate area during the operation.

This section does not apply to portable power saws and other portable tools powered by a gasoline-fueled internal combustion engine.

PRC 4428

No person, except any member of an emergency crew or except the driver or owner of any service vehicle owned or operated by or for, or operated under contract with, a publicly or privately owned utility, which is used in the construction, operation, removal, or repair of the property or facilities of such utility when engaged in emergency operations, shall use or operate any vehicle, machine, tool or equipment powered by an internal combustion engine operated on hydrocarbon fuels, in any industrial operation located on or near any forest, brush, or grass-covered land between April 1 and December 1 of any year, or at any other time when ground litter and vegetation will sustain combustion permitting the spread of fire, without providing and maintaining, for firefighting purposes only, suitable and serviceable tools in the amounts, manner and location prescribed in this section.

- (a) On any such operation a sealed box of tools shall be located, within the operating area, at a point accessible in the event of fire. This fire toolbox shall contain: one backpack pump-type fire extinguisher filled with water, two axes, two McLeod fire tools, and a sufficient number of shovels so that each employee at the operation can be equipped to fight fire.
- (b) One or more serviceable chainsaws of three and one-half or more horsepower with a cutting bar 20 inches in length or longer shall be immediately available within the operating area, or, in the alternative, a full set of timber-felling tools shall be located in the fire toolbox, including one crosscut falling saw six feet in length, one double-bit ax with a 36-inch handle, one sledge hammer or maul with a head weight of six, or more, pounds and handle length of 32 inches, or more, and not less than two falling wedges.
- (c) Each rail speeder and passenger vehicle, used on such operation shall be equipped with one shovel and one ax, and any other vehicle used on the operation shall be equipped with one shovel. Each tractor used in such operation shall be equipped with one shovel.
- (d) As used in this section:
 - (1) "Vehicle" means a device by which any person or property may be propelled, moved, or drawn over any land surface, excepting a device moved by human power or used exclusively upon stationary rails or tracks.
 - (2) "Passenger vehicle" means a vehicle which is self-propelled and which is designed for carrying not more than 10 persons including the driver, and which is used or maintained for the transportation of persons, but does not include any motortruck or truck tractor.

PRC 4431

During any time of the year when burning permits are required in an area pursuant to this article, no person shall use or operate or cause to be operated in the area any portable saw, auger, drill, tamper, or other portable tool powered by a gasoline-fueled internal combustion engine on or near any forest-covered land, brush-covered land, or grass-covered land, within 25 feet of any flammable material, without providing and maintaining at the immediate locations of use or operation of the saw or tool, for firefighting purposes one serviceable round point shovel, with an overall length of not less than 46 inches, or one serviceable fire extinguisher. The Director of Forestry and Fire Protection shall by administrative regulation specify the type and size of fire

extinguisher necessary to provide at least minimum assurance of controlling fire caused by use of portable power tools under various climatic and fuel conditions.

The required fire tools shall at no time be farther from the point of operation of the power saw or tool than 25 feet with unrestricted access for the operator from the point of operation.

PRC 4442

- (a) Except as otherwise provided in this section, no person shall use, operate, or allow to be used or operated, any internal combustion engine which uses hydrocarbon fuels on any forest-covered land, brush-covered land, or grass-covered land unless the engine is equipped with a spark arrester, as defined in subdivision (c), maintained in effective working order or the engine is constructed, equipped, and maintained for the prevention of fire pursuant to Section 4443.
- (b) Spark arresters affixed to the exhaust system of engines or vehicles subject to this section shall not be placed or mounted in such a manner as to allow flames or heat from the exhaust system to ignite any flammable material.
- (c) A spark arrester is a device constructed of nonflammable materials specifically for the purpose of removing and retaining carbon and other flammable particles over 0.0232 of an inch in size from the exhaust flow of an internal combustion engine that uses hydrocarbon fuels or which is qualified and rated by the United States Forest Service.
- (d) Engines used to provide motive power for trucks, truck tractors, buses, and passenger vehicles, except motorcycles, are not subject to this section if the exhaust system is equipped with a muffler as defined in the Vehicle Code.
- (e) Turbocharged engines are not subject to this section if all exhausted gases pass through the rotating turbine wheel, there is no exhaust bypass to the atmosphere, and the turbocharger is in effective mechanical condition.
- (f) Motor vehicles when being operated in an organized racing or competitive event upon a closed course are not subject to this section if the event is conducted under the auspices of a recognized sanctioning body and by permit issued by the fire protection authority having jurisdiction.

California Building Code

The CBC includes regulations that are consistent with nationally recognized standards of good practice, intended to facilitate protection of life and property. Among other things, its regulations address the mitigation of the hazards of fire explosion, management and control of the storage, handling and use of hazardous materials and devices, mitigation of conditions considered hazardous to life or property in the use or occupancy of buildings, and provisions to assist emergency response personnel.

Chapter 7 of the CBC details the materials, systems, and assemblies used in the exterior design and construction of new buildings located within a Wildland-Urban Interface Fire Area. A Wildland-Urban Interface Area is defined in Section 702A as a geographical area identified by the areas of a fire hazard severity zones in accordance with Public Resources Code Sections 4201 through 4204 and Government Code Sections 51175 through 51189, or other areas designated by the enforcing agency to be at a significant risk from wildfires. Fire hazard severity zones are

geographical areas classified as Very High, High, or Moderate in State Responsibility Areas or as Local Responsibility Areas as Very High Fire Hazard Severity Zones. Fire hazard severity zones, which are determined based on factors such as fuel, slope, and fire weather, do not predict when or where a wildfire will occur, but they do identify the degree of fire hazard (very high, high or moderate). The CBC details the materials, systems, and assemblies used for structural fire resistance and fire-resistance-rated construction separation of adjacent spaces to safeguard against the spread of fire and smoke within a building and the spread of fire to or from buildings.

The City of Irvine, per Ordinance No. 16-07 adopted a building and fire code that is complicit with the CBC discussed above (City of Irvine 2019b).

Local

County of Orange and Orange County Fire Authority Local Hazard Mitigation Plan

The County of Orange and Orange County Fire Authority Local Hazard Mitigation Plan (OCLHMP) is a multi-jurisdiction plan developed jointly between the County of Orange, a local government, and the Orange County Fire Authority (OCFA), a Joint Powers Authority (County of Orange and Orange County Fire Authority 2015). The document focuses on mitigating all natural hazards impacting unincorporated areas of the County as well as County and OCFA-owned facilities. OCFA provides fire suppression and prevention services to the County unincorporated areas, as well as a variety of other jurisdictions and contracts under their Joint Powers Authority. As a result, fire mitigation strategies in this plan are inclusive of all areas served by the OCFA.

The mission of the OCLHMP is to promote sound public policy designed to protect residents, critical facilities, infrastructure, key resources, private property, and the environment from natural hazards in County unincorporated area, fire hazards in the OCFA service area, and County and OCFA owned facilities.

The OCLHMP discusses factors that exacerbate fire risk such as vegetation, weather, topography, and fuel hazards. The OCLHMP provides requirements involved in developments at the wildland urban interface, where the project resides. These include requiring the construction of fuel modification zones (firebreak, fuel break, or green belt) in unincorporated County areas.

The proposed project is located within unincorporated Orange County and would therefore, be subject to compliance with the OCLHMP. The OCLHMP identifies hazard mitigation measures to limit the impact of wildland fires in Orange County. The OCFA is the responsible agency for these mitigation measures which includes the list below.

- Implementation of a real-time remote sensing and fire detection platform to increase the ability to detect, respond to, and monitor wildland areas in Orange County.
- Increase communication, coordination and collaboration between Wildland-Urban Interface (WUI) property owners, local and county planners and fire prevention crews and officials to address risk, existing mitigation measures and federal assistance programs.
- Reduce the amount of combustible fuels within identified at-risk communities.

- Encourage implementation of wildfire mitigation activities in a manner consistent with the goals of promoting sustainable ecological management and community stability.
- Evaluate and implement roadway hardening measures on identified high risk roadways in wildland areas in Orange County.
- Enhance outreach and education programs aimed at mitigating Wildland-Urban Interface (WUI) hazards thereby reducing the exposure of stakeholders (public and private) to these hazards.
- Establish a countywide wildland fire prevention education "Task Force".
- Enhance efficiency of Wildland-Urban Interface/Intermix response and recovery activities.
- Development and dissemination of maps relating to the fire hazard to help educate and assist builders and home owners in being engaged in wildland/urban mitigation activities and to help guide emergency services during response.
- Inventory alternative firefighting water sources and encourage the development of additional sources.

County of Orange General Plan, Safety Element

The Safety Element, one of nine elements of the County of Orange General Plan, contains County policies on identified and potential hazards and safety considerations, their mitigation (i.e., reduction in damage and loss to real and personal property and minimization of adverse social and economic impacts) and implications for development (County of Orange 2005).

The Safety Element examines the threat of fire to urban areas, wildlands, and the urban/wildlands interface. Fire is a constant threat in all parts of the County. The Safety Element includes wildland fire defense planning the purpose of which is to prevent wildland fires from starting and, if unsuccessful, to minimize the damage to natural resources and structures once a wildland fire starts. The following goal, policies, and implementation measure in the Safety Element pertain to fire:

Goal 1: Provide a safe living environment, ensuring adequate fire protection facilities and resources to prevent and minimize the loss of life and property fire.

Policy 2: To establish improved development standards for location of new construction, structural design, emergency vehicular access, and detection hardware.

Policy 3: To improve building code regulations to provide increased built-in fire protection.

Policy 5: To continue to improve the minimum water system design requirements for fire protection.

Policy 9: To encourage improvement of fire defense systems in hazardous areas.

Implementation Measure/Planning and Development: OCFA reviews all land use proposals including subdivisions and site development permits for adequate site design and implementation to assure that fire safe construction materials, and fire detection and protection systems are incorporated into the proposal in order to achieve maximum fire protection and to minimize extent of loss associated with fire incidence.

Orange County Sheriff's Department's Emergency Management Division

The mission of the Orange County Sheriff's Department's Emergency Management Division is to promote, facilitate and support the County of Orange and the Operational Area efforts to prepare for, respond to and recover from disasters. The Emergency Management Division provides emergency management and preparedness services to the unincorporated areas of Orange County and supports the efforts of the Orange County Operational Area. There are currently over 100 jurisdictions in the Operational Area encompassing all County departments and agencies, public and private organizations and the general population within the boundaries of Orange County (Orange County Sheriff's Department 2020).

City of Irvine General Plan, Safety Element

The goal of the City of Irvine's General Plan, Safety Element is to minimize the danger to life and property from manmade and natural hazards, including fire hazards, flood hazards, non-seismic geologic hazards and air hazards (City of Irvine 2015b). The following Safety Element objectives and policies are applicable to the proposed project.

Objective J-1: Hazard Occurrence

Policy (c): Establish criteria for land development in hillside areas with emphasis on fire retardant materials, minimization of exposure risk to wildfire and adjacent structure fires, provision of access for firefighting personnel and equipment, and removal of combustible vegetation

Objective J-2: Disaster Response

Policy (b): Ensure that each development will have adequate emergency ingress and egress.

3.14.3 Impact Analysis and Mitigation Measures

Thresholds of Significance

The following criteria from Appendix G of the *CEQA Guidelines* are used as thresholds of significance to determine the impacts of the proposed project as related to wildfire. If located in or near State Responsibility Areas or lands classified as Very High Fire Hazard Severity Zone, the proposed project would have a significant impact if it would:

1. Substantially impair an adopted emergency response plan or emergency evacuation plan.
2. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.
3. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.
4. Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.
5. Result in cumulatively considerable impacts to wildfire.

Methodology

The proposed project's potential impacts associated with wildfire are evaluated using a variety of resources, including CAL FIRE maps showing fire hazard severity zones, the FRAP database, and fire history. Vegetation data is provided in Section 3.3 Biological Resources. As described in Section 3.14.1, *Environmental Settings*, this analysis conservatively assumes that wildfire risk conditions (i.e. large amounts of flammable vegetation) that would exist during proposed construction activities would be similar to conditions that existed prior to the Silverado Fire at the time the NOP was published.

Impact Analysis

Emergency Response Plan

Impact 3.14-1: The proposed project could substantially impair an adopted emergency response plan or emergency evacuation plan.

Construction

The proposed project site is located within a State Responsibility Area, Moderate Fire Hazard Severity Zone. The Evacuation Plan for the City of Irvine indicates the proposed project site is bounded by two evacuation routes: Portola Parkway to the west and SR-133 to the southeast. Construction of the proposed project involves intersection improvements at the Portola Parkway/Sand Canyon Avenue intersection. All other project construction would be located onsite and not on public rights-of-ways. The proposed project would modify the existing intersection and associated traffic lights to allow construction access through the intersection directly onto the project site. Cross walks and associated pedestrian signals would also be modified to facilitate safe pedestrian crossing in all directions. All proposed modifications would be implemented in accordance with City of Irvine requirements, including traffic control to ensure emergency access is maintained on both rights-of-ways. The proposed intersection modification would not involve closure of any roadways; however, temporary lane closures could be required, for example to allow for restriping of lanes or creating the curb cut and entrance to the proposed access road. As explained in Section 3.12, Transportation, to ensure that impacts related to the circulation system do not occur as a result of the proposed project, IRWD would implement **Mitigation Measure TRA-1** which would require the preparation and implementation of a Traffic Control Plan. The Traffic Control Plan would include, but not be limited to, signage, striping, delineated detours, flagging operations, changeable message signs, delineators, arrow boards, and K-Rails that would be used during construction to guide motorists, bicyclists, and pedestrians safely through the construction area and allow for adequate emergency access and circulation to the satisfaction of the City. The Traffic Control Plan would be coordinated with the City of Irvine, as necessary, as well as with emergency responders, which include fire departments, police departments, and ambulances that have jurisdiction within the proposed project area. Therefore, with implementation of Mitigation Measure TRA-1, impacts to circulation system during the initial intersection improvement phase of the project would be reduced to a less than significant level, and project construction would not impair or physically

interfere with emergency response teams or an evacuation plan. Impacts would be less than significant with mitigation.

Operation

Operation and maintenance activities for the proposed project would be substantially similar to current conditions respective to emergency response and evacuation. No operation-related activities would occur within surrounding rights-of-ways or along evacuation routes. Once the proposed intersection improvements at Portola Parkway/Sand Canyon Avenue are complete, site access for operation and maintenance vehicles would be through the intersection onto IRWD property. The proposed project would not result in impacts on emergency response plans or emergency evacuation plans. As a result, no impact would occur.

Mitigation Measures

Implement Mitigation Measure TRA-1: Traffic Control Plan (see Section 3.12, *Transportation*, for details)

Significance Determination

Less than Significant Impact with Mitigation

Exposure to Pollutant Concentrations

Impact 3.14-2: The proposed project could, due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.

Construction

The proposed project site is located within a State Responsibility Area, Moderate Fire Hazard Severity Zone. The proposed project site includes slopes surrounding the existing reservoir that are susceptible to prevailing winds. Brush and grassland habitats within the proposed project site are highly flammable. During construction, equipment and on-site diesel fuel could pose a risk to wildfire with possible ignition sources such as internal combustion engines, gasoline-powered tools, and equipment that could produce a spark, fire, or flame. The use of spark-producing construction machinery within fire risk areas such as the proposed project site could expose temporary project workers and contractors to pollutant concentrations from a wildfire or the uncontrolled spread of wildfire, resulting in a potentially significant impact. However, all personnel on the project site would have to comply with PRC Sections 4427, 4428, 4431, and 4442, which include regulations relating to the handling of combustible fuels and equipment that can exacerbate fire risks. During construction, strict adherence to these PRC sections would ensure that contractors are responsible for all monitoring and safety measures ensuring that any risk to exacerbate wildfire would be reduced. Additionally, all construction must comply with fire protection and prevention requirements specified by the California Code of Regulations (CCR) and Cal/OSHA. This includes various measures such as easy accessibility of firefighting equipment, proper storage of combustible liquids, no smoking in service and refueling areas, and

worker training for firefighter extinguisher use. Furthermore, implementation of **Mitigation Measure WDF-1** would be required to ensure fire hazard reduction measures are implemented during proposed project activities to further reduce the potential for wildfire impacts on project workers. As a result, impacts would be reduced to a less than significant level with mitigation.

Operation

As discussed above, the proposed project is located within a State Responsibility Area, Moderate Fire Hazard Severity Zone, and includes slopes susceptible to prevailing winds. Brush and grassland habitats within the project site are highly flammable. The proposed project would involve expansion of the existing reservoir water storage capacity and water levels would effectively create more inundated area and fewer steep slopes susceptible to prevailing winds within the project area in winter and spring months when the reservoir is full. The reduction of flammable surface area within the Moderate Fire Hazard Severity Zone could prevent or reduce uncontrolled spread of wildfire. As the reservoir is drawn down in the summer months to satisfy recycled water needs in IRWD's service area, the surface area susceptible to wildfire risk would increase. However, the flammable vegetation removed during construction would continue to be absent within the limits of the high- water elevation, reducing the risk of wildfire. Operation-related activities would involve a limited number of maintenance trucks for inspections and material delivery. These trucks would be limited to established access roads and would have a low potential of producing sparks, fire, or flame, that could result in uncontrolled spread of wildfire. Nevertheless, due to the site topography and wildfire risk, operators of the proposed project site would comply with PRC Sections 4427, 4428, 4431, and 4442, which include regulations relating to the handling of combustible fuels and equipment that can exacerbate fire risks, and IRWD would require implementation of Mitigation Measure WDF-1. As a result, impacts would be reduced to a less than significant level with mitigation.

Mitigation Measures

WDF-1: Fire Hazard Reduction Measures. During project implementation, IRWD shall require all spark arrestors on construction and maintenance equipment to be in good working order. Contractors shall require all vehicles and crews to have access to functional fire extinguishers at all times.

Significance Determination

Less than Significant Impact with Mitigation

Infrastructure that Exacerbates Wildfire Risk

Impact 3.14-3: The proposed project could require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.

The proposed project includes construction and operation of new proposed access roads and pipelines to support the expanded dam and reservoir. This new infrastructure does not pose

additional risk to exacerbation of wildfires other than what is discussed in Impact 3.14-2 above. New electrical power lines, which could exacerbate fire risk, would not be installed as a result of the proposed project. All infrastructure installed as part of the project during operation and maintenance will adhere to CCR Title 24, the CBC, and County of Orange Safety Element, and would be required to implement fire reduction measures as outlined in Mitigation Measure WDF-1. Adherence to applicable laws and regulations and implementation of Mitigation Measure WDF-1 would reduce impacts to a less than significant level.

Mitigation Measures

Implement Mitigation Measure WDF-1

Significance Determination

Less than Significant Impact with Mitigation

Post-Fire Slope or Drainage

Impact 3.14-4: The proposed project would not expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.

Construction

As discussed in Chapter 2, Project Description, during construction of the proposed project, approximately 2.4 million cubic yards of material is proposed to be excavated from the project site. Approximately 2.2 million cubic yards of compacted material would be reused onsite for construction of the new proposed dam. Site alteration through movement of substantial quantities of soil and earth materials has the potential to result in landslides as a result of runoff or drainage changes during construction. Due to the bowl-shaped topography of the site and the project's planned sediment basins, it is unlikely that conditions of erosion would extend beyond the boundaries of the project site. As discussed in section 3.6, Geology and Soils, given that the size of the proposed project exceeds one acre the project would be required to comply with the *NPDES General Permit for Discharges of Storm Water Runoff Associated with Construction and Land Disturbance Activities* (Order 2009-0009-DWQ, NPDES No. CAS000002; as amended by Orders 2010-0014-DWQ and 2012-006-DWQ) (Construction General Permit) and local stormwater ordinances. These state and local requirements were developed to ensure that erosion is controlled on construction sites. The Construction General Permit requires preparation and implementation of a SWPPP, which requires applications of BMPs to control runoff and runoff from construction work sites. The BMPs would include, but would not be limited to, physical barriers to prevent erosion and sedimentation, construction of sedimentation basins, limitations on work periods during storm events, use of infiltration swales, protection of stockpiled materials, and a variety of other measures that would substantially reduce or prevent erosion from occurring during construction. In the event that a wildland fire is followed by a rain event, and results in downstream flooding or landslides as a result of post-fire runoff, the BMP measures required to be implemented under the SWPPP would reduce the risk of runoff, post-fire slope instability, and

drainage changes. With compliance with existing regulations, impacts would be less than significant.

Operation

Once constructed, the proposed project would be designed to withstand a variety of site conditions to maintain capacity for the purpose of water storage. For instance, criteria used to develop the new reservoir grading plan includes slopes no steeper than 4H:1V (a ratio of 4 units of horizontal length to 1 unit of vertical height) to promote slope stability. The inclinations of the natural hillside slopes surrounding the reservoir are typically 4H:1V, and thus the inclination of cut slopes would be similar to that of the natural slopes. With the wide fluctuations of reservoir levels anticipated during operation, the slopes around the new reservoir would undergo repeated cycles of wetting and drying. These fluctuations combined with the poor slope stability characteristics of the soil composition (Vaqueros and Sespe Formations) could result in some slope instability which could be exacerbated by wildland fires. In the event that a wildland fire is followed by a rain event and results in downstream flooding or landslides as a result of post-fire runoff, slope instability, or drainage changes, the result would be material moving downslope into the reservoir. Given that the reservoir is in a canyon closed off by the presence of the dam, these materials would be removed during periods when the reservoir has low water levels and would pose no risks to downstream flooding. Operation of the proposed project would not involve onsite personnel that could be put at risk should landslides or flooding occur as a result of wildland fires. Operation of the proposed project would be managed in a manner that would not result in runoff, post-fire slope instability, or drainage changes as a result of potential wildland fire. As a result, impacts would be less than significant.

Mitigation Measures

None required

Significance Determination

Less than Significant Impact

Cumulative Impacts

Impact 3.14-5: Concurrent construction and operation of the proposed project and related projects in the geographic scope could result in cumulative impacts to wildfire.

This section presents an analysis of the cumulative effects of the proposed project in combination with other present and reasonably foreseeable future projects that could generate cumulatively considerable impacts to wildfire.

As described in Table 3-1, *Related Projects for Cumulative Analysis*, there are numerous projects that would require vehicles that utilize combustible materials to complete construction, similar to the proposed project. Several of these projects are Capital Improvement Projects from the City of Irvine Department of Public Works. Projects 3, 9, 10, and 11 are within close proximity to the proposed project. Projects 10 and 11 are anticipated to be complete by December 2020 and would

not occur at the same time as the proposed project which is anticipated to begin in Fall of 2022. Projects 3 and 9 could occur at the same time as the proposed project. Other projects further away as identified on Figure 3-1 that occur at the same time include Project 14 which involves the construction of a freeway interchange, Projects 17 and 18, which are IRWD pump stations, and Projects 4, 6, and 7 which are residential projects that are currently under construction and could still be in construction when the proposed project begin construction in Fall 2022. Significant cumulative impacts related to wildfire could occur if the incremental impacts of the project combined with the incremental impacts of one or more cumulative projects identified in Table 3-1, to substantially increase risk that people or the environment would be exposed to wildfire.

Cumulative projects would be subject to the same regulatory requirements discussed for the proposed project, including the adherence to emergency planning. That is, cumulative projects involving activities that could exacerbate wildfire risk (such as combustible fuel used for construction and during maintenance), impair emergency plans, or expose people to downstream post-fire landslides also would be required to adhere to the same established regulatory standards. While it is possible that the proposed project and cumulative projects could result in increased wildfire risk at the same time and in overlapping locations, the responsible party associated with each project would be required to control the safety of their own site conditions to the same established regulatory standards. The proposed project would be required to implement Mitigation Measure WDF-1 as discussed above that would further mitigate cumulative impacts.

For the above reasons, the combined effects of the construction of the proposed project in combination with cumulative projects would not have a cumulatively considerable contribution to a cumulative impact. Other cumulative construction projects would be required to provide appropriate traffic control, emergency access, and fire safety for their projects. No significant cumulative impact related to wildfire would occur with implementation of Mitigation Measure WDF-1

Mitigation Measures

Implement Mitigation Measure WDF-1

Significance Determination

Less than Significant Impact with Mitigation

CHAPTER 4

CEQA Plus Considerations

This Draft EIR has been prepared in accordance with the CEQA-Plus requirements of the U.S. Environmental Protection Agency (USEPA) to fulfill the requirement of potential federal funding partners to comply with the National Environmental Policy Act (NEPA). Potential federal funding partners could include U.S. Bureau of Reclamation (USBR) or the State Water Resources Control Board (SWRCB) through the State Revolving Fund (SRF) Loan Program, both of which provide funding for construction of publicly-owned treatment facilities and water reclamation projects. This funding for capital improvements to wastewater treatment and water recycling facilities is authorized under the federal Clean Water Act. The CEQA-Plus requirements have been established by the USEPA and are intended to supplement the CEQA Guidelines with specific requirements for environmental documents acceptable to the USBR or SWRCB when reviewing applications for wastewater treatment facility loans. They are not intended to supersede or replace the CEQA Guidelines. In order to qualify for federal loan programs administered by the USBR or the SWRCB, the proposed project must comply with the following federal cross-cutting regulations:

- Archaeological and Historic Preservation Act
- Clean Air Act
- Coastal Barriers Resources Act
- Coastal Zone Management Act
- Endangered Species Act
- Environmental Justice Executive Order
- Farmland Protection Policy Act
- Fish and Wildlife Conservation Act
- Floodplain Management
- Magnuson-Stevens Fishery Conservation and Management Act
- Migratory Bird Treaty Act
- National Historic Preservation Act
- Protection of Wetlands
- Rivers and Harbors Act
- Safe Drinking Water Act
- Wild and Scenic Rivers Act

Compliance with the federal laws and relevant executive orders are described below in Sections 4.1 and 4.2. In summary, the proposed project complies with those laws and executive orders, with further evidence provided in other sections of this Draft EIR as cross-referenced below.

4.1 Federal Regulations

4.1.1 Archaeological and Historic Preservation Act

The Archaeological and Historic Preservation Act (AHPA) also known as the Archaeological Recovery Act was passed and signed into law in 1974. The AHPA required that Federal agencies provide for "... the preservation of historical and archeological data (including relics and specimens) which might otherwise be irreparably lost or destroyed as the result of ... any alteration of the terrain caused as a result of any Federal construction project of federally licensed activity or program (Section 1)." (NPS 2020)

The impetus for AHPA was the destruction of archaeological sites throughout the country, frequently by actions funded or otherwise supported by Federal agencies, but not covered by the Reservoir Salvage Act, which required archeological salvage as part of dam projects (NPS 2020).

The AHPA built upon the national policy, set out in the Historic Sites Act of 1935, "... to provide for the preservation of historic American sites, buildings, objects, and antiquities of national significance ..." The AHPA expanded the policy by focusing attention on significant resources and data, but does not require that they be shown to be of "national" significance. The connection between the 1935 statute and the AHPA is mentioned explicitly in the first section of the statute (NPS 2020).

Compliance with the National Historic Preservation Act (see below), and particularly the implementing regulations for Section 106, as discussed in Section 3.4 and 3.13 of this EIR, fulfill the requirements of the AHPA.

4.1.2 Clean Air Act

The federal Clean Air Act (CAA) requires the USEPA to identify National Ambient Air Quality Standards (NAAQS) to protect public health and welfare. NAAQS have been established for ozone, carbon monoxide, nitrogen dioxide, sulfur dioxide, PM10, PM2.5, and lead. Pursuant to the 1990 FCAA Amendments, the USEPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for these criteria air pollutants, based on whether or not the NAAQS have been achieved. The CAA requires each state to prepare a State Implementation Plan (SIP), which is an air quality control plan that includes pollution control measures for states that violate the NAAQS. Clean Air Act compliance is described in Section 3.2 Air Quality. CEQA-Plus requirements include a CAA general conformity analysis for projects in a federal nonattainment area or an attainment area subject to a SIP. The South Coast Air Basin is designated under federal ambient air quality standards as nonattainment for ozone and fine particulate matter PM2.5 as explained in Section 3.2 *Air Quality*. As a result, a CAA general conformity analysis has been included in Section 3.2 *Air Quality*.

4.1.3 Coastal Barriers Resources Act

The Coastal Barriers Resources Act (CBRA) was enacted in 1982 to designate relatively undeveloped coastal barriers along the Atlantic, Gulf of Mexico, Great Lakes, U.S. Virgin Islands, and Puerto Rico coasts as part of the John H. Chafee Coastal Barrier Resources System (CBRS). Those areas became ineligible for most new federal expenditures and financial assistance in order to discourage development such as federal flood insurance (USFWS 2019). The goals of the CBRA are to minimize loss of human life by discouraging development in high risk areas, to reduce wasteful expenditure of federal resources, and to protect the natural resources associated with coastal barriers (USFWS 2020). There are no designated Coastal Barrier Resources System in California. Additionally, the proposed project does not propose any development associated with coastal barriers. Therefore, this Act is not applicable to the proposed project, and no impact would occur.

4.1.4 Coastal Zone Management Act

Section 307 of the Coastal Zone Management Act (CZMA) requires activities approved or funded by the federal government that affect any land or water use or natural resource of a state's coastal zone be consistent with the enforceable policies of the state's federally approved coastal management program. California's federally approved coastal management program consists of the California Coastal Act, the McAtteer-Petris Act, and the Suisun Marsh Protection Act. The California Coastal Commission (CCC) implements the California Coastal Act and the federal consistency provisions of the CZMA for activities affecting coastal resources outside of San Francisco Bay. The proposed project does not lie within a State Coastal Zone and would not result in impact to coastal zone natural resources. Therefore, this Act is not applicable to the proposed project, and no impact would occur.

4.1.5 Endangered Species Act

The purpose of the Endangered Species Act (ESA) is to protect and recover imperiled wildlife and plant species and the habitats/ecosystems upon which they depend for survival. Section 10 provides a means whereby a nonfederal action with the potential to result in take of a listed species can be allowed under an incidental take permit. Application procedures are found at 50 CFR 13 and 17 for species under the jurisdiction of USFWS and 50 CFR 217, 220, and 222 for species under the jurisdiction of NMFS. To comply with the ESA, a project applicant analyzes the project's effects on threatened and endangered species, as well as any critical habitat designated for any of the species. The applicant uses biological assessments that have been prepared for the project, as well as any documents pertaining to the project's effects on listed species and designated critical habitat. If a listed species may be adversely affected by a project, USBR or SWRCB staff will confer with the USFWS to inform these agencies of project impacts to any federally listed species or critical habitat. If USFWS staff determine the project will adversely impact a federally listed species or designated critical habitat, formal consultation is initiated, where USEPA assumes the role as the lead agency. This EIR includes the documentation to disclose the proposed project's effects on special-status species and compliance with the federal ESA, including compliance with the Orange County Central & Coastal Subregions NCCP/HCP. Further details about the regional NCCP/HCP and ESA are discussed in

Section 3.3, *Biological Resources*, as well as the Biological Resources Technical Report included in Appendix C to this Draft EIR.

4.1.6 Farmland Protection Policy Act

The purpose of the Farmland Protection Policy Act (FPPA) is to minimize the extent to which federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses. It additionally directs federal programs to be compatible with state and local policies for the protection of farmlands. For the purpose of the FPPA, farmland includes Prime Farmland, Unique Farmland, and Land of Statewide or Local Importance. Projects are subject to FPPA requirements if they may irreversibly convert farmland (directly or indirectly) to nonagricultural use and are completed by a federal agency or with assistance from a federal agency (NRCS 2020). As discussed in Chapter 3.0, Environmental Setting, Impact Analysis, and Mitigation Measures, the proposed project is identified as “Other Land” on the CDC Farmland Map for Orange County. Other Land can include low density rural developments, brush, timber, wetland, and riparian areas not suitable for livestock grazing, confined livestock, poultry or aquatic facilities, strip mines, borrow pits, and water bodies smaller than 40 acres. Further, there is no Prime, Unique, or Farmland of Statewide Importance located in the project area, nor would the project convert any farmland to non-agricultural use. As such, the project would not impact farmland and would adhere to the FPPA.

4.1.7 Fish and Wildlife Conservation Act

The Fish and Wildlife Conservation Act declares that fish and wildlife are of ecological, educational, esthetic, cultural, recreational, economic, and scientific value to the United States. The purposes of this Act are to encourage all federal departments and agencies to utilize their statutory and administrative authority, to the maximum extent practicable and consistent with each agency's statutory responsibilities and to conserve and to promote conservation of non-game fish and wildlife and their habitats. Another purpose is to provide financial and technical assistance to the states for the development, revision, and implementation of conservation plans and programs for nongame fish and wildlife. Fish and Wildlife Conservation Act compliance is described in Section 3.3 Biological Resources.

4.1.8 Magnuson-Stevens Fishery Conservation and Management Act

The Magnuson-Stevens Fishery Conservation and Management Act (MSA) is the principal law governing marine fisheries in the U.S. First enacted in 1976, it was adopted to create a U.S. fishery conservation zone out to 200 nautical miles off the U.S. coast, to phase out foreign fishing activities within this zone, to prevent overfishing, to allow overfished stocks to recover, and to conserve and manage fishery resources. MSA requires federal agencies to consult with the National Oceanic and Atmospheric Administration (NOAA) Fisheries when their actions or activities may adversely affect habitat identified by federal regional management councils as Essential Fish Habitat (EFH). The MSA defines EFH as “those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity” (NOAA Fisheries, 2020). The proposed project would have no adverse impact on the marine environment or EFH in the Pacific

Ocean. The proposed project is located approximately 11 miles northwest of the Pacific Ocean, and no project component includes discharge to the Pacific Ocean which could potentially impact EFH's. Therefore, the MSA is not applicable to the proposed project, and no impact would occur.

4.1.9 Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) is the domestic law that affirms, or implements, a commitment by the U.S. to four international conventions (with Canada, Mexico, Japan, and Russia) for the protection of a shared migratory bird resource. The MBTA makes it unlawful at any time, by any means, or in any manner to pursue, hunt, take, capture, or kill migratory birds. The law also applies to the removal of nests occupied by migratory birds during the breeding season. The MBTA makes it unlawful to take, pursue, molest, or disturb these species, their nests, or their eggs anywhere in the United States. Migratory Bird Treaty Act (MBTA) compliance is described in Section 3.3 Biological Resources.

4.1.10 National Historic Preservation Act

CEQA-Plus requires compliance with Section 106 of the National Historic Preservation Act (NHPA). Consultation with the State Historic Preservation Officer (SHPO) is required to demonstrate/confirm that Section 106 compliance has been achieved. This EIR and the administrative record includes the information and documentation that is required to provide to the SHPO to initiate the Section 106 consultation, including, (1) identification of the proposed project's Area of Potential Effects (APE), (2) cultural records searches for the APE at the appropriate Information Centers, (3) documentation of Native American consultation, (4) cultural resources field surveys of the APE, (4) evaluations of elements of the built environment in and around the APE that are eligible for the National Register of Historic Places, and (5) Determination of Eligibility for any cultural resources that cannot be avoided during project construction. Compliance with the NHPA is discussed in Section 3.4 Cultural Resources, and Section 3.13 Tribal Cultural Resources.

4.1.11 Rivers and Harbors Act

Section 9 of the Rivers and Harbors Appropriation Act of 1899 (33 U.S.C. 403; Chapter 425, March 3, 1899; 30 Stat. 1151), commonly known as the Rivers and Harbors Act of 1899, prohibits the construction of any bridge, dam, dike or causeway over or in navigable waterways of the U.S. without Congressional approval. Under Section 10 of the Act, the building of any wharfs, piers, jetties, and other structures is prohibited without Congressional approval, and excavation or fill within navigable waters requires the approval of the Chief of Engineers. The proposed project does not entail the construction of any wharfs, piers, or jetties, nor is the proposed project located on a federally designated navigable water. As such, this Act is not applicable to the proposed project, and no impact would occur.

4.1.12 Safe Drinking Water Act

The Safe Drinking Water Act (SDWA) was established to protect the quality of drinking water in the United States. The SDWA focuses on all waters actually or potentially designed for drinking uses, whether from above ground or underground sources. The principal federal agency involved

in drinking water regulation is the USEPA. USEPA is responsible for implementing federal drinking water law and setting national drinking water requirements. The proposed project would increase the volume of recycled water the Syphon Reservoir, but would not involve potable water that would be regulated by the SDWA. Therefore, this Act is not applicable to the proposed project, and no impact would occur.

4.1.13 Wild and Scenic Rivers Act

The Wild and Scenic Rivers Act was created in 1968 to protect and preserve the special character of certain rivers with outstanding natural, cultural and recreational values and recognize their appropriate use and development. Section 5(d)(1) of the Wild and Scenic Rivers Act lists interim protection measures for eligible or suitable rivers. For a river to be eligible for designation in the National Wild and Scenic River System, it must have one or more outstandingly remarkable river values. There are no Wild and Scenic Rivers located within the project area (National Wild and Scenic River System 2020). Therefore, this Act is not applicable to the proposed project, and no impact would occur.

4.2 Executive Orders

4.2.1 Floodplain Management, Executive Order No. 11988

Executive Order 11988 requires federal agencies avoid, to the extent possible, the long and short-term adverse impacts associated with the occupancy and modification of flood plains and to avoid direct and indirect support of floodplain development wherever there is a practicable alternative (FEMA 2020a). If a project has a potential impact to or within a floodplain, there is an eight-step process that agencies can carry out during their decision-making process on the project. The eight-step process includes: (1) determine if a proposed action is in the base floodplain or area which has a one percent or greater chance of flooding in any given year, (2) conduct early public review, (3) identify and evaluate practicable alternatives to locating in the base floodplain, (4) identify impacts of the proposed action, (5) develop measures to minimize the impacts and restore and preserve the floodplain if impacts cannot be avoided, (6) re-evaluate the alternatives, (7) present the findings and a public explanation, and (8) implement the action (FEMA 2020a).

As discussed in Section 3.9, Hydrology and Water Quality, the proposed project is located in a FEMA identified FIRM flood hazard area. However, project components are designed to handle 100-year flood events, and would comply with federal regulations pertaining to floodplain management. In the event of a dam breach, there is a risk of flooding for downstream communities that was analyzed in a feasibility study to assess geographic areas that could become potentially inundated if the dam were to breach. However, the dam would be compliant with all DSOD regulations. Refer to Section 3.9 Hydrology and Water Quality for further discussion of the proposed project components in the floodplain and potential impacts and mitigation measures.

4.2.2 Protection of Wetlands, Executive Order No. 11990, as Amended by Executive Order No. 12608

Under this Executive Order No. 11990, each Federal agency takes action to minimize the destruction, degradation, or modification of wetlands and enhance the natural and beneficial values of wetlands. The Executive Order also directs the avoidance of direct or indirect support of new construction in wetlands and public involvement throughout the wetlands protection decision-making process (HUD 2020). Impacts to wetlands in the project area are described in Section 3.3 Biological Resources.

4.2.3 Environmental Justice, Executive Order No. 12898

Under Executive Order 12898, federal agencies are directed to make achieving environmental justice a part of their mission by identifying and addressing, as appropriate, disproportionately high adverse human health or environmental effects of its activities on minority and low-income populations (FEMA 2020b). Per Executive Order 12898, each Federal agency must make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health, environmental, economic and social effects of its programs, policies, and activities on minority and low-income populations, particularly when such analysis is required by NEPA. The Executive Order emphasizes the importance of NEPA's public participation process, directing that each Federal agency shall provide opportunities for community input in the NEPA process. Agencies are further directed to identify potential effects and mitigation measures in consultation with affected communities. An Environmental Justice Analysis is included in Section 4.3 below for the proposed project per the guidelines set above to comply with federal cross cutting regulations required to receive federal funding.

4.3 Environmental Justice Analysis

The following section discusses the environmental justice issues pertaining to the proposed project and evaluates the potential for the proposed project to disproportionately affect minority and low-income populations. Data presented in this section was obtained from the 2010 U.S. Census by the U.S. Census Bureau.

4.3.1 Environmental Setting

Potentially Affected Populations

The study area for environmental justice effects includes areas that may experience adverse human health or environmental effects resulting from construction and operation of the proposed project. While the project is located entirely within Unincorporated Orange County this analysis includes census tracts in the City of Irvine and the City of Tustin given their proximity to the proposed project and physical relationship to potential project impacts. The census tracts included for the cities of Tustin and Irvine include downstream emergency inundation areas, and tracts that could be impacted by project-related localized air quality and traffic impacts. **Table 4-1** and **Table 4-2** list the census tracts potentially affected by the proposed project. The tracts are also shown in **Figure 4-1**.

**TABLE 4-1
DEMOGRAPHIC INFORMATION FOR CENSUS TRACTS POTENTIALLY AFFECTED BY THE PROJECT (2010)**

Census Tract	Black or African American Alone, Not Hispanic or Latino	Asian Alone, Not Hispanic or Latino	Hispanic or Latino (of Any Race)	Total Minority (Other than Non-Hispanic White) ^{a,b}
CT 524.17	1.05%	37.04%	6.96%	45.19%

Minority Populations

According to the federal Council on Environmental Quality (CEQ) guidelines for environmental justice analyses (CEQ 1997), minority populations should be identified where either (a) the minority population of the affected area exceeds 50 percent or (b) the minority population percentage of the affected area is “meaningfully greater” than the majority population percentage in the general population or other appropriate unit of geographic analysis. CEQ guidance does not define the term “meaningfully greater;” however, the Federal Interagency Working Group on Environmental Justice NEPA Committee’s *Promising Practices for EJ Methodologies* (FIWGEJ 2016) suggests that the 50 percent approach and the “meaningfully greater” approach should be used together, and that “[t]he Meaningfully Greater analysis requires use of a reasonable, subjective threshold (e.g., ten or twenty percent greater than the reference community).” This analysis embraces the NEPA Committee’s advice on this approach.

Information regarding racial and ethnic diversity in the study area was derived from the 2010 census by the U.S. Census Bureau. The City of Irvine and City of Tustin both have a total minority population greater than 50 percent, and thus, as a reference population, represent a minority population. The City of Irvine has a minority population of 59.3%, and the City of Tustin has a minority population of 69.4% (US Census Bureau 2019a). However, the minority population percentages of individual census tracts within both cities differ widely reflecting local patterns of diversity, separation, and integration. While the entire population of both cities represents a greater than 50 percent minority population, the “total minority” population, which for this analysis is considered to include all residents who reported their race and ethnicity as anything other than non-Hispanic white to the U.S. Census Bureau, above 50 percent within individual census tracts comprises about 35 percent of the census tracts in the City of Irvine, and 23 percent of the census tracts in the City of Tustin.

Selected racial and ethnic characteristics of census tracts potentially affected by the proposed project are summarized in Table 4-1. The final column in Table 4-1 presents the “total minority” population percentage.

Because the City of Irvine and City of Tustin both have a minority population over 50 percent, the “meaningfully greater” approach also is used here to identify minority populations that exceed the percentage of the two cities. As explained above, no official threshold defines this term, and a lead agency must select a threshold that provides a reasonable and meaningful basis of comparison. Given the range of minority population concentrations within the two cities, an inclusive threshold is used to acknowledge areas of particularly high minority populations: any census tracts within the potential area of environmental impact that have concentrated minority populations greater than the two cities (59.3% for Irvine and 69.4% for Tustin) are considered to be “meaningfully” greater.

Low-Income Populations

The CEQ environmental justice guidance states that “...low-income populations in an affected area should be identified with the annual statistical poverty thresholds from the Bureau of the Census’ Current Population Reports, Series P-60 on Income and Poverty” (CEQ 1997, page 25).

USEPA guidance (1998) recommends the use of Census data on poverty income as one indicator, as well as other available data. Unlike the CEQ guidance on minority populations, none of the environmental justice guidance documents contains a quantitative definition of what proportion of low-income individuals defines a low-income population. The annual statistical poverty thresholds are based on family income. A threshold of 50 percent of individuals in families with incomes below the poverty threshold (similar to the 50 percent threshold used to identify a minority population) would be an overly restrictive threshold for identifying a low-income population due to the nature of the poverty thresholds, which are not adjusted for regional costs of living, and are below levels commonly considered low-income in many areas of California.

For the purposes of this environmental justice analysis, the method of identifying low-income populations within the study area must account for regional costs of living. Therefore, this analysis uses a comparative approach and identifies a low-income population if the proportion of people with family incomes below the poverty threshold is greater than that within the general population; in other words, if the percentage of such people in any of the communities considered is greater than 10.5 percent, which is the poverty rate in Orange County (US Census Bureau 2019b). Additionally, California’s Integrated Regional Water Management guidelines provide criteria for identifying “disadvantaged communities” during water resources planning efforts. Under the California Water Code, a disadvantaged community is defined as one with an annual median household income that is less than 80 percent of the statewide median household income (California Water Code, Section 79505.5[a]). The statewide median household income during 2010 when the census tract data was gathered was \$59,540. Therefore, the threshold of 80 percent of the statewide median is \$47,632. As shown in Table 4-2, there are census tracts within the cities of Irvine and Tustin that have mean incomes below this figure, and are therefore identified as disadvantaged communities and low-income populations, as denoted with bold italics in Table 4-2.

These two approaches identify slightly different groups of census tracts as low-income. This may be related to different average household/family sizes (because poverty thresholds are based on family size, but median income is not) or other factors.

4.3.2 Significance Thresholds and Criteria

For the purposes of this EIR and consistency with NEPA and CEQA-Plus Guidelines, applicable local plans, and agency and professional standards, the proposed project would be considered to have a significant effect on environmental justice if it would:

- Affect the health or environment of minority or low-income populations disproportionately.

4.3.3 Impacts and Mitigation Measures

Construction

Construction-related environmental impacts would be experienced within portions of the City of Irvine and the City of Tustin. For the purposes of this discussion and as identified in Tables 4-1 and 4-2 above, only tracts that represent a greater than 50% minority population are considered

minority communities, and tracts with a poverty rate above 10.5% are considered low income. The rest of the City of Irvine and the City of Tustin are excluded from consideration herein.

Because the proposed project is not located within either city, no construction-related project activities would occur in minority or low-income communities that could cause primary environmental impacts. However, construction-related project activities could have environmental impacts that reach beyond the geography of the immediate project site. Construction impacts of the proposed project are explained in detail in Sections 3.1 through 3.14 of this Draft EIR. Environmental topics that have the potential to exacerbate existing disproportionate impacts on minority and low-income populations during construction include Sections 3.2, *Air Quality*, and 3.12, *Transportation*. As explained within Sections 3.2 and 3.12, short-term temporary impacts related to air quality and traffic during construction of the proposed project could occur.

The primary construction related environmental impacts that could have the potential to exacerbate existing disproportionate impacts on minority and low-income populations include emissions of pollutant concentrations emitted near sensitive receptors. As explained in Section 3.2, the only sensitive receptors that would be exposed to significant increases in pollutant concentrations (NO_x) are located within Census Tract 524.26 that covers the Stonegate community within the City of Irvine and areas within unincorporated Orange County surrounding the project site. As shown in Tables 4-1 and 4-2, Census Tract 524.26 is neither a minority nor low-income community, and can be dismissed from further environmental analysis. All other criteria pollutant air quality impacts are based on a regional scale within the South Coast Air Quality Management District (SCAQMD) and thus do not differentiate between census tracts in IRWD's service area, either low-income/minority or not. Even still, both regional and localized emissions for NO_x would be mitigated to less than significant levels with implementation of Mitigation Measure AIR-1. As a result, while the proposed project would result in an increase in criteria pollutants for NO_x that would be mitigated to less than significant levels, the sensitive receptors close enough to the project to be impacted by localized emissions are not within low-income/minority areas, and would therefore not be disproportionately impacted.

As discussed in Section 3.12, *Transportation*, truck trips during construction would not result in a significant increase in traffic and would be for the most part concentrated on Portola Parkway between Jeffrey Boulevard and Sand Canyon Avenue, Sand Canyon Avenue between Irvine Boulevard and Portola Parkway, and Irvine Boulevard between Jeffrey Road and Sand Canyon Avenue, as well as SR-261, SR-241, and SR-133. Aside from the State Routes, the entirety of this area is located within Census Tract 524.26, which covers the Stonegate community within the City of Irvine and areas within unincorporated Orange County surrounding the project site. This tract is neither a minority nor low-income community, and can be dismissed from further environmental analysis. SR-241 also only traverses Census Tract 524.26 and likewise can be dismissed from further environmental analysis.

SR-133 traverses Census Tracts 524.04, 525.18, 626.04, and 626.21. SR-261 traverses Census Tracts 524.20, 252.25, 525.27, and 755.15. None of the Census Tracts that are traversed by SR-133 and SR-261 are considered low income per the discussion above. Additionally, the Census

Tracts that are traversed by SR-133 are not considered minority populations. All the census tracts that SR-261 traverses are considered minority populations. As discussed in Section 3.12 Transportation, to ensure the project does not cause significant impact a Traffic Control Plan would be required (see Mitigation Measure TRA-1). As such, the proposed project would not create impacts to traffic and transportation that would disproportionately affect low income or minority populations with implementation of Mitigation Measure TRA-1.

Operation

Operation of the proposed project would not create local impacts to air quality or traffic that could disproportionately affect public health within minority or low-income communities. The potential impact of inundation due to emergency releases from the proposed enlarged Syphon Dam is discussed in Section 3.9, *Hydrology and Water Quality*, and shown in Figures 3.9-3 and 3.9-4. While dam failure is not anticipated, the downstream hazard for the existing Syphon Reservoir is classified as extremely high. As a result, and as required by DSOD, an inundation map was prepared for the reservoir that shows areas downstream that could be subject to flooding in the event of dam failure. As shown in Figure 3.9-4, a hypothetical breach of the expanded Syphon Reservoir would flow overland; split at the I-5 Culver Drive Bridge and continue through the defined channels of Trabuco Road Drainage and Peters Canyon Channel before reaching Upper Newport Bay and, ultimately, the Pacific Ocean (GEI 2012; Stetson 2020).

Table 4-3 shows the census tracts within the City of Irvine and City of Tustin that would be inundated if the dam were to fail. Table 4-3 also shows which tracts represent low-income and minority populations that would be affected by inundation. While none of the tracts that would be inundated were identified in the 2010 Census as low-income, there are several minority communities that would be affected should the proposed dam fail.

**TABLE 4-3
CENSUS TRACTS AFFECTED BY PROJECT INUNDATION (2010)**

Geography	Minority Community	Low-Income Community
CT 524.17	N	N
CT 524.18	Y	N
CT 524.21	N	N
CT 524.26	N	N
CT 525.05	N	N
CT 525.15	Y	N
CT 525.21	Y	N
CT 525.25	Y	N
CT 525.26	N	N
CT 525.27	Y	N
CT 525.28	N	N
CT 755.15	N	N

Of the 12 census tracts that would be affected by the inundation area of the proposed enlarged Syphon Dam, five are characterized by predominantly minority populations (Census Tracts 524.18, 525.15, 525.21, 525.25, and 525.27) as indicated in Table 4-3. Three of these census tracts (524.18, 525.25, 525.27) are included in the current inundation area of the existing Syphon Dam. As such, the proposed project would affect two additional census tracts (525.15, 525.21) that are characterized by predominantly minority populations. The proposed project would affect seven census tracts that are not predominantly minority populations, of which six are already included in the current inundation of the existing Syphon Dam and one would be added to the inundation area due the proposed project (Census Tract 524.21). As a result, the census tracts that would be affected by inundation as a result of the proposed project would not be predominantly characterized by minority populations.

As seen in Figure 3.9-3 and 3.9-4 different cross sections were analyzed to determine impact of inundation to different areas within Irvine and Tustin as the water flowed toward the Portola Parkway storm drain. While all Census Tracts discussed above would be affected by inundation, based on location certain tracts would be inundated disproportionately more than others. The closest tract immediately southwest of the dam is Census Tract 525.26, which is neither a low income or minority community. This Census Tract is located between Cross Sections 1 and 2 and would experience the largest depths of inundation from 9 to 25 feet. As a basis of comparison the impact of dam failure on the minority and low income tracts in the project area are discussed below.

Census Tract 524.18 lies between Cross Section 1 and 3 and would, similar to Census Tract 525.26 discussed above, experience the greatest inundation with an inundation depth range of 4 to 25 feet. However, only the northern most portion of Census Tract 524.18 would be affected with potential depths of 25 feet, while the majority of the tract lies further west where levels of inundation would be lower. A larger portion of Census Tract 525.26 would be inundated and the entirety of that Census Tract would experience the highest maximum depths of inundation.

Further west, Census Tracts 525.25 and 525.27 are located between Cross Sections 3 and 4 and would experience inundation depths of 4 to 5 feet. Census Tract 525.15 is located between Cross Sections 4 and 5 and would experience inundation depths of 5 to 11 feet. Lastly, Census Tract 525.27 is located between Cross Sections 5 and 7 and would experience inundation depths of 6 to 11 feet. Generally speaking, as the flood water would move toward the Peters Canyon Channel the overall depth of inundation decreases. However, due to changing topography between the Syphon Reservoir and the Portola Parkway channel depths would vary.

As such, low income and minority communities would not receive a disproportionate impact as a result of the potential inundation and flooding due to dam failure. Additionally, dam failure is not anticipated, and this inundation represents a conservative worst case scenario.

As mentioned previously in Chapter 2, *Project Description*, during precipitation events, IRWD would maintain reservoir levels well below the spillway crest to create space for stormwater runoff to enter the reservoir and avoid use of the spillway. The annual operating plan would identify a maximum water surface elevation that would ensure overtopping of reservoir and

spillway would not occur due to stormwater inflow, wave action, or overflowing of the reservoir from IRWD's recycled water system. Reservoir operations would be adjusted by IRWD during the year based on changes in projected demands, and other factors as needed. Under normal operating conditions, all flow in or out of the reservoir would be conveyed through the existing 36-inch inlet/outlet pipeline. In the event of an emergency, IRWD can also draw down the reservoir through the existing 48-inch pipeline that discharges to the existing storm drain in Portola Parkway.

As designed, a baffled concrete dissipation structure and short rip-rap channel would be installed to reduce velocities to safe levels to control the release of water through the discharge pipeline and into the storm drain. Settlement and groundwater pressure monitoring, utilization of dissipation controls, and other site monitoring would maintain the expanded reservoir in sound order. As required under DSOD regulations, regular monitoring and reporting would occur. As such, impacts regarding dam inundation are not expected to impact low-income or minority communities disproportionately.

CHAPTER 5

Growth Inducement

5.1 Overview

The California Environmental Quality Act (CEQA) Guidelines (Section 15126.2(e)) require that an EIR discuss the potential growth-inducing impacts of a proposed project. The CEQA Guidelines provide the following guidance for such discussion:

Discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects which would remove obstacles to population growth (a major expansion of a wastewater treatment plant might, for example, allow for more construction in service areas). Increases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects. Also discuss the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment.

A project can have direct and/or indirect growth-inducement potential. Direct growth inducement would result if a project involves construction of new housing. A project can have indirect growth-inducement potential if it establishes substantial new permanent employment opportunities (e.g., commercial, industrial, or governmental enterprises) or if it involves a construction effort with substantial short-term employment opportunities that indirectly stimulates the need for additional housing and services to support the new employment demand. Similarly, under CEQA, a project would indirectly induce growth if it removes an obstacle to additional growth and development, such as removing a constraint on a required public service.

Water storage and supply is one of the primary public services needed to support growth and community development. While water supply plays a role in supporting growth, it is not the single determinant of such growth. Other factors, including general plan policies, land use plans, and zoning, the availability of wastewater treatment and solid waste disposal capacity, public schools, transportation services, and other essential public infrastructure, also influence business and residential population growth. Economic factors, in particular, greatly affect development rates and locations.

Growth inducement itself is not necessarily an adverse environmental impact. It is the potential consequences of growth, the secondary effects of growth, which may result in environmental

impacts. Potential secondary effects of growth include increased demand on other public services; increased traffic and noise; degradation of air quality; loss of plant and animal habitats; and the conversion of agriculture and open space to developed uses. Growth inducement may result in adverse impacts if the growth is not consistent with the land use plans and growth management plans and policies for the area, as “disorderly” growth could indirectly result in additional adverse environmental impacts. Thus, it is important to assess the degree to which the growth accommodated by a project would or would not be consistent with applicable land use plans.

As stated in Chapter 2, Project Description, the proposed project would replace the existing engineered dam with a new and larger engineered dam. The proposed project would expand the reservoir’s recycled water storage capacity from the current 500 AF to approximately 5,000 AF and would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water from both the California State Water Project and the Colorado River. The proposed project would help IRWD to store more drought-proof recycled water during summer months, and support the increased use of recycled water for public landscaping, agricultural, business and industrial uses. By reducing IRWD’s dependence on costly imported water, the proposed project would allow IRWD to replace an expensive source of water for one that is less expensive and a drought-resilient supply, which increases IRWD’s water supply reliability. The project is expected to begin construction in the fall of 2022 and would be operational by early 2026.

This chapter evaluates the potential for the proposed project to induce growth in IRWD’s service area. This chapter reviews the population growth projections for the IRWD service area and describes the existing and projected water demand and water supply conditions. It provides a description of IRWD’s role in providing water and recycled water to customers within their service area and evaluates the potential for the proposed project to induce growth, both directly and indirectly.

5.2 Project Area Population and Water Demand Projections

5.2.1 Population Projections

Southern California Association of Governments Population Projections

The proposed project site is located entirely within IRWD’s service area within unincorporated Orange County bordering the City of Irvine. Both Orange County and the City of Irvine’s adopted General Plans guide the type and location of land uses and the intensity of development in response to projected population growth and associated housing needs. Each jurisdiction has assessed the growth-related impacts associated with planned land use and build-out scenarios allowed under their General Plans.

The proposed project and the IRWD service area are located within the jurisdiction of the Southern California Association of Governments (SCAG). SCAG consists of local governments

from Orange, Ventura, San Bernardino, Los Angeles, Riverside, and Imperial Counties. One of SCAG’s primary functions is to forecast population, housing, and employment growth for each region, subregion, and city within its jurisdiction. SCAG recently adopted the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) which acts as a long-term planning and management tool for the regional transportation system, providing mitigation measures to off-set the impacts of projected growth. SCAG population estimates are included in **Table 5-1** for the City of Irvine and Unincorporated Orange County in the years 2020, 2035, and 2040. As shown in Table 5-1, the populations of the City of Irvine and Unincorporated Orange County are anticipated to increase through 2040. The population in Unincorporated Orange County is expected to increase by approximately 30 percent while the population of the City of Irvine is anticipated to increase by approximately 10 percent.

**TABLE 5-1
POPULATION PROJECTIONS**

	2020	2025	2030	2035	2040	% Change
City of Irvine	296,300	—	—	326,700	327,300	10.5%
Unincorporated Orange County	137,700	—	—	177,900	180,100	30.1%
IRWD Service Area	440,981	467,483	475,346	479,783	N/A	8.8% ¹

NOTE:

^a The percent change is based on 2035 population data provided in IRWD’s UWMP.

SOURCE: SCAG 2016a, IRWD 2016

Irvine Ranch Water District’s 2015 Urban Management Plan Projections

IRWD is a multi-service agency responsible for providing domestic water service, sewage collection and treatment, water recycling, and urban runoff natural treatment in Central Orange County, California. IRWD provides water service to approximately 422,000 residents as of 2019 (IRWD 2019). IRWD encompasses approximately 181 square miles extending from the Pacific Coast to the foothills of the Santa Ana Mountains, covering elevations ranging from sea level to 1,700 feet. IRWD services the City of Irvine and portions of Costa Mesa, Lake Forest, Newport Beach, Orange, Tustin, Santa Ana and unincorporated areas of Orange County.

Population projections for the IRWD service area were obtained from the IRWD’s 2015 Urban Water Management Plan (UWMP). UWMPs are prepared by California’s urban water suppliers to support long-term resource planning and ensure adequate water supplies are available to meet existing and future water demands. Every urban water supplier that either provides over 3,000 AF of water annually or serves more than 3,000 connections is required to assess the reliability of its water sources over a 20-year planning horizon considering normal, dry, and multiple dry years. This reliability assessment is required to be included in its UWMP, which are to be prepared every five years and submitted to the California Department of Water Resources (DWR) for consistency review under the Urban Water Management Planning Act. The latest IRWD UWMP is the 2015 plan published in 2016; the 2020 plan will be published in 2021 after the release of this Draft EIR. As a result, IRWD’s 2015 UWMP is relied on herein. The UWMP takes into

account the projected population growth for the water supplier's service area when determining future available water supply and future anticipated water demand.

The northern portion of Orange County was extensively developed in the 1970s and 1980s. In the period from 2000 to 2018, Orange County population density grew at a 13.2 percent, which was lower than the SCAG regional average during that time (SCAG 2019). IRWD's 2015 UWMP demonstrates that IRWD's service area is anticipated to experience minimal growth from 2020 through 2035 relative to recent conditions. As shown in Table 5-1, IRWD's service area has an anticipated growth rate of approximately 8.8 percent through 2035 (IRWD 2016).

5.2.2 Water Supply and Demand

IRWD is a member agency of the Municipal Water District of Orange County (MWDOC), which is a wholesale importer of water from the Metropolitan Water District of Southern California (MWD). MWD manages and coordinates the delivery of imported surface water supplies from the Colorado River and from Northern California through the State Water Project with six southern California counties including Orange County. MWDOC, as a water wholesale agency, does not provide water directly to customers but rather purchases it from MWD and sells it to its approximately 30 member agencies, comprising cities and water districts throughout the county. These member agencies, including IRWD, are the local water retailers, selling water directly to their local customers. IRWD is the largest retail member agency of MWDOC in terms of service area and overall water use.

IRWD's water supplies include imported potable and non-potable water, groundwater, surface water, recycled water, and water exchanges. Approximately 50 percent of IRWD's overall supply comes from local groundwater wells in the Orange County Groundwater Basin, and the Irvine and Lake Forest sub-basins. IRWD also receives surface water from other local sources including the Santiago Creek watershed. Water recycling is an essential component of IRWD's water supply portfolio, as any demand met with recycled water reduces the demand for high-quality drinking water. Today, recycled water meets approximately 26 percent of IRWD's service area water demands, and is applied towards uses including landscape irrigation, agricultural irrigation, toilet flushing, cooling towers, industrial processes, composting, grading and compaction. Water demand projections for the service area are provided in **Table 5-2**.

As shown in Table 5-2, recycled water demand is projected to steadily increase from 2020 to 2035 by about 16 percent. Recycled water demand is expected to experience the greatest increase between the years 2020 and 2025 (11 percent) when the Syphon Reservoir would be constructed and become operable. Recycled water supply is expected to increase by about 8 percent from 2020 to 2025 and then remain constant through the year 2035.

**TABLE 5-2
IRWD CURRENT AND PROJECTED WATER SUPPLY AND DEMAND (AFY)**

Source	2020	2025	2030	2035
Water Demand				
Potable and Raw Water Demand	71,086	77,700	80,645	81,966
Recycled Water Demand	25,359	28,261	28,786	29,311
Water Supply				
Imported Water (Potable)	41,929	41,929	41,929	41,929
Imported Water (Non-Potable)	17,826	17,826	17,826	17,826
Surface Water	N/A	N/A	N/A	N/A
Groundwater	53,171	65,523	65,523	65,523
Groundwater (Non-Potable)	3,514	3,514	3,514	3,514
Recycled Water	28,757	28,757	28,757	28,757
Total Demand	96,445	105,961	109,431	111,277
Total Supply	145,197	157,549	157,549	157,549

5.3 Growth Inducement Potential

Implementation of the proposed project would not have a direct growth inducement effect, as it does not propose development of new housing that would attract additional population to the area. Further, implementation of the proposed project would not result in substantial permanent employment that could indirectly induce population growth. Although construction activities would create some short-term construction employment opportunities over the approximately 36-month duration of construction, the amount of opportunities created would not require persons outside of the Orange County work force. Further, no new permanent employees would be required to operate the proposed dam and reservoir.

The objectives of the proposed project are to maximize the use of recycled water produced by IRWD for the benefit of IRWD customers, reduce diversions of sewage to OCSD and recycled water to the ocean, improve local water supply reliability by reducing the need to purchase imported water from MWD by storing and using additional recycled water when needed during high demand periods, all while ensuring the new Syphon Reservoir would continue to meet or exceed the current safety and design requirements established by DSOD. Currently, excess recycled water that otherwise could be stored and used within IRWD's service area is diverted to the ocean or diverted to the Green Acres Project of OCWD. IRWD can also divert sewage to OCSD during periods of low recycled water demand and low storage levels for recycled water. During the dry summer season, service area demand for recycled water depletes existing reservoir storage and exceeds the rate at which new recycled water is produced by the Michelson Water Recycling Plant (WRP) and the Los Alisos WRP, so IRWD must then purchase costly, supplemental imported water from MWD to meet the seasonal demands of IRWD's recycled water customers. The proposed project would not increase IRWD's production of its recycled

water supply, but instead would create additional storage in order to use the majority of the recycled water supply already being produced. As a result, implementation of the proposed project would not create a new or expanded recycled water supply that could create an indirect growth inducement potential. Although the proposed project includes implementation of expanded recycled water storage, the recycled water to be stored is the existing recycled water being produced at the Michelson WRP, and therefore does not represent a new supply. Rather, the proposed project would allow IRWD to maximize the use of its recycled water and improve the efficiency of its recycled water system, making it consistent with California's Water Code Section 13512. The proposed project would eliminate the need for IRWD to purchase costly, supplemental imported water to meet the demands of IRWD's recycled water customers. The proposed project would not affect IRWD's potable water supply sources, and as such would not provide potable water supplies to support growth, either directly or indirectly. As demonstrated in Table 5-2 above, IRWD has sufficient water supply sources to meet current and planned future potable demands. With implementation of the proposed project, the increased use of recycled water would allow IRWD to support the region's existing and planned demand for recycled water as well, and withstand future water shortages by relying more on locally-produced water supply and less on imported water supply.

The local jurisdictions that govern land use and development within the proposed project area include the City of Irvine and the County of Orange. These jurisdictions' adopted General Plan documents guide the type, location, and level of land use and development within each respective jurisdiction. Both of these jurisdictions have assessed the growth-related impacts associated with planned land use and growth allowed under their General Plans and the CEQA EIRs they have prepared for those plans. In addition, SCAG prepared the Regional Comprehensive Plan (RCP) (SCAG 2008), which combines regional planning efforts into a single focused document. The RCP addresses growth management as well as several core elements including housing, transportation, air quality, and water. The principal objectives of the RCP are to coordinate regional and local decisions with respect to future growth and development and to minimize future environmental impacts. SCAG has also prepared the 2016-2040 RTP/SCS as mentioned above (SCAG 2016b). The RTP/SCS acts as a long-term planning and management plan for the regional transportation system, providing mitigation measures to off-set the impacts of growth projected in the RCP. The Final RTP/SCS Program EIR identifies significant unavoidable impacts in a number of issue areas, and concludes that when population and employment growth is held constant, many adverse environmental impacts will be significant and unavoidable regardless of whether the RTP/SCS is approved (SCAG 2015).

The proposed project would expand recycled water infrastructure to store and use recycled water that is already produced by IRWD. The proposed project would support planned population growth within IRWD's service area by providing recycled water to meet the current and planned demand for irrigation of public landscaping such as street medians, parks and golf courses, agricultural irrigation, office building uses such as toilet flushing and cooling towers. The proposed project would not create a new recycled water supply that would induce future growth. Rather, the proposed project would accommodate the population growth already planned by SCAG, the City of Irvine and the County of Orange such that water infrastructure reliability would not be an impediment to already-planned growth. As a result, the proposed project neither

supports nor encourages growth within the IRWD service area to a greater degree than presently estimated by the City of Irvine, County of Orange, and SCAG, as the land use agencies with jurisdiction over the proposed project area. The proposed project would not remove any obstacles to growth and would not indirectly have a significant impact on growth inducement. As a result, impacts to growth inducement would be less than significant.

CHAPTER 6

Alternatives Analysis

6.1 Overview of Alternatives Analysis

According to CEQA, an EIR must describe a reasonable range of alternatives to a proposed project that would feasibly attain most of the basic project objectives and would avoid or substantially lessen any of the proposed project's significant environmental effects. Section 15126.6(f) of the CEQA Guidelines provides direction on the required alternatives analysis:

The range of alternatives required in an EIR is governed by a “rule of reason” that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project. The range of feasible alternatives shall be selected and discussed in a manner to foster meaningful public participation and informed decision making.

The alternatives considered may include a different type of project, modification of the project, or suitable alternative project sites. An EIR need not consider every conceivable alternative to a project. Rather, the alternatives must be limited to ones that meet the project objectives, are feasible, and would avoid or substantially lessen at least one of the significant environmental effects of the project. “Feasible” means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors (CEQA California Public Resources Code Section 21061.1). Section 15126.6(b) of the CEQA Guidelines states an EIR:

...must identify ways to mitigate or avoid the significant effects that a project may have on the environment, the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

Section 15126.6(d) of the CEQA Guidelines provides further guidance on the extent of the alternatives analysis required:

The EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. A matrix displaying the major characteristics and significant environmental effects of each alternative may be used to summarize the comparison. If an alternative

would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative shall be discussed, but in less detail than the significant effects of the project as proposed.

The EIR must briefly describe the rationale for selection and rejection of alternatives and the information the lead agency relied on when making the selection. It also should identify any alternatives considered but rejected as infeasible by the lead agency during the scoping process and briefly explain the reasons for the exclusion (CEQA Guidelines Section 15126.6(c)). Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid any significant environmental effects.

Section 15126.6(e)(1) of the CEQA Guidelines also requires that the No Project Alternative must be addressed in this analysis. The purpose of evaluating the No Project Alternative is to allow decision-makers to compare the potential consequences of the proposed project with the consequences that would occur without implementation of the proposed project.

Finally, an EIR must identify the environmentally superior alternative. The No Project Alternative may be the environmentally superior alternative to the proposed project based on the minimization or avoidance of physical environmental impacts. CEQA Guidelines (Section 15126.6(e)(2)) requires that, if the environmentally superior alternative is the No Project Alternative, the EIR shall identify an environmentally superior alternative among the other alternatives.

6.1.1 Project Objectives

The primary objective of the proposed project is to allow for an increase in IRWD's seasonal recycled water storage capacity. In implementing the proposed project, IRWD would:

- Improve local water supply reliability by reducing the need to purchase costly imported water from Metropolitan Water District of Southern California (MWD) by storing additional recycled water during low demand periods for use when needed during high demand periods;
- Ensure the new engineered dam and reservoir meet or exceed the current safety and design requirements established by the California Department of Water Resources (DWR), Division of Safety of Dams (DSOD), which is the governing state agency associated with this project;
- Reduce diversions of sewage to OCSD;
- Maximize the use of recycled water produced by IRWD for the benefit of IRWD customers; and
- Reduce recycled water discharges to the ocean.

6.1.2 Potentially Significant Impacts of the Proposed Project

Chapter 3 of this Draft EIR identifies potential impacts associated with the proposed project for each environmental issue area in Appendix G of the CEQA Guidelines, including cumulative impacts. Chapter 4 addresses CEQA-Plus requirements that are required due to a federal funding nexus. Chapter 5 addresses impacts anticipated related to growth-inducement. Mitigation measures were identified to reduce all of the potentially significant impacts to a less than significant level. No

significant and unavoidable impacts were identified as a result of construction and operation of the proposed project. A summary of the significance determination for the impacts for each environmental resource analyzed in Chapter 3 is presented in **Table 6-1**. Specific impacts and all mitigation measures are provided in Table ES-1 in the Executive Summary of this Draft EIR.

**TABLE 6-1
SUMMARY OF PROPOSED PROJECT IMPACT ANALYSIS**

Environmental Resource	Proposed Project Significance Determination
Aesthetics	LTSM
Air Quality	LTSM

Greenhouse Gas Emissions	LTS
Hazards and Hazardous Materials	LTSM
Hydrology and Water Quality	LTS
Noise and Vibration	LTS
Recreation	LTSM
Transportation	LTSM
Tribal Cultural Resources	LTSM
Wildfire	LTSM

NOTES:
LTS = Less than Significant
LTSM = Less than Significant with Mitigation

6.2 Alternatives to the Proposed Project

6.2.1 Alternatives Considered but Rejected

As stated above, CEQA Guidelines Section 15126.6(c) states that an EIR should identify any alternatives considered but rejected as infeasible by the lead agency during the scoping process and briefly explain the reasons for the exclusion. Alternatives may be eliminated from detailed consideration in the EIR if they fail to meet most of the project objectives, are infeasible, or do not avoid any significant environmental effects.

IRWD has evaluated a reasonable range of alternatives to the proposed project that would feasibly attain most of the basic project objectives and would avoid or substantially lessen any of the proposed project's significant environmental effects. These alternatives include looking at alternative locations to the proposed project, use of aboveground storage tanks, a new ocean outfall, and expansion of the Orange County Water District Green Acres Project.

6.2.1.1 Alternative Locations

CEQA Guidelines Section 15126.6(f)(2) provides guidance regarding consideration of one or more alternative location(s) for a proposed project, stating that putting the project in another location should be considered if doing so would allow significant effects of the project to be

avoided or substantially lessened. Only locations that would avoid or substantially lessen any of the significant effects of the proposed project need to be considered for inclusion in the EIR. If no feasible alternative locations exist, the EIR must disclose the reasons for this conclusion. Among the factors that may be considered when addressing the feasibility of an alternative site is suitability, economic viability, availability of infrastructure, general plan consistency, and whether the proponent can reasonably acquire, control, or otherwise have access to the alternative site.

Reservoir Expansion

IRWD currently operates four recycled water storage reservoirs within its service area, including Syphon Reservoir: Sand Canyon, Rattlesnake, and San Joaquin. Peter's Canyon Reservoir, located in North Tustin, is owned by the County of Orange and managed by OC Parks. Over the last 25 years, IRWD has conducted multiple studies to investigate the potential for expanding its recycled water reservoirs to augment recycled water storage capacity. The results of these investigations are summarized below (see also Sections 6.2.3.1 and 6.2.3.2 for discussion of Sand Canyon Reservoir and Rattlesnake Reservoir expansions).

- **Peter's Canyon Reservoir:** Peter's Canyon Reservoir, owned by the County of Orange, currently has a recycled water storage capacity of approximately 400 AF (HDR 2020). In 2008, IRWD procured the services of MWH to investigate the feasibility of storage at Peters Canyon Reservoir as part of the Peters Canyon and Syphon Reservoir Integration Study. The study concluded that the storage at Peters Canyon was limited and did not meet IRWD's recycled water storage goals established at the time. In 2020, IRWD procured the services of HDR to again evaluate the possible expansion of Peters Canyon based on current recycled water storage goals. Given the site constraints, the maximum water surface could be increased from elevation 530 to elevation 543, adding an additional 225 AF, providing a total of 625 AF at the reservoir (HDR 2020). Site constraints of expanding Peter's Canyon Reservoir include maintaining the existing flood pool footprint in the Peter's Canyon Regional Park boundaries and other environmental factors (HDR 2020). Minor modifications to the existing trail system would be required along with raising the spillway of the existing reservoir. Expansion of the water surface elevation beyond 225 AF would require new levees to avoid inundation of homes and protection of other infrastructure in the park boundaries, including the MWD Pump Station. Given the expansion of Peter's Canyon Reservoir would result in a smaller incremental increase in storage when compared to the proposed expansion at Syphon Reservoir, this site is not considered to be a feasible project alternative and is rejected from further consideration in this Draft EIR.
- **San Joaquin Reservoir:** San Joaquin Reservoir is located in Newport Beach and initially stored drinking water until its conversion by IRWD in 2004 to store recycled water (IRWD 2020a). The reservoir currently has a recycled water storage capacity of approximately 3,080 AF. In 1995, a landslide at the San Joaquin Reservoir damaged components of the reservoir such as liners, access roads, and concrete barriers, which deposited large amounts of dirt and mud into the reservoir (MetroPoint Engineers 2001). Slope stability and landslide concerns are environmental factors that limit the expansion of San Joaquin Reservoir. Additionally, the reservoir site is land-locked by development on all sides, and therefore it would not be feasible to expand the reservoir to achieve the storage goals of the proposed project. Given the site constraints that limit physical expansion of the reservoir above existing storage capacity, this site is not considered to be a feasible project alternative and is rejected from further consideration in this Draft EIR.

Round Canyon Reservoir

IRWD considered installation of a new 6,000 AF reservoir at Round Canyon as one of several options for increased storage capacity in 1996 (Woodward-Clyde 1996). The reservoir site is located just southeast of the Frank Bowerman Landfill and north of the Foothill Transportation Corridor 241. At the time a reservoir was considered by IRWD at this location, the Foothill Transportation Corridor 241 had not yet been constructed. Site constraints at Round Canyon include unfavorable bedding dips and slope instability, with landslides identified in the upper reaches of the reservoir site (Woodward-Clyde 1996). These geologic conditions are less favorable when compared to the proposed Syphon Reservoir expansion site. In terms of environmental impacts, the new dam face at Round Canyon could be as close as 1,000 feet from the Foothill Transportation Corridor 241, which, at a height of approximately 180 feet, would result in increased aesthetic impacts to a greater number of vehicles traveling on public rights-of-way than the proposed project. Additionally, initial research conducted for the Round Canyon Reservoir site yielded at least one archaeological site, Tomato Springs, located at the mouth of Round Canyon that appears to have been the center of a group of permanent and seasonal villages which were inhabited for a period of several thousand years (Woodward-Clyde 1996). This settlement site would likely have to be destroyed during construction of the dam and spillway. While cultural resources have been identified at the proposed project site, significant known archaeological sites would not be destroyed by construction or operation of the proposed reservoir expansion at Syphon Reservoir. Due to the site constraints and known greater environmental impacts due to construction and operation of a new reservoir at Round Canyon versus an expansion of the existing reservoir at Syphon Reservoir, this alternative is not considered to be a feasible project alternative and is rejected from further consideration.

6.2.1.2 Aboveground Storage Tanks

In addition to reservoir storage, aboveground storage tanks can be used to store recycled water for future use. Given the scale of the storage expansion of the proposed project (4,500 AF), approximately 1.47 billion gallons of aboveground storage would need to be secured in order to replace the increase of recycled water stored in a reservoir. An average storage tank holds 8 million-gallons and is approximately 135 feet in diameter. If the reservoir storage were to be converted to aboveground storage tanks, approximately 175 8-million-gallon storage tanks would need to be constructed within IRWD's service area. This scale of facility construction and operation would be infeasible for IRWD to implement given open space constraints in the service area and pressure zone limitations. Additionally, constructing 175 storage tanks would not be economically infeasible for IRWD. As a result, replacement of reservoir storage with aboveground storage tanks is not considered to be a feasible project alternative and is rejected from further consideration in this Draft EIR.

6.2.1.3 New Ocean Outfall

A few small areas in IRWD's service area are not served by either the Michelson WRP or the Los Alisos WRP sewage collection and treatment systems. A small percentage of sewage generated within IRWD's service area is currently collected by neighboring OCSD or Santa Margarita Water District where these agencies' facilities treat the sewage for subsequent reuse. On a volume basis, IRWD currently sends approximately 7,300 AFY out of a total of 33,900 AFY of

wastewater to OCSD, which in turn provides wastewater to Orange County Water District (OCWD) where it is treated and injected into the aquifer as part of the Groundwater Replenishment System (GWRS). In order to meet the objective to reduce diversions of sewage to OCSD, IRWD could construct a new ocean outfall and pipeline. However, an ocean outfall would be prohibitively difficult to construct due to the complexity of acquiring easements and laying pipeline through developed portions of the City of Newport Beach. A new ocean outfall would also result in a suite of impacts to the terrestrial and marine environment that would exceed in magnitude those of the proposed project. In addition, an ocean outfall would not allow for any of the water storage benefits afforded by expanding and improving Syphon Reservoir. The New Ocean Outfall Alternative would not meet the project objectives and would result in more environmental impacts than the proposed project. Therefore, this alternative is rejected from further consideration in this Draft EIR.

6.2.1.4 Expansion of Green Acres Project

In response to comments received during the NOP public review period, IRWD evaluated expanding the OCWD Green Acres Project (GAP) as a means of managing IRWD's recycled water produced at the MWRP. The OCWD GAP is a non-potable water supply project that delivers recycled water to irrigation and industrial users. The GAP facilities include 37 miles of pipeline, two reservoirs with a combined storage capacity of 7.5 million gallons, and two pump stations (OCWD 2021). IRWD is connected to the GAP distribution system through a 24-inch metered interconnection pipe. The potential expansion project would include replacement and expansion of existing facilities to allow up to 28 mgd of recycled water from IRWD's non-potable system to GAP. Neither OCSD or OCWD has indicated the need for additional recycled water for GAP or GWRS purposes. Without such a need, it would not be feasible for OCSD and OCWD to accept 28 mgd from IRWD.

An evaluation of alternative project scenarios and associated life cycle costs was performed by HDR (HDR 2020). This evaluation confirmed the need to increase IRWD's seasonal storage as the primary method for managing IRWD's recycled water. The GAP expansion alternative would not feasibly attain most of the primary objectives for the proposed project. The GAP expansion alternative:

- Would not improve local water supply reliability by reducing the need to purchase costly imported water from MWD by storing and using additional recycled water;
- Would not maximize the use of recycled water produced by IRWD for the benefit of IRWD customers; and
- Would not reduce recycled water discharges to the ocean.

Therefore, this alternative is rejected from further consideration in this Draft EIR. A copy of HDR's evaluation is available from IRWD's District Secretary.

6.2.2 No Project Alternative

According to Section 15126.6(e) of the CEQA Guidelines, discussion of the No Project Alternative must include a description of existing conditions and reasonably-foreseeable-future

conditions that would exist if the Project were not approved. Under the No Project Alternative, IRWD would not demolish the existing Syphon Dam and Syphon Reservoir and would not build a new dam and reservoir with a capacity of approximately 5,000 AF and associated infrastructure. The existing 500 AF reservoir would continue to be operated by IRWD, with excess sewage continuing to be sent to OCSD for disposal. The benefits of the proposed project, which include maximizing the use of recycled water produced by IRWD for the benefit of IRWD customers, would not occur.

Ability to Meet Project Objectives

The No Project Alternative would not meet most of the project objectives. Without the proposed project, local water supply reliability would not be improved, diversions of sewage to OCSD would not be reduced, water diversions to the ocean would not decrease, and recycled water produced by IRWD for the benefit of IRWD customers would not be maximized. It is important to note that even without implementation of the proposed project, DWR DSOD safety standards would still be met for the existing dam and reservoir.

By not constructing the project, IRWD does not gain the benefit of additional seasonal storage of recycled water which optimizes IRWD's recycled water use for its recycled water customers. Without additional storage capacity provided by the proposed project, as future recycled water demands increase due to planned growth, there will be an increased shortage of available recycled water during peak water demands. Under the No Project Alternative, IRWD would need to purchase additional costly, imported supplies to ensure that an amount equivalent to the yield of the proposed increase in the Syphon Reservoir's storage capacity is seasonally available to meet IRWD's projected demands during peak periods. Imported water from MWD is subject to availability and may be reduced under a MWD-implemented Water Supply Allocation Plan during water supply shortages. In addition, without sufficient storage capacity in the winter months when IRWD has excess sewage, IRWD would need to divert excess sewage each year to OCSD for discharge. Under the No Project Alternative, IRWD does not optimize the beneficial reuse of its recycled water and does not provide long term water supply benefits for IRWD.

Impact Analysis

Aesthetics

The construction and operation of a dam and reservoir capable of holding approximately 5,000 AF would not occur under the No Project Alternative. The No Project Alternative would have no potential to impact scenic vistas, scenic resources, visual character, or light and glare in the proposed project area since no new facilities would be built. The proposed project would have a less than significant impact to scenic vistas and visual character after implementation of mitigation measures due to implementation of the enlarged dam and reservoir, and supporting infrastructure. Since the No Project Alternative would not alter any above-ground facilities at the project site, it would result in fewer aesthetic impacts when compared to the proposed project.

Air Quality

The No Project Alternative would not involve any construction activities or operation of an expanded reservoir and would therefore not generate emissions above baseline conditions that could impact air quality. While the proposed project would result in potentially significant construction-related air quality impacts due to emissions of NO_x and diesel particulate matter, mitigation measures would reduce the impacts to less than significant levels. As such, the No Project Alternative would result in fewer air quality impacts when compared to the proposed project.

Biological Resources

The No Project Alternative would not involve any construction activities or operation of an expanded recycled water reservoir and would therefore not alter the existing site conditions at the Syphon Reservoir. The proposed project has the potential to impact sensitive natural communities such as coastal sage scrub, wetland, and riparian habitat and associated special-status species, which would be reduced to less than significance levels with implementation of mitigation measures. However, the No Project Alternative would completely avoid potential impacts to sensitive natural communities and special-status species. Therefore, the No Project Alternative would result in fewer potential biological resource impacts than the proposed project.

Cultural Resources

The No Project Alternative would not involve any construction activities or operation of an expanded recycled water reservoir and therefore would not result in ground disturbance that would disrupt or affect archaeological resources, historic resources, or human remains. Although the proposed project would not directly impact any known cultural resources, construction activities would involve substantial grading and excavation that could significantly impact unknown discovered cultural resources. With implementation of mitigation measures, the proposed project would result in less than significant impacts to unknown resources. Nevertheless, the No Project Alternative would result in no ground disturbance and therefore no potential to uncover any cultural resources. As a result, the No Project Alternative would result in fewer impacts to cultural resources than the proposed project.

Energy

The No Project Alternative would not involve any construction activities or operation of an expanded recycled water reservoir, and would therefore not result in an increase in energy consumption relative to existing conditions. The proposed project would result in an increased usage of electricity to operate existing pumps, but not at significant levels that would result in wasteful use of energy. The proposed project would reduce the total energy consumption associated with IRWD's provision of water supply since more energy is required to import water through the SWP and the Colorado River than to provide locally-produced recycled water. Therefore, the No Project Alternative would result in no change to energy consumption when compared to the proposed project, but also would not result in the beneficial reduction in energy consumption associated with the proposed project.

Geology and Soils

The No Project Alternative would involve continued operation of the existing reservoir at the project site. The No Project Alternative would not involve any construction activities or operation of an expanded recycled water reservoir. As a result, geologic impacts related to groundshaking and soil erosion would not occur. While the geologic effects of the proposed project were determined to be potentially significant, the impacts due to ground shaking, soil erosion, unstable geologic units, and expansive soil would be reduced to a less than significant level by incorporating into the project design the geotechnical recommendations for soils remediation and/or foundation systems necessary to reduce seismic-related hazards to less than significant levels, and compliance with DSOD regulations. For paleontological resources, construction of the proposed project could encounter unknown paleontological resources; however, mitigation measures would reduce the impact to less than significant levels. As a result, since the No Project Alternative would not result in any ground disturbing activities or potential to uncover paleontological resources, the alternative would result in fewer geological, soil, and paleontological impacts when compared to the proposed project.

Greenhouse Gas Emissions

The No Project Alternative would not involve any construction activities or operation of an expanded recycled water reservoir and therefore would not result in an increase in greenhouse gas emissions relative to existing conditions because no infrastructure would be constructed. The proposed project would result in greenhouse gas emissions during construction but not at significant levels. As such, the No Project Alternative would result in fewer greenhouse gas emissions impacts when compared to the proposed project.

Hazards and Hazardous Materials

The No Project Alternative would result in the continued operation of the existing reservoir at the project site, which would involve transport and use of water treatment chemicals (sodium bisulfite and sodium hypochlorite). No new facilities would be constructed or operated under the No Project Alternative. While the proposed project would involve routine transport and use of potentially hazardous materials including increased amounts of sodium bisulfite and sodium hypochlorite, compliance with existing State regulations would reduce all impacts to less than significant levels. While the proposed project would be located within a very high fire severity zone, mitigation measures would implement fire hazard reduction measures that would reduce impacts to a less than significant level. The No Project Alternative would involve no additional transport of potentially hazardous fuels and lubricants or use of hazardous materials above what is currently used onsite for water treatment, nor create new structures at risk of wildland fire. As a result, the No Project Alternative would result in fewer impacts to hazards and hazardous materials when compared to the proposed project.

Hydrology and Water Quality

The No Project Alternative would not result in construction or operation of any new facilities at the project site, and therefore would not result in ground disturbance that could impact surface water, associated drainage patterns, or modifications to downstream inundation risk. Under the proposed project, construction of new facilities would involve ground-disturbing activities that

could impact surface water quality due to polluted runoff from the soil stockpiling and construction sites. Such potential impacts would be mitigated with implementation of required regulatory requirements such as SWPPPs and BMPs. The proposed project also involves an increase in the capacity of the reservoir which increases the potential downstream inundation area in the event of a dam breach or emergency release. IRWD would be required to adhere to all DSOD requirements, which includes construction of a spillway to provide direction for emergency release flows. Additionally, the project's structure, seepage control components, and spillway would be designed and evaluated for structural integrity by geotechnical engineers to reduce likelihood of dam breach. The No Project Alternative would not involve any ground-disturbing activities and would not have the potential for impacts to water quality during construction. The No Project Alternative would also not result in any changes to the existing storage capacity of the reservoir; therefore, risk to downstream communities due to inundation would be reduced when compared to the proposed project. As a result, the No Project Alternative would result in fewer impacts to hydrology and water quality when compared to the proposed project.

Noise and Vibration

The No Project Alternative would not involve any construction activities or operation of an expanded recycled water reservoir, and therefore would not involve activities that would generate noise above baselines conditions. The proposed project would result in less than significant temporary impacts to sensitive receptors and ambient noise levels during construction; no mitigation measures would be required. Therefore, since the No Project Alternative would not alter the existing noise environment, there would be lesser impacts associated with noise when compared to the proposed project.

Recreation

The No Project Alternative would not include a new recreation trail at the project site. The proposed project would result in increased access to the project site due to a new walking trail, although IRWD would control access to the trail. The proposed project would have indirect impacts to biological and cultural resources due to the construction and public use of the proposed recreation trail; but, these potential impacts would be mitigated to less than significant levels. Nevertheless, the No Project Alternative would not provide onsite access to recreational facilities that could result in deterioration of nearby recreational facilities or other related environmental impacts. As a result, the No Project Alternative would result in fewer recreation-related impacts when compared to the proposed project.

Transportation

The No Project Alternative would not result in construction activities or operation of any additional facilities onsite and would not include the intersection modification at Portola Parkway and Sand Canyon Avenue. The proposed project would result in temporary impacts to traffic and the circulation system due to increased vehicle trips during construction and would result in a modified intersection at Portola Parkway and Sand Canyon Avenue that could temporarily impact emergency access during construction. The proposed project impacts would be reduced to less than significant levels with implementation of a Traffic Control Plan. Nevertheless, since the No Project Alternative would not involve any changes to the existing activities at Syphon Reservoir

that could impact traffic and emergency access, the No Project Alternative would result in fewer impacts when compared to the proposed project.

Tribal Cultural Resources

Under the No Project Alternative, the existing Syphon Reservoir would continue to operate but no new ground disturbing activities would occur. Therefore, the No Project Alternative would not affect any known or unknown tribal cultural resources. According to record searches and tribal resource consultations, no tribal resources are present on the proposed project site. As such, the proposed project would not cause a substantial adverse change in the significance of a known tribal cultural resource. However, there always exists the potential that an unknown tribal cultural resource could be impacted by construction or operational activities. For the proposed project, this potential impact would be reduced to less than significant impacts with implementation of mitigation measures. Nonetheless, the No Project Alternative would result in fewer potential impacts to tribal cultural resources when compared to the proposed project.

Wildfire

The project site is located within a locally-designated very high fire severity zone. The No Project Alternative would involve operation of the existing reservoir at the project site, which involves drawdown of the reservoir in summer months when fire risk is elevated. However, the No Project Alternative would not alter the existing wildlife risk at the project site. The proposed project would require operation of construction equipment that has the potential produce a spark, fire or flame in an area that includes highly flammable vegetation and prevailing winds. As a result, construction of the proposed project has potential to increase the risk of wildfire; however, implementation of mitigation measures that include fire hazard reduction measures would ensure impacts associated with wildfire risk are reduced to less than significant levels. Nonetheless, the No Project Alternative would not exacerbate the risk of wildland fire. As a result, the No Project Alternative would result in fewer impacts associated with wildfire when compared to the proposed project.

6.2.3 Alternatives to the Proposed Project

6.2.3.1 Sand Canyon Reservoir Alternative

The Sand Canyon Reservoir Alternative would involve enlarging the existing reservoir at Sand Canyon in Irvine, CA (see **Figure 6-1**). IRWD previously identified the expansion of the existing Sand Canyon Reservoir as one option for obtaining additional recycled water storage capacity. The Sand Canyon Reservoir currently has a 768 AF storage capacity (IRWD 2020a) and an early feasibility study indicated that raising the dam 28 feet above its existing elevation would increase the reservoir storage capacity to approximately 3,000 AF. Site constraints include quality and quantity of the onsite borrow and embankment materials and costs associated with property acquisitions (Woodward-Clyde 1992). Expansion of Sand Canyon Reservoir would result in approximately 2,000 AF less recycled water storage when compared to the proposed expansion at Syphon Reservoir. Existing pipelines and pump stations would be sized appropriately for the expansion, and no additional pipelines or pump stations would be required (Woodward-Clyde 1992).

SOURCE: ESRI, 2016; OC LAFCO, 2018

Syphon Reservoir Improvement Project

Figure 6-1
Proposed Project Alternatives

Ability to Meet Project Objectives

The Sand Canyon Reservoir Alternative would partially meet all of the project objectives. With the storage capacity capped at 3,000 AF, the Sand Canyon Reservoir Alternative would improve local water supply reliability, but to a lesser extent relative to the Syphon Reservoir expansion. Additionally, while diversions of sewage to OCSD and water diversions to the ocean would be reduced, the reductions would not be to the fullest extent proposed under the project at Syphon Reservoir and reduced amounts of sewage and water would continue to be diverted. Under the Sand Canyon Reservoir Alternative, IRWD would need to purchase additional costly, imported supplies to offset approximately 2,000 AF of recycled water that could not be stored when compared to the proposed project to ensure that water is seasonally available to meet demands of IRWD's recycled water customers. Recycled water produced by IRWD for the benefit of IRWD customers would not be maximized under the Sand Canyon Reservoir Alternative. However, an expansion of the reservoir under the Sand Canyon Reservoir Alternative would meet all DWR DSOD safety standards.

Aesthetics

The Sand Canyon Reservoir Alternative would result in a similar expansion of an existing reservoir as the proposed project. Expansion of the reservoir under the Sand Canyon Reservoir Alternative would involve raising the dam crest height 28 feet above its existing elevation while the proposed project at Syphon Reservoir would involve a dam raise of 77 feet above the existing condition. The Sand Canyon Reservoir Alternative site is visible from the adjacent community of Turtle Rock and William R. Mason Regional Park, and raising the crest of the dam would increase its visibility to downstream Irvine communities (Dudek 2003). Similar kinds of construction equipment would be used for both reservoir expansions. The proposed project at Syphon Reservoir would be visible to downstream Irvine communities such as Stonegate, but would have a less than significant impact with implementation of mitigation measures to aesthetics and visual resources as a result of reservoir expansion. The Sand Canyon Reservoir Alternative would similarly increase the dam's visibility to the downstream Irvine communities. As a result, the Sand Canyon Reservoir Alternative would result in a similar aesthetic impact when compared to the proposed project.

Air Quality

The Sand Canyon Reservoir Alternative would result in air quality-related construction and operation impacts that are similar in nature to the proposed project. The most likely scenario for expanding the Sand Canyon Reservoir would involve an upstream raise of the existing dam along with excavation of the reservoir bottom (Woodward-Clyde 1992). This would involve large amounts of excavation and soil movement onsite. The Sand Canyon Reservoir Alternative site is located adjacent to residential sensitive receptors (as close as 80 feet) and has a high likelihood of resulting in cancer-causing construction health risk impacts due to the elevated levels of diesel particulate matter in close proximity to residences. The proposed project would result in potentially significant construction-related air quality impacts due to emissions of NO_x, however mitigation measures would reduce the impacts to less than significant levels. Given the distance between the proposed project and nearby sensitive receptors, the cancer risk for the maximum impacted sensitive receptor near Syphon Reservoir is 8.72 per million which would not exceed the SCAQMD's threshold of 10 per million. The Sand Canyon Reservoir Alternative would result

in similar potentially significant impacts due to an increase in NO_x emissions from construction activities that could be mitigated, but would likely result in increased cancer-causing construction health risk impacts due to closer proximity to sensitive receptors. As such, the Sand Canyon Reservoir Alternative would result in greater air quality impacts when compared to the proposed project.

Biological Resources

The area around the existing Sand Canyon Reservoir contains riparian woodland, freshwater marsh, disturbed grassland, coastal sage scrub, and chaparral (Woodward-Clyde 1992). The Sand Canyon Reservoir Alternative would result in impacts to riparian woodland and coastal sage scrub that support a variety of special-status species including least Bell's vireo. Additionally, "landmark" sycamore trees exist around the reservoir and a rare plant habitat area for the Orange County Turkish exists along the dam face and existing reservoir rim that would be impacted by a reservoir expansion (Woodward-Clyde 1992). The proposed project would permanently impact up to 29 acres of coastal sage scrub communities and temporarily impact 0.85 acre of California sagebrush scrub. While the proposed project would permanently impact 12.28 acres of riparian communities that supports the least Bell's vireo, implementation of mitigation measures would reduce impacts to a less than significant level. Based on a preliminary study of the Sand Canyon Reservoir Alternative expansion completed in 1992, it was determined that this site contains significant biological resources that would potentially be impacted by an expansion. It is assumed similar mitigation measures to those required for the proposed project would be implemented to reduce impacts to that species and others effected to a less than significant level. As a result, the Sand Canyon Reservoir Alternative would result in similar biological resources impacts when compared to the proposed project.

Cultural Resources

Based on archaeological surveys conducted for residential developments surrounding the Sand Canyon Reservoir site, up to 10 archaeological sites may exist downstream of the dam and to the south and east of the existing reservoir (Woodward-Clyde 1992). One of these sites has been identified as a settlement. As a result, the potential for impacting cultural resources is high. The proposed project site was found to include nine historical/archaeological resources, only two of which could be impacted by proposed project activities. The presence of both historic period and prehistoric archaeological sites within the vicinity of the project area indicates that the area is sensitive for archaeological resources. Mitigation measures would require procedures to avoid the two known resources, as well as procedures to reduce impacts to any unknown resources uncovered during construction, which would reduce impacts to a less than significant level. Based on the fact that known cultural resources exist on the site of the Sand Canyon Reservoir Alternative and the archaeological sensitivity is high, similar mitigation measures as those described in Section 3.4, *Cultural Resources* for the proposed project, would be required to reduce impacts to known and unknown cultural resources. Therefore, the Sand Canyon Reservoir Alternative would result in similar impacts to cultural resources when compared to the proposed project.

Energy

The Sand Canyon Reservoir Alternative would require increased amounts of energy to pump the additional 2,200 AF water to the reservoir for storage. As described in Section 3.5, *Energy*, the proposed project would require an additional 1,082,727 kWh of electricity annually to pump an additional 4,500 AF recycled water to Syphon Reservoir. The total net new operating electricity consumption for the expanded Syphon Reservoir represents approximately 0.006 percent of the county and 0.002 percent of SCE consumption for 2018. As a result, impacts would be less than significant and no mitigation measures would be required for the proposed project. Given the smaller increase in capacity relative to the proposed project, the Sand Canyon Reservoir Alternative would be expected to result in fewer net additional kWh of electricity to operate the expanded reservoir, and would also result in less than significant impacts to the existing electrical grid. As a result, the Sand Canyon Reservoir Alternative would result in similar impacts to energy when compared to the proposed project.

Geology and Soils

The Sand Canyon Reservoir site is underlain primarily by beds of the Santiago Formation, which are constituted by silty and clayey sandstones (Woodward-Clyde 1992). These formations are considered moderately stable with low to moderate permeability (Woodward-Clyde 1992). A fault is located within the existing spillway of the Sand Canyon Reservoir, which has not been determined to be an active/inactive fault (Woodward-Clyde 1992). The Sand Canyon Reservoir site has high paleontological potential based on the identification of 17 paleontological sites east of the reservoir (Woodward-Clyde 1992). The proposed project is located in the Vaqueros and Sespe Formations, which are rated as generally having very poor slope stability characteristics and are described as landslide/erosion-prone and low permeability. As described in Section 3.6, *Geology and Soils*, an inactive fault runs through the Syphon Reservoir site. Paleontological sensitivity is moderate to high at the proposed project site. While the geologic effects of the proposed project were determined to be potentially significant, the impacts due to ground shaking, soil erosion, unstable geologic units, and expansive soil would be reduced to a less than significant level by incorporating into the project design the geotechnical recommendations for soils remediation and/or foundation systems necessary to reduce seismic-related hazards to less than significant levels, and compliance with DSOD regulations. Additionally, mitigation measures would be required to reduce impacts to any fossils that may be uncovered by construction of the project. Similarly, any expansion of Sand Canyon Reservoir would require adherence to DSOD regulatory requirements, as well as mitigation measures to reduce impacts to paleontological resources due to the high paleontological potential. As a result, the Sand Canyon Reservoir Alternative would result in similar impacts to geology and soils when compared to the proposed project.

Greenhouse Gas Emissions

The Sand Canyon Reservoir Alternative would involve an increase in greenhouse gas emissions from existing conditions to operate the pumps that would convey approximately 2,200 AF additional recycled water to the reservoir. As described in Section 3.7, *Greenhouse Gas Emissions*, construction and operation of the proposed project's increase in storage of 4,500 AF would result in emissions approximately 433 MTCO₂e per year (amortized over 30 years), which

would not exceed the SCAQMD 3,000 MTCO_{2e} threshold. No mitigation measures would be required. Since the amount of water pumped to the Sand Canyon Reservoir would be less than the proposed project, it would be anticipated to similarly result in emissions less than the 3,000 MTCO_{2e} threshold, and impacts would constitute a less than significant without the need for mitigation measures. As such, the Sand Canyon Reservoir Alternative would result in similar greenhouse gas emissions impacts when compared to the proposed project.

Hazards and Hazardous Materials

The Sand Canyon Reservoir Alternative would result in the similar routine transport of hazardous materials as the proposed project, including construction-related fuels and operational-related chemicals for recycled water treatment. Both the alternative and the proposed project would comply with existing State regulations that would reduce all impacts to a level of less than significant. Both the proposed project and the Sand Canyon Reservoir Alternative would be located within a very high fire severity zone. Mitigation measures would require implementation of fire hazard reduction measures that would reduce impacts to a less than significant level. As a result, the Sand Canyon Reservoir Alternative would result in similar impacts to hazards and hazardous materials when compared to the proposed project.

Hydrology and Water Quality

The Sand Canyon Reservoir Alternative would result in similar construction ground-disturbing activities as the proposed project that could impact surface water quality due to polluted runoff from the construction sites. Additionally, the Sand Canyon Reservoir Alternative would be similar to the proposed project in that it would result in substantial soil movement to construct the expanded reservoir, which would result in alteration of drainage patterns. The Sand Canyon Reservoir Alternative would involve an increase in the capacity of the reservoir which increases the potential downstream inundation area in the event of a dam breach or emergency release which is similar to the proposed project. For both the proposed project and the alternative, IRWD would be required to adhere to all DSOD requirements, which includes construction of a spillway to provide direction for emergency release flows. Additionally, for both the proposed project and the alternative, the dam's structure, seepage control components, and spillway would be designed and evaluated for structural integrity by geotechnical engineers to reduce likelihood of dam breach. For the proposed project and the Sand Canyon Reservoir Alternative, surface water quality and drainage impacts would be mitigated with implementation of required regulatory requirements such as SWPPPs and BMPs. The Sand Canyon Reservoir Alternative would result in an increase in the risk to downstream communities due to inundation, which would be mitigated through project design and DSOD requirement, similar to the proposed project. As a result, the Sand Canyon Reservoir Alternative would result in similar impacts to hydrology and water quality when compared to the proposed project.

It should be noted that the Sand Canyon Reservoir Alternative site is located in a large drainage area, which, once operational, could result in large amounts of stormwater entering the expanded upper reservoir. The Sand Canyon Reservoir Alternative would require additional freeboard in the expanded reservoir to accommodate increased amounts of stormwater, which may impact operational storage capacity.

Noise and Vibration

The Sand Canyon Reservoir Alternative would result in construction-related noise levels and operation impacts that are similar in nature to the proposed project. The greatest impacts to ambient noise levels would be during construction, to sensitive receptors surrounding the Sand Canyon Reservoir. The sensitive receptors surrounding the Sand Canyon Reservoir are closer in proximity when compared to the sensitive receptors surrounding the Syphon Reservoir, especially given the position of the receptors above the reservoir at Sand Canyon Reservoir (versus below and with intervening topography at Syphon Reservoir). The proposed project would result in less than significant impacts to temporary and permanent increases in ambient noise and vibration levels, and would not require mitigation measures. Given that the Sand Canyon Reservoir Alternative would be located as close as 80 feet from adjacent sensitive receptors, it is likely that the increase in noise and vibration levels would be potentially significant and require mitigation measures. As a result, the Sand Canyon Reservoir Alternative would result in greater noise and vibration impacts when compared to the proposed project.

Recreation

The canyon bottom of the Sand Canyon Reservoir Alternative site has been designated for recreational open space and wildlife habitat by the City of Irvine, which has also established open space linear corridors to connect the flat areas of the city with the surrounding hills (Woodward-Clyde 1992). Currently, the Strawberry Farms Golf Course operates surrounding and downstream of the reservoir and could be impacted by expansion of the reservoir. The proposed project would result in increased access to the project site due to a new walking trail, although IRWD would control access to the trail. The proposed project would have indirect impacts to biological and cultural resources due to the construction and public use of the proposed recreation trail; but, these potential impacts would be mitigated to less than significant levels. An expansion of the Sand Canyon Reservoir Alternative may eliminate portions of the adjacent recreational facilities, requiring a relocation of recreational facilities which could have an adverse physical effect on the environment. Because the proposed project would not result in increased environmental effects due to expansion of recreational facilities, the Sand Canyon Reservoir Alternative would result in greater impacts to recreational facilities.

Transportation

The Sand Canyon Reservoir Alternative would result in the same kind of construction activities that could potentially result in temporary impacts to traffic and circulation patterns on local roadways when compared to the proposed project. Similar to the proposed project, impacts associated with the Sand Canyon Reservoir Alternative would be temporary and would be reduced to less than significant levels with implementation of mitigation measures such as a Traffic Control Plan. As a result, the Sand Canyon Reservoir Alternative would result in similar transportation impacts when compared to the proposed project.

Tribal Cultural Resources

Based on the archaeological sensitivity around the Sand Canyon Reservoir Alternative site and particularly the identification of an archaeological settlement, there is a potential that tribal cultural resources could be impacted by reservoir expansion. According to record searches and

tribal resource consultations, no tribal resources are present on the proposed project site and expansion at Syphon Reservoir would not impact known tribal cultural resource. Although unknown tribal cultural resource could be impacted by construction or operational activities, mitigation measures would reduce the impact to less than significant levels. Based on the fact that archaeological sensitivity is high, and that similar mitigation measures would be required to reduce impacts to known and unknown tribal cultural resources, the Sand Canyon Reservoir Alternative would result in similar impacts to tribal cultural resources when compared to the proposed project.

Wildfire

Similar to the proposed project, the Sand Canyon Reservoir Alternative site would be located within a very high fire severity zone, and construction and operation of an expanded reservoir has the potential to result in uncontrolled spread of wildfire and exacerbation of fire risk. Mitigation measures would be required to ensure fire hazard reduction measures are implemented during proposed project activities to further reduce the potential for wildfire impacts on project workers. Similar mitigation measures would be required for any expansion of the Sand Canyon Reservoir Alternative within the same fire hazard zone. As a result, the Sand Canyon Reservoir Alternative would result in similar wildfire impacts when compared to the proposed project.

6.2.3.2 Upper Rattlesnake Reservoir Alternative

The Upper Rattlesnake Reservoir Alternative would involve expansion of storage capacity at the existing Rattlesnake Dam complex (see Figure 6-1). Rattlesnake Reservoir currently has a capacity of up to 1,480 AF of recycled water storage (IRWD 2020b). This alternative would involve construction of a new dam and upper reservoir that would be 3,000 feet upstream of the existing Rattlesnake Dam and would provide approximately 6,000 AF of recycled water storage. Water would flow from the new Upper Rattlesnake Reservoir downstream to the existing Rattlesnake Reservoir (Woodward-Clyde 1996). In addition, the expanded reservoir would require 5,500 linear feet of new pipeline and a new 1,200 horsepower pump station. IRWD previously identified the expansion of the existing Rattlesnake Reservoir in 1995 and considered the expansion as an alternative to the San Joaquin Reservoir Conservation Project in 2003 (Dudek 2003).

Ability to Meet Project Objectives

The Upper Rattlesnake Reservoir Alternative would meet all of the project objectives. The Upper Rattlesnake Reservoir Alternative would improve local water supply reliability by reducing the need to purchase costly, imported water from MWD and would reduce diversions of sewage to OCSD and water diversions to the ocean. Recycled water produced by IRWD for the benefit of IRWD customers would be maximized under the Upper Rattlesnake Reservoir Alternative. Additionally, an expansion of the reservoir under the Upper Rattlesnake Reservoir Alternative would meet all DWR DSOD safety standards.

Aesthetics

Expansion of the reservoir under the Upper Rattlesnake Reservoir Alternative would involve construction of a second additional dam approximately 3,000 feet upstream from the existing

reservoir. The second reservoir would involve an increase in dam crest height of 115 feet above the existing condition (Woodward-Clyde 1996) while the proposed project at Syphon Reservoir would be raised 77 feet from its existing height of 59 feet to a total dam crest height of 136 feet. The Upper Rattlesnake Reservoir Alternative site would be visible from the adjacent community of Orchard Hills and likely from State Route 241 north of the site, both of which had not been constructed at the time the Woodward-Clyde 1996 was prepared. Similar kinds of construction equipment would be used for both reservoir expansions. The Draft EIR found that the proposed project at Syphon Reservoir would be visible to downstream Irvine communities such as Stonegate, but would have a less than significant impact with implementation of mitigation measures such as a landscape plan as a result of reservoir expansion. The Upper Rattlesnake Reservoir Alternative would similarly increase the dam's visibility to nearby Irvine communities and rights-of-way. Unlike the proposed project at Syphon Reservoir, which would involve expansion of an existing facility, the Rattlesnake Reservoir Alternative would result in greater aesthetic impacts since a second new dam and reservoir would be built within an undeveloped area. As a result, the Upper Rattlesnake Reservoir Alternative would result in greater aesthetic impact when compared to the proposed project.

Air Quality

The Upper Rattlesnake Reservoir Alternative would result in air quality-related construction and operation impacts that are similar in nature to the proposed project. The alternative would involve constructing the reservoir either within existing topography or reshaping existing topography by excavating large amounts of earth (Dudek 2003). Either option would involve between 1,200,000 to 1,400,000 cubic yards of embankment volume and would require extensive soil movement onsite (Woodward-Clyde 1996). The alternative would also require construction of 5,500 linear feet of new pipeline, a new 1,200 horsepower pump station, and haul routes of approximately 3,000 feet from the existing reservoir to the upper reservoir. The Upper Rattlesnake Reservoir Alternative site is located approximately 2,000 feet from the nearest existing sensitive receptor although pipelines would be installed within rights-of-way adjacent to receptors. It should be noted that the Orchard Hills community is being developed and the upper reservoir would be located adjacent to residential sensitive receptors in the future. The proposed project would result in potentially significant construction-related air quality impacts due to emissions of NO_x from soil excavation and other construction activities, however mitigation measures would reduce the impacts to less than significant levels. Given the distance between the proposed project and nearby sensitive receptors, the cancer risk for the maximum impacted sensitive receptor near Syphon Reservoir is 8.72 per million which would not exceed the SCAQMD's threshold of 10 per million. The Upper Rattlesnake Reservoir Alternative would result in similar potentially significant impacts due to an increase in NO_x emissions from construction of the reservoir, but would require additional activities for construction of the pump station, 5,500 linear feet of pipeline, and 3,000 linear feet of haul roads. The increase in intensity of construction activities could result in greater emissions levels and would constitute a significant impact. Additionally, construction of the pipelines would be located close to existing sensitive receptors potentially resulting in greater impacts to construction health risk than the proposed project. Even though mitigation measures would be implemented, construction of the Upper Rattlesnake Reservoir Alternative has the potential to result in greater air quality emissions than the proposed project,

which may not be able to be mitigated to a less than significant level. As such, the Upper Rattlesnake Reservoir Alternative would result in greater air quality impacts when compared to the proposed project.

Biological Resources

The Upper Rattlesnake Reservoir Alternative site is within the Coastal Subregion of the Orange County NCCP/HCP Reserve (Woodward-Clyde 1996), similar to the proposed project. The area is specifically within the coastal sage scrub habitat reserve, and depending on the reservoir footprint, includes between 24.1 and 34.5 acres of coastal sage scrub (Woodward-Clyde 1996). This coastal sage scrub habitat supports a variety of special-status species. The proposed project would permanently impact up to 29 acres of coastal sage scrub communities and temporarily impact 0.85 acre of California sagebrush scrub. The proposed project would require mitigation measures that would reduce impacts to coastal sage scrub and special-status species to a less than significant level. The Upper Rattlesnake Reservoir Alternative site includes coastal sage scrub habitat within the Orange County NCCP/HCP Reserve and would require mitigation similar to that associated with the Syphon Reservoir expansion (Woodward-Clyde 1996). As a result, the Upper Rattlesnake Reservoir Alternative would result in similar biological resources impacts when compared to the proposed project.

Cultural Resources

The Upper Rattlesnake Reservoir Alternative site has moderate to high sensitivity for archaeological resources (Woodward-Clyde 1996). The proposed project site was found to include nine historical/archaeological resources, only two of which could be impacted by proposed project activities. The presence of both historic period and prehistoric archaeological sites within the vicinity of the project area indicates that the area is sensitive for archaeological resources. Mitigation measures would require procedures to avoid the two known resources, as well as procedures to reduce impacts to any unknown resources uncovered during construction, which would reduce impacts to a less than significant level. Based on the fact that archaeological resource sensitivity is presumed to be high at the Upper Rattlesnake Reservoir Alternative site, and that similar mitigation measures would be required to reduce impacts to unknown cultural resources, the Upper Rattlesnake Reservoir Alternative would result in similar impacts to cultural resources when compared to the proposed project.

Energy

The Upper Rattlesnake Reservoir Alternative would require increased amounts of energy to pump the additional 6,000 AF recycled water to the new upper reservoir for storage. The proposed project would require 1,082,727 kWh of electricity annually to pump an additional 4,500 AF recycled water to Syphon Reservoir. The total net new operating electricity consumption for the expanded Syphon Reservoir represents approximately 0.006 percent of the county and 0.002 percent of SCE consumption for 2018. As a result, impacts would be less than significant and no mitigation measures would be required. The Upper Rattlesnake Reservoir Alternative would result in increased energy consumption compared to the proposed project to pump an additional 1,500 AF water. While the Upper Rattlesnake Reservoir Alternative would result in more kWh of electricity to operate the expanded reservoir, when compared to the county and SCE regional

consumptions levels, the increase would be less than significant when compared to the existing electrical grid. As a result, the Upper Rattlesnake Reservoir Alternative would result in similar impacts to energy when compared to the proposed project.

Geology and Soils

The Upper Rattlesnake Reservoir Alternative site is underlain by bedrock of the Capistrano, Vaqueros-Sespe, and Santiago Formations (Woodward-Clyde 1996). Several bedrock faults are mapped beneath the potential location for the upper reservoir dam that have not been proven to be active/inactive (Woodward-Clyde 1996). Given the geologic formations onsite, the Upper Rattlesnake Reservoir Alternative site has a high potential for scientifically significant fossil resources (Woodward-Clyde 1996) and therefore has high paleontological potential. The bedding at the site dips favorably with respect to slope stability and there have been several small landslides detected onsite (Woodward-Clyde 1996). The proposed project is located in the Vaqueros and Sespe Formations, which are rated as generally having very poor slope stability characteristics and are described as landslide/erosion-prone and low permeability. An inactive fault runs through the Syphon Reservoir site. Paleontological sensitivity is moderate to high at the proposed project site. While the geologic effects of the proposed project were determined to be potentially significant, the impacts due to ground shaking, soil erosion, unstable geologic units, and expansive soil would be reduced to a less than significant level by incorporating into the project design the geotechnical recommendations for soils remediation and/or foundation systems necessary to reduce seismic-related hazards to less than significant levels, and compliance with DSOD regulations. Additionally, mitigation measures would be required to reduce impacts to any fossils that may be uncovered by construction of the project. Similarly, any new dam constructed as part of the Upper Rattlesnake Reservoir Alternative would require adherence to DSOD regulatory requirements, as well as mitigation measures to reduce impacts to paleontological resources due to the high paleontological potential. As a result, the Upper Rattlesnake Reservoir Alternative would result in similar impacts to geology and soils when compared to the proposed project.

Greenhouse Gas Emissions

The Upper Rattlesnake Reservoir Alternative would involve an increase in greenhouse gas emissions relative to existing conditions to operate the pumps that would convey approximately 6,000 AF additional recycled water to the reservoir. Construction and operation of the proposed project's increase in storage of 4,500 AF would equal approximately 433 MTCO_{2e} per year (amortized over 30 years), which would not exceed the SCAQMD 3,000 MTCO_{2e} threshold. No mitigation measures would be required. While the amount of water pumped to the Upper Rattlesnake Reservoir would be more than the proposed project by approximately 1,500 AF, it would similarly result in fewer greenhouse gas emissions than the 3,000 MTCO_{2e} threshold, and impacts would be less than significant without the need for mitigation measures. As such, the Upper Rattlesnake Reservoir Alternative would result in similar greenhouse gas emissions impacts when compared to the proposed project.

Hazards and Hazardous Materials

The Upper Rattlesnake Reservoir Alternative would result in the similar routine transport of hazardous materials as the proposed project, including construction-related fuels and operational-related chemicals for recycled water treatment. Both the alternative and the proposed project would comply with existing State regulations that would reduce all impacts to a level of less than significant. While the Upper Rattlesnake Reservoir Alternative would not be located in a very high fire severity zone, historic fires at the site suggest an increased risk of wildland fire, which would require implementation of mitigation measures similar to the proposed project. As a result, the Upper Rattlesnake Reservoir Alternative would result in similar impacts to hazards and hazardous materials when compared to the proposed project.

Hydrology and Water Quality

The Upper Rattlesnake Reservoir Alternative would result in similar construction ground-disturbing activities as the proposed project that could impact surface water quality due to polluted runoff from construction. Additionally, the Upper Rattlesnake Reservoir Alternative would be similar to the proposed project in that it would result in substantial soil movement to construct the reservoir, which would result in alteration of drainage patterns. Operation of the Upper Rattlesnake Reservoir Alternative would involve an increase in the capacity of the reservoir which increases the potential downstream inundation area in the event of a dam breach or emergency release. For both the proposed project and the alternative, IRWD would be required to adhere to all DSOD requirements, which includes construction of a spillway to provide direction for emergency release flows. Additionally, the alternative and the project's structure, seepage control components, and spillway would be designed and evaluated for structural integrity by geotechnical engineers to reduce likelihood of dam breach. For the proposed project and the Upper Rattlesnake Reservoir Alternative, surface water quality and drainage impacts would be mitigated with implementation of required regulatory requirements such as SWPPPs and BMPs. The Upper Rattlesnake Reservoir Alternative would result in an increase in the risk to downstream communities due to inundation, which would be mitigated through project design and DSOD requirement, similar to the proposed project. As a result, the Upper Rattlesnake Reservoir Alternative would result in similar impacts to hydrology and water quality when compared to the proposed project.

It should be noted that the Upper Rattlesnake Reservoir Alternative site is located in a large drainage area, which, once operational, could result in excess amounts of stormwater entering the expanded upper reservoir. The Upper Rattlesnake Reservoir Alternative would require additional freeboard in the expanded reservoir to accommodate increased amounts of stormwater, which may impact operational storage capacity.

Noise and Vibration

The Upper Rattlesnake Reservoir Alternative would result in construction-related noise levels and operation impacts that are similar in nature to the proposed project. The Upper Rattlesnake Reservoir Alternative site is located approximately 2,000 feet from the nearest existing sensitive receptor. However, the alternative would require construction of approximately 5,500 linear feet of pipeline that would be installed within rights-of-way adjacent to sensitive receptors such as

schools and residences. The proposed project would result in less than significant impacts to temporary and permanent increases in ambient noise and vibration levels, and would not require mitigation measures. Given that the Upper Rattlesnake Reservoir Alternative involves construction of pipelines installed within rights-of-way adjacent to sensitive receptors, it is likely that the increase in noise and vibration levels would be potentially significant and require mitigation measures. As a result, the Upper Rattlesnake Reservoir Alternative would result in greater noise and vibration impacts when compared to the proposed project.

Recreation

The Upper Rattlesnake Reservoir Alternative is not currently operated as a recreational facility although trails in the vicinity are used for hiking purposes. The proposed project would result in increased access to the project site due to a new walking trail, although IRWD would control access to the trail. The proposed project would have indirect impacts to biological and cultural resources due to the construction and public use of the proposed recreation trail; but, these potential impacts would be mitigated to less than significant levels. An expansion of the Upper Rattlesnake Reservoir Alternative would not eliminate recreational facilities, or require relocation that could cause an adverse physical effect on the environment. As a result, the Upper Rattlesnake Reservoir Alternative would result in similar recreation impacts when compared to the proposed project.

Transportation

The Upper Rattlesnake Reservoir Alternative would result in the same kind of construction activities that could potentially result in temporary impacts to traffic and circulation patterns on local roadways as the proposed project. The Upper Rattlesnake Reservoir Alternative would involve installation of pipeline within rights-of-way and the proposed project would involve intersection improvements, both of which would result in lane closures and/or detours. Similar to the proposed project, impacts associated with the Upper Rattlesnake Reservoir Alternative would be temporary and would be reduced to less than significant levels with implementation of mitigation measures such as a Traffic Control Plan. As a result, the Upper Rattlesnake Reservoir Alternative would result in similar transportation impacts when compared to the proposed project.

Tribal Cultural Resources

The Upper Rattlesnake Reservoir Alternative site has a potential for unknown tribal cultural resources. According to record searches and tribal resource consultations, no tribal resources are present on the proposed project site and expansion at Syphon Reservoir would not impact known tribal cultural resources. Although unknown tribal cultural resource could be impacted by construction or operational activities, mitigation measures would reduce the impact to less than significant levels. Based on the potential for tribal cultural resources, and the fact that similar mitigation measures would be required to reduce impacts to known and unknown tribal cultural resources, the Sand Canyon Reservoir Alternative would result in similar impacts to tribal cultural resources when compared to the proposed project.

Wildfire

Unlike the proposed project, the Upper Rattlesnake Reservoir Alternative site would not be located within a moderate, high, or very high fire severity zone (see Figure 3.14-1). However, historic fires such as the 2007 Santiago Fire have impacted the Upper Rattlesnake Reservoir Alternative (see Figure 3.14-2). As a result, construction and operation of a new reservoir has the potential to result in uncontrolled spread of wildfire and exacerbation of fire risk. The proposed project would be located within a very high fire severity zone; mitigation measures would be required to ensure fire hazard reduction measures are implemented during proposed project activities to further reduce the potential for wildfire impacts on project workers. Similar mitigation measures would be required for any expansion of the Upper Rattlesnake Reservoir Alternative. As a result, the Upper Rattlesnake Reservoir Alternative would result in similar wildfire impacts when compared to the proposed project.

6.2.3.3 Reduced Project Alternative

The Reduced Project Alternative would result in expansion of Syphon Reservoir but not at the capacity proposed under the project. Instead of raising the existing 59-foot dam height to 136 feet as proposed for the project, the Reduced Project Alternative would raise the existing dam to 98 feet. The Reduced Project Alternative would provide approximately 2,500 AF of recycled water storage, or about half of the proposed project's capacity. The Reduced Project Alternative would involve similar activities as the project, such as excavation of large amounts of onsite sediment, import of dam embankment material, construction of a spillway, treatment facility, access roads, and recreation trail.

Ability to Meet Project Objectives

The Reduced Project Alternative would partially meet all of the project objectives. Because the Reduced Project Alternative would result in half of the storage proposed under the project, IRWD would still have to purchase costly, imported water from MWD to account for the lack of full storage potential. Due to the fact that the full capacity of the reservoir would not be achieved, IRWD would not be able to maximize the use of recycled water to benefit its customers within its service area. Additionally, while diversions of sewage to OCSD and recycled water to the ocean would be reduced if approximately half of the storage at Syphon Reservoir were achieved, diversions would still occur under the Reduced Project Alternative. Any new dam built by IRWD would continue to meet or exceed the current safety and design requirements established by DSOD.

Aesthetics

The Reduced Project Alternative would result in a total dam crest height of 98 feet compared to the proposed project's height of 136 feet. Similar construction equipment would be required for construction of the Reduced Project Alternative as the proposed project. The proposed project at Syphon Reservoir would be visible to downstream Irvine communities such as Stonegate and could obstruct views of dominant ridgelines and vistas associated with the Sana Ana Mountains. However, mitigation measures such as a landscape plan would be required to mitigate impacts to local scenic views, which would reduce impacts to a less than significant level. The Reduced Project Alternative would similarly increase the dam's visibility compared with existing

conditions, although it would do so to a lesser degree than the proposed project due to the reduced dam crest height. While the lower dam crest associated with the Reduced Project Alternative would maintain views of the dominant ridgelines and vistas associated with the Sana Ana Mountains, mitigation measures would still be required to reduce impacts to a less than significant level. As a result, the Reduced Project Alternative would result in a similar aesthetic impact when compared to the proposed project.

Air Quality

The Reduced Project Alternative would result in air quality-related construction and operation impacts that are similar in nature to the proposed project. The residential sensitive receptors would be located the same distance from the Reduced Project Alternative site as the proposed project site, and therefore the likelihood of resulting in cancer-causing construction health risk impacts due to the elevated levels of diesel particular matter would be similar. The proposed project would result in potentially significant construction-related air quality impacts due to emissions of NO_x, however mitigation measures would reduce the impacts to less than significant levels. Given the distance between the proposed project and nearby sensitive receptors, the cancer risk for the maximum impacted sensitive receptor near Syphon Reservoir is 8.72 per million which would not exceed the SCAQMD's threshold of 10 per million. These conditions are expected to be similar under the Reduced Project Alternative, and the alternative would result in similar potentially significant impacts due to an increase in NO_x emissions from construction activities that could be mitigated, and similar less than significant cancer-causing construction health risk impacts. As such, the Reduced Project Alternative would result in similar air quality impacts when compared to the proposed project.

Biological Resources

The Reduced Project Alternative would be implemented in the same location as the proposed project and would therefore have the same potential to impact coastal sage scrub and riparian habitat and the special-status species supported by that habitat. The proposed project would permanently impact up to 29 acres of coastal sage scrub communities and temporarily impact 0.85 acre of California sagebrush scrub. While the proposed project would permanently impact 12.28 acres of riparian communities that supports the least Bell's vireo, implementation of mitigation measures would reduce impacts to a less than significant level. Biological resource impact acreages associated with the Reduced Project Alternative would be reduced because the area that would be inundated by the reservoir would be lessened when compared to the proposed project due to the smaller reservoir capacity. Therefore, sensitive natural communities such as coastal sage scrub, wetlands, and riparian habitats and associated special-status species would be impacted to a lesser degree. Nevertheless, mitigation measures would be required to reduce impacts to lower elevations of habitat impacted by the Reduced Project Alternative inundation levels. As a result, the Reduced Project Alternative would result in similar biological resources impacts when compared to the proposed project.

Cultural Resources

The Reduced Project Alternative would be implemented in the same location as the proposed project and would therefore have the potential to impact known and unknown cultural resources.

The proposed project site was found to include nine historical/archaeological resources, only two of which could be impacted by proposed project activities. The presence of both historic period and prehistoric archaeological sites within and within the vicinity of the project area indicates that the area is sensitive for archaeological resources. Mitigation measures would require procedures to avoid the two known resources, as well as to reduce impacts to any unknown resources uncovered during construction, which would reduce impacts to a less than significant level. Based on the fact that known cultural resources exist on the Reduced Project Alternative site and the archaeological sensitivity is high, and that similar mitigation measures would be required to reduce impacts to known and unknown cultural resources, the Reduced Project Alternative would result in similar impacts to cultural resources when compared to the proposed project.

Energy

The Reduced Project Alternative would require increased amounts of energy to pump the additional 2,500 AF water to Syphon Reservoir for storage. The proposed project would require 1,082,727 kWh of electricity annually to pump an additional 4,500 AF recycled water to Syphon Reservoir. The total net new operating electricity consumption for the expanded Syphon Reservoir represents approximately 0.006 percent of the county and 0.002 percent of SCE consumption for 2018. As a result, impacts would be less than significant and no mitigation measures would be required. Given the smaller increase in capacity, the Reduced Project Alternative would result in lesser additional kWh of electricity to operate the expanded reservoir, but would still result in less than significant impacts to the existing electrical grid. As a result, the Reduced Project Alternative would result in similar impacts to energy when compared to the proposed project.

Geology and Soils

The Reduced Project Alternative would be implemented in the same location as the proposed project. The site is located in the Vaqueros and Sespe Formations, which are rated as generally having very poor slope stability characteristics and are described as landslide/erosion-prone and low permeability. An inactive fault runs through the Syphon Reservoir site. Paleontological sensitivity is moderate to high at the proposed project site. While the geologic effects of the proposed project were determined to be potentially significant, the impacts due to ground shaking, soil erosion, unstable geologic units, and expansive soil would be reduced to a less than significant level by incorporating into the project design the geotechnical recommendations for soils remediation and/or foundation systems necessary to reduce seismic-related hazards to less than significant levels, and compliance with DSOD regulations. Additionally, mitigation measures would be required to reduce impacts to any fossils that may be uncovered by construction of the project. Similarly, the Reduced Project Alternative would require adherence to DSOD regulatory requirements, as well as mitigation measures to reduce impacts to paleontological resources due to the high paleontological potential onsite. As a result, the Reduced Project Alternative would result in similar impacts to geology and soils when compared to the proposed project.

Greenhouse Gas Emissions

The Reduced Project Alternative would involve an increase in greenhouse gas emissions from existing conditions to operate the pumps that would convey approximately 2,500 AF additional recycled water to an expanded Syphon Reservoir. Construction and operation of the proposed project's increase in storage of 4,500 AF would result in emissions approximately 433 MTCO₂e per year (amortized over 30 years), which would not exceed the SCAQMD 3,000 MTCO₂e threshold. No mitigation measures would be required. Since the amount of water pumped to the Reduced Project Alternative would be less than the proposed project, it would be anticipated to similarly result in less than the 3,000 MTCO₂e threshold, and impacts would constitute a less than significant without the need for mitigation measures. As such, the Reduced Project Alternative would result in similar greenhouse gas emissions impacts when compared to the proposed project.

Hazards and Hazardous Materials

The Reduced Project Alternative would result in the similar routine transport of hazardous materials as the proposed project, including construction-related fuels and operational-related chemicals for recycled water treatment. Both the alternative and the proposed project would comply with existing State regulations that would reduce all impacts to a level of less than significant. Both the proposed project and the Reduced Project Alternative would be located within a very high fire severity zone. Mitigation measures would require implementation of fire hazard reduction measures that would reduce impacts to a less than significant level. As a result, the Reduced Project Alternative would result in similar impacts to hazards and hazardous materials when compared to the proposed project.

Hydrology and Water Quality

The Reduced Project Alternative would result in similar construction ground-disturbing activities as the proposed project that could impact surface water quality due to polluted runoff from the construction. Even though the Reduced Project Alternative would result in a smaller storage capacity, substantial soil movement would be required to construct the expanded reservoir, which would result in similar alteration of drainage patterns when compared to the proposed project. While operation of the Reduced Project Alternative would involve a smaller increase in capacity of the reservoir when compared to the proposed project, the alternative would increase the potential downstream inundation area in the event of a dam breach or emergency release above the existing condition. For both the project and the alternative, IRWD would be required to adhere to all DSOD requirements, which includes construction of a spillway to provide direction for emergency release flows. Additionally, the alternative and the project's structure, seepage control components, and spillway would be designed and evaluated for structural integrity by geotechnical engineers to reduce likelihood of dam breach. For the proposed project and the Reduced Project Alternative, surface water quality and drainage impacts would be mitigated with implementation of required regulatory requirements such as SWPPPs and BMPs. The Reduced Project Alternative would result in an increase in the risk to downstream communities due to inundation, which would be mitigated through project design and DSOD requirement, similar to the proposed project. As a result, the Reduced Project Alternative would result in similar impacts to hydrology and water quality when compared to the proposed project.

Noise and Vibration

The Reduced Project Alternative would result in construction-related noise levels and operation impacts that are similar in nature to the proposed project. The greatest impacts to ambient noise levels would be during construction to sensitive receptors in the vicinity of the Syphon Reservoir site. The proposed project would result in less than significant impacts to temporary and permanent increases in ambient noise and vibration levels, and would not require mitigation measures. Given that the Reduced Project Alternative would be located the same distance from sensitive receptors as the proposed project, the increase in noise and vibration levels would be similar. As a result, the Reduced Project Alternative would result in similar noise and vibration impacts when compared to the proposed project.

Recreation

The Reduced Project Alternative would be implemented in the same location as the proposed project and would therefore have the same potential to impact recreation. The Reduced Project Alternative and the proposed project would involve recreation opportunities at Syphon Reservoir in the form of a walking trail, which would be moderated by IRWD and therefore would not increase the use of nearby recreation facilities. Because neither the Reduced Project Alternative nor the proposed project would not result in increased environmental effects due to expansion of recreational facilities, the alternative would result in similar impacts to recreational facilities.

Transportation

The Reduced Project Alternative would result in the same kind of construction activities that could potentially result in temporary impacts to traffic and circulation patterns on local roadways as the proposed project. Similar to the proposed project, impacts associated with the Reduced Project Alternative would be temporary and would be reduced to less than significant levels with implementation of mitigation measures such as a Traffic Control Plan. As a result, the Reduced Project Alternative would result in similar transportation impacts when compared to the proposed project.

Tribal Cultural Resources

The Reduced Project Alternative would be implemented in the same location as the proposed project and would therefore have the potential to impact known and unknown tribal cultural resources. According to record searches and tribal resource consultations, no tribal resources are present on the proposed project site and expansion at Syphon Reservoir would not impact known tribal cultural resources. Although unknown tribal cultural resource could be impacted by construction or operational activities, mitigation measures would reduce the impact to less than significant levels. Based on the potential to unearth unknown tribal cultural resources, and that similar mitigation measures would be required to reduce impacts to known and unknown tribal cultural resources, the Reduced Project Alternative would result in similar impacts to tribal cultural resources when compared to the proposed project.

Wildfire

Similar to the proposed project, the Reduced Project Alternative would be located within a very high fire severity zone, and construction and operation of an expanded reservoir has the potential

to result in uncontrolled spread of wildfire and exacerbation of fire risk. Mitigation measures would be required to ensure fire hazard reduction measures are implemented during proposed project activities to further reduce the potential for wildfire impacts on project workers. Similar mitigation measures would be required for any expansion of the Reduced Project Alternative within the same fire hazard zone. As a result, the Reduced Project Alternative would result in similar wildfire impacts when compared to the proposed project.

6.3 Environmentally Superior Alternative

CEQA requires that an EIR identify the environmentally superior alternative of a project other than the No Project Alternative (CEQA Guidelines Section 15126.6(e)(2)). One of the primary purposes of the alternatives analysis is to identify project alternatives that may avoid or substantially lessen significant project impacts (CEQA Guidelines Section 15126.6). With incorporation of mitigation measures, the proposed project would result in no significant and unavoidable impacts.

As stated above and summarized in **Table 6-2**, the No Project Alternative would avoid all of the mitigated environmental impacts associated with the proposed project, but would not meet all of the project objectives. Because the proposed project does not result in any significant and unavoidable impacts, the No Project Alternative does not avoid or substantially lessen significant environmental effects.

TABLE 6-2
SUMMARY OF ALTERNATIVES ANALYSIS
IMPACTS AS COMPARED TO THE PROPOSED PROJECT

Environmental Resource	Proposed Project	No Project Alt.	Sand Canyon Reservoir Alt.	Upper Rattlesnake Reservoir Alt.	Reduced Project Alt.
Meets All Project Objectives?	Yes	No	No	Yes	No
Environmental Impacts					
Aesthetics	LTSM	-	-	+	0

SOURCE: ESA 2020; (+) Greater Impacts; (-) Lesser Impacts; (0) Similar Impacts

The Sand Canyon Reservoir Alternative would result in greater impacts when compared to the proposed project to air quality and noise during construction due to sensitive receptors located approximately 80 feet from construction activities. Temporary increases in noise levels and construction health risk impacts would be greater than the proposed project, resulting in potentially significant impacts. Additionally, the Sand Canyon Reservoir Alternative may eliminate portions of adjacent recreational facilities, requiring the relocation of recreational facilities which could have an adverse physical effect on the environment. As a result, the Sand Canyon Reservoir Alternative would result in greater environmental impacts when compared to the proposed project. The Sand Canyon Reservoir Alternative would not fully achieve all of the project objectives.

The Upper Rattlesnake Reservoir Alternative would result in greater impacts when compared to the proposed project to air quality and noise during construction due to proximity of pipelines to adjacent sensitive receptors. Temporary increases in noise levels and construction health risk impacts would be greater than the proposed project, resulting in potentially significant impacts. Additionally, the Upper Rattlesnake Reservoir Alternative would involve installation of a new separate reservoir, not an expansion of an existing reservoir, which would result in greater impacts to aesthetic resources from surrounding Irvine communities. As a result, the Upper Rattlesnake Reservoir Alternative would result in greater environmental impacts when compared to the proposed project. The Upper Rattlesnake Reservoir Alternative would fully achieve all of the project objectives due to reservoir capacity, resulting in maximization of recycled water produced by IRWD and elimination of the need to purchase expensive imported water, among other objectives.

The Reduced Project Alternative would generally result in similar environmental impacts to the proposed project. The extent of earth moving activities would be the same for the project and the Reduced Project Alternative, with the main difference being the height of the dam. Because the proposed project does not result in any significant and unavoidable impacts, the Reduced Project Alternative does not avoid or substantially lessen significant environmental effects. The Reduced Project Alternative would not fully achieve all of the project objectives.

CEQA requires that an EIR identify the environmentally superior alternative of a project other than the No Project Alternative (CEQA Guidelines Section 15126.6(e)(2)). While the proposed project would result in potentially significant impacts, with the incorporation of mitigation measures, no significant and unavoidable impacts would occur. The Sand Canyon Reservoir Alternative and the Upper Rattlesnake Reservoir Alternative would result in greater environmental impacts due to proximity to sensitive receptors, when compared to the proposed project. The Reduced Project Alternative would generally result in similar environmental impacts to the proposed project without fully achieving its objectives. Overall, none of the alternatives would avoid any impacts or mitigation measures associated with the proposed project. Only the Upper Rattlesnake Reservoir Alternative would fully achieve all of the project objectives, but with greater environmental impacts than the proposed project.

subject Syphon Reservoir Improvement Project California Environmental Quality Act Public Scoping
 Summary

Introduction

Irvine Ranch Water District (IRWD), as the Lead Agency, is proposing the Syphon Reservoir Improvement Project (proposed project). The proposed project would involve increasing the capacity of Syphon Reservoir, which is an existing recycled water storage reservoir in unincorporated County of Orange, California. As part of the reservoir expansion, the existing engineered dam would be replaced with a new engineered dam that would meet and exceed the latest safety standards. The new dam would increase the recycled water reservoir capacity from approximately 500 acre-feet (AF) to 5,000 AF, and would allow IRWD to serve the seasonal and future water needs within its service area. The proposed project is located on the northeast side of Portola Parkway between Bee Canyon Access Road and State Route 133 (SR-133), where the majority of the property bounded by these thoroughfares is owned by IRWD.

Recycled water is vital to the community, serving as a reliable, affordable and drought-proof source in IRWD's water supply portfolio. Recycled water is used for irrigation, cooling office buildings, flushing toilets, mixing concrete, fighting regional wildfires, and other industrial uses. By making more recycled water available to the community, the proposed project would reduce IRWD's dependence on costly imported water and make the community more self-sufficient.

Notice of Preparation

The Notice of Preparation (NOP) was prepared pursuant to Section 15082 of the California Environmental Quality Act (CEQA) Guidelines, to notify interested parties that IRWD will be preparing an Environmental Impact Report (EIR) to evaluate potential environmental impacts of the proposed project (see Attachment 1). The NOP was mailed on August 2, 2019 to interested parties, including local, state, and federal agencies; local tribes; and other groups or individuals who had previously expressed interest in the project. The NOP also was posted by the County Clerk in Orange County (see Attachment 1). A Notice of Completion (NOC) was also prepared by IRWD and sent to the State Clearinghouse (see Attachment 2). The proposed project was given a State Clearinghouse number of SCH# 2019080009, and the project information was posted in the CEQAnet Database

(see Attachment 2). Copies of the NOP were made available for public review at Irvine/Heritage Park Library (14361 Yale Ave, Irvine CA 92604) and online at the IRWD website (<https://www.irwd.com/construction/syphon-reservoir-improvement-project>).

Scoping Period

The 45-day project scoping period began with the distribution of the NOP on August 2, 2019 and remained open through September 16, 2019 at 4:00 p.m. During the scoping period, one scoping meeting was held on August 21, 2019 at IRWD headquarters (15600 Sand Canyon Avenue, Irvine CA 92618). Public notices of the scoping meeting were placed in the Orange County Register newspaper (see Attachment 3). Public notices of the scoping meeting were also mailed directly to interested homeowners’ associations (HOAs), and to residents within the Stonegate Village, Stonegate East, Woodbury Community, and Woodbury East communities (see Attachment 4).

At the scoping meetings, ESA gave a presentation on the proposed project and the CEQA process (see Attachment 5). Aside from ESA and IRWD staff, approximately twenty-two (22) meeting participants attended the August 21, 2019 scoping meeting at the IRWD headquarters. Participant questions and comments were recorded and comment cards were also available for participants to fill out at the meeting or to send in at a later date. The sign-in sheet from the August 21, 2019 public scoping meeting is included as Attachment 6.

Comments

During the scoping period, IRWD received a total of thirty-five (35) comment letters on the proposed project via mail and e-mail (see Attachment 7). Table 1 below includes a list of the agencies and individuals that submitted comments during the 30-day project scoping period. IRWD also received verbal comments during the scoping meeting, which have been recorded as Attachment 8. CEQA does not require IRWD to formally respond to these comments, but rather to consider these comments during preparation of the EIR.

IRWD Syphon Reservoir Improvement Project

Figure 1
Project Location

ATTACHMENT A

Introduction

Irvine Ranch Water District (IRWD), as the lead agency pursuant to CEQA, is proposing to implement the Syphon Reservoir Improvement Project (proposed project). The proposed project would increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam that would meet and exceed the latest safety standards. The proposed project would be able to store additional recycled water to meet the seasonal demand of customers and will enhance IRWD's water supply reliability.

Project Background

District Overview

Established in 1961 as a California Water District under the provisions of the State of California Water Code, IRWD is a non-profit, independent special district serving central Orange County, California. IRWD provides drinking water, reliable sewage collection and treatment, recycled water and urban runoff treatment to approximately 422,000 residents. As an independent public agency, IRWD is governed by a five-member publicly-elected Board of Directors that are responsible for the District's policies and decision-making. Day-to-day operations are supervised by the General Manager and District staff.

IRWD has a diverse water supply that includes local groundwater, recycled water, imported water, and local surface water. Approximately 54 percent of the IRWD water supply comes from 26 local groundwater wells in the Orange County Groundwater Basin; approximately 18 percent of the District's water supply is imported from the Metropolitan Water District of Southern California (MWD); and roughly 26 percent of the District's water demands are met with recycled water. IRWD produces recycled water at its Michelson Water Recycling Plant (WRP) located in Irvine, CA and at its Los Alisos WRP located in Lake Forest, CA. Recycled water is provided to customers primarily for irrigation of public landscaping such as street medians, parks and golf courses as well as agricultural irrigation. It is also used in industrial processes such as mixing concrete, office building uses such as toilet flushing and cooling towers, as well as for firefighting. When recycled water production exceeds seasonal demands, recycled water is stored at Syphon Reservoir, as well as other recycled water storage reservoirs operated by IRWD, including San Joaquin, Rattlesnake, and Sand Canyon Reservoirs.

Existing Syphon Reservoir

The existing Syphon Reservoir is formed by a 59-foot high, engineered dam with a crest width of approximately 12-feet. An engineered dam is built by compacting successive layers of earth, using the most impervious materials. Syphon Reservoir was constructed in 1949 and was acquired by IRWD in 2010 from the Irvine Company, which previously used the reservoir to store water for agricultural irrigation. In 2012, IRWD converted the facilities at Syphon Reservoir for storage of recycled water, by adding strainer and disinfection facilities, as well as constructing a pipeline and pump station to connect the reservoir to IRWD's existing recycled water distribution system.

The tertiary-treated recycled water stored in the Syphon Reservoir originates from IRWD's Michelson WRP. Recycled water is currently conveyed to the Syphon Reservoir via a portion of the Highline Canal

from IRWD's Rattlesnake Reservoir into Syphon Reservoir. Syphon Reservoir's existing outlet facilities include a series of underground pipes that convey flows through the strainer and disinfection facilities and then to IRWD's recycled water system for distribution to customers. Alternatively, the existing reservoir can be drawn down through an existing 48-inch pipeline that discharges to the storm drain at Portola Parkway (see **Figure 1** and **Figure 2**).

IRWD directly controls the water into and out of Syphon Reservoir and can lower the water surface to allow for storage of minor amounts of runoff during storm events. The reservoir does not receive water from rivers or streams. The existing reservoir also includes a spillway structure that protects the dam from overtopping by conveying recycled water to the existing storm drain in Portola Parkway. The reservoir includes a small watershed that is not capable of generating significant amounts of runoff that need to be managed through the use of the spillway.

Project Location

The proposed project would be constructed within the IRWD service area at the site of the existing Syphon Reservoir, which is located on the northeast side of Portola Parkway between Bee Canyon Access Road and State Route 133 (SR-133) in the County of Orange (see **Figure 1** and **Figure 2**). IRWD owns the majority of the property bounded by these thoroughfares. Crean Lutheran High School's Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway. The ground surrounding the reservoir, which dominates the Syphon site, is hilly with ridgelines and terraced slopes. Ground surface elevations at the site range from about 675 feet above mean sea level (amsl) in the northeast corner to about 319 feet amsl at Portola Parkway immediately downstream of the existing reservoir. Syphon Reservoir is surrounded by sensitive upland and wetland vegetation communities that are protected under local, state and federal environmental regulatory requirements, as well as school recreation facilities and residential neighborhoods.

The Syphon Reservoir is located within the Central and Coastal Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) and is included as an operating reservoir allowed within the NCCP/HCP Reserve. Implementation of expanded seasonal storage for recycled water purposes was anticipated and identified as a permitted use in the NCCP/HCP.

Project Purpose and Objectives

The purpose of the proposed project is to increase the recycled water storage capacity of Syphon Reservoir by replacing and enlarging the existing reservoir facilities to meet the seasonal demands of recycled water customers and to enhance IRWD's water supply reliability. Currently, once IRWD's existing recycled water storage reservoirs are filled to capacity in winter months, IRWD sewage is either diverted around the Michelson WRP to the Orange County Sanitation District (OCSD) or recycled water produced at the Michelson WRP is discharged to the ocean. During peak summer months, IRWD is left short of recycled water to meet the demands of IRWD's recycled water customers and IRWD must then purchase costly supplemental imported water from MWD.

IRWD Syphon Reservoir Improvement Project
Figure 2
 Project Site and Proposed Project

SOURCE: ESRI, 2016

Based on projected demands and supplies, IRWD estimates that it will need an additional 4,500 AF of recycled water seasonal storage capacity by the year 2030. The expansion of Syphon Reservoir would allow the storage of recycled water that is currently lost to the ocean or that could have been produced at Michelson WRP absent any diversion of sewage to OCSD. The additional stored recycled water could then be used to meet the projected seasonal recycled water demands within IRWD's service area.

The proposed project would allow the storage of additional recycled water produced at the Michelson WRP during periods of low demand (winter months) for use during periods of high demand (summer months). The expansion of the reservoir's storage capacity from the current 500 AF to approximately 5,000 AF would help IRWD become more self-sufficient by reducing its dependence on costly and less reliable imported water during summer months, and support the increased use of recycled water for public landscaping, agricultural, business and industrial uses. Increased use of recycled water for these non-drinking water purposes would make more drinking water available to the region to better withstand future water shortages. The recycled water available for use by IRWD's customers as a result of the proposed project would not be subject to water shortages and would therefore increase IRWD's water supply reliability.

The objectives of the proposed project are as follows:

- Improve local water supply reliability by reducing the need to purchase less reliable imported water from MWD by storing and using additional recycled water;
- Reduce diversions of sewage to OCSD;
- Promote additional recycling of water while reducing effluent discharges to the ocean; and
- Ensure the new dam and reservoir continue to meet or exceed the latest safety standards, including the standards of the California Department of Water Resources (DWR), Division of Safety of Dams requirements (DSOD).

Project Components

Dam Replacement

The proposed project would involve replacement of the existing 59-foot high engineered dam with a new 136-foot high engineered dam with a 20-foot wide crest. The new dam would be constructed primarily from on-site impermeable materials, although the importation of some specialty materials is anticipated. During removal of the existing dam, materials would be stockpiled for reuse to the extent feasible. In addition, new borrow areas would be identified onsite, where material would be excavated for use as fill for the new dam. IRWD recently approved the Syphon Reservoir Geotechnical Investigations Project, which will be completed prior to designing the proposed new dam. The Geotechnical Investigations Project will help to determine the amount and type of specialty materials that would need to be imported to the site, as well as help to define the limits of disturbance to minimize impacts. The total volume of all materials comprising the dam would be approximately 2.3 million cubic yards.

The new reservoir would include the same small watershed as the existing reservoir and would not be capable of generating significant amounts of runoff that would need to be managed through the use of the spillway. Similar to the existing dam, it is a requirement of DSOD that a spillway be included with the new dam to protect the dam from overtopping. The new spillway would be constructed and lined with reinforced concrete to prevent erosion of the abutment and embankment materials. The spillway would be

designed to meet and exceed the latest safety standards. Flows through the spillway would discharge into a channel lined with grouted rip-rap (concrete grout placed in void spaces between rip-rap pieces), and then into a partially below-grade retention basin designed to dissipate the energy of the flow. Water would exit the retention basin into the existing 48-inch pipeline to the storm drain at Portola Parkway.

Slope protection for the new dam would consist of rip-rap on the upstream slope and vegetation on the downstream slope. The rip-rap on the upstream slope would provide erosion protection from small wave action resulting from water in the reservoir. The vegetation on the downstream slope would provide erosion protection from rainfall runoff.

Reservoir Enlargement

The replacement dam would result in an increase in the reservoir's maximum water surface elevation from 376 feet amsl to 456 feet amsl and increase the reservoir's capacity from approximately 500 AF to 5,000 AF. The proposed project would expand the reservoir's shoreline and inundate up to approximately 82 acres upstream of the dam that currently support upland and wetland vegetation communities, some of which are within the NCCP/HCP Reserve area and deed restricted lands. **Figure 2** shows the preliminary footprint of the proposed dam and reservoir inundation area.

Similar to existing operations, with implementation of the proposed project, water levels at Syphon Reservoir would fluctuate seasonally. Water would be stored in winter when recycled water supplies exceed demands, and the reservoir would be drawn down in summer when demands exceeds supply. The estimated minimum operating capacity of the reservoir would be about 180 AF to maintain water quality.

IRWD would develop an annual operating plan for the enlarged Syphon Reservoir to set targets for the volume of water to be contained in the reservoir on a daily, monthly, annual, or seasonal basis. Reservoir operations would vary with time and would need to consider a wide variety of factors, such as: seasonal storage needs, water quality considerations, rainfall projections, and operational compatibility with the IRWD recycled water system. Reservoir operations would be adjusted by IRWD during the year based on changes in projected demands and other factors.

Conveyance Facilities and Other Project Components

The conveyance and inlet facilities that would deliver recycled water from the Michelson WRP to Syphon Reservoir are sufficiently sized to accommodate the proposed project and would not require modification. Under the proposed project, water would be delivered to Syphon Reservoir via an existing 36-inch recycled water pipeline and the Eastwood Recycled Water Pump Station, which is located off-site and currently under construction. The Highline Canal would be abandoned in place and no longer used to deliver water to Syphon Reservoir from Rattlesnake Reservoir.

As stated previously, Syphon Reservoir's existing outlet facilities include a series of underground pipes that convey flow through the strainer and disinfection facilities and then into IRWD's recycled water system for distribution to customers. In the event of an emergency, the existing reservoir can also be drawn down through an existing 48-inch pipeline that discharges to the existing storm drain in Portola Parkway (see **Figures 1 and 2**). Under normal operating conditions, all flow in or out of the reservoir would be conveyed through the existing 36-inch inlet/outlet pipeline. With the exception of the strainer and disinfection facilities, these existing outlet conveyance facilities are sufficiently sized to accommodate the proposed project and would not require modification (see **Figure 2**).

The expanded strainer and disinfection facilities would be relocated at the toe of future dam in the same general vicinity of the existing facility (see **Figure 2**) and would continue to use sodium hypochlorite to disinfect water stored in the reservoir. The new facility would also include sodium bisulfite storage and associated metering pumps to de-chlorinate the future inlet flow to Syphon Reservoir.

Other operational systems that would likely be part of the proposed project include (1) an internal seepage control system within the new dam; and (2) a circulation/aeration system for the enlarged reservoir. In addition, during project design, IRWD will consider recreational opportunities that may be compatible with the project site. Recreational opportunities that will be reviewed include public walking trails, potential restrooms, shade structure, benches, and interpretive signs.

Project Construction Schedule

Construction of the proposed project is estimated to require approximately 36 months, depending on weather conditions and other variables. Construction is currently anticipated to begin in the fall of 2022.

Potential Environmental Impacts

The EIR will assess and disclose the reasonably foreseeable direct, indirect, and cumulative impacts that would likely result from the construction and operation of the proposed project. Potential impacts to resources listed in Appendix G of the CEQA Guidelines, as amended on December 28, 2018, are summarized below. The EIR will identify mitigation measures if necessary to avoid, minimize, and offset potentially significant impacts of the project. The EIR also will describe the alternatives screening analysis conducted for the proposed project, and evaluate alternatives to the proposed project that would avoid, minimize, and offset potentially significant impacts of the project while attempting to meet the objectives of the proposed project.

Aesthetics

The project area is not officially designated as a scenic vista; however, open space and conservation areas are considered important scenic resources within the County of Orange and the adjacent City of Irvine. Replacing the dam and enlarging the reservoir would alter the views of the project site from surrounding public vantage points, including the Crean Lutheran High School Athletic Complex immediately below the reservoir and the adjacent residential areas, parks, and roadways. Potential direct and indirect visual impacts could occur both during construction and after the reservoir is enlarged and infrastructure is built and operational. The EIR will identify the visible changes to scenic resources, scenic vistas, and visual character of the project area due to the reservoir enhancement and development of ancillary facilities associated with the proposed project within the viewshed. Further, the EIR will evaluate the potential increase in light and glare from the proposed project on motorists traveling along Portola Parkway, SR-133 and neighboring sensitive receptors.

Agriculture and Forestry Resources

The project site includes the existing Syphon Reservoir and surrounding open space area. While the project site is zoned as General Agriculture by the County of Orange, the General Agricultural District allows for low-intensity uses that have predominantly open space character, such as Syphon Reservoir. The EIR will analyze the potential impacts of project implementation on farmland or forestry resources, as well as conflicts with zoning designations for such land uses.

Air Quality

The project site is located within the South Coast Air Basin, which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). Deconstruction of the existing reservoir and construction of a new reservoir and ancillary facilities would generate temporary emissions from construction equipment exhaust, earth movement, construction workers' commute, and material hauling. Operational activities associated with the proposed project could generate air pollutants from employee commuting, truck deliveries and operation of stationary equipment. The EIR will evaluate the generation of air pollutants during construction and operational activities associated within the proposed project. Conflicts or obstructions with the implementation of the SCAQMD Air Quality Plan will also be discussed in the EIR. Furthermore, the exposure of sensitive receptors to pollutant concentrations or other emissions such as odors will be analyzed.

Biological Resources

Sensitive biological resources at the project site could be significantly affected by construction of the proposed project and the long-term seasonal water elevation changes that would result during operation of an enlarged reservoir. The EIR will evaluate the potential for construction and operation of the proposed project to affect biological resources and will discuss local ordinances, as well as state and federal regulations governing biological resources. In particular, consistency with the NCCP/HCP will be discussed in the EIR. Such analysis will incorporate updated spatial data from the California Natural Diversity Database, the proposed project's Biological Resources Technical Report, various surveys conducted at the project site for rare plants, natural communities, and special-status species, and will address recent changes to the status of federal and State listed species.

A large portion of the project site was previously used by the Transportation Corridor Agencies (TCA) for mitigation lands for impacts associated with the Eastern Transportation Corridor Project. When IRWD acquired Syphon Reservoir from the Irvine Company, the Conveyance Agreement included a Grant Deed with use restrictions that provide for the conservation of biological resources associated with that mitigation. The EIR will evaluate the impacts associated with biological resources within areas included in the Grant Deed. IRWD will continue ongoing consultation with both U.S. Fish and Wildlife Service and California Department of Fish and Wildlife regarding consistency with both the NCCP/HCP and the Grant Deed and appropriate mitigation. A modification to the Grant Deed could be pursued consistent with these consultations.

Cultural Resources

The analysis included in the EIR will document and evaluate the existing dam and associated facilities, which would be deconstructed as part of the project. Constructed in 1949, the existing facilities are over 45 years of age and therefore meet the California Office of Historic Preservation's threshold for consideration as a historical resource. The proposed project also would include excavation activities that could uncover previously known or unknown historical or archaeological resources, or unknown human burial resources. The EIR will assess the potential effects on cultural resources in the project area as a result of the proposed dam replacement, reservoir enlargement and construction of ancillary facilities.

Energy

The proposed project could require significant amounts of energy during construction and operation of the proposed facilities. The EIR will quantitatively evaluate energy demand from construction equipment, haul trucks, vendor trucks, and construction workers. The EIR will also quantify the Project's anticipated operational energy needs, including direct consumption of electricity to pump recycled water and fuel needed for maintenance operations. Any construction of new or expanded energy related facilities could result in environmental effects. The EIR will assess the potential impacts of the proposed project on energy use.

Geology and Soils

The project site is located in a seismically active region. Active or potentially active faults that could potentially affect Syphon Reservoir include the San Joaquin Hills, Chino, Elsinore, Newport-Inglewood, Puente Hills, San Jacinto, and San Andreas faults; the closest is Puente Hills, which is located 4.3 miles away from the project site. Previous studies indicate that two faults are located within the project site, one of which runs directly beneath the existing reservoir and dam.¹ Neither fault is considered active or potentially active. The proximity of these faults places the project area at potential risk for geological hazards. IRWD recently approved the Syphon Reservoir Geotechnical Investigations Project, which will be completed prior to designing the proposed project. The Geotechnical Investigations Project will characterize the geologic and geotechnical conditions of the Syphon Reservoir site and verify the location and historic activity of the onsite faults. The Geotechnical Investigations Project will also help develop criteria for the proposed project that will be used to design for potential geologic hazards.

Construction and operation of the proposed project could be subject to potential seismic hazards including surface fault rupture, strong seismic shaking, soil liquefaction, and geologic hazards such as subsidence, soil erosion, ground collapse, and expansive soil. The EIR will evaluate the potential seismic and geologic hazards that could affect the proposed facilities. The proposed project and its appurtenant facilities would be designed to safely accommodate these potential hazards and the structures would meet and exceed the latest state and federal safety standards.

Greenhouse Gas Emissions

In addition to air emissions, the proposed project would result in the emission of greenhouse gases from construction and operational activities. Construction activities could generate greenhouse gas emissions from equipment exhaust, construction workers' commutes, and material hauling. Operational activities could generate emissions from employee commuting, truck deliveries, and stationary equipment. The EIR will evaluate the contribution of construction and operational greenhouse gas emissions to global climate change. The EIR will evaluate the proposed project's consistency with state and local regulatory requirements and regulations.

Hazards and Hazardous Materials

A database search of hazardous materials sites using the online Department of Toxic Substances Control's EnviroStor and State Water Resources Control Board (SWRCB) GeoTracker databases showed that Syphon Reservoir is not located on a hazardous materials site. However, construction activities associated with the proposed project could result in the release of hazardous materials. Additionally, the proposed disinfection facilities could result in use, storage and/or transport of potentially hazardous materials to and

¹ GEI Consultants, Inc. 2012. Syphon Reservoir Expansion Engineering Feasibility Study, Constructability Analysis.

from the project site. The proposed project would be designed to safely store any potentially hazardous materials. The EIR will assess the potential for storing and transporting hazardous materials associated with the operation of proposed facilities, and the upset/accident condition involving the release of hazardous materials into the environment, including the emission of hazards within 0.25 mile of a school. Further, the proposed project may result in increased truck load intensities that could increase traffic and physically interfere with an adopted emergency response plan. The EIR will also evaluate the potential for interference with an adopted emergency response plan to occur and wildland fire threats due to project implementation.

Hydrology and Water Quality

The proposed project may change local drainage patterns at the project site, which could impact water quality, volume, and surface runoff, as well as groundwater resources. The EIR will describe relevant federal, state, and local regulations and agencies, including provisions of the federal Clean Water Act and the permitting and regulatory authority of the Regional Water Quality Control Board and the SWRCB. The EIR will identify potential seiche and dam inundation hazard zones in the project area, as well as stormwater quality protection measures required during construction and operation of proposed project.

Land Use and Planning

The project site is designated as Open Space Reserve and is zoned as General Agriculture by the County of Orange. The project area contains specialized development requirements as required by various regulatory agencies and the City of Irvine. The EIR will evaluate the proposed project's potential to conflict with all applicable plan, policies, and regulations as well as any deed restrictions imposed on surrounding mitigation lands as described above under Biological Resources.

Mineral Resources

While the project site is not identified as a known mineral resource area and does not have a history of mineral extraction uses, the EIR will include an evaluation of the project's potential to result in the loss of availability of a known mineral resource.

Noise

Implementation of the proposed project would require construction and operation of project components that would generate noise and vibration. Construction activities could be a significant source of temporary noise and vibration from trucking operations and the use of heavy construction equipment (e.g., drill rigs, graders, cranes, and frontend loaders). During project operation, fixed sources of noise could be established. The EIR will describe the local noise policies and ordinances. The EIR will quantify potential noise and vibration levels associated with construction and operation of the proposed project for comparison to standards and thresholds established in local noise policies and ordinances.

Population and Housing/Growth Inducement

The proposed project does not include the construction of new housing. As such, the proposed project would not directly induce population growth. The proposed project will be built to enable IRWD to meet the community's needs for recycled water. The proposed project is not expected to indirectly result in construction of new housing or increase the local population; the workforce for construction of the proposed project is anticipated to derive from the existing labor pool in Orange County, and operation of the proposed project is not expected to create new long-term employment opportunities. However, the

EIR will address the proposed project's potential to induce indirect population growth due to expansion of water storage capacity and the corresponding ability to store recycled water at Syphon Reservoir. The EIR will evaluate the proposed project's potential to indirectly induce growth in the region.

Public Services

The proposed project would construct a new recycled water storage facility but is unlikely to affect demand for other public services or to require other new or expanded public facilities. The EIR will assess the potential for the proposed project to affect police and fire protection services, schools, and parks.

Recreation

In the project vicinity, the City of Irvine and Orange County Parks (OC Parks) maintain parks and provide recreational services. The nearest recreational facility is the Crean Lutheran High School Athletic Complex and Mockingbird Park located adjacent and approximately 0.25-mile south of the project site, respectively. The EIR will analyze potential impacts to existing local recreational resources. The EIR also will evaluate any potential recreational opportunities that may be compatible with the project site and implemented as a component of the proposed project.

Traffic and Transportation

Construction of the proposed project could affect traffic on local roadways as a result of vehicle trips associated with hauling of material and equipment, increased demand for parking to serve construction workers, and increase in traffic hazards caused by construction activities. In addition, operation of the proposed project could introduce vehicle trips to the project area for delivery of disinfection materials and operation and maintenance vehicles. The EIR will evaluate the potential impact to traffic and circulation due to construction-related vehicle trips and operational vehicle trips on local and regional roadways.

Tribal Cultural Resources

IRWD is conducting AB 52 tribal consultation with the following three Native American Tribes who have requested to be informed of activities initiated by IRWD: San Gabriel Band of Mission Indians, Gabrieleño Band of Mission Indians – Kizh Nation, and Juaneño Band of Mission Indians/Acjachemen Nation. There is a potential for the proposed project to affect tribal cultural resources during ground-disturbing activities associated with construction of the proposed project. The EIR will evaluate potential impacts to tribal cultural resources and incorporate the results of AB 52 consultations into the analysis.

Utilities and Service Systems

The EIR will evaluate whether construction and operation of the proposed project could result in impacts to existing public utilities, such as water or sewage treatment, storm water drainage, and solid waste disposal. The proposed project would not require additional water facilities beyond those identified in the project description; however, development of the proposed project may modify the mix of water supplies used within the IRWD service area. The proposed project is not anticipated to increase impervious surfaces that can result in increases in storm water runoff, and the existing storm drain in Portola Parkway has sufficient capacity for discharges from the proposed enlarged reservoir as described previously. As such, additional storm water drainage facilities would not be required. Construction activities associated with the proposed project could increase construction waste that could be required to be placed in a landfill, subject to solid waste regulations.

Wildfire

The project site is located within an undeveloped and vegetated open space area. The project site area is located within a State/Federal Responsibility Area, Very High Fire Hazard Severity Zone. The project site includes slopes that surround the existing reservoir and are susceptible to prevailing winds. During construction, equipment and on-site diesel fuel could pose a risk to wildfire with possible ignition sources such as internal combustion engines, gasoline-powered tools, and equipment that could produce a spark, fire, or flame. The use of spark-producing construction machinery within fire risk areas such as the project area could expose temporary project workers and contractors to pollutant concentrations from a wildfire or the uncontrolled spread of wildfire. Additional water available for firefighting would be available as a result of the additional recycled water stored in the proposed enlarged reservoir. The EIR will evaluate potential impacts of wildfires due to implementation of the proposed project.

Present Land Use/Zoning/General Plan Designation:
Orange County GP: Open Space Reserve; Unincorporated Orange County Zoning: A1 (General Agriculture); Orange County NCCP Reserve
Project Description: (please use a separate page if necessary)

The proposed Syphon Reservoir Improvement Project (proposed project) would increase the capacity of the existing recycled water reservoir to serve the community's seasonal and future recycled water needs. The reservoir capacity would increase from approximately 500 acre-feet (AF) to 5,000 AF. As a part of the reservoir expansion, the existing engineered dam would be replaced with a new engineered dam that would meet and exceed the latest safety standards.

Syphon Reservoir Improvement Project

Summary

SCH Number	2019080009
Lead Agency	Irvine Ranch Water District
Document Title	Syphon Reservoir Improvement Project
Document Type	NOP - Notice of Preperation
Received	8/1/2019
Present Land Use	Orange County GP: Open Space Reserve; Unincorporated Orange County Zoning: A1 (General Agriculture); Orange County NCCP Reserve

Document Description The proposed Syphon Reservoir Improvement Project (proposed project) would increase the capacity of the existing recycled water reservoir to serve the community's seasonal and future recycled water needs. The reservoir capacity would increase from approximately 500 acre-feet (AF) to 5,000 AF. As a part of the reservoir expansion, the existing engineered dam would be replaced with a new engineered dam that would meet and exceed the latest safety standards.

Attachment 3: Public Notice of Scoping Meeting

This Notice of Preparation (NOP) has been prepared to notify agencies and interested parties that Irvine Ranch Water District (IRWD), as the lead agency, will prepare an Environmental Impact Report (EIR) pursuant to the California Environmental Quality Act (CEQA) for the Syphon Reservoir Improvement Project (proposed project). The proposed project would be built within the IRWD service area at the site of the existing Syphon Reservoir, which is currently a recycled water storage reservoir. Syphon Reservoir is located in unincorporated County of Orange, California, on the northeast side of Portola Parkway between Bee Canyon Access Road and State Route 133, where the majority of the property bounded by these thoroughfares is owned by IRWD. The proposed project would increase the capacity of the existing recycled water reservoir to serve the community's seasonal and future water needs. As a part of the reservoir expansion, the existing engineered dam would be replaced with a new engineered dam that would meet and exceed the latest safety standards. The new engineered dam would increase the reservoir capacity from approximately 500 acre-feet (AF) to 5,000 AF.

IRWD is soliciting comments from responsible and trustee agencies as well as interested parties as to the scope and content of the environmental information to be included in the EIR. In accordance with CEQA, agencies are requested to review the project description provided in the NOP and provide comments on environmental issues related to the statutory responsibilities of the agency. The EIR will be issued by IRWD when considering approval of the proposed project as well as any related discretionary approvals.

A 45-day public review period for the NOP begins on **August 2, 2019** and ends **September 16, 2019**. Copies of the NOP are available at Heritage Park Library located at 14361 Yale Ave, Irvine CA 92604; and online at the IRWD Web Site (<http://www.irwd.com/doing-business/environmental-documents>).

IRWD will hold a public scoping meeting on **August 21, 2019, 6:00 p.m.** at IRWD's Main Office (15600 Sand Canyon Avenue Irvine, CA 92618, Multi-Purpose Room) to receive comments and suggestions about the issues to be included in the EIR. The scoping meeting will include a brief presentation, providing an overview of the proposed project. After the presentation, public comments will be accepted either orally or in writing at the scoping meeting. Comment forms will be supplied for those who wish to submit written comments at the meeting; written comments will also be accepted by IRWD anytime during the 45-day review period until the **4:00 p.m. deadline on September 16, 2019**. Please send your comments to the mailing address or email address shown below. Include a return address or email address and a contact name for your agency or party with your comments.

Aviso de Preparación de un Reporte de Impacto Ambiental para el Proyecto de Mejora de la Reserva Syphon

Este Aviso de Preparación (NOP, por sus siglas en inglés) ha sido preparado para notificar a las agencias y partes interesadas acerca de que el Irvine Ranch Water District (IRWD) (Distrito de Agua Irvine Ranch), como agencia líder, preparará un Reporte de Impacto Ambiental (EIR, por sus siglas en inglés) de acuerdo con la Ley de Calidad Ambiental de California (CEQA, por sus siglas en inglés) para el Proyecto de Mejora de la Reserva Syphon (proyecto propuesto). El proyecto propuesto se construirá dentro del área de servicio del IRWD en el sitio donde se encuentra la Reserva Syphon, que actualmente es una reserva de almacenamiento de agua reciclada. La Reserva Syphon se encuentra en el Condado no incorporado de Orange, California, en el lado Noreste de Portola Parkway entre Bee Canyon Access Road y State Route 133, donde la mayor parte de la propiedad delimitada por estas carreteras es propiedad del IRWD. El proyecto propuesto aumentará la capacidad de la reserva de agua reciclada existente para atender las necesidades de agua futuras y estacionales de la comunidad. Como parte de la expansión de la reserva, la reserva existente sería reemplazada por una represa nuevamente diseñada que cubriría y excedería las últimas normas de seguridad. La nueva represa aumentaría la capacidad de la reserva de unos 500 acres-pies (AF, por sus siglas en inglés) a 5,000 AF.

El IRWD solicita comentarios de agencias responsables y administradoras así como de partes interesadas respecto del alcance y contenido de la información ambiental para incluir en el EIR. De acuerdo con la CEQA, las agencias deben revisar la descripción del proyecto provista en el NOP y ofrecer comentarios sobre asuntos ambientales relacionados con las responsabilidades legales de la agencia. El EIR será utilizado por el IRWD al considerar la aprobación del proyecto propuesto así como aprobaciones discrecionales relacionadas.

El período de revisión pública de 45 días para el NOP comienza el **2 de agosto de 2019** y termina el **16 de septiembre de 2019**. Hay disponibles copias del NOP en la Biblioteca Heritage Park ubicada en 14361 Yale Ave, Irvine CA 92604; y en línea en el sitio web del IRWD (<http://www.irwd.com/doing-business/environmental-documents>).

El IRWD realizará una reunión pública el **21 de agosto de 2019 a las 6:00 p.m.** en la Oficina Central del IRWD (15600 Sand Canyon Avenue Irvine, CA 92618, Salón de Usos Múltiples) para recibir comentarios y sugerencias acerca de los asuntos para incluir en el EIR. La reunión incluirá una breve presentación, que brindará una descripción general del proyecto propuesto. Tras la presentación, se aceptarán comentarios públicos en forma oral o escrita. A quienes deseen brindar comentarios escritos en la reunión se les proporcionarán formularios para comentarios; también el IRWD aceptará comentarios escritos en cualquier momento durante el período de revisión de 45 días, hasta las **4:00 p.m. del 16 de septiembre de 2019**. Envíe sus comentarios a la dirección postal o por correo electrónico a la dirección que se indica a continuación. Incluya una dirección de retorno o dirección de correo electrónico y nombre de contacto de su agencia o grupo con sus comentarios.

사이런 리저저 개선 프로젝트에 대한
환경영향정보서준비 통지서

본 통지서(NOP)는 주로 기관인 이비안 런치 수도국에서 캘리포니아 환경보호법(CEQA)에 따라 사이런 리저저 개선 프로젝트(개발 프로젝트)에 대한 환경영향보고서(EIR)를 작성하는 데 대하여 기관들과 이해 관계자들에게 통지하기 위하여 작성되었습니다. 개발 프로젝트는 현재 재환용 상수 수로를 사용하고 있는 기존의 사이런 리저저 부지에 위치한 IRWD 서비스 지역 이내에 건설될 것입니다. 사이런 리저저는 캘리포니아 주 지체제로서 인위적이지 않은 오렌지 카운티의 Bee Canyon Access Road와 State Route 133 사이에 있는 Portola Parkway의 북동쪽에 위치해 있고 이치던 주로 도로로 카운티의 부지는 IRWD의 소유입니다. 지역 사회의 개발 수요와 향후 상수 수로를 공급하기 위해 개발 프로젝트의 지역 재환용 리저저 용량을 늘릴 것입니다. 리저저 확장 계획으로 인해 기존 기준을 맞추거나 늘기하는 새로운 공학적 필요로 기존의 공학적 팀을 교체할 것입니다. 새로운 공학적 팀은 리저저의 용량을 약 300 에이커 피트(AF)로부터 5,000 에이커 피트(AF)까지 늘리게 됩니다.

IRWD는 EIR에 포함시킬 환경 정보의 범위와 내용에 대하여 이해 관계자들과 책임지는 기관과 섹터 기관들로부터 의견을 요청하고 있습니다. 기관들은 CEQA에 근거하여 NOP에 제공된 프로젝트 설명을 검토해 보고 해당 기관들의 법적 책임에 관련된 환경 문제에 대하여 의견을 제출해야 합니다. IRWD는 개발 프로젝트의 승인과 관련된 재환용 승인을 고려하는 측면에서 EIR을 이용합니다.

NOP 공표 45일 동안 진행되며 **2019년 8월 2일**에 시작하여 **2019년 9월 16일**에 마무리 됩니다. 14361 Yale Ave, Irvine CA 92604에 위치한 역사공원도서관(Heritage Park Library)에서 NOP 사본을 열람할 수 있으며 온라인에서 BMD 웹사이트 (<http://www.irwd.com/doing-business/environmental-documents>)에서 NOP 사본을 가져올 수 있습니다.

EIR에 포함시킬 문제에 대한 의견과 질문을 받게 위해, IRWD는 **2019년 8월 21일 오후 6시**에 IRWD의 본사(15600 Sand Canyon Avenue Irvine, CA 92618, 다목적실/ Multi-Purpose Room)에서 공공 회의의 열릴 것입니다. 회의에는 간단한 프레젠테이션을 포함하여 개발 프로젝트의 개요를 제공할 것입니다. 프레젠테이션을 마친 후 질문 회의에서 구두 또는 서면 형식으로 공공 의견을 받게 됩니다. 회의에서 서면 의견을 제출하려는 분들을 위하여 의견 양식을 제공해 드립니다. 또한, 서면 의견은 마칠일인 **2019년 9월 16일 오후 4시**까지 45일 동안의 검토 기간 중 언제든지 발송 가능할 것입니다. 우편 주소 또는 아래의 이메일 주소로 소중히 의견을 보내주세요 바랍니다. 최신 주소 또는 이메일 주소와 기관 또는 단체와 연락처 이름도 함께 보내주세요.

此項目準備通知(NOP)旨在通知各個機構及相關單位，瞭解虹吸水池(虹吸水池)作為儲水庫，即將遵照《加州環境品質法》(CEQA)的要求，對修改虹吸水池(Syphon Reservoir)改善項目(擬議計劃)製作一份環境影響報告(EIR)。擬議計劃將在 IRWD 服務區範圍內修改虹吸水池庫址並建造。虹吸水池目前為回收水儲水池，位於加州橙縣與聖地亞哥地區，虹吸水池 Canyon 聯絡道和 133 號州道之間的 Portola 公路東北面，在這裡，由主要幹線鐵路的地產大部分屬於 IRWD 所有。擬議計劃將擴大現有虹吸水池庫容容量，以便滿足社區季節性的用水需求以及未來的用水需求。作為水庫擴建的一部分，現有的工程水壩將由符合並超越最新安全標準的全新工程水壩取代，新建的工程水壩將比水庫容量從大約 500 英畝英尺(AF)提升到 5,000 英畝英尺(AF)。

IRWD 目前正在召集負責機構、委任機構和相關各方的意見，以便確定 EIR 的涵蓋範圍以及將納入 EIR 中的多項議題內容。根據 CEQA 的規定，機構需要審查 NOP 中提供的專案說明，並針對與本機構相關議題的法定職責提供意見。IRWD 將在考慮是否批准該專案以及相關授權時用到 EIR。

NOP 將有 45 天的公審期，於 **2019 年 8 月 2 日**開始，並在 **2019 年 9 月 16 日**結束。您可前往 14361 Yale Ave, Irvine CA 92604 的 Heritage Park 圖書館領取 NOP 副本，或訪問 IRWD 網站，在 IRWD 網站上在線獲取取碼(<http://www.irwd.com/doing-business/environmental-documents>)。

IRWD 將在 **2019 年 8 月 21 日下午 6 點**，在 IRWD 的辦公室 (15600 Sand Canyon Avenue Irvine, CA 92618，多用途室)舉行內容定議會，聽取各方就 EIR 應涵蓋這些問題和問題地的意見和建議。範圍界定會議將提供簡短的展示，並聽取聽眾專家提出陳述。在展示過後，範圍界定會議將歡迎公眾提供口頭或書面意見。IRWD 將提供公眾提供意見表格並在會議上有關提交書面意見的參與者。IRWD 也將在 **2019 年 9 月 16 日下午 4 點截止**的 45 天公眾審判期內與與期取書面意見，請將您的意見寄送到以下地址或發送以下電子郵件。並請在提交意見前聯絡我們所稱的機構、各方的相關地址或聯絡地址以及聯絡人資訊。

اعلان امامتاری یک گزارش زیست محیطی
برای پروژه بهبود مخزن سيفون

این اعلان امامتاری (NOP) تهیه شده است تا به ازنرها و شرکای ذی نفع اطلاع داده شود متعلق به مزرعه اروین (IRWD)؛ به عنوان ازن اصلی، برای گزارش ازن زیست محیطی (EIR) پرو قنون کیفیت زیست محیطی کالیفرنیا (CEQA) برای پروژه بهبود مخزن سيفون (پروژه پیشنهادی) آماده خواهد کرد. پروژه پیشنهادی در ناحیه خدمتکاران IRWD در محل فعلی مخزن سيفون، که در حال حاضر یک مخزن نگهداری آب بارشقی است، ساخته خواهد شد. مخزن سيفون در امتداد تانگه آرایج در کالیفرنیا در سمت شمال شرقی پورتولا پارکوی بین جاده می کیون کس و جاده باثلی 133 واقع شده است. بیشتر امکانات ساخته شده توسط این شاعرانها در تانگه IRWD است. پروژه پیشنهادی، ظرفیت مخزن آب بارشقی فعلی را افزایش خواهد داد تا پاسخگوی نیازهای آبی فعلی و آبی جامعه باشد. سد همسند شده فعلی، به عنوان بخشی از گسترش مخزن، با یک سد همسند شده جدید که از آخرین استانداردهای ایمنی برخوردار بوده و بالاتر از آن ها باشد، جایگزین خواهد شد. سد همسند شده جدید ظرفیت مخزن را از حدود 500 اکر فوت (AF) به 5000 اکر فوت افزایش خواهد داد.

IRWD از ازنهای مسئول و مورد اعتماد و همچنین شرکای ذی نفع درخواست کرده است که نظرات خود را درباره حدود و محتوای اطلاعات زیست محیطی، تا لام است در EIR گنجانده شود اعلام کنند. در رابطه با CEQA، از ازنها درخواست شده است که شرح پروژه در NOP را بررسی کرده و نظرات خود را درباره مسائل مرتبط با مسئولیتها قوتی از ازن اعلام کنند. EIR هنگام بررسی موافقت با پروژه پیشنهادی و همچنین هرگونه موافقت مرتبط در صورت صلاحدید، توسط IRWD استفاده خواهد شد.

نور بررسی عمومی 45 روزه برای NOP از **2 اگوست 2019** آغاز شده و در **16 سپتامبر 2019** پایان میپذیرد. رونوشتهایی از NOP در کتابخانه برنیج پارک واقع بر 14361 Yale Ave, Irvine CA 92604 و در سایت www.irwd.com/doing-business/environmental-documents در دسترس هستند.

IRWD جهت دریافت نظرات و پیشنهادت درباره مسائلی که لازم است در EIR گنجانده شوند، در روز **2 اگوست 2019 ساعت 6:00 بظرف یک جلسه** عمومی تعیین حدود نظر اصلی 15600 خیابان سند کانون اروین، کالیفرنیا 92618، اتاق چندمنظوره برگزار میکند. تعیین حدود شامل یک از آن گونه می شود که مروری کلی بر پروژه پیشنهادی خواهد داشت پس از ارائه نظرات مردم، مردم در صورت نشانی با کسی در جلسه تعیین حدود توافق خواهد شد. فرهای توافق خواهی به کسانی که تمایل دارند نظرات خود را در صورت نشانی در جلسه اعلام کرده ارائه خواهد شد. به علاوه IRWD هواره نظرات کسی را در طول دوره بررسی 45 روزه با پذیرش فرهای مهلت، **16 اگوست 2019** دریافت خواهد کرد. لطفاً نظرات خود را در نشانی پستی با نشانی ایمیل درج شده در پایین ارسال کنید. به همراه نظرات خود، یک نشانی باکس یا نشانی ایمیل و یک نام مستطب برای ازن یا طرف در نظر در نظر گرفته شده کنید.

Thông Báo Về Việc Lập Báo Cáo Đánh Giá Tác Động Môi Trường
cho Dự Án Cải Thiện Hồ Chứa Nước Syphon

Thông Báo Về Việc Chuẩn Bị (NOP) này nhằm thông báo cho các cơ quan và các bên liên quan rằng Thủy Cục Irvine Ranch (IRWD), với vai trò là cơ quan điều hành, sẽ chuẩn bị một Báo Cáo Đánh Giá Tác Động Môi Trường (EIR) theo Đạo Luật và Chất Lượng Môi Trường California (CEQA) cho Dự Án Cải Thiện Hồ Chứa Nước Syphon (sau đây được gọi tắt là dự án để xuất). Dự án để xuất sẽ được xây dựng trong khu vực phục vụ của IRWD tại vị trí hiện tại của Hồ Chứa Nước Syphon, một hồ chứa nước tái chế. Hồ Chứa Nước Syphon nằm tại phần chứa thành lập chính thức của Quận Orange, California, ở phía đông bắc của Portola Parkway giữa Đường Bee Canyon và Xa lộ Tiểu bang 133, nơi phần lớn tài sản trong phạm vi các đường phố này thuộc sở hữu của IRWD. Dự án để xuất sẽ giúp tăng công suất của hồ chứa nước tái chế hiện tại để phục vụ các nhu cầu nước theo mùa và trong tương lai của công đồng. Trong công việc mở rộng hồ chứa, đập mới hiện tại sẽ được thay thế bằng một đập nước mới đập ứng và vượt các tiêu chuẩn an toàn mới nhất. Đập nước mới sẽ làm tăng công suất của hồ chứa từ 500 mẫu-feet (AF) lên 5.000 AF.

IRWD đang lấy ý kiến từ các cơ quan có trách nhiệm và ủy thác cũng như các bên liên quan về phạm vi và nội dung của các thông tin môi trường được đưa vào EIR. Theo CEQA, các cơ quan được yêu cầu xem xét mô tả dự án được nêu trong NOP và đưa ra ý kiến về các vấn đề môi trường liên quan đến trách nhiệm theo luật định của cơ quan. EIR sẽ được IRWD sử dụng khi xem xét phê duyệt dự án để xuất cũng như mọi phê duyệt liên quan theo nhiệm vụ của IRWD.

Thời hạn xem xét NOP công khai trong 45 ngày được bắt đầu từ ngày **02 tháng 8 năm 2019** và kết thúc vào ngày **16 tháng 9 năm 2019**. Các bản sao NOP hiện có sẵn tại Thư viện Heritage Park ở địa chỉ 14361 Yale Ave, Irvine CA 92604; và được đăng trực tuyến trên trang web của IRWD (<http://www.irwd.com/doing-business/environmental-documents>).

IRWD sẽ tổ chức một cuộc họp đánh giá công khai vào lúc **6 giờ chiều ngày 21 tháng 8 năm 2019** tại Văn phòng IRWD (Phòng Đa năng, 15600 Sand Canyon Avenue Irvine, CA 92618) để tiếp nhận các ý kiến và gợi ý về các vấn đề được nêu trong EIR. Cuộc họp đánh giá sẽ có một bản trình bày ngắn với các thông tin tổng quan về dự án để xuất. Sau khi trình bày, chúng tôi sẽ tiếp nhận các ý kiến của người dân trực tiếp hoặc bằng văn bản từ cuộc họp đánh giá. Những người muốn gửi ý kiến bằng văn bản thì cuộc họp sẽ được cung cấp các mẫu in bản trình bày ý kiến. Các ý kiến bằng văn bản cũng sẽ được IRWD chấp nhận vào bất kỳ lúc nào trong thời hạn xem xét 45 ngày cho tới **4:00 chiều ngày 16 tháng 9 năm 2019**. Quý vị hãy gửi ý kiến của mình cho chúng tôi theo địa chỉ bưu tín hoặc email dưới đây. Hãy ghi địa chỉ nhận thư trả lời hoặc địa chỉ email và tên người liên lạc của cơ quan hoặc nhóm của quý vị hoặc cùng với ý kiến của mình.

Foothill Ranch, CA 92610
via email rick.zarski@associa.us

Re: Stonegate Village Community Association

Dear Mr. Zarski,

We wanted the Stonegate Village Community Association Board of Directors to be among the first to know about our plans to increase the recycled water supply for the Irvine Ranch Water District service area. Recycled water is an important part of IRWD's water portfolio as it benefits all IRWD customers. In fact, we have successfully recycled water in this community for more than 50 years. It's a reliable, drought-proof source of non-drinking water that makes up about one-fourth of our water supply.

Recycled water is used to:

- Keep parks, medians, school athletic fields, public landscaping, and other open space areas green and beautiful;
- Provide additional water to fight wildfires throughout the region; and
- Supply commercial and industrial needs such as mixing concrete and cooling office buildings.

And because recycled water can be used for these purposes, more drinking water is available for all IRWD customers.

We are just now beginning the environmental review process for the long-planned Syphon Reservoir Improvement Project. This project will increase the recycled water storage capacity in the reservoir from 535 acre-feet to a proposed 5,000 acre-feet (1.6 billion gallons), allowing IRWD to use nearly 100% of the recycled water that we produce. You can follow our progress at syphonreservoirproject.com.

The first opportunity for the community to learn about the project and provide feedback is at an upcoming open house for what is known as the Notice of Preparation Scoping Meeting for the Environmental Impact Report (EIR). This is where you can let us know what you would like to be included in our analysis for the EIR.

Syphon Reservoir Improvement Project: Public Scoping Meeting Open House
Wednesday, August 21, 2019 at 6 p.m.
Irvine Ranch Water District in the Multi-Purpose Room
15600 Sand Canyon Avenue, Irvine, CA 92618

There will be additional opportunities to provide input on the project as well – when the draft EIR and final EIR are circulated for public comment and when the EIR is submitted to the IRWD Board for consideration of acceptance.

We would welcome the opportunity to make a presentation to the Stonegate Village Community Association Board, before the August 21 Public Scoping Meeting, so we can inform your directors about the project and answer any questions they may have.

Mr. Rick Zarski
August 8, 2019

Re: Woodbury Community Association

Dear Ms. Susan Seifen,

We wanted the Woodbury Community Association Community Association Board of Directors to be among the first to know about our plans to increase the recycled water supply for the Irvine Ranch Water District service area. Recycled water is an important part of IRWD's water portfolio as it benefits all IRWD customers. In fact, we have successfully recycled water in this community for more than 50 years. It's a reliable, drought-proof source of non-drinking water that makes up about one-fourth of our water supply.

Recycled water is used to:

- Keep parks, medians, school athletic fields, public landscaping, and other open space areas green and beautiful;
- Provide additional water to fight wildfires throughout the region; and
- Supply commercial and industrial needs such as mixing concrete and cooling office buildings.

And because recycled water can be used for these purposes, more drinking water is available for all IRWD customers.

We are just now beginning the environmental review process for the long-planned Syphon Reservoir Improvement Project. This project will increase the recycled water storage capacity in the reservoir from 535 acre-feet to a proposed 5,000 acre-feet (1.6 billion gallons), allowing IRWD to use nearly 100% of the recycled water that we produce. You can follow our progress at syphonreservoirproject.com.

The first opportunity for the community to learn about the project and provide feedback is at an upcoming open house for what is known as the Notice of Preparation Scoping Meeting for the Environmental Impact Report (EIR). This is where you can let us know what you would like to be included in our analysis for the EIR.

Syphon Reservoir Improvement Project: Public Scoping Meeting Open House
Wednesday, August 21, 2019 at 6 p.m.
Irvine Ranch Water District in the Multi-Purpose Room
15600 Sand Canyon Avenue, Irvine, CA 92618

There will be additional opportunities to provide input on the project as well – when the draft EIR and final EIR are circulated for public comment and when the EIR is submitted to the IRWD Board for consideration of acceptance.

We would welcome the opportunity to make a presentation to the Woodbury Community Association Board, before the August 21 Public Scoping Meeting, so we can inform your directors about the project and answer any questions they may have.

Ms. Susan Seifen
August 8, 2019

There will be additional opportunities to provide input on the project as well – when the draft EIR and final EIR are circulated for public comment and when the EIR is submitted to the IRWD Board for consideration of acceptance.

Irvine Ranch Water District has one of the most technologically advanced and safe recycled water systems in the nation. If you would like to learn more or to view a video about our recycled water system, visit www.irwd.com/services/recycled-water.

We are committed to a safe, high-quality project that ensures enough recycled water to meet the needs of our customers. You can also follow our progress at www.syphonreservoirproject.com and sign up for notifications. If you have any questions, please email us at info@irwd.com or call us at 949-453-5500.

SYPHON RESERVOIR IMPROVEMENT PROJECT

CEQA PUBLIC SCOPING MEETING
August 21, 2019

PRESENTATION OVERVIEW

- Purpose of Meeting
- California Environmental Quality Act (CEQA) Overview
- Irvine Ranch Water District (IRWD) Overview
- Project Description
- CEQA Process and Schedule
- Public Comments

PURPOSE OF MEETING

- **Initiate the CEQA Process**

- The Notice of Preparation published on August 2, 2019, initiated the environmental review process for the environmental impact report (EIR).
- 45-day public review and comment period.

- **Public Scoping**

- Scoping is early public consultation.
- Scoping is used to identify potential issues to address in the EIR.

- **Describe the Project**

- Increase the capacity of the existing Syphon Reservoir.
- Increase recycled water storage from approximately 500 to 5,000 acre-feet, to serve the community's seasonal and future water needs.

CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA)

Disclosure

Identifies potentially significant impacts to the environment

Decision-Making Tool

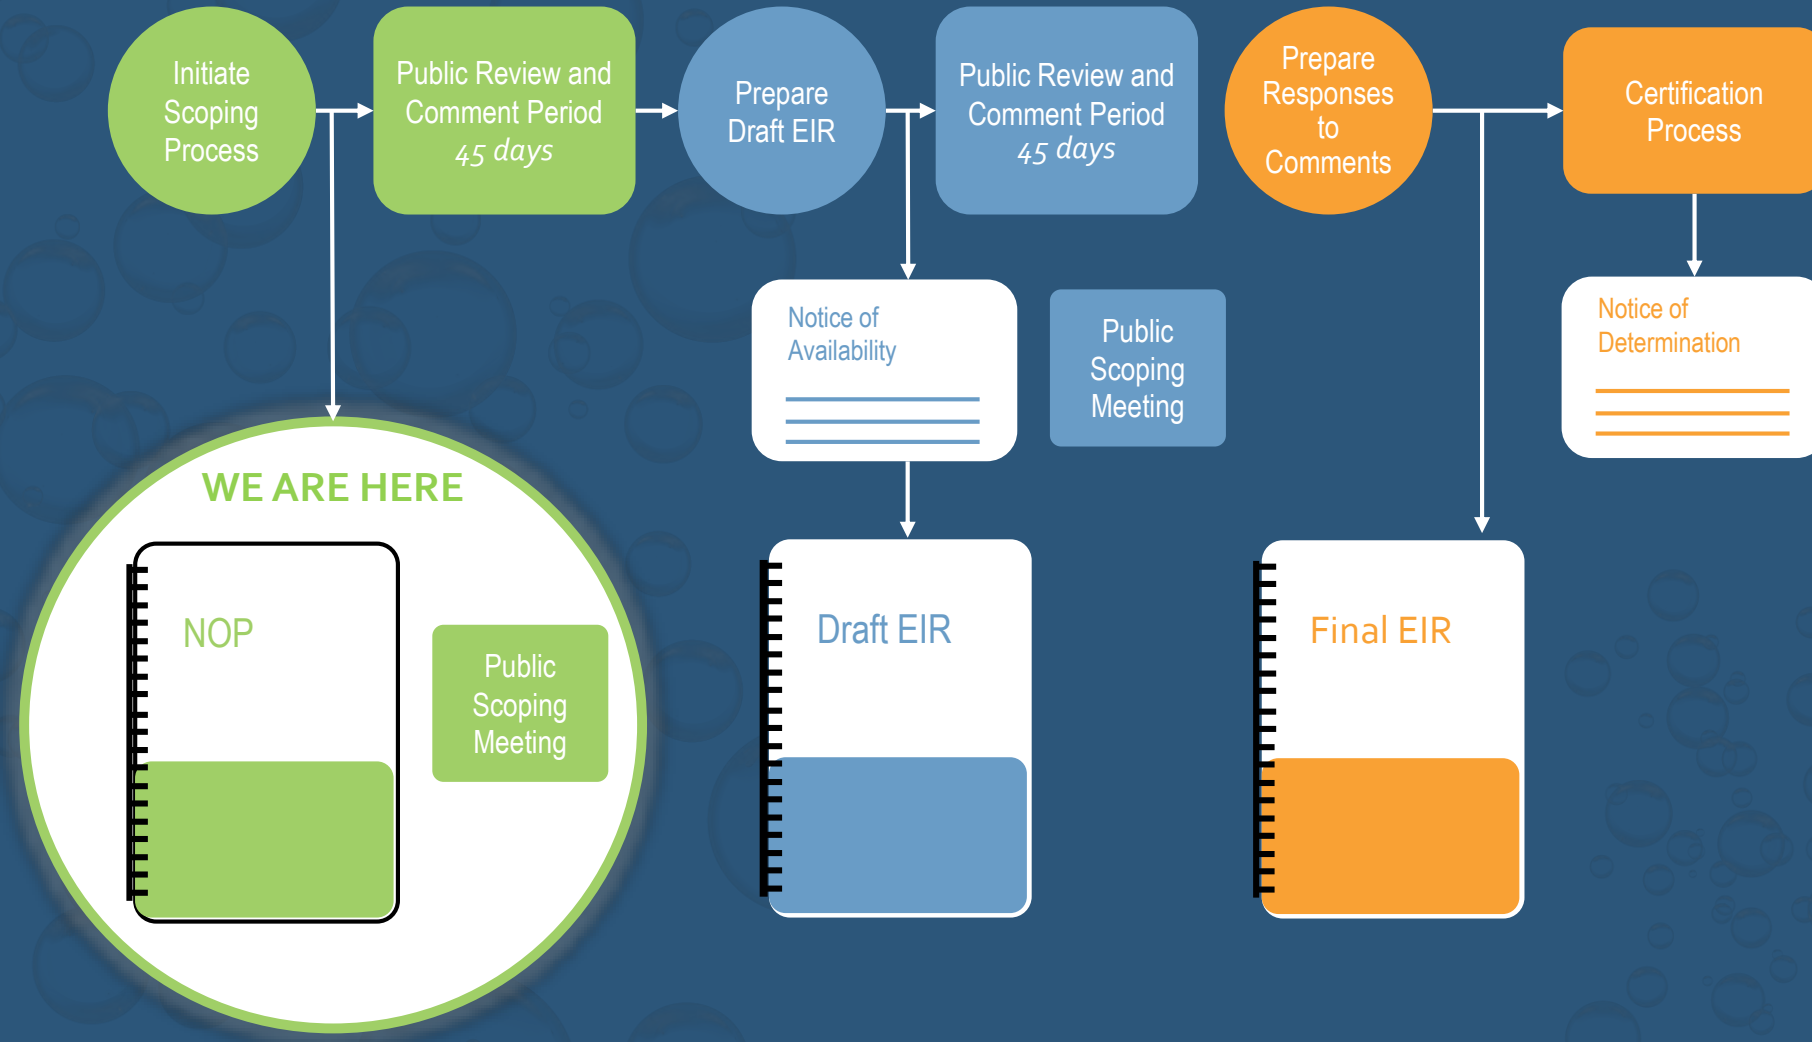

Requires public agencies to consider impacts prior to project approval

Reduce Impacts

Identifies feasible mitigation measures and alternatives

CEQA PROCESS FOR THE SYPHON RESERVOIR EIR

IRVINE RANCH WATER DISTRICT OVERVIEW

- Current Water Supply Sources
- 21% = treated groundwater
- 29% = clear groundwater
- 6% = local surface water
- 18% = imported surface water
- 26% = recycled water

- Recycled Water Production
- Michelson Water Recycling Plant
- Los Alisos Water Recycling Plant

- Recycled Water Storage
 - Storage is used when supply exceeds demand in winter months.
 - When storage is full, recycled water is discharged to the ocean.

IRWD RECYCLED WATER RESERVOIRS IN THE COMMUNITY

**RATTLESNAKE
RESERVOIR**

Built 1959

1,480 AF capacity

**SAN JOAQUIN
RESERVOIR**

Built 1966

3,036 AF capacity

**SAND CANYON
RESERVOIR**

Built 1912

960 AF capacity

**SYPHON
RESERVOIR**

Built 1949

578 AF capacity
5,000 AF (proposed)

EXISTING SYPHON RESERVOIR

Existing capacity = approx. 500 acre-feet.
Water levels fluctuate seasonally to balance recycled water supply and demand.

PROJECT LOCATION MAP

PROJECT OBJECTIVES

- **Improve local water supply reliability**
 - Store and use additional recycled water
 - Reduce purchases of more expensive, less-reliable imported water and make the community more self-sufficient.
- **Use 100% of recycled water produced by IRWD**
 - Reduce discharges of recycled water to the ocean.
 - Prepare for the future by storing more drought-proof water.
 - Keep parks, medians, athletic fields, public landscaping and golf courses green and beautiful.
- **Meet or exceed the latest safety standards**
 - Facilities are regulated by California Department of Water Resources, Division of Safety of Dams.

PROJECT SITE & PROPOSED PROJECT

DAM REPLACEMENT

- Replacement of the existing 59-foot-high engineered dam with a new 136-foot-high engineered dam with a 20-foot-wide crest.
- The new dam would be constructed primarily from on-site impermeable materials, although the importation of some specialty materials is anticipated.
- New dam would meet or exceed the latest safety standards.
- Project design will be peer reviewed through a rigorous process overseen by a technical advisory panel of respected reservoir experts.

RESERVOIR ENLARGEMENT

- The replacement dam would result in an increase in the reservoir's maximum water surface elevation from 376 feet to 456 feet above mean sea level and increase the reservoir's capacity from approximately 500 acre-feet (AF) to 5,000 AF.
- Expand the reservoir's shoreline and water surface area up to approximately 82 acres upstream of the dam.

TOPICS TO BE ANALYZED IN THE EIR

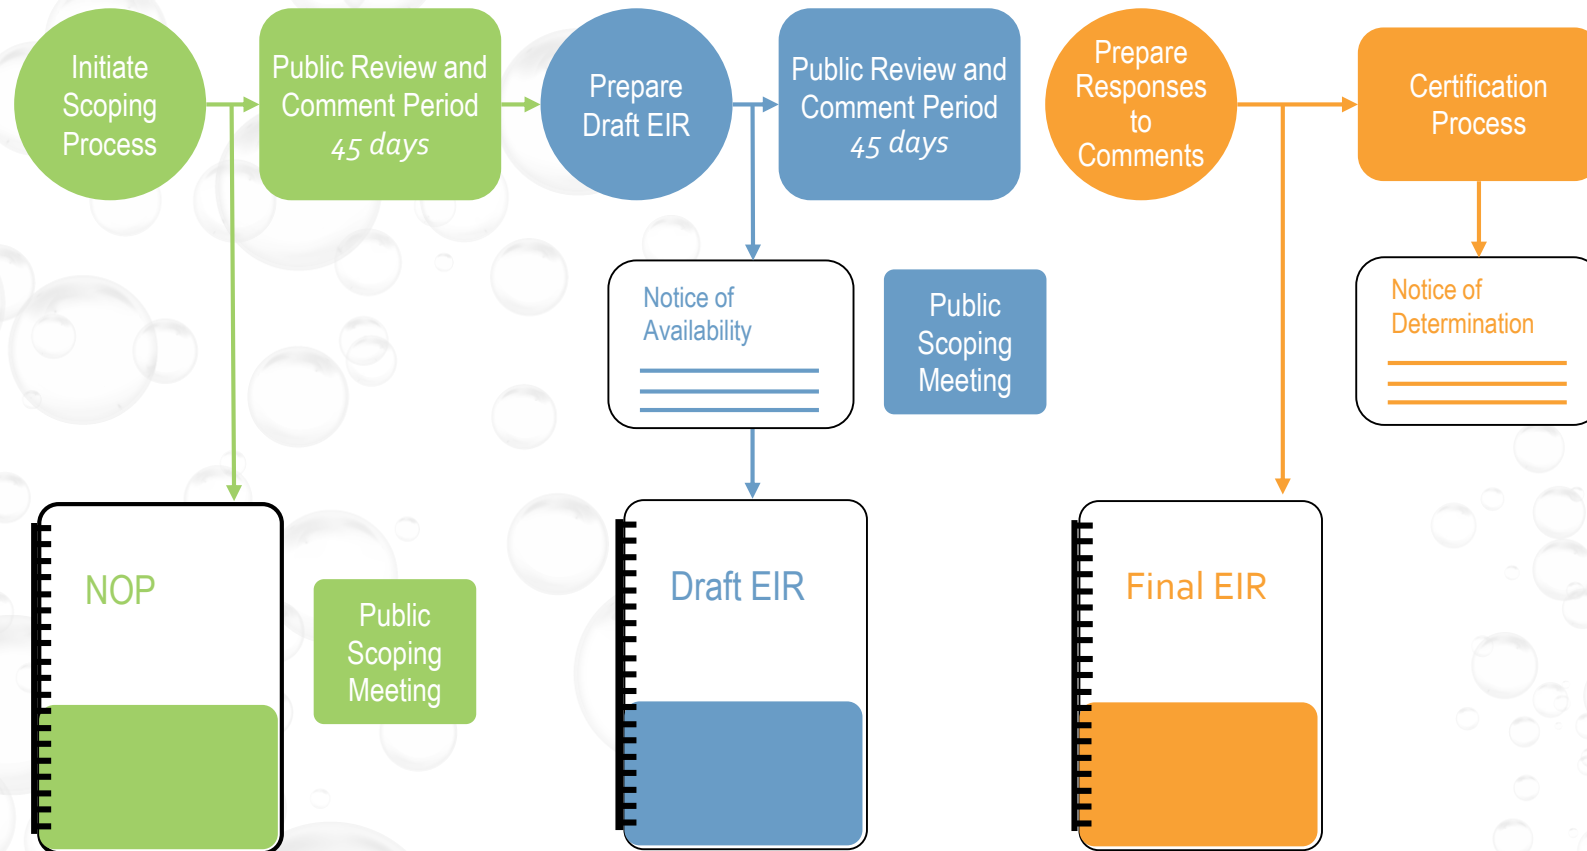

- Environmental resources required by CEQA
 - Aesthetics
 - Agriculture & Forestry Resources
 - Air Quality
 - Biological Resources
 - Cultural Resources
 - Energy
 - Geology & Soils
 - Greenhouse Gas Emissions
 - Hazards & Hazardous Materials
 - Hydrology & Water Quality
 - Land Use & Planning
 - Mineral Resources
 - Noise
 - Population & Housing
 - Public Services
 - Recreation
 - Traffic & Transportation
 - Tribal Cultural Resources
 - Utilities & Service Systems
 - Wildfire
- Growth Inducement
- Alternatives

CEQA SCHEDULE – NEXT STEPS

Scoping Period Ends
September 16, 2019

Draft EIR Publication
Spring 2020

Final EIR Publication
Fall 2020

PUBLIC SCOPING COMMENTS

- NOP Availability
 - Heritage Park Library, 14361 Yale Ave, Irvine CA 92604
 - Online at the IRWD Web Site
 - www.irwd.com/doing-business/environmental-documents
- Comment period ends **September 16, 2019**
- Submit comments tonight or e-mail/mail comments to:
 - Irvine Ranch Water District
 - Attn: Jo Ann Corey, Environmental Compliance Specialist
 - P.O. Box 57000
 - Irvine, California 92619-7000

August 9, 2019

AUG 15 2019

Jo Ann Corey
Irvine Ranch Water District
15600 Sand Canyon Avenue
Irvine, CA 92618

IRVINE RANCH WATER DISTRICT

RE: SCH# 2019080009, Syphon Reservoir Improvement Project, Orange County

Dear Ms. Corey:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP) for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:
 - a. A brief description of the project.
 - b. The lead agency contact information.
 - c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
 - d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).
2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).
 - a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).
3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:
 - a. Alternatives to the project.
 - b. Recommended mitigation measures.
 - c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).
4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:
 - a. Type of environmental review necessary.
 - b. Significance of the tribal cultural resources.
 - c. Significance of the project's impacts on tribal cultural resources.
 - d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).
5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).
6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:
 - a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
 - b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:
 - a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
 - b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).
8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).
9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).
10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:
 - a. Avoidance and preservation of the resources in place, including, but not limited to:
 - i. Planning and construction to avoid the resources and protect the cultural and natural context.
 - ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
 - b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - i. Protecting the cultural character and integrity of the resource.
 - ii. Protecting the traditional use of the resource.
 - iii. Protecting the confidentiality of the resource.
 - c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
 - d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).
 - e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).
 - f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).
11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
 - a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.
 - b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
 - c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. **Tribal Consultation**: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. **No Statutory Time Limit on SB 18 Tribal Consultation**. There is no statutory time limit on SB 18 tribal consultation.
3. **Confidentiality**: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. **Conclusion of SB 18 Tribal Consultation**: Consultation should be concluded at the point in which:
 - a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
 - b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: <http://nahc.ca.gov/resources/forms/>

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
 - a. If part or all of the APE has been previously surveyed for cultural resources.
 - b. If any known cultural resources have already been recorded on or adjacent to the APE.
 - c. If the probability is low, moderate, or high that cultural resources are located in the APE.
 - d. If a survey is required to determine whether previously unrecorded cultural resources are present.
2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
 - a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
 - b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
 - a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
 - b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.
4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
 - a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
 - b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
 - c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subs. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

Environmental Document Transmittal for the Syphon Reservoir Improvement Project
SCH2019080009
Orange County

Dear Ms. Corey:

The Division of Safety of Dams (DSOD) has reviewed the Notice of Preparation for the Syphon Reservoir Improvement Project Environmental Impact Report which describes a proposed enlargement of the existing reservoir by replacing the existing dam with a new approximately 150-foot tall dam. The project will increase the recycled water storage capacity from 500 acre-feet to 5,000 acre-feet on the subject parcels.

As defined in Sections 6002 and 6003, Division 3, of the California Water Code, dams 25 feet or higher with a storage capacity of more than 15 acre-feet, and dams higher than 6 feet with a storage capacity of 50 acre-feet or more are subject to State jurisdiction. The dam height is the vertical distance measured from the maximum possible water storage level to the downstream toe of the barrier.

The proposed construction of the new dam is subject to State jurisdiction, and a construction application, together with plans, specifications, and the appropriate filing fee must be filed with DSOD for this project. All dam safety related issues must be resolved prior to approval of the application, and the work must be performed under the direction of a Civil Engineer registered in California. Erik Malvick, our Design Engineering Branch Chief, is responsible for the application process and can be reached at (916) 565-7840.

If you have any questions or need additional information, you may contact Field Engineer Ashley Moran at (909) 214-1503, or me at (916) 565-7827.

Sincerely,

A handwritten signature in black ink, appearing to read "Rick G. Draeger".

>>> "Beavers, Jeffrey" <beavers@creanlutheran.org> 8/29/2019 8:19 AM >>>
Public Scoping Comments from Wednesday August 21, 2019 at 6pm meeting:

Comments from Jeffrey Beavers, CEO, Crean Lutheran High School. A not-for-profit high recognized service organization (RSO) private parochial high school located at 12500 Sand Canyon Avenue, which both shares a land border (athletic complex, and student parking lot), and is located adjacent to the Syphon Reservoir Proposed Expansion Project.

1. Top concerns are that of safety for both the athletic complex and the high school
2. Daily school operations and student safety and impact during exploration and construction, should the project move forward
 1. Including access to athletic complex, and parking
 2. Including path of travel for students on sidewalk at Sand Canyon and Portola intersection
 3. If IRWD adds additional public recreation features to this project, how might that impact our operations? And could there be an opportunity to add additional shared use parking?
3. On a positive note, we believe the project will make the 1070's dam structurally safer and are excited about that

1. With more water capacity we will want to closely monitor groundwater at the Athletic Complex
2. IRWD added a french drain on the North side of our property that we believe has helped with groundwater, we hope that with additional acreage of water it continues to keep ground water at a minimum

4. With additional acreage of water we hope consumers like us, with a split system domestic/recycled, may benefit from the possibilities of price reduction?
5. We appreciate the opportunity and communications from IRWD to know and discuss updates on this matter, including being able to help in updating the Emergency Evacuation Plan for the reservoir.

Please let me know if there are any questions about these comments. They shouldn't be a surprise, as we've had a pre meeting discussing each of these in more detail, thank you.

His peace,

Jeffrey S. Beavers, M.A., LMFT

Subject: Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Syphon Reservoir Improvement Project (SCH # 2019080009)

Dear Ms. Corey:

The Department of Fish and Wildlife (Department) has reviewed the above-referenced Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Syphon Reservoir Improvement Project, located in the unincorporated County of Orange, California. The following statements and comments have been prepared pursuant to the Department's authority as Trustee Agency with jurisdiction over natural resources affected by the project (California Environmental Quality Act [CEQA] Guidelines § 15386) and pursuant to our authority as a Responsible Agency under CEQA Guidelines section 15381 over those aspects of the proposed project that come under the purview of the California Endangered Species Act (Fish and Game Code § 2050 et seq.) and Fish and Game Code section 1600 et seq. The Department also administers the Natural Community Conservation Planning (NCCP) program. The Irvine Ranch Water District (IRWD) participates in the NCCP program through its role as a Participating Landowner under the County of Orange Central and Coastal Subregion NCCP/HCP (NCCP/HCP).

The proposed project would be built within the IRWD service area at the site of the existing Syphon Reservoir, located on the northeast side of Portola Parkway between Bee Canyon Access Road and State Route 133. The project would expand the reservoir's recycled water storage capacity from its current 500 acre-feet capacity to approximately 5,000 acre-feet by replacing the current 59-foot-high earthen engineered dam with a 136-foot-high dam of similar construction. The resulting increased recycled water storage capacity is expected to allow IRWD to meet the projected seasonal recycled water demands within its service area and decrease its dependence on imported water. Approximately 82 acres of upland and wetland vegetation communities would be inundated by the reservoir's expanded footprint. A large portion (precise acreage still to be determined) of the expansion area is located within the Habitat Reserve System (Reserve) established by the NCCP/HCP and/or protected by use restrictions in the January 4, 2010, Grant Deed that originally conveyed the property to IRWD (IRWD Doc. D0204).

In advance of the proposed project, IRWD will conduct a geotechnical investigation to characterize the geologic and geotechnical baseline conditions of the site. The Department and the U.S. Fish and Wildlife Service (collectively the Wildlife Agencies) submitted comments on the Mitigated Negative Declaration that was completed for the geotechnical investigations project, and IRWD worked closely with the Wildlife Agencies to address concerns regarding impacts to biological resources protected by the Grant Deed and the Reserve. We anticipate similar close coordination among our agencies during the evaluation and review of this current project.

In order to assist IRWD in avoiding and minimizing potential project impacts on biological resources and maintaining consistency with the NCCP/HCP, the Department offers the following comments and recommendations based on its review of the NOP, its past project discussions with IRWD, and its knowledge of the habitat and resources present on site.

1. Recent surveys conducted between April 10 and July 8, 2019, documented that the habitat within and surrounding the proposed project area was occupied by up to 16 individual least Bell's vireo (*Vireo bellii pusillus*), a state and federally endangered species. In addition, the federally threatened coastal California gnatcatcher (*Polioptila californica californica*; gnatcatcher) has been historically documented breeding on site and were detected during the 2019 surveys, as were two California Species of Special Concern, the yellow breasted chat (*Icteria virens*) and the yellow warbler (*Setophaga petechia*). IRWD has initiated early discussions with the Wildlife Agencies to begin the process of identifying appropriate mitigation for potential impacts to sensitive species and their habitats that would ensure the proposed project is consistent with the NCCP/HCP and accounts for any past restoration and protection commitments associated with the Grant Deed. It is anticipated that discussions between our agencies will continue in advance of the finalization of the DEIR and that the final mitigation plan may involve (but is not limited to) some combination of off-site conservation and/or restoration of habitat as well as the utilization of take credits established through the NCCP/HCP. We look forward to these continued discussions and working with IRWD to develop an agreeable mitigation plan that is consistent with the requirements of the NCCP/HCP and minimizes impacts to sensitive biological resources within the project area. We recommend having a draft mitigation plan in place prior to the release of the DEIR to allow for public input during the review process. The Department is available to assist in facilitating any necessary meetings to achieve this outcome.
2. The NOP indicates the DEIR will evaluate the potential for compatible recreational opportunities to be implemented as a component of the proposed project. During past coordination meetings, the Department has agreed it is appropriate to evaluate potential recreational opportunities within the project site provided that they are consistent with the NCCP/HCP and the allowable uses in the Reserve. We recommend that any review of potential recreational

opportunities examine the impact the proposed uses could have on sensitive species and important biological resources on site, including gnatcatcher and least Bell's vireo, as well as evaluate the compatibility of recreation with the use restrictions in the Grant Deed. The restrictions currently stipulate that the land conveyed by the Grant Deed shall be used for (i) the protection of threatened and endangered species, (ii) preservation, restoration, and enhancement of the habitat for these species, and (iii) open space preservation and other related environmental purposes compatible with the uses described in (i) and (ii), and for no other purpose whatsoever beyond the specified use exceptions. These exceptions allow for the installation and maintenance of infrastructure, continuation of existing operations and maintenance activities, and the potential for reservoir improvements described by the NOP with appropriate approvals.

While not expressly prohibited, recreational use is not currently described as acceptable use of the Grant Deed property. Given the sensitive nature of the biological resources present and the conservation-based objectives of the overlying Grant Deed, the Department recommends limiting consideration of recreational opportunities to passive uses such as hiking and nature viewing (NCCP/HCP Section 5.3, pp. II-294). If, following thorough evaluation of the potential impacts to sensitive biological resources, it is determined that limited passive recreational use could be compatible and would not interfere with the conservation purposes of the property, it is the Department's understanding that an amendment to the Grant Deed language would be required to establish the recreation activity as an excepted and allowable use. This would require consent of the Foothill/Eastern Transportation Corridor Agency and the U.S. Fish and Wildlife Service in accordance with Section 7.2 of the Grant Deed. Any impacts incurred from trail creation or other impacts associated with recreational activity would also require appropriate mitigation and would need to account for the past restoration efforts and adequately replace any lost habitat that is protected by the Grant Deed.

3. The Department has responsibility for wetland and riparian habitats. It is the policy of the Department to strongly discourage development in wetlands or conversion of wetlands to uplands. We oppose any development or conversion that would result in a reduction of wetland acreage or wetland habitat values, unless, at a minimum, project mitigation assures there will be "no net loss" of either wetland habitat values or acreage. Mitigation measures to compensate for impacts to riparian habitat should be included in the DEIR to compensate for the loss of function and value of the impacted habitat.
 - a. The Department also has regulatory authority over activities in streams and/or lakes that will divert or obstruct the natural flow, or change the bed, channel, or bank (which may include associated riparian resources) of any river, stream, or lake or use material from a river, stream, or lake. For any such activities, the project applicant (or "entity") must provide written

Ms. Jo Ann Corey
Irvine Ranch Water District
August 30, 2019
Page 4 of 4

notification to the Department pursuant to section 1600 et seq. of the Fish and Game Code. Based on this notification and other information, the Department determines whether a Lake and Streambed Alteration Agreement (LSAA) with the applicant is required prior to conducting the proposed activities. The Department's issuance of a LSAA for a project that is subject to CEQA will require CEQA compliance actions by the Department as a Responsible Agency. The Department as a Responsible Agency under CEQA may consider the Lead Agency's Environmental Impact Report for the project. To minimize additional requirements by the Department pursuant to section 1600 et seq. and/or under CEQA, the document should fully identify the potential impacts to riparian resources and provide adequate avoidance, mitigation, monitoring, and reporting commitments for issuance of the LSAA. The Department recommends including this information as a component of the overall mitigation plan to be developed for this project (see Comment 1 above).

The Department appreciates the opportunity to comment on the NOP and IRWD's ongoing communication during this process. We look forward to our continued relationship and the development of an agreeable mitigation plan that appropriately addresses project impacts and ensures project consistency with the NCCP/HCP. If you have any questions or comments regarding this letter, please contact Kyle Rice at (858) 467-4250, or kyle.rice@wildlife.ca.gov.

Sincerely,

Gail K. Sevens

Notice of Preparation of an Environmental Impact Report for the Proposed Syphon Reservoir Improvement Project

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. South Coast AQMD staff's comments are recommendations regarding the analysis of potential air quality impacts from the Proposed Project that should be included in the Environmental Impact Report (EIR). Please send South Coast AQMD a copy of the EIR upon its completion. Note that copies of the EIR that are submitted to the State Clearinghouse are not forwarded to South Coast AQMD. Please forward a copy of the EIR directly to South Coast AQMD at the address shown in the letterhead. **In addition, please send with the EIR all appendices or technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all air quality modeling and health risk assessment files¹. These include emission calculation spreadsheets and modeling input and output files (not PDF files). Without all files and supporting documentation, South Coast AQMD staff will be unable to complete our review of the air quality analyses in a timely manner. Any delays in providing all supporting documentation will require additional time for review beyond the end of the comment period.**

Air Quality Analysis

South Coast AQMD adopted its California Environmental Quality Act (CEQA) Air Quality Handbook in 1993 to assist other public agencies with the preparation of air quality analyses. South Coast AQMD recommends that the Lead Agency use this Handbook as guidance when preparing its air quality analysis. Copies of the Handbook are available from South Coast AQMD's Subscription Services Department by calling (909) 396-3720. More guidance developed since this Handbook is also available on South Coast AQMD's website at: [http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-\(1993\)](http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/ceqa-air-quality-handbook-(1993)). South Coast AQMD staff also recommends that the Lead Agency use the CalEEMod land use emissions software. This software has recently been updated to incorporate up-to-date state and locally approved emission factors and methodologies for estimating pollutant emissions from typical land use development. CalEEMod is the only software model maintained by the California Air Pollution Control Officers Association (CAPCOA) and replaces the now outdated URBEMIS. This model is available free of charge at: www.caleemod.com.

South Coast AQMD has also developed both regional and localized significance thresholds. South Coast AQMD staff requests that the Lead Agency quantify criteria pollutant emissions and compare the results

¹ Pursuant to the CEQA Guidelines Section 15174, the information contained in an EIR shall include summarized technical data, maps, plot plans, diagrams, and similar relevant information sufficient to permit full assessment of significant environmental impacts by reviewing agencies and members of the public. Placement of highly technical and specialized analysis and data in the body of an EIR should be avoided through inclusion of supporting information and analyses as appendices to the main body of the EIR. Appendices to the EIR may be prepared in volumes separate from the basic EIR document, but shall be readily available for public examination and shall be submitted to all clearinghouses which assist in public review.

to South Coast AQMD's CEQA regional pollutant emissions significance thresholds to determine air quality impacts. South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found here at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf>. In addition to analyzing regional air quality impacts, South Coast AQMD staff recommends calculating localized air quality impacts and comparing the results to localized significance thresholds (LSTs). LSTs can be used in addition to the recommended regional significance thresholds as a second indication of air quality impacts when preparing a CEQA document. Therefore, when preparing the air quality analysis for the Proposed Project, it is recommended that the Lead Agency perform a localized analysis by either using the LSTs developed by South Coast AQMD staff or performing dispersion modeling as necessary. Guidance for performing a localized air quality analysis can be found at: <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds>.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis.

In the event that the Proposed Project generates or attracts vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment. Guidance for performing a mobile source health risk assessment ("*Health Risk Assessment Guidance for Analyzing Cancer Risk from Mobile Source Diesel Idling Emissions for CEQA Air Quality Analysis*") can be found at: <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis>. An analysis of all toxic air contaminant impacts due to the use of equipment potentially generating such air pollutants should also be included.

In addition, guidance on siting incompatible land uses can be found in the California Air Resources Board's *Air Quality and Land Use Handbook: A Community Health Perspective*, which can be found at: <http://www.arb.ca.gov/ch/handbook.pdf>. CARB's Land Use Handbook is a general reference guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Guidance² on strategies to reduce air pollution exposure near high-volume roadways can be found at: https://www.arb.ca.gov/ch/rd_technical_advisory_final.PDF.

Mitigation Measures

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized during project construction and operation to minimize these impacts. Pursuant to CEQA Guidelines Section 15126.4 (a)(1)(D), any impacts resulting from mitigation measures must also be discussed. Several resources are available to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project, including:

² In April 2017, CARB published a technical advisory, *Strategies to Reduce Air Pollution Exposure Near High-Volume Roadways: Technical Advisory*, to supplement CARB's *Air Quality and Land Use Handbook: A Community Health Perspective*. This technical advisory is intended to provide information on strategies to reduce exposures to traffic emissions near high-volume roadways to assist land use planning and decision-making in order to protect public health and promote equity and environmental justice. The technical advisory is available at: <https://www.arb.ca.gov/ch/landuse.htm>.

- Chapter 11 “Mitigating the Impact of a Project” of South Coast AQMD’S *CEQA Air Quality Handbook* South Coast AQMD’s CEQA web pages available here: <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies>
- South Coast AQMD’s Rule 403 – Fugitive Dust, and the Implementation Handbook for controlling construction-related emissions and Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities
- South Coast AQMD’s Mitigation Monitoring and Reporting Plan (MMRP) for the 2016 Air Quality Management Plan (2016 AQMP) available here (starting on page 86): <http://www.aqmd.gov/docs/default-source/Agendas/Governing-Board/2017/2017-mar3-035.pdf>
- CAPCOA’s *Quantifying Greenhouse Gas Mitigation Measures* available here: <http://www.capcoa.org/wp-content/uploads/2010/11/CAPCOA-Quantification-Report-9-14-Final.pdf>

Alternatives

In the event that the Proposed Project generates significant adverse air quality impacts, CEQA requires the consideration and discussion of alternatives to the project or its location which are capable of avoiding or substantially lessening any of the significant effects of the project. The discussion of a reasonable range of potentially feasible alternatives, including a “no project” alternative, is intended to foster informed decision-making and public participation. Pursuant to CEQA Guidelines Section 15126.6(d), the EIR shall include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the Proposed Project.

Responsible Agency, South Coast AQMD Permits, and Rules

It is important to note that generally, operation of portable engines and portable equipment units of 50 horsepower or greater that emit particulate matter require a permit from South Coast AQMD or registration under the Portable Equipment Registration Program (PERP) through the California Air Resources Board (CARB)³. The Lead Agency should consult with South Coast AQMD’s Engineering and Permitting staff to determine if there is any diesel-powered equipment during implementation that will require a South Coast AQMD permit or if the equipment will need to be registered under the PERP through CARB. If a permit from South Coast AQMD is required, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the EIR. Any assumptions used in the Air Quality Analysis in the EIR will be used as the basis for permit conditions and limits for the Proposed Project. If there is any information in the permitting process suggesting that the Proposed Project would result in significant adverse air quality impacts not analyzed in the EIR or substantially more severe air quality impacts than those analyzed in the EIR, the Lead Agency should commit to reevaluating the Proposed Project’s air quality impacts through a CEQA process (CEQA Guidelines Section 15162). For more information on permits and rules, please visit South Coast AQMD’s webpage at: <http://www.aqmd.gov/home/permits>. Questions on permits can be directed to South Coast AQMD’s Engineering and Permitting staff at (909) 396-3385. For more information on the PERP Program, please contact CARB at (916) 324-5869 or visit CARB’s webpage at: <https://ww2.arb.ca.gov/our-work/programs/portable-equipment-registration-program-perp>.

Data Sources

South Coast AQMD rules and relevant air quality reports and data are available by calling South Coast AQMD’s Public Information Center at (909) 396-2039. Much of the information available through the Public Information Center is also available at South Coast AQMD’s webpage at: <http://www.aqmd.gov>.

³ South Coast AQMD. *Portable Equipment Registration Program (PERP)*. Accessed at: <http://www.aqmd.gov/home/permits/equipment-registration/perp>

South Coast AQMD staff is available to work with the Lead Agency to ensure that project's air quality and health risk impacts are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

Lijin Sun

Subject: Notice of Preparation (NOP) for an Environmental Impact Report (EIR) for Syphon Reservoir Improvement Project

Dear Ms. Corey:

Staff is in receipt of an NOP for an EIR for the Irvine Water Ranch District's (IRWD) Syphon Reservoir Improvement Project. The site is located on the northeast side of Portola Parkway between Bee Canyon Access Road and SR - 133. The project consists of increasing the reservoir's existing recycled water capacity to serve the community's water needs. To accomplish this, IRWD will replace an existing dam with one that increases reservoir capacity from approximately 500 acre-feet to 5,000 acre-feet.

The City staff has reviewed the NOP and has no comments. We look forward to reviewing the EIR when it is available. If you have any questions, you may contact me at 949-724-6364 or at jequina@cityofirvine.org.

Sincerely,

Re: Notice of Preparation of an Environmental Impact Report for the Syphon Reservoir Improvement Project

Dear Ms. Corey:

The Foothill/Eastern Transportation Corridor Agency ("F/ETCA") has received and reviewed the Notice of Preparation of an Environmental Impact Report ("Notice") prepared in connection with the Syphon Reservoir Improvement Project ("Project"). As the Irvine Ranch Water District ("IRWD") acknowledges in the Notice, the Project site is subject to various restrictions ("CC&Rs") as listed in that certain Grant Deed, dated January 4, 2010 and recorded in the Official Records of Orange County on January 4, 2010 as Instrument No. 2010000000111 ("Grant Deed"). Pursuant to Section 6 of the Grant Deed, the F/ETCA is an intended third-party beneficiary of the CC&Rs. Further, Section 7.2 of the Grant Deed provides that no termination, amendment, modification or extension of any provision of the CC&Rs can be made without the prior written consent of the F/ETCA.

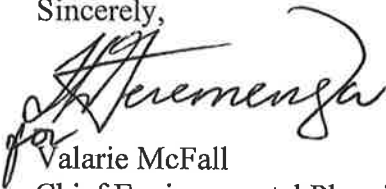

Further, pursuant to that certain Grant Deed dated January 4, 2010 and recorded in the Official Records of Orange County on January 4, 2010 as Instrument No. 2010000000110 from the F/ETCA to the Irvine Company LLC, the F/ETCA has a permanent easement on and across the Project site together with the right of ingress and egress over the property for purposes of monitoring and related activities. Please be advised that the F/ETCA requires continued access onto the Project site in order to comply with its ongoing permitting obligations.

Ms. Corey
F/ETCA Comments on the Syphon Reservoir Improvement Project
September 12, 2019

We request IRWD to provide the undersigned with notice of any public meeting or proposed action by IRWD regarding the Project or the CC&Rs, and notice and copies of any draft amendment or modification of the Grant Deed or the CC&Rs, along with any other forthcoming documentation for the Project.

If you have questions or require additional information, please do not hesitate to contact me at 949.754.3475 or via email (vmcfall@thetollroads.com).

Sincerely,

IGR Log # 2019-01193
SR133 PM 12.906; SR 241
PM 27.496

Dear Ms. Corey:

Thank you for including the California Department of Transportation (Caltrans) in the review of the Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Syphon Reservoir Improvement Project. The mission of Caltrans is to provide a safe, sustainable, and integrated efficient transportation system to enhance California's economy and livability.

The proposed project would increase the capacity of the existing recycled water reservoir to serve the community's seasonal and future recycled water needs. The reservoir capacity would increase from approximately 500 acre-feet (AF) to 5,000 AF. As part of the reservoir expansion, the existing engineered dam would be replaced with a new engineered dam that would meet and exceed the latest safety standards. The proposed project is located on the northeast side of Portola Parkway between Bee Canyon Access Road and State Route (SR) 133 in the County of Orange. The nearest State facility to the project site are SR-133 and SR-241.

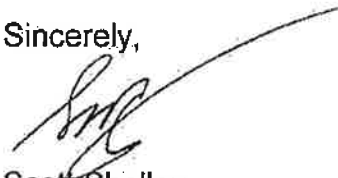

Caltrans is a responsible agency on this project and has the following comments:

1. The Environmental Impact Report (EIR) should evaluate the potential impact to traffic and circulation during the construction phase that include: related vehicle trips and operational vehicle trips on local and regional roadways, particularly both SR-241 and SR-133.
2. Traffic assessment for the project requires a Traffic Impact Study (TIS). The following intersections on Caltrans right of way should be included in the TIS:
 - Northbound SR-133 and Irvine Boulevard on/off-ramps
 - Southbound SR-133 and Irvine Boulevard on/off-ramps
 - Northbound SR-241 and Portola Parkway on/off-ramps
 - Southbound SR-241 and Portola Parkway on/off-ramps

3. Prior to the construction stage, please include a Traffic Management Plan (TMP) to Caltrans for review and approval.
4. Caltrans wishes to caution that deeply buried archaeological resources have been discovered in the vicinity of the current project area, making the deployment of archaeological monitors during construction especially important for this undertaking.
5. Please be advised that Caltrans Encroachment Permit prohibits the discharge of groundwater onto State facilities. All State drainage facilities should be protected during construction and the existing flow pattern shall be maintained. Final construction plans will be reviewed by Caltrans Hydraulics Branch during Encroachment Permit Process.
6. In the event of any activity on Caltrans right of way an encroachment permit will be required. For specific details on Encroachment Permits procedure, please refer to Encroachment Permits Manual at: <https://dot.ca.gov/programs/traffic-operations/ep>

Please continue to keep us informed of this project and any future developments that could potentially impact State transportation facilities. If you have any questions or would like to meet with us regarding these comments, please do not hesitate to call Maryam Molavi at (657) 328-6280.

Sincerely,

Scott Shelley

Subject: Notice of Preparation of an Environmental Impact Report for The Syphon Reservoir Improvement Project

Dear Ms. Corey,

Thank you for the opportunity to comment on the Notice of Preparation of an Environmental Impact Report for The Syphon Reservoir Improvement Project. The County of Orange offers the following comments for your consideration.

North OC Watershed Management Area

1. In Section 4.10 *Hydrology and Water Quality* (page 76) the document discusses discharge methods of effluent water generated as a component of geotechnical boring activities. One method discussed describes effluent water discharged to a local storm drain and the associated NPDES discharge permit from the Santa Ana Regional Water Quality Control Board. The Irvine Ranch Water District also may require permit coverage if the discharge is to an Orange County Flood Control District right of way. Information on this permit can be found at <https://myoceservices.ocgov.com/>. In addition, the document should discuss specifically which storm drain would likely be designated to incur effluent water.

If you have any questions regarding these comments, please contact Matt Tucker at (714) 955-0669 in North OC Watershed Management Area or Cindy Salazar at (714) 667-8870 in OC Development Services.

Sincerely,

Richard Vuong, Manager, Planning Division
OC Public Works Service Area/OC Development Services

Scoping for the proposed EIR for the Enlargement of Syphon Reservoir

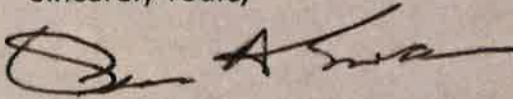

Please address the following concerns during the EIR process for the proposed enlargement of Syphon Reservoir:

1. In each of the next 30 years please project the amount of capacity needed for storage of recycled water based on the hydrology during the past 20 years and projected flows to Michaelson Reclamation plant using the 50 gal per person per day water use.
2. Taking the above information and using the same hydrology project the amount of purchased MWD water needed without a project taking into consideration the native water in Irvine Lake during each year.
3. Calculate the cost of Tertiary treatment and the cost of Pumping recycled water to the enlarged Syphon Reservoir versus the cost of MWD untreated water.
4. Evaluate the cost of an alternative project which specifically delivers winter surplus water to the Green Acres Project owned by the Orange County Water District (OCWD) and during non-storm periods to the OCWD GWRS project headworks, and when necessary to a blow-off value to be constructed where the Green Acres conveyance line crosses the Santa Ana River. Further evaluate the revenue receivable from OCWD to IRWD for water delivered to the Green Acres customers along with half the treatment savings derived by OCWD for using IRWD recycled water instead of Orange County Sanitation District (OCSD) Plant 2 water during non-storm events. Evaluate the cost of delivery through the existing pipelines (mostly owned by OCWD), potential revenue to be gained from OCWD for cost reductions caused by the deliveries, the reduced cost by NOT pumping water this water to the enlarged Syphon Reservoir versus the added purchase of MWD untreated water less the use of native water from Irvine Lake. Compare operation costs delta to the cost of building the proposed Enlargement to Syphon Reservoir using a twenty year payback. Assume that MWD rates do not increase over 3% on average over the 20 year period.
5. Evaluate other alternative projects that may eliminate the need for the proposed project as well as alternative sites such as enlarging Big Peters Reservoir.
6. Evaluate if necessary construction a parallel pipeline to the Green Acres pipeline to increase flows using the above assumptions.

7. Evaluate the impact on property values on the recently built homes in the vicinity of the proposed project.
8. Evaluate the cost and other impacts to the playing fields of Crean High School due to the proposed construction.
9. In evaluating the proposed expansion calculate the added weight impacts on the stability of the surrounding land, evaluate the likely hood of slides caused by the maximum credible earthquake and the dollar impacts to the community of a failure.

Thank you for this opportunity to add to the scope of the proposed project EIR. I look forward to getting answers to the above from the consultant that I have been sadly otherwise unable to get from the staff that advocates for this project.

Sincerely Yours,

Peer A. Swan

Member of the Board of Directors, IRWD

September 16, 2019

To: JoAnn Corey Corey@IRWD.com

Scoping for the proposed EIR for the Enlargement of Syphon Reservoir

JoAnn, I talked to Paul Weghorst this morning and he said he would accept added comments and concerns the proposed enlargement of Syphon Reservoir:

Evaluate over a twenty year period the amount of low cost ground water that may be pumped from the Orange County Basin by decreasing the amount of recycled water use within IRWD and increasing MWD untreated usage in my Item # 4 alternative project outlined in my prior submission. Add these savings to overall savings of the alternative outlined in my prior item #4.

Sincerely Yours,

Peer A. Swan

Member of the Board of Directors, IRWD

Comments: I am opposed to the expansion of the syphon reservoir.
Putting residents and students at increased risk is not an improvement.
What is the scenario if the expanded reservoir has a catastrophic structural failure? What is the projected area of flooding? What size area would have to be evacuated? For insurance purposes, what area is necessitated as being in a flood zone? How much would this insurance cost? How much would this negative impact effect the values of homes in the area? What impact on businesses in area?
We do need water storage areas, but not in locations where it jeopardizes the safety of the community. Valerie Gebhardt

Comments: As a homeowner in Stonegate Village and a member of the HOA Board, I vehemently oppose this project. It is completely ludicrous to think our IRWD would put the entire Stonegate Village, including homes and schools, in harms way if an unforeseen disaster (earthquake, 100 yr. flood, etc.) occurs. The Village of Montecito, CA did not expect their flood disaster 10 Jan. 18 caused by rains and mud rolling down hill!
Please consider a more carefully planned Reservoir in another location.
As a former OC Grand Jury Member 2018-19, I will ask the current panel to investigate the EIR and supporting docs for this project. syphonreservoirproject.com 949-453-5500
Respectfully, Lawrence Gebhardt

Comments:

I oppose the proposed reservoir expansion because it would endanger Stonegate lives, property and 2 schools directly in the path of being inundated by a potential dam break. An 8.0 earthquake is a reality in the near future, as are other smaller, yet damaging seismic events. A failure due to natural causes or faulty construction poses a serious risk. Residents should not be forced to live with that threat or its consequences. A huge body of water above our homes is a disclosure that would affect property values and increase insurance rates. This site is not safe/appropriate for expansion!

SyphonEIR - Syphon Reservoir Public Comments

From: Mark OBrien <mark.r.obrien@gmail.com>
To: <SyphonEIR@irwd.com>
Date: 9/11/2019 1:59 PM
Subject: Syphon Reservoir Public Comments

Hello Jo Ann Corey,

Thank you for an opportunity to respond to the Syphon Reservoir project proposal.

The Syphon Reservoir [NOP](#) (page 11) references a Geotechnical Investigations Project to evaluate potential geological or seismic hazards and their impact to the proposed Syphon reservoir facilities and dam.

Responding as a Stonegate Village homeowner, please consider for future discussion:

1. A potential for partial or catastrophic failure of the dam (however caused, but especially resulting from earthquakes), and any subsequent disaster response plans to imminent flood hazards and impact to downhill or topographically down gradient residential properties and schools, as well as any risk mitigation proposals such as spillways or water diversion capabilities.
2. Community-level financial impact for potential damages resulting from sudden and significant water release from a failure of the dam (however caused, but especially resulting from earthquakes), noting homeowner, earthquake, or flood insurance policies commonly exclude coverage for a reservoir breach or acts of God, or that homeowners and HOAs may incur costs of premium to attain flood coverage if available.

Best Regards,
Mark O'Brien

Re: IRWD Syphon Reservoir Improvement Project
Attn: Jo Ann Corey, Environmental Compliance Specialist

This letter is to provide our comments as requested by the public scoping meeting and express concern about the planned expansion of Syphon Reservoir by the Irvine Ranch Water District. The main concern is safety of the surrounding community. Current inundation maps show two schools directly in the flood path. In the situation of a dam failure, the Crean Lutheran Athletic Complex is currently projected to be under 15-20 ft of water in less than 3 minutes. Stonegate Elementary School is projected to be under 5-10 feet of water in 6-9 minutes.

[adapted from <https://fmds.water.ca.gov>]

The projected increase in reservoir capacity from approximately 500 acre-feet (AF) to 5,000 AF would significantly worsen the scenario to the schools in case of a dam failure. This further increases the risk to the children of our community. There is currently no document that illustrates the potential increased risk of flood to the surrounding community that would be expected from increasing the reservoir volume 10 times. The document "Notice of Preparation of an Environmental Impact Report" provided by Irvine Ranch Water District on August 2, 2019 conveniently avoids mentioning the hazard of dam failure. In case of a dam failure, there does not appear to be a viable spillway to divert water from schools and homes. The current reservoir was constructed in 1949 at a time when the surrounding area did not have homes and schools, as seen the attached 1974 photo. Irvine's landscape has changed

considerably within the last few decades with an increased population near the existing reservoir's flood path.

[adapted from <https://ngmdb.usgs.gov>]

Specific questions that we demand to be addressed prior to building of the damn is

- (1) How can IRWD guarantee our children's and community's safety with 5,000 AF of water at higher elevation so close homes and schools?
- (2) What emergency response plan can be expected to save hundreds of lives in a few minutes in the setting of a catastrophic failure during an earthquake?
- (3) Will IRWD provide compensation to homeowners for flood insurance and potential diminished property values as a result of the reservoir expansion?

Given that the current state of downstream hazard at Syphon Reservoir is "Extremely High" according to the California Department of Water Resources, we demand not only to stop plans for expanding Syphon Reservoir, but also to use funds appropriated for the expansion to fortify the existing damn to bring it up to current code. Further, we demand distribution of up to date inundation maps and projected inundation maps to current community members. Lastly, we demand that the Environmental Impact Report (EIR) address the potential of loss of life and property in a dam failure.

[adapted from <https://fmds.water.ca.gov>]

The following list of residents have assembled to provide the comments stated herein, which we hereby submit to be part of the EIR for the Syphon Reservoir Improvement Project.

Dear Board Members,

I am a resident of Stonegate Village and the homeowner. I and my wife living in Stonegate Village with my 3 kids for 3 years. We enjoyed the beautiful and peaceful surroundings of our community for the past years, until we heard about the Syhpon project proposed.

With this proposed project, the reservoir just across the Portola Springs Parkway will be extended 10 times bigger, and the dam will be 80 feet higher. This will post huge threat and danger to our property, our lives, and our community if something goes wrong. If some kind of disaster happened, our community would be flooded into water in minutes, including our house and the elementary school. Think about that possibility would waken me up in the night. I just couldn't imagine how this will affect our life in the future.

Though I understand this project would benefit the city of Irvine with more water supply available, I just do not want it so close to my property and community. When the Syphon Reservoir was built decades ago, it was far from the city, with not much population around it to minimize the possible damage. Now with the highly populated communities around, why don't you consider some other place to put this reservoir? You put great value to people's life and property decades ago, and I believe you will do the same now.

With the above thoughts, I strongly oppose the extension of Syphon Reservoir. I suggest the city choose another place to build this project.

Re: IRWD Syphon Reservoir Improvement Project
 Attn: Jo Ann Corey, Environmental Compliance Specialist

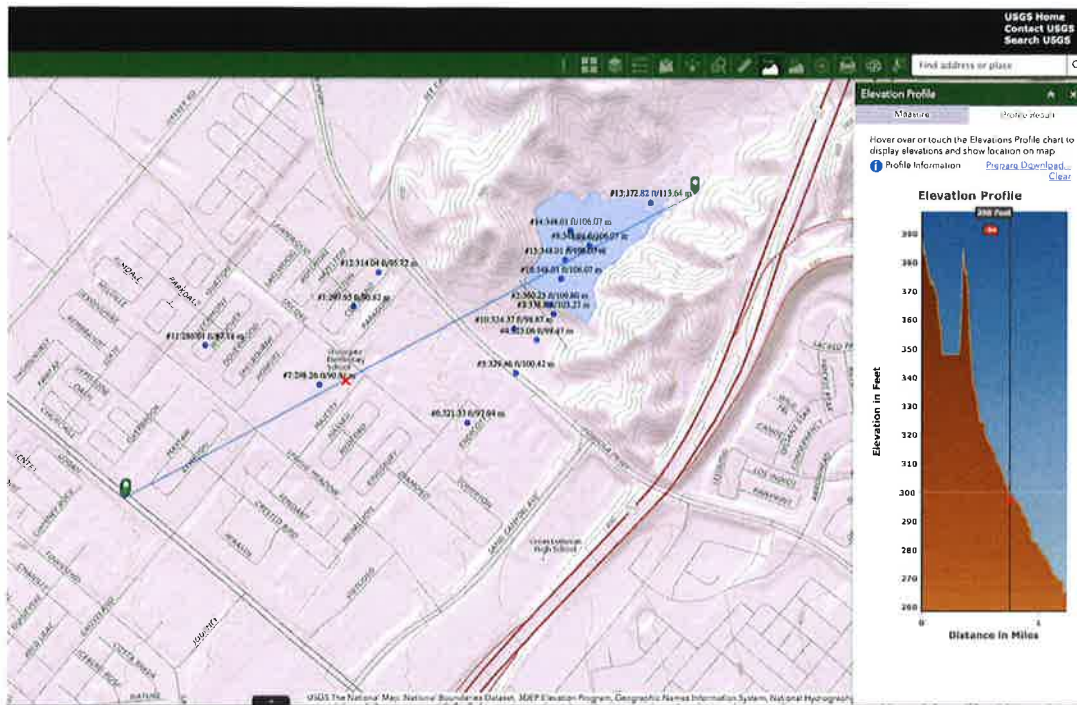

**IRVINE RANCH
 WATER DISTRICT**

This letter is to provide my comments as requested by the public scoping meeting on August 21st and express strong concern about the planned expansion of Syphon Reservoir by the Irvine Ranch Water District. The main concern is safety of the surrounding community and schools.

With the current Syphon Reservoir, based on the <https://fmds.water.ca.gov/>, the Downstream hazard is already "Extremely High". As screenshot below.

The current Syphon Reservoir was built on 1949, by then, there was no community close to the reservoir. But things changed dramatically since the past 30 years, Stonegate, Woodbury, Cypress Village, Eastwood are all the new high density community surrounding Syphon reservoir, even more dangerous is the Crean Lutheran High School Athletic Complex, which is directed under the dam in less then 400 ft, and also Stonegate elementary school is also less then 0.4 miles away from the dam. In case of a catastrophic failure, it could put over 1000 elementary school student's life into danger in less than 5 minutes. The current Syphon reservoir's water surface is 376ft, and the basin of the reservoir is 348ft, so the depth of the water is 28 ft. However, the water surface of the newly proposed reservoir is 456 ft, which means the depth of the water will be 108 ft. In case of a catastrophic failure, no one will be able to survive such high flood wave.

Though it is good to hear that the "new dam would meet or exceed the latest safety standards" in the presentation, still no one can guarantee the new dam will never fail. It could be a super earthquake, or a mud slide after the wild fire, or even a terrorist attack. No one can ease the peace of mind for the resident live next to the new dam.

We all want to see a more green, more beautiful Irvine because we all live here, and it is our home. But we could not put thousands of Irvine residence's life in danger to get this, no matter what's the benefit it will bring.

In summary, I have a high concern for the surrounding communities and schools. We need further understand the safety assurance before move the project to the next phase.

Best regards,

Vivian Qian (Stonegate resident)

Re: IRWD Syphon Reservoir Improvement Project

Attn: Jo Ann Corey, Environmental Compliance Specialist

This letter is to provide our comments as requested by the public scoping meeting and express concern about the planned expansion of Syphon Reservoir by the Irvine Ranch Water District. The main concern is safety of the surrounding community.

Current inundation maps show two schools directly in the flood path. In the situation of a damn failure, the Crean Lutheran Athletic Complex is currently projected to be under 15-20 ft of water in less than 3 minutes. Stonegate Elementary School is projected to be under 5-10 feet of water in 6-9 minutes.

The projected increase in dam height from 59 feet to 136 feet and reservoir capacity from approximately 500 acre-feet (AF) of water to 5,000 AF of water would significantly worsen the scenario to the schools in case of a damn failure. This further increases the risk to the children of our community.

There is currently no document that illustrates the potential increased risk of flood to the surrounding community that would be expected from increasing the reservoir volume 10 times. The document "Notice of Preparation of an Environmental Impact Report" provided by Irvine Ranch Water District on August 2, 2019 conveniently avoids mentioning the hazard of dam failure. In case of a dam failure, there does not appear to be a viable spillway to divert water from schools and homes. The scenario of dam failure must be considered as reservoir is located in a seismically active area with the Puente Hills fault located just 4.3 miles away.

The current reservoir was constructed in 1949 at a time when the surrounding area did not have homes and schools, as seen the attached 1974 photo. Irvine's landscape has changed considerably within the last few decades with an increased population near the existing reservoir's flood path.

Specific questions that we demand to be addressed prior to building of the damn is (1) How can IRWD guarantee our children's and community's safety with 5,000 AF of water at higher elevation

so close homes and schools? (2) What emergency response plan can be expected to save thousands of lives in a few minutes in the setting of a catastrophic failure during an earthquake? (3) Will IRWD provide compensation to homeowners for flood insurance and potential diminished property values as a result of the reservoir expansion?

Given that the current state of downstream hazard at Syphon Reservoir is “Extremely High” according to the California Department of Water Resources, we demand not only to stop plans for expanding Syphon Reservoir, but also to use funds appropriated for the expansion to fortify the existing damn to bring it up to current code.

Further, we demand distribution of up to date inundation maps and projected inundation maps to current community members. Lastly, we demand that the Environmental Impact Report (EIR) address the potential of loss of life and property in a dam failure.

Please submit these comments to be part of the EIR for the Syphon Reservoir Improvement Project.

Re: IRWD Syphon Reservoir Improvement Project
 Attn: Jo Ann Corey, Environmental Compliance Specialist

This letter is to provide my comments as requested by the public scoping meeting on August 21st and express strong concern about the planned expansion of Syphon Reservoir by the Irvine Ranch Water District. The main concern is safety of the surrounding community and schools.

With the current Syphon Reservoir, based on the <https://fmds.water.ca.gov/>, the Downstream hazard is already "Extremely High". As screenshot below.

The current Syphon Reservoir was built on 1949, by then, there was no community close to the reservoir. But things changed dramatically since the past 30 years, Stonegate, Woodbury, Cypress Village, Eastwood are all the new high density community surrounding Syphon reservoir, even more dangerous is the Crean Lutheran High School Athletic Complex, which is directed under the dam in less than 400 ft, and also Stonegate elementary school is also less than 0.4 miles away from the dam. In case of a catastrophic failure, it could put over 1000 elementary school student's life into danger in less than 5 minutes. The current Syphon reservoir's water surface is 376ft, and the basin of the reservoir is 348ft, so the depth of the water is 28 ft. However, the water surface of the newly proposed reservoir is 456 ft, which means the depth of the water will be 108 ft. In case of a catastrophic failure, no one will be able to survive such high flood wave.

Subject: Syphon reservoir project located in a liquefaction and landslides overlap zone. Need to reconsider safety for having it around big communities and schools

Dear Jo Ann Corey,

We are very worried about our safety and we not only strongly oppose this project with the comment as attached documents below, but also would like to ask if we need to stop using it. We understand the purpose to expand but the safety to our kids and our popular communities is a top priority.

Please do not expand it and also need to consider if it needs to stop using it since it is located in a liquefaction and landslides overlap zone.

There is no such big community in this area about 70 years ago. Thank you.

sincerely,

Guoshan Lai

Jo Ann Corey - No to Syphon reservoir

From: Amy P <amyuyen777@gmail.com>
To: <SyphonEir@irwd.com>
Date: 9/16/2019 9:16 AM
Subject: No to Syphon reservoir

To Whom It May Concern:

I am a resident of Stonegate and am writing to voice my concern about the planned expansion of Syphon Reservoir by the Irvine Ranch Water District in regard to safety of our surrounding community and the financial implications from dam failure.

It has been brought to my attention that Stonegate Elementary School, which my daughter currently attends, is one of the two schools directly in the flood path should the dam be compromised. Within a matter of less than 10 minutes, give or take, our school will be under 5-10 feet of water while Crean Lutheran Athletic Complex is projected at less than 5 minutes should this happen. What are the current measures being taken should this happen or to prevent it?

To me, it doesn't make sense to build a reservoir 10 times bigger when we currently haven't addressed these current issues. Count me as a no to building the Syphon reservoir.

--

Warmest regards,

Amy Pham

Jo Ann Corey - Strongly disagree with the Syphon Reservoir Improvement Project

From: YP <yunpan2000@gmail.com>
To: <syphoneir@irwd.com>
Date: 9/16/2019 1:23 PM
Subject: Strongly disagree with the Syphon Reservoir Improvement Project

To whom who concerns,

As a Stonegate resident, we strongly disagree the extension of Syphon Reservoir project.

This will put our children and residents at risk in our densely populated areas. The current reservoir was constructed in 1949 at a time when the surrounding area did not have homes and schools, Irvine's landscape has changed considerably within the last few decades with an increased population near the existing reservoir's flood path.

So the first thing to do is to close it off instead of expanding.

Jo Ann Corey - Concerned about Syphon Reservoir expansion

From: Pei Yang <yangpei@hotmail.com>
To: "syphoneir@irwd.com" <syphoneir@irwd.com>
Date: 9/16/2019 9:06 AM
Subject: Concerned about Syphon Reservoir expansion

Hello,

I'm emailing to express my, and all of our neighbor's deep concern of the expansion plan for the Syphon Reservoir near Stonegate community. It's great threat to the safety of our elementary school kids and the entire community. Please build it somewhere else where it's not so close to residential area and schools!

Thank you for listening to the residents voice!

Pei Yang (Stonegate resident)

Jo Ann Corey - Community concerns about Syphon reservoir & dam expansion. ATTN Jo Ann Corey, Environmental Compliance Specialist

From: Amanda Yu <aescott83@gmail.com>
To: <SyphonEIR@irwd.com>
Date: 9/16/2019 11:55 AM
Subject: Community concerns about Syphon reservoir & dam expansion. ATTN Jo Ann Corey, Environmental Compliance Specialist
Attachments: Stonegate against Syphon Expansion.docx; syphon reservoir expansion 9_2019 sig & ltr.pdf; CA00749_MD_Scenario1 (1).pdf; IRWD Petition

Good afternoon Mrs. Jo Ann Corey,

Attached is a word document letter & pdf supplemental with resident signatures as well as enlarged graphics detailing our neighborhood concerns regarding the Syphon reservoir & dam expansion.

There is also a pdf from a petition on change.org that has been circulating. Please refer to the word docx I have attached for our most recent updated version of the letter.

You have likely received more emails and letters sent from others in the community with additional signatures.

There may also be additional comment cards arriving this week, post marked prior to the Sept 16 4pm deadline.

I appreciate IRWD seriously taking into account the community & neighborhood's concern.

Cordially,
Amanda Scott-Yu

Re: IRWD Syphon Reservoir Improvement Project

Attn: Jo Ann Corey, Environmental Compliance Specialist

This letter is to provide our comments as requested by the public scoping meeting and express concern about the planned expansion of Syphon Reservoir by the Irvine Ranch Water District. The main concern is safety of the surrounding community.

Current inundation maps show two schools directly in the flood path. In the situation of a damn failure, the Crean Lutheran Athletic Complex is currently projected to be under 15-20 ft of water in less than 3 minutes. Stonegate Elementary School is projected to be under 5-10 feet of water in 6-9 minutes.

[adapted from <https://fmds.water.ca.gov>]

The projected increase in dam height from 59 feet to 136 feet and reservoir capacity from approximately 500 acre-feet (AF) of water to 5,000 AF of water would significantly worsen the scenario to the schools in case of a damn failure. This further increases the risk to the children of our community.

There is currently no document that illustrates the potential increased risk of flood to the surrounding community that would be expected from increasing the reservoir volume 10 times. The document "Notice of Preparation of an Environmental Impact Report" provided by Irvine Ranch Water District on August 2, 2019 conveniently avoids mentioning the hazard of dam failure. In case of a dam failure, there does not appear to be a viable spillway to divert water from schools and homes. The scenario of dam failure must be considered as reservoir is located in a seismically active area with the Puente Hills fault located just 4.3 miles away.

The current reservoir was constructed in 1949 at a time when the surrounding area did not have homes and schools, as seen the attached 1974 photo. Irvine's landscape has changed considerably within the last few decades with an increased population near the existing reservoir's flood path.

[adapted from <https://ngmdb.usgs.gov>]

Specific questions that we demand to be addressed prior to building of the damn is (1) How can IRWD guarantee our children’s and community’s safety with 5,000 AF of water at higher elevation so close homes and schools? (2) What emergency response plan can be expected to save thousands of lives in a few minutes in the setting of a catastrophic failure during an earthquake? (3) Will IRWD provide compensation to homeowners for flood insurance and potential diminished property values as a result of the reservoir expansion?

Given that the current state of downstream hazard at Syphon Reservoir is “Extremely High” according to the California Department of Water Resources, we demand not only to stop plans for expanding Syphon Reservoir, but also to use funds appropriated for the expansion to fortify the existing damn to bring it up to current code. Further, we demand distribution of up to date inundation maps and projected inundation maps to current community members. Lastly, we demand that the Environmental Impact Report (EIR) address the potential of loss of life and property in a dam failure.

[adapted from <https://fmds.water.ca.gov>]

S.G started this petition to [Irvine ranch water district](#)

The construction of IRWD Syphon Reservoir presents a huge flooding risk to two school areas (Stonegate Elementary & Crean Lutheran Athletic Complex) and hundreds of homes in the Stonegate Community.

The projected increase in reservoir capacity from approximately 500 acre-feet (AF) to 5,000 AF (by raising the dam height from **59 feet to 136 feet**) would significantly worsen the scenario to the schools in case of a dam failure.

In the situation of a dam failure, the Crean Lutheran Athletic Complex is currently projected to be **under 15-20 ft of water in less than 3 minutes**. Stonegate Elementary School is projected to be **under 5-10 feet of water in 6-9 minutes**.

DEMAND THAT IRWD ENVIRONMENTAL IMPACT REPORT (EIR) ADDRESS THE POTENTIAL OF LOSS OF LIFE AND PROPERTY IN A DAM FAILURE SCENARIO.

Attachment 8: Scoping Meeting Verbal Comments

IRWD Scoping Meeting – Syphon Reservoir Improvement Project
Public Comment Notes

Gregg La Cagnina, Stonegate resident

- Expresses understanding of project benefits
- Primary concern is safety of children in the Stonegate neighborhood, at Stonegate Elementary, and at Crean Lutheran High School
- States concern for lack of inundation zone mapping in the Notice of Preparation, and its impact on the community's ability to fully understand project impacts
- Flooding: How would the project affect home values and cost of insurance?
- States that flood risks associated with the project would add to the existent fire risks in the community
- Requests explanation for selection of project location, project size, lack of inundation map

Richard Zeng, Stonegate homeowner

- States agreement with concerns raised by Gregg La Cagnina
- States concern about costs and burdens associated with the project
- Requests that first evaluation of the project includes data that will allow the community to understand the costs and other effects on the community

Michele Jacknik

- Will the project trigger a requirement for flood insurance?

Jeffrey Beavers, Exec Officer, Crean Lutheran High School

- Looks forward to continuing dialogue with IRWD
- States concern for safety of students, families, faculty, and staff at Crean Lutheran high school
- Looks forward to learning more information about the safety features being implemented, and potentially learning about lower water rates as a result of using recycled water as part of a split water system

Tim Cheng, co-president, Asian American Senior Citizens Service Center (AASCSC)

- Asks if the reservoir will be open/accessible for public recreation after project completion, similar to the San Joaquin Marsh Reservoir

IRWD Scoping Meeting – Syphon Reservoir Improvement Project
Public Comment Notes

Jeffrey Beavers Exec Officer, Crean Lutheran High School (x2)

- Expresses appreciation for notices sent by IRWD regarding participation in the emergency evacuation planning process

Michele Jacknick (X2)

- States concern about project impacts to traffic on Sand Canyon Avenue during construction and onward

Vivien Chen, Stonegate homeowner

- Requests specifications for the dam (new length and width)
- Earthquake risks: How will safety features of the dam guarantee disaster prevention?
- States that water bills have increased dramatically over the past few years
- Requests information about additional water costs, and how the project will be funded

EXECUTIVE SUMMARY

The purpose of this Air Quality and Greenhouse Gas Technical Report is to assess and discuss the impacts of potential air quality and greenhouse gas (GHG) emission impacts that may occur with the implementation of the proposed Syphon Reservoir Improvement Project (proposed project) located in unincorporated County of Orange and within the City of Irvine's (City) sphere of influence. The Syphon Reservoir is an existing recycled water storage reservoir in Irvine Ranch Water District's (IRWD's) service area. The proposed project would increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The proposed project would allow the storage of additional recycled water produced at the Michelson Water Recycling Plant (WRP) during periods of low demand (winter months) for use during periods of high demand (summer months).

The analysis describes the existing air quality and GHG environment in the vicinity of the project limits, estimates future air pollutant and GHG emissions resulting from construction and operation of the project, and identifies the potential for significant air quality and GHG emission impacts based on applicable threshold of significance. Air pollutant and GHG emissions calculation worksheets and technical data used in this analysis are provided in Appendices A through F of this report. The findings of the analyses are as follows:

- The incremental increase in regional emissions from construction of the project would exceed the regional significance thresholds for nitrogen oxides (NO_x) emissions set forth by the South Coast Air Quality Management District (SCAQMD). With implementation of mitigation measures, NO_x emissions would be reduced to below the regional NO_x significance threshold. Thus, construction of the Project with implementation of mitigation would not result in a regional violation of applicable air quality standards or jeopardize the timely attainment of such standards in the South Coast Air Basin (the Air Basin).
- The increase in on-site emissions from construction of the Project would exceed the localized significance threshold for NO_x emission set forth by the SCAQMD. With implementation of mitigation measures, NO_x emissions would be reduced to below the localized NO_x significance threshold. Thus, construction of the Project with implementation of mitigation would not result in a localized violation of applicable air quality standards or expose off-site receptors to substantial levels of regulated air contaminants.
- The incremental increase in regional emissions from operation of the Project would not exceed the regional significance thresholds set forth by the SCAQMD. Thus, operation of the Project would not result in a regional violation of applicable air quality standards or jeopardize the timely attainment of such standards in the Air Basin.
- The increase in on-site emissions from operation of the Project would not exceed the localized significance thresholds set forth by the SCAQMD. Thus, operation of the Project would not result in a localized violation of applicable air quality standards or expose off-site receptors to substantial levels of regulated air contaminants.

- Emissions from the increase in traffic due to operation of the Project would not have a significant impact upon 1-hour or 8-hour local carbon monoxide (CO) concentrations due to mobile source emissions. Thus, the Project would not result in a localized violation of CO air quality standards or expose off-site receptors to substantial levels of CO emissions.
- Construction of the Project would not generate emissions of toxic air contaminants (TAC) that would exceed the SCAQMD health risk significance threshold of an incremental increase in cancer risk of 10 in one million. However, with implementation of mitigation measures required to reduce regional and local emissions, TAC emissions would be further reduced. Thus, construction of the Project would not expose off-site receptors to substantial levels of regulated air contaminants.
- Operation of the Project would not generate TAC emissions that would exceed the SCAQMD health risk significance threshold of an incremental increase in cancer risk of 10 in one million. Thus, operation of the Project would not expose off-site receptors to substantial levels of regulated air contaminants.
- Construction and operation of the Project would not result in the generation of odors affecting a substantial number of people. Therefore, odor impacts would be less than significant.
- The Project would not conflict with applicable strategies in the SCAQMD Air Quality Management Plan and would not exceed growth projections for the area. The Project would not result in a significant cumulative air quality impact.
- The Project would not result in the generation of GHG emissions that would have a significant impact and would not conflict with applicable plans, policies and strategies to reduce GHG emissions. The Project would not result in significant GHG emission impacts.

SECTION 1

Introduction

The Syphon Reservoir is an existing recycled water storage reservoir in IRWD's service area. The proposed project would increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The proposed project would allow the storage of additional recycled water produced at the Michelson WRP during periods of low demand (winter months) for use during periods of high demand (summer months).

This Air Quality and GHG Technical Report evaluates the Syphon Reservoir Improvement Project's potential air quality impacts and GHG emissions, as well as its potential cumulative impacts. The Air Quality analysis describes and evaluates the pollutant emission and related air quality impacts that could result from construction and operation of the proposed project. The report contains: (1) a description of the existing land uses as they pertain to air emissions; (2) a summary of the federal, State, and local regulations related to air quality, including those set forth within the SCAQMD Air Quality Management Plan (AQMP), and applicable County of Orange (County) plans; and (3) an analysis of the potential impacts related to air quality associated with the implementation of the proposed project, as well as identification of potentially feasible measures that could mitigate significant impacts.

The GHG analysis addresses the potential impacts of GHG emissions from the proposed project. The section contains: (1) a summary of the relationship between GHG emissions and global climate change; (2) an overview of applicable plans, policies, and regulations related to GHG emissions; (3) an assessment of current GHG emissions at the County, State, national, and global levels; (4) a quantitative analysis of future GHG emissions associated with construction and operation of the proposed project; and (5) an analysis of the consistency of the proposed project with applicable regulations, plans, and policies to reduce GHGs as set forth by the State of California, SCAQMD, Southern California Association of Governments (SCAG) and the County of Orange.

The objectives of this air quality and GHG report are to:

1. Describe the existing air quality and GHG environment and regulatory framework for the Project;
2. Evaluate the project's construction and operational-related air quality and GHG emissions and the potential for significant impacts;
3. For identified significant impacts, provide feasible mitigation measures to reduce impacts.

The analysis was developed based on project-specific construction and operational characteristics of the proposed project as provided by IRWD and included in Appendix A. Calculations and modeling outputs are included in Appendix B through F.

The assumptions and GHG modeling included in this analysis is used in detail to inform the modeling of the Energy Impacts for the Draft EIR. While the energy impacts are discussed separately in the Energy section of the Draft EIR, the additional modeling and summary results of the energy analysis are included as Appendix G to this document.

1.1 Project Location

The proposed project would be implemented within IRWD's service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and State Route 133 (SR-133) in the County of Orange. The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway. The ground surrounding the reservoir is hilly with ridgelines and terraced slopes.

1.2 Existing Site Conditions

The existing engineered dam is comprised of compacted on-site geologic materials, approximately 59 feet high, with a crest length of 843 feet and width of 10 to 12 feet. The surface area of the existing reservoir is approximately 28 acres when filled to capacity, and the current capacity of the reservoir below the existing spillway crest is approximately 535 acre-feet (AF). The 2011 topography survey of the dam indicates its crest is at an elevation of 387.7 feet above mean sea level (amsl).

The existing dam spillway was constructed as a 12-foot wide, broad-crested weir, located at the left abutment of the dam with a crest at 380 feet amsl. The reservoir would not receive water from rivers or streams. The reservoir includes a small watershed that is approximately 205 acres and not capable of generating significant amounts of runoff that need to be managed through the use of the spillway.

1.3 Project Description

The proposed project primarily involves the expansion of three on-site facilities: Syphon Reservoir Dam, Syphon Reservoir, and the Syphon Treatment Facilities. Other operational design features would include an internal seepage control system within the new engineered dam; a circulation/aeration system for the reservoir; new onsite access and maintenance roads; a wetland mitigation area; and potential recreational facilities.

The delivery of recycled water to and from Syphon Reservoir would be accomplished with existing offsite facilities. Modifications to offsite facilities would be limited to the addition of pumps within the existing structures as further described below. Existing offsite conveyance facilities would be used to deliver tertiary-treated recycled water from the Michelson WRP to the Eastwood Recycled Water Pump Station, and then to Syphon Reservoir via an existing 36-inch recycled water pipeline. The pump station structure is currently under construction. When completed, the Eastwood Recycled Water Pump Station can accommodate the Syphon Reservoir Improvement Project with additional pump equipment. Installation of the additional pump equipment would be coordinated as a separate "equipping project" in parallel to the construction of the proposed Syphon Reservoir

improvements. The existing Highline Canal would be abandoned in place and no longer used to deliver water to Syphon Reservoir from IRWD's Rattlesnake Reservoir. Under normal operating conditions, all flow out of Syphon Reservoir would be conveyed back to Eastwood Recycled Water Pump Station through the same 36-inch recycled water pipeline, for connection to IRWD's recycled water distribution system.

1.3.1 Dam Replacement

The proposed project would replace the existing engineered dam with a new engineered dam, which would be an earth-fill embankment with upstream and downstream slopes. Onsite materials would be obtained from excavation of the existing earthen embankment dam and spillway, excavation below the new dam footprint and borrow excavations within the existing and proposed reservoir area. The proposed project would require an estimated 2.3 million cubic yards of fill, of which approximately 2.2 million cubic yards would be available onsite. Approximately 0.1 million cubic yards (100,000 cubic yards) of material would be imported from offsite sources, including rock, gravel and other materials required to construct portions of the dam. Similar to the existing dam, it is a requirement of the California Department of Water Resources, Division of Safety of Dams requirements that a spillway be included with the new dam to protect the reservoir from overtopping. The new spillway would be constructed and lined with reinforced concrete to prevent erosion of the abutment and embankment materials.

1.3.2 Reservoir Enlargement

The replacement dam would increase the reservoir's capacity from approximately 500 AF to approximately 5,000 AF. The existing reservoir ground surface would be excavated non-uniformly to obtain approximately 2.2 million cubic yards of material to construct the new engineered dam.

A new approximately 42-inch inlet/outlet conduit would be constructed to connect two proposed inlet/outlet ports along the north-facing reservoir slope to the existing onsite 36-inch inlet/outlet pipeline that ends near the toe of the existing dam. Similar to the existing reservoir, the proposed project would require a water circulation/aeration system to maintain water quality within the reservoir. The water circulation/aeration system will be detailed during final design, but would likely consist of a compressed air distribution system or surface mixer/aeration system.

1.3.3 Treatment Facilities

The existing strainer and disinfection facilities would be demolished, reconstructed and expanded at the toe of the new dam to provide filtration, chlorination and de-chlorination facilities (treatment facilities). The treatment facilities could be constructed at one of two locations, both of which are located close to the toe of the existing dam. The layout would consist of an enclosed masonry building. The footprint of the proposed treatment facilities would be determined during the detailed design, but is anticipated to be approximately 40 feet by 160 feet. A masonry block wall building would house the storage tanks, metering pumps, and control system.

1.3.4 Access and Maintenance Roads

The primary access point for construction traffic and future IRWD operation and maintenance is anticipated to be from the intersection at Portola Parkway and Sand Canyon Avenue. As part of the proposed project, the existing intersection and associated traffic lights would be modified to allow construction and future IRWD access through the intersection into the District's property. Construction vehicles and IRWD vehicles would also leave the site through the same intersection. Cross walks and associated pedestrian signals would also be modified to allow safe pedestrian crossing in both directions.

An unpaved road currently exists on the District's property in the vicinity of the intersection at Portola Parkway and Sand Canyon Avenue, which was used to access and maintain the existing Highline Canal. As part of the proposed project, this dirt road would be utilized and improved to allow two lanes (one in each direction) for ingress and egress for the construction and IRWD operation traffic. As part of the access road improvements, it is anticipated that excavation into the existing slope and construction of a retaining wall may be necessary to allow trucks to make the left turn onto the existing highline canal road after passing through the intersection. Potential secondary construction access may be considered through existing IRWD maintenance roads off of Bee Canyon Access Road. If used, these roads would be considered as one-way access points and limited to specific construction activities as further determined during the detailed design phase.

1.3.5 On-Site Wetland and Riparian and Mitigation Areas

At least 12.3 acres of riparian/wetland habitat consisting of native woody riparian vegetation and freshwater marsh habitat is proposed to be established onsite to replace habitat displaced by construction. Both freshwater marsh and woody riparian vegetation are proposed to be placed within a large patch at the northeast end of the proposed reservoir. Also, much of the woody riparian replacement habitat would be situated within a strip that would extend around the proposed reservoir at the same elevation as the planned water surface elevation when the reservoir is full. A shallow trough would be constructed around the reservoir perimeter (excluding the dam face), which would support native trees and shrubs (e.g., willows, mulefat, etc.) forming a belt of riparian vegetation around the upper edge of the artificial lake. In addition to reserving a strip around the edge of the expanded reservoir for woody riparian habitat, an approximately 6- to 8-acre wetland area would also be established within a flat area extending northeast of the expanded reservoir.

1.3.6 Recreational Facilities

During project design, IRWD would consider passive recreational facilities compatible with the project site. Recreational facilities could include a walking trail along existing access roads at the project site. This proposed walking trail could be located in the south and west portions of the project site, beginning at the new permanent access road at Portola Parkway and Sand Canyon Avenue and traveling along that route, across the dam crest, and following the alignment of the existing Highline Canal, which would be abandoned with implementation of the proposed project. Offsite recreational facilities are not part of this project and would be analyzed under separate environmental review if/when future offsite recreational facilities are established. Final design

would determine the appropriateness and location of the proposed walking trail on existing access roads and any other optional recreational facilities.

1.3.7 Additional Geotechnical Investigations

IRWD previously completed a comprehensive geotechnical investigation of the site from which the resulting data would be used during final design to develop the detailed construction documents. During the design phase, additional geotechnical investigations may need to be performed. If additional investigations are deemed necessary, the investigations may include the performance of exploratory test pits, soil borings, packer testing, and/or non-intrusive geologic investigations and observations. The additional geotechnical investigations, if needed, would remain within the proposed limits of disturbance defined by the project and would be mitigated as part of the overall project.

1.3.8 Technical Advisory Group

During the design phase, IRWD intends to establish an independent Technical Advisory Group (TAG) comprised of nationally recognized industry experts in the disciplines of dam geology/site characterization, seismic analysis, hydrology/hydraulics, dam construction, and potential failure mode analysis and RIDM. The purpose of the TAG is to provide an independent assessment of the design development including, but not limited to, review of design criteria, design details, technical approach, and other aspects of the design engineer's work to confirm the project design is in full compliance with governing standards and requirements.

1.4 Project Construction

Construction of the proposed project is estimated to require a total of 41 months. The preconstruction activities would begin in the fall of 2022 and would involve approximately 5 months of access road improvements. Preconstruction would be followed by approximately 36 months for construction of the new dam, reservoir, and associated facilities, depending on weather conditions and other variables. Construction is currently anticipated to begin in 2023. Most construction activities would be limited to 7:00 a.m. to 7:00 p.m. Monday through Friday and 9:00 am to 6:00 p.m. on Saturday. If construction work is conducted outside of these hours, IRWD would secure a variance/waiver from the appropriate entity. Construction of the proposed project would include activities implemented in phases as outlined below, which may involve overlap. Construction of the proposed project would include activities implemented in phases as outlined below in **Table 1**, which may involve overlap.

TABLE 1
CONSTRUCTION SCHEDULE

Phases	Start Date	End Date
<i>Preconstruction Activities</i>		
Drain Reservoir ^a	9/12/2022	2/24/2023
Vegetation Clearing	9/12/2022	11/4/2022
<i>Access Routes/Intersection Improvements</i>	9/12/2022	1/27/2023
<i>Excavation of Sediment/Existing Dam</i>		
Mobilization, site prep/Staging Areas	1/30/2023	3/24/2023
Upstream Excavation and Foundation Treatment	3/27/2023	8/11/2023
Dam Excavation and Foundation Treatment	8/14/2023	11/3/2023
<i>Construction of Dam/Spillway/Reservoir</i>		
Install Inlet/Outlet	9/25/2023	11/10/2023
Install Embankment to Bottom of Blanket Drain	11/13/2023	1/5/2024
Install Blanket Drain	1/8/2024	3/29/2024
Install Chimney/Remaining Embankment	4/1/2024	2/28/2025
Spillway Construction	12/9/2024	4/25/2025
<i>Construction of Filtration/Chlor/Dechlor Facility</i>	3/3/2025	1/30/2026
<i>Wetlands/Riparian Installation</i>	3/3/2025	5/23/2025
<i>Installation of Recreation Facilities</i>	4/2/2025	7/18/2025
<i>Demobilization</i>	2/2/2026	3/13/2026

Notes:

a) This phase was not modeled as it is remote activity that requires no on-site work.

1.5 Air Quality and Greenhouse Gas Fundamentals

1.5.1 Air Quality

Criteria Pollutants

Elevated concentrations of certain air pollutants in the atmosphere have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants. In the United States, such pollutants have been identified and are regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in air quality. The following pollutants are regulated by the United States Environmental Protection Agency (USEPA) and are subject to emissions control requirements adopted by federal, State and local regulatory agencies. These pollutants are referred to as “criteria air pollutants” as a result of the specific standards, or criteria, which have been adopted pertaining to them. The USEPA established the National Ambient Air Quality Standards (NAAQS) to “provide public health protection, including protecting the health of ‘sensitive’ populations such as asthmatics, children, and the elderly,” (USEPA 2016a) allowing “an adequate margin of safety” (42 USC Section 7409;

CAA Section 109). California Ambient Air Quality Standards (CAAQS) were “established to protect the health of the most sensitive groups in our communities” and “defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without any harmful effects on people or the environment” (CARB 2020a). NAAQS and CAAQS for each of the monitored pollutants and their effects on health are discussed below.

Ozone: Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds (VOCs) and nitrogen oxides (NO_x) in the presence of sunlight under certain meteorological conditions, such as high temperature and stagnation episodes. Ozone concentrations are generally highest during the summer months when direct sunlight, light wind, and warm temperature conditions are favorable.

According to the USEPA, ozone can cause the muscles in the airways to constrict potentially leading to wheezing and shortness of breath (USEPA 2019a). Ozone can make it more difficult to breathe deeply and vigorously; cause shortness of breath and pain when taking a deep breath; cause coughing and sore or scratchy throat; inflame and damage the airways; aggravate lung diseases such as asthma, emphysema and chronic bronchitis; increase the frequency of asthma attacks; make the lungs more susceptible to infection; continue to damage the lungs even when the symptoms have disappeared; and cause chronic obstructive pulmonary disease (USEPA 2019a).

Long-term exposure to ozone is linked to aggravation of asthma and is likely to be one of many causes of asthma development. Long-term exposures to higher concentrations of ozone may also be linked to permanent lung damage, such as abnormal lung development in children (USEPA 2019a). According to the California Air Resources Board (CARB), inhalation of ozone causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms, and exposure to ozone can reduce the volume of air that the lungs breathe in and cause shortness of breath (CARB 2020b).

The USEPA states that people most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers (USEPA 2019a). Children are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure (USEPA 2019a). According to CARB, studies show that children are no more or less likely to suffer harmful effects than adults; however, children and teens may be more susceptible to ozone and other pollutants because they spend nearly twice as much time outdoors and engaged in vigorous activities compared to adults (CARB 2020b). Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults and are less likely than adults to notice their own symptoms and avoid harmful exposures (CARB 2020b). Further research may be able to better distinguish between health effects in children and adults (CARB 2020b).

Volatile Organic Compounds: VOCs are organic chemical compounds of carbon and are not “criteria” air pollutants themselves; however, in combination with NO_x they form ozone, and are regulated to prevent the formation of ozone (USEPA 2017a). According to CARB, some VOCs are highly reactive and play a critical role in the formation of ozone. Potential health effects of ozone

exposure are discussed above. Other VOCs can result in adverse health effects from direct exposure and are classified by the State of California as toxic air contaminants or Hazardous Air Pollutants (HAPs) by the USEPA (CARB 2020c; USEPA 2018a). The health effects of VOCs, as Toxic Air contaminants/Hazardous Air Pollutants (TACs/HAPs), are discussed more thoroughly below.

VOCs are typically formed from combustion of fuels and/or released through evaporation of organic liquids. Fuel combustion can occur in internal combustion sources, such as motor vehicle usage, landscape and other portable equipment, and stationary generators, or external combustion, such as for water and space heating. Evaporation sources include fueling operations, consumer products (e.g., cleaning solutions), and architectural coatings (USEPA 2017b).

Nitrogen Dioxide (NO₂) and Nitrogen Oxide: NO_x is a term that refers to a group of compounds containing nitrogen and oxygen. As mentioned above, NO_x combines with VOCs to form ozone. The health effects associated with the formation of ozone were discussed above under Ozone. The primary compounds of air quality concern include NO₂ and nitric oxide (NO). Ambient air quality standards have been promulgated for NO₂, which is a reddish-brown, reactive gas (CARB 2020d).

The principal form of NO_x produced by combustion is NO, but NO reacts quickly in the atmosphere to form NO₂, creating the mixture of NO and NO₂ referred to as NO_x. Major sources of NO_x include emissions from cars, trucks and buses, power plants, and off-road equipment. The terms NO_x and NO₂ are sometimes used interchangeably. However, the term NO_x is typically used when discussing emissions, usually from combustion-related activities, and the term NO₂ is typically used when discussing ambient air quality standards. Where NO_x emissions are discussed in the context of the thresholds of significance or impact analyses, the discussions are based on the conservative assumption that all NO_x emissions would oxidize in the atmosphere to form NO₂.

According to the USEPA, short-term exposures to NO₂ can potentially aggravate respiratory diseases, particularly asthma, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms while longer exposures to elevated concentrations of NO₂ may contribute to the development of asthma and potentially increase susceptibility to respiratory infections (USEPA 2016b). According to CARB, controlled human exposure studies that show that NO₂ exposure can intensify responses to allergens in allergic asthmatics (CARB 2020d).

In addition, a number of epidemiological studies have demonstrated associations between NO₂ exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses (CARB 2020d). Infants and children are particularly at risk from exposure to NO₂ because they have disproportionately higher exposure to NO₂ than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration while in adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease (CARB 2020d).

CARB states that much of the information on distribution in air, human exposure and dose, and health effects is specifically for NO₂ and there is only limited information for NO and NO_x, as well as large uncertainty in relating health effects to NO or NO_x exposure (CARB 2020d).

Carbon Monoxide (CO): CO is primarily emitted from combustion processes and motor vehicles due to the incomplete combustion of fuel, such as natural gas, gasoline, or wood, with the majority of outdoor CO emissions from mobile sources (CARB 2020e).

According to the USEPA, breathing air with a high concentration of CO reduces the amount of oxygen that can be transported in the blood stream to critical organs like the heart and brain and at very high levels, which are possible indoors or in other enclosed environments, CO can cause dizziness, confusion, unconsciousness and death (USEPA 2016c). Very high levels of CO are not likely to occur outdoors; however, when CO levels are elevated outdoors, they can be of particular concern for people with some types of heart disease since these people already have a reduced ability for getting oxygenated blood to their hearts and are especially vulnerable to the effects of CO when exercising or under increased stress (USEPA 2016c). In these situations, short-term exposure to elevated CO may result in reduced oxygen to the heart accompanied by chest pain also known as angina (USEPA 2016c).

According to CARB, the most common effects of CO exposure are fatigue, headaches, confusion, and dizziness due to inadequate oxygen delivery to the brain (CARB 2020e). For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress; inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance (CARB 2020e). Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO (CARB 2020e).

Sulfur Dioxide (SO₂): According to the USEPA, the largest source of SO₂ emissions in the atmosphere is the burning of fossil fuels by power plants and other industrial facilities while smaller sources of SO₂ emission include industrial processes such as extracting metal from ore; natural sources such as volcanoes; and locomotives, ships and other vehicle and heavy equipment that burn fuel with a high sulfur content (USEPA 2019b). In 2006, California phased-in the ultra-low-sulfur diesel regulation limiting vehicle diesel fuel to a sulfur content not exceeding 15 parts per million, down from the previous requirement of 500 parts per million, substantially reducing emissions of sulfur from diesel combustion (CARB 2004).

According to the USEPA, short-term exposures to SO₂ can harm the human respiratory system and make breathing difficult (USEPA 2019b). According to CARB, health effects at levels near the State one-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath and chest tightness, especially during exercise or physical activity and exposure at elevated levels of SO₂ (above 1 parts per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality (CARB 2020f). Children, the elderly, and those with asthma, cardiovascular disease, or chronic lung disease (such as bronchitis or emphysema) are most likely to experience the adverse effects of SO₂ (CARB 2020f; USEPA 2019b).

Particulate Matter (PM10 and PM2.5): Particulate matter air pollution is a mixture of solid particles and liquid droplets found in the air (USEPA 2018b). Some particles, such as dust, dirt, soot, or smoke, are large or dark enough to be seen with the naked eye while other particles are so small they can only be detected using an electron microscope (USEPA 2018b). Particles are defined by their diameter for air quality regulatory purposes: inhalable particles with diameters that are generally 10 micrometers and smaller (PM10); inhalable particles with diameters that are 2.5 micrometers or less (PM2.5) (USEPA 2018b). Thus, PM2.5 comprises a portion or a subset of PM10.

Sources of PM10 emissions include dust from construction sites, landfills and agriculture, wildfires and brush/waste burning, industrial sources, and wind-blown dust from open lands (CARB 2020g). Sources of PM2.5 emissions include combustion of gasoline, oil, diesel fuel, or wood (CARB 2020g). PM10 and PM2.5 may be either directly emitted from sources (primary particles) or formed in the atmosphere through chemical reactions of gases (secondary particles) such as SO₂, NO_x, and certain organic compounds (CARB 2020g).

According to CARB, both PM10 and PM2.5 can be inhaled, with some depositing throughout the airways; PM10 is more likely to deposit on the surfaces of the larger airways of the upper region of the lung, while PM2.5 is more likely to travel into and deposit on the surface of the deeper parts of the lung, which can induce tissue damage, and lung inflammation (CARB 2020g). Short-term (up to 24-hours duration) exposure to PM10 has been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits (CARB 2020g). The effects of long-term (months or years) exposure to PM10 are less clear, although studies suggest a link between long-term PM10 exposure and respiratory mortality. The International Agency for Research on Cancer published a review in 2015 that concluded that particulate matter in outdoor air pollution causes lung cancer (CARB 2020g).

Short-term exposure to PM2.5 has been associated with premature mortality, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. Long-term exposure to PM2.5 has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children (CARB 2020g). According to CARB, populations most likely to experience adverse health effects with exposure to PM10 and PM2.5 include older adults with chronic heart or lung disease, children, and asthmatics. Children and infants are more susceptible to harm from inhaling pollutants such as PM10 and PM2.5 compared to healthy adults because they inhale more air per pound of body weight than do adults, spend more time outdoors, and have developing immune systems (CARB 2020g).

Lead (Pb): Major sources of lead emissions include ore and metals processing, piston-engine aircraft operating on leaded aviation fuel, waste incinerators, utilities, and lead-acid battery manufacturers (USEPA 2017c). In the past, leaded gasoline was a major source of lead emissions; however, the removal of lead from gasoline has resulted in a decrease of lead in the air by 98 percent between 1980 and 2014 (USEPA 2017c).

Lead can adversely affect the nervous system, kidney function, immune system, reproductive and developmental systems and the cardiovascular system, and affects the oxygen carrying capacity of blood (USEPA 2017c). The lead effects most commonly encountered in current populations are neurological effects in children, such as behavioral problems and reduced intelligence, anemia, and liver or kidney damage (CARB 2020h). Excessive lead exposure in adults can cause reproductive problems in men and women, high blood pressure, kidney disease, digestive problems, nerve disorders, memory and concentration problems, and muscle and joint pain (CARB 2020h).¹

Other Criteria Pollutants (California Only)

The California Ambient Air Quality Standards regulate the same criteria pollutants as the NAAQS but in addition, regulate State-identified criteria pollutants, including sulfates, hydrogen sulfide, visibility-reducing particles, and vinyl chloride (CARB 202a). With respect to the State-identified criteria pollutants (i.e., sulfates, hydrogen sulfide, visibility reducing particles, and vinyl chloride), the Project would either not emit them (i.e., hydrogen sulfide and vinyl chloride), or they would be accounted for as part of the pollutants estimated in this analysis (i.e., sulfates and visibility reducing particles). For example, visibility reducing particles are associated with particulate matter emissions and sulfates are associated with SO₂ emissions. Both particulate matter and SO₂ are included in the emissions estimates for the project. A description of the health effects of the State-identified criteria air pollutants is provided below.

Sulfates (SO₄²⁻): Sulfates in the environment occur as a result of SO₂ (sulfur dioxide) being converted to SO₄²⁻ compounds in the atmosphere where sulfur is first oxidized to SO₂ during the combustion process of sulfur containing, petroleum-derived fuels (e.g., gasoline and diesel fuel) (CARB 2020i). Exposure to SO₄²⁻, which are part of PM_{2.5}, results in health effects similar to those from exposure to PM_{2.5} including reduced lung function, aggravated asthmatic symptoms, and increased risk of emergency department visits, hospitalizations, and death in people who have chronic heart or lung diseases (CARB 2020i). Population groups with higher risks of experiencing adverse health effects with exposure to SO₄²⁻ include children, asthmatics, and older adults who have chronic heart or lung diseases (CARB 2020i).

Hydrogen Sulfide (H₂S): H₂S is a colorless gas with a strong odor of rotten eggs. The most common sources of H₂S emissions are oil and natural gas extraction and processing, and natural emissions from geothermal fields. Industrial sources of H₂S include petrochemical plants and kraft paper mills. H₂S is also formed during bacterial decomposition of human and animal wastes, and is present in emissions from sewage treatment facilities and landfills (CARB 2020j). Exposure to H₂S can induce tearing of the eyes and symptoms related to overstimulation of the sense of smell, including headache, nausea, or vomiting; additional health effects of eye irritation have only been reported with exposures greater than 50 ppm, which is considerably higher than the odor threshold (CARB 2020j). H₂S is regulated as a nuisance based on its odor detection level; if the standard were based on adverse health effects, it would be set at a much higher level (CARB 2020j). According

¹ While the SCAQMD CEQA Air Quality Handbook contains a thresholds of significance of significance for lead, project construction and operation would not include sources of lead emissions and would not exceed the thresholds of significance for lead. Unleaded fuel and unleaded paints have virtually eliminated lead emissions from commercial land use projects such as the Project. As a result, lead emissions are not further evaluated.

to CARB, there are insufficient data available to determine whether or not some groups are at greater risk than others (CARB 2020j).

Visibility-Reducing Particles: Visibility-reducing particles are any particles in the atmosphere that obstruct the range of visibility by creating haze (CARB 2020k). These particles vary in shape, size and chemical composition, and come from a variety of natural and manmade sources including windblown metals, soil, dust, salt, and soot. Other haze-causing particles are formed in the air from gaseous pollutant (e.g., sulfates, nitrates, organic carbon particles) which are the major constituents of fine PM, such as PM_{2.5} and PM₁₀, and are caused from the combustion of fuel. CARB's standard for visibility reducing particles is not based on health effects, but rather on welfare effects, such as reduced visibility and damage to materials, plants, forests, and ecosystems. The health impacts associated with PM_{2.5} and PM₁₀ are discussed above under Particulate Matter.

Vinyl Chloride: Vinyl chloride is a colorless gas with a mild, sweet odor. Most vinyl chloride is used to make polyvinyl chloride (PVC) plastic and vinyl products and are generally emitted from industrial processes and other major sources of vinyl chloride have been detected near landfills, sewage plants, and hazardous waste sites, due to microbial breakdown of chlorinated solvents (CARB 2020l). Short-term health effects of exposure to high levels of vinyl chloride in the air include central nervous system effects, such as dizziness, drowsiness, and headaches while long-term exposure to vinyl chloride through inhalation and oral exposure causes liver damage and has been shown to increase the risk of angiosarcoma, a rare form of liver cancer in humans (CARB 2020l). Most health data on vinyl chloride relate to carcinogenicity; thus, the people most at risk are those who have long-term exposure to elevated levels, which is more likely to occur in occupational or industrial settings; however, control methodologies applied to industrial facilities generally prevent emissions to the ambient air (CARB 2020l).

Air Toxics

Toxic Air Contaminants (TACs): TACs, or hazardous air pollutants (HAPs) as defined by the USEPA, are defined as those contaminants that are known or suspected to cause serious health problems, but do not have a corresponding ambient air quality standard (USEPA 2017d). For consistency within this document they will be referred to as TACs. TACs are also defined as an air pollutant that may increase a person's risk of developing cancer and/or other serious health effects. TACs are emitted by a variety of industrial processes such as petroleum refining, electric utility and chrome plating operations, commercial operations such as gasoline stations and motor vehicle exhaust. TACs may exist as PM₁₀ and PM_{2.5} or as vapors (gases). TACs include metals, other particles, gases absorbed by particles, and certain vapors from fuels and other sources. The emission of a TAC does not automatically create a health hazard. Other factors, such as the amount of the TAC, its toxicity, how it is released into the air, the weather, and the terrain, all influence whether the emission could be hazardous to human health. Emissions of TACs into the air can be damaging to human health and to the environment. Human exposure to TACs at sufficient concentrations and durations can result in cancer, poisoning, and rapid onset of sickness, such as nausea or difficulty in breathing. Other less measurable effects include immunological, neurological, reproductive, developmental, and respiratory problems. TACs deposited onto soil or into lakes and streams affect ecological systems and eventually human health through consumption of contaminated food. The carcinogenic potential of TACs is a particular public health concern because many scientists

currently believe that there is no “safe” level of exposure to carcinogens. Any exposure to a carcinogen poses some risk of contracting cancer (CARB 2020m).

The public’s exposure to TACs is a significant public health issue in California. The Air Toxics “Hotspots” Information and Assessment Act is a State law requiring facilities to report emissions of TACs to air districts (CARB 2020n). The program is designated to quantify the amounts of potentially HAPs released, the location of the release, the concentrations to which the public is exposed, and the resulting health risks. The State Air Toxics Program (AB 2588) identified over 200 TACs, including the 188 TACs identified in the Clean Air Act (CAA) (CARB 2020m).

The USEPA has assessed this expansive list and identified 21 TACs as Mobile Source Air Toxics (MSATs) (USEPA 2004). MSATs are compounds emitted from highway vehicles and non-road equipment. Some toxic compounds are present in fuel and are emitted to the air when the fuel evaporates or passes through the engine unburned. Other toxics are emitted from the incomplete combustion of fuels or as secondary combustion products. Metal air toxics also result from engine wear or from impurities in oil or gasoline. USEPA also extracted a subset of these 21 MSAT compounds that it now labels as the nine priority MSATs: 1,3-butadiene, acetaldehyde, acrolein, benzene, diesel particulate matter (DPM)/diesel exhaust organic gases, ethylbenzene, naphthalene, and polycyclic organic matter (POM). While these nine MSATs are considered the priority transportation toxics, USEPA stresses that the lists are subject to change and may be adjusted in future rules (USDOT 2016).

Diesel Exhaust: According to the California Almanac of Emissions and Air Quality, the majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being particulate matter from the exhaust of diesel-fueled engines, i.e., DPM (CARB 2020o). DPM differs from other TACs in that it is not a single substance, but rather a complex mixture of hundreds of substances.

Diesel exhaust is composed of two phases, gas and particle, and both phases contribute to the health risk. The gas phase is composed of many of the urban HAPs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde and polycyclic aromatic hydrocarbons. The particle phase is also composed of many different types of particles by size or composition. Fine and ultra-fine diesel particulates are of the greatest health concern and may be composed of elemental carbon with adsorbed compounds such as organic compounds, sulfate, nitrate, metals and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines; the on-road diesel engines of trucks, buses and cars and the off-road diesel engines that include locomotives, marine vessels and heavy-duty equipment. Although DPM is emitted by diesel-fueled internal combustion engines, the composition of the emissions varies depending on engine type, operating conditions, fuel composition, lubricating oil, and whether an emission control system is present.

The most common exposure to DPM is breathing air that contains diesel exhaust. The fine and ultra-fine particles are respirable (similar to PM_{2.5}), which means that they can avoid many of the human respiratory system defense mechanisms and enter deeply into the lung. Exposure to DPM comes from both on-road and off-road engine exhaust that is either directly emitted from the engines or lingering in the atmosphere.

Diesel exhaust causes health effects from long-term chronic exposures. The type and severity of health effects depends upon several factors including the amount of chemical exposure and the duration of exposure. Individuals also react differently to different levels of exposure. There is limited information on exposure to only DPM, but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes chronic health effects as well as having cancer-causing potential.

Because it is part of PM_{2.5}, DPM also contributes to the same non-cancer health effects as PM_{2.5} exposures. These effects include premature death, hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma, increased respiratory symptoms, and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies. Those most vulnerable to non-cancer health effects are children whose lungs are still developing and the elderly who often have chronic health problems (CARB 2020o).

1.5.2 Greenhouse Gases

Global climate change refers to changes in average climatic conditions on Earth as a whole, including changes in temperature, wind patterns, precipitation and storms. Historical records indicate that global climate changes have occurred in the past due to natural phenomena; however, current data increasingly indicate that the current global conditions differ from past climate changes in rate and magnitude. Global climate change attributable to anthropogenic (human) GHG emissions is currently one of the most important and widely debated scientific, economic and political issues in the United States and the world. The extent to which increased concentrations of GHGs have caused or will cause climate change and the appropriate actions to limit and/or respond to climate change is the subject of significant and rapidly evolving regulatory efforts at the federal and state levels of government.

GHGs are compounds in the Earth's atmosphere that play a critical role in determining temperature near the Earth's surface. More specifically, these gases allow high-frequency shortwave solar radiation to enter the Earth's atmosphere, but retain some of the low frequency infrared energy that otherwise is radiated back from the Earth towards space, resulting in a warming of the atmosphere.

Not all GHGs possess the same capacity to induce atmospheric warming; as a result, the warming contribution of a GHG is commonly quantified in the common unit of carbon dioxide equivalent (CO₂e) over a 100-year period, by applying the appropriate global warming potential (GWP) value.² By using the applicable GWP for each GHG, Project-related emissions can be tabulated in the common unit of metric tons per year CO₂e. GWP ratios are provided by the Intergovernmental Panel on Climate Change (IPCC). Historically, GHG emission inventories were calculated using the GWPs from the IPCC's Second Assessment Report (SAR), published in 1996. The IPCC has since updated the GWP values based on the latest science in its Fourth Assessment Report (IPCC AR4) and Fifth Assessment Report (IPCC AR5), published in 2007 and 2014, respectively (IPCC

² GWPs and associated CO₂e values were developed by the IPCC, and published in its Second Assessment Report (SAR) in 1996. Historically, GHG emission inventories have been calculated using the GWPs from the IPCC's SAR. The IPCC updated the GWP values based on the latest science in its AR4. The CARB reports GHG emission inventories for California using the GWP values from the IPCC AR4.

2007; IPCC 2014). California Air Resources Board (CARB) uses the AR4 GWPs in the statewide GHG emissions inventory, in the current Climate Change Scoping Plan, and in the current version of the California Emissions Estimator Model (CalEEMod®) that is used to calculate CO₂e values for construction as well as operations for existing and proposed project build-out conditions. Compounds that are regulated as GHGs are discussed below (CARB 2019; CARB 2017a; CAPCOA 2017).

Carbon Dioxide (CO₂): CO₂ is the most abundant anthropogenic GHG in the atmosphere and is primarily generated from fossil fuel combustion from stationary and mobile sources. CO₂ is the reference gas (GWP of 1) for determining the GWPs of other GHGs. CO₂ accounted for approximately 83 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Methane (CH₄): CH₄ is emitted from biogenic sources (i.e., resulting from the activity of living organisms), incomplete combustion in forest fires, anaerobic decomposition of organic matter in landfills, manure management, and leaks in natural gas pipelines. The GWP of CH₄ is 25 in the IPCC AR4. CH₄ accounted for approximately 9 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Nitrous Oxide (N₂O): N₂O produced by human-related sources including agricultural soil management, animal manure management, sewage treatment, mobile and stationary combustion of fossil fuel, adipic acid production, and nitric acid production. The GWP of N₂O is 298 in the IPCC AR4. N₂O emissions accounted for approximately 3 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Hydrofluorocarbons(HFCs): HFCs are fluorinated compounds consisting of hydrogen, carbon, and fluorine. They are typically used as refrigerants in both stationary refrigeration and mobile air conditioning systems. The GWPs of HFCs range from 124 for HFC-152a to 14,800 for HFC-23 in the IPCC AR4. HFCs and PFCs (see below) combined accounted for approximately 5 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Perfluorocarbons (PFCs): PFCs are fluorinated compounds consisting of carbon and fluorine. They are primarily created as a byproduct of aluminum production and semiconductor manufacturing. The GWPs of PFCs range from 7,390 to 17,700 in the IPCC AR4.

Sulfur Hexafluoride (SF₆): SF₆ is a fluorinated compound consisting of sulfur and fluoride. It is a colorless, odorless, nontoxic, nonflammable gas. It is most commonly used as an electrical insulator in high voltage equipment that transmits and distributes electricity. SF₆ has a GWP of 22,800 in the IPCC AR4. SF₆ emissions accounted for less than 1 percent of anthropogenic GHG emissions (CO₂e) in California in 2016.

Effects of Global Climate Change

The scientific community's understanding of the fundamental processes responsible for global climate change has improved over the past decade, and its predictive capabilities are advancing. However, there remain scientific uncertainties in, for example, predictions of local effects of climate change, occurrence, frequency, and magnitude of extreme weather events, effects of

aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, and changes in oceanic circulation. Due to the complexity of and inability to accurately model Earth's climate system, the uncertainty surrounding climate change may never be completely eliminated. Nonetheless, the IPCC's AR5 states that it is extremely likely that the dominant cause of the observed warming since the mid-20th century is the anthropogenic increase in GHG concentrations (IPCC 2014). A report from the National Academy of Sciences concluded that 97 to 98 percent of the climate researchers most actively publishing in the field support the tenets of the IPCC in that climate change is very likely caused by human (i.e., anthropogenic) activity (Anderegg 2010).

The IPCC's AR4, found that the potential impacts in California due to global climate change include: loss in snow pack; sea-level rise; more extreme heat days per year; more high ozone days; more extreme forest fires; more severe droughts punctuated by extreme precipitation events; increased erosion of California's coastlines and sea water intrusion into the Sacramento and San Joaquin Deltas and associated levee systems; and increased pest infestation (OPR 2018). The Fourth Assessment's findings are consistent with climate change studies published by the California Natural Resources Agency (CNRA) since 2009, starting with the *California Climate Adaptation Strategy* as a response to the Governor's Executive Order S-13-2008. In 2014, the CNRA rebranded the first update of the 2009 adaptation strategy as the *Safeguarding California Plan* (CNRA 2009; CNRA 2014). The 2018 update to *Safeguarding California Plan* identifies hundreds of ongoing actions and next steps state agencies are taking to safeguard Californians from climate impacts within a framework of 81 policy principles and recommendations (CNRA 2018).

In 2016, the CNRA released *Safeguarding California: Implementation Action Plans* in accordance with Executive Order B-30-15, identifying a lead agency to lead adaptation efforts in each sector. In accordance with the 2009 *California Climate Adaptation Strategy*, the California Energy Commission (CEC) was directed to develop a website on climate change scenarios and impacts that would be beneficial for local decision makers. The website, known as Cal-Adapt, became operational in 2011 (Cal-adapt 2020). The information provided on the Cal-Adapt website represents a projection of potential future climate scenarios comprised of local average values for temperature, sea-level rise, snowpack and other data representative of a variety of models and scenarios, including potential social and economic factors.

Below is a summary of some of the potential effects that could be experienced in California as a result of global warming and climate change.

Temperature Increase

The primary effect of adding GHGs to the atmosphere has been a rise in the average global temperature. The impact of human activities on global temperature is readily apparent in the observational record. Since 1895, the contiguous United States has observed an average temperature increase of 1.5°F per century (NOAA 2019). The 5-year period between 2014 and 2018) is the warmest on record for the contiguous United States (NOAA 2019). The average temperature for the contiguous United States was 52.7 degrees Fahrenheit placing it at 0.7 degrees higher than the 20th century average and ranking 2019 within the warmest third of the 125 years of record with the 20 warmest years have occurred over the past 22-year period (NOAA 2020).

The Fourth Assessment indicates that average temperatures in California could rise 5.6°F to 8.8°F by the end of the century, depending on the global trajectory of GHG emissions (OPR 2018). According to the Cal-Adapt website, the portion of the state in which the project site is located could result in an average increase in temperature of approximately 4.2° to 6.9°F by 2070–2090, compared to the baseline period of 1961–1990.

With climate change, extreme heat conditions and heat waves are predicted to impact larger areas, last longer, and have higher temperatures. Heat waves, defined as three or more days with temperatures above 90°F, are projected to occur more frequently by the end of the century. Extreme heat days and heat waves can negatively impact human health. Heat-related illness includes a spectrum of illnesses ranging from heat stress, cardiovascular and respiratory complications, kidney disease, to severe heat exhaustion and life-threatening heat stroke (C2ES n.d.).

Wildfires

The hotter and dryer conditions expected with climate change will make forests more susceptible to extreme wildfires. One study found that, if GHG emissions continue to rise, the frequency of extreme wildfires burning over approximately 25,000 acres would increase by nearly 50 percent, and the average area burned statewide each year would increase by 77 percent, by the year 2100. In the areas that have the highest fire risk, wildfire insurance is estimated to see costs rise by 18 percent by 2055 and the fraction of property insured would decrease (Westerling 2018).

Air Quality

Higher temperatures, conducive to air pollution formation, could worsen air quality in California and make it more difficult for the state to achieve air quality standards. Climate change may increase the concentration of ground-level ozone in particular, which can cause breathing problems, aggravate lung diseases such as asthma, emphysema, chronic bronchitis, and cause chronic obstructive pulmonary disease but the magnitude of the effect, and therefore, its indirect effects, are uncertain. Emissions from wildfires can lead to excessive levels of particulate matter, ozone, and volatile organic compounds (Kenward 2013). Additionally, severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks throughout the state (USEPA 2017e).

Precipitation and Water Supply

There is a high degree of uncertainty with respect to the overall impact of global climate change on future water supplies in California. Studies indicate considerable variability in predicting precise impacts of climate change on California hydrology and water resources. Increasing uncertainty in the timing and intensity of precipitation will challenge the operational flexibility of California's water management systems. Warmer, wetter winters would increase the amount of runoff available for groundwater recharge; however, this additional runoff would occur at a time when some basins are either being recharged at their maximum capacity or are already full. Conversely, reductions in spring runoff and higher evapotranspiration because of higher temperatures could reduce the amount of water available for recharge (CNRA 2014).

Hydrology and Sea-Level Rise

As discussed above, climate changes could potentially affect: the amount of snowfall, rainfall and snowpack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, coincidental high tide and high runoff events); sea-level rise and coastal flooding; coastal erosion; and the potential for saltwater intrusion. Sea-level rise can be a product of global warming through two main processes: expansion of seawater as the oceans warm, and melting of ice over land. A rise in sea levels could result in coastal flooding and erosion and could jeopardize California's water supply. Sea level could rise as much as 2 feet along most of the U.S. coastline. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to handle storm events (CNRA 2014).

Agriculture

California has a massive agricultural industry that represents 11.3 percent of total US agricultural revenue. Higher CO₂ levels can stimulate plant production and increase plant water-use efficiency. However, a changing climate presents significant risks to agriculture due to “potential changes to water quality and availability; changing precipitation patterns; extreme weather events including drought, severe storms, and floods; heat stress; decreased chill hours; shifts in pollinator lifecycles; increased risks from weeds, pest and disease; and disruptions to the transportation and energy infrastructure supporting agricultural production (CNRA 2014).”

Ecosystems and Wildlife

Increases in global temperatures and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increased concentrations of GHGs are likely to accelerate the rate of climate change. Scientists expect that the average global surface temperature could rise by 2–11.5°F (1.1–6.4°C) by 2100, with significant regional variation (NRC 2010). Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. With climate change, ecosystems and wildlife will be challenged by the spread of invasive species, barriers to species migration or movement in response to changing climatic conditions, direct impacts to species health, and mismatches in timing between seasonal life-cycle events such as species migration and food availability (CNRA 2014).

1.6 Regulatory Framework

This section provides a summary of pertinent federal, State, and local statutes, regulations, plans, and policies that have been adopted that address air quality.

1.6.1 Federal

Clean Air Act

The 1963 CAA was the first federal legislation regarding air pollution control and has been amended numerous times in subsequent years, with the most recent amendments occurring in 1990. At the federal level, USEPA is responsible for implementation of certain portions of the CAA including mobile source requirements.

The CAA establishes federal air quality standards and specifies future dates for achieving compliance. The CAA also mandates that the State submit and implement a State Implementation Plan (SIP) for areas not meeting these standards. SIPs must include pollution control measures that demonstrate how the NAAQS will be met. The 1990 amendments to the CAA identify specific emission reduction goals for areas not meeting the NAAQS. These amendments require both a demonstration of reasonable further progress toward attainment and incorporation of additional sanctions for failure to attain or to meet interim milestones. The sections of the CAA that are most applicable to the proposed project include Title I (Nonattainment Provisions).

Title I requirements are implemented for the purpose of attaining NAAQS for the following criteria air pollutants: ozone; NO₂; CO; SO₂; PM₁₀; and lead. The NAAQS were amended in July 1997 to include an 8-hour standard for ozone and to adopt a NAAQS for PM_{2.5}. The NAAQS were also amended in September 2006 to include an established methodology for calculating PM_{2.5} as well as revoking the annual PM₁₀ threshold. **Table 2** shows the NAAQS currently in effect for each criteria air pollutant.

In *Massachusetts v. Environmental Protection Agency*, 549 U.S. 497 (2007), twelve states and cities, including California, together with several environmental organizations, sued to require the USEPA to regulate GHGs as pollutants under the CAA. The United States Supreme Court ruled that GHGs fit within the CAA's definition of a pollutant and the USEPA had the authority to regulate GHGs.

TABLE 2
AMBIENT AIR QUALITY STANDARDS

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
ozone ^h	1 Hour	0.09 ppm (180 µg/m ³)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m ³)		0.070 ppm (137 µg/m ³)		
NO ₂ ⁱ	1 Hour	0.18 ppm (339 µg/m ³)	Gas Phase Chemi- luminescence	100 ppb (188 µg/m ³)	None	Gas Phase Chemi- luminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m ³)		53 ppb (100 µg/m ³)	Same as Primary Standard	
CO	1 Hour	20 ppm (23 mg/m ³)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m ³)	None	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10mg/m ³)		9 ppm (10 mg/m ³)		
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m ³)		—		

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
SO ₂ ^j	1 Hour	0.25 ppm (655 µg/m ³)	Ultraviolet Fluorescence	75 ppb (196 µg/m ³)	—	Ultraviolet Fluorescence; Spectro- photometry (Pararosaniline Method) ^g
	3 Hour	—		—	0.5 ppm (1300 µg/m ³)	
	24 Hour	0.04 ppm (105 µg/m ³)		0.14 ppm (for certain areas) ^j	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas) ^j	—	
PM10 ^k	24 Hour	50 µg/m ³	Gravimetric or Beta Attenuation	150 µg/m ³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m ³		—		
PM2.5 ^k	24 Hour	No Separate State Standard		35 µg/m ³	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m ³	Gravimetric or Beta Attenuation	12.0 µg/m ^{3k}		
Lead ^{l,m}	30 Day Average	1.5 µg/m ³	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 µg/m ³ (for certain areas) ^m	Same as Primary Standard	
	Rolling 3- Month Average ^m	--		0.15 µg/m ³		
Visibility Reducing Particles ⁿ	8 Hour	Extinction coefficient of 0.23 per kilometer — visibility of ten miles or more due to particles when relative humidity is less than 70 percent.		No Federal Standards		
Sulfates (SO ₄)	24 Hour	25 µg/m ³	Ion Chroma- tography	No Federal Standards		
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m ³)	Ultraviolet Fluorescence	No Federal Standards		
Vinyl Chloride ^l	24 Hour	0.01 ppm (26 µg/m ³)	Gas Chroma- tography	No Federal Standards		

- ^a California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
- ^b National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 micrograms/per cubic meter (µg/m³) is equal to or less than one. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard.
- ^c Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
- ^d Any equivalent procedure which can be shown to the satisfaction of the California Air Resources Board to give equivalent results at or near the level of the air quality standard may be used.
- ^e National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
- ^f National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
- ^g Reference method as described by the U.S. EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the U.S. EPA.
- ^h On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

Pollutant	Average Time	California Standards ^a		National Standards ^b		
		Concentration ^c	Method ^d	Primary ^{c,e}	Secondary ^{c,f}	Method ^g
		<ul style="list-style-type: none"> ⁱ To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. ^j On June 2, 2010, a new 1-hour SO₂ standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO₂ national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated non-attainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. ^k On December 14, 2012, the national annual PM_{2.5} primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. ^l CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants. ^m The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated non-attainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved. ⁿ In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively. 				
SOURCE: CARB 2016a; CARB 2020a-c; CARB 2020d-l						

On December 7, 2009, the USEPA Administrator signed two distinct findings regarding GHGs under CAA section 202(a):

- **Endangerment Finding:** The current and projected concentrations of the six key GHGs—CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆—in the atmosphere threaten the public health and welfare of current and future generations.
- **Cause or Contribute Finding:** The combined emissions of these GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

These findings did not, by themselves, impose any requirements on industry or other entities. However, these actions were a prerequisite for implementing GHG emissions standards for motor vehicles.

On-Road Vehicle Rules

Heavy-Duty Vehicles

GHG emissions and fuel efficiency standards for medium- and heavy-duty trucks have been jointly developed by the USEPA and the National Highway Traffic Safety Administration (NHTSA). For vocational vehicles, which consist of a variety of work vehicles including dump trucks, the Phase 1 Heavy-Duty Vehicle Greenhouse Gas Regulation started with model year 2014 and the standard requires up to a 10 percent reduction in CO₂ emissions by model year 2017 over the 2010 baseline. The Phase 2 standards start in model year 2021 and require the phase-in of a 12 to 24 percent reduction in CO₂ emission reduction from vocational vehicles by model year 2027 over the 2017 baseline.

Light-Duty Vehicles

In August 2018, the USEPA and NHTSA proposed the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule that would, if adopted, maintain the CAFE and CO₂ standards applicable in model

year 2020 for model years 2021 through 2026. The estimated CAFE and CO₂ standards for model year 2020 are 43.7 mpg and 204 grams of CO₂ per mile for passenger cars and 31.3 mpg and 284 grams of CO₂ per mile for light trucks, projecting an overall industry average of 37 mpg, as compared to 46.7 mpg under the standards issued in 2012. In September 2019, the USEPA published the final rule in the Federal Register (Federal Register, Vol. 84, No. 188, Friday, September 27, 2019, Rules and Regulations, 51310-51363). The USEPA also published the final rule for the One National Program on Federal Preemption of State Fuel Economy Standards that finalizes critical parts of the SAFE Vehicles Rule and makes clear that federal law preempts state and local tailpipe GHG emissions standards as well as zero emission vehicle (ZEV) mandates. In November 2019, California and 23 other states, environmental groups, and the cities of Los Angeles and New York, filed a petition with the U.S. Court of Appeals for the District of Columbia Circuit, for the EPA to reconsider the published rule. On March 31, 2020, USEPA and NHTSA issued the SAFE Vehicles Rule, setting fuel economy and carbon dioxide standards that increase 1.5 percent in stringency each year from model years 2021 through 2026 (see 85 Federal Register 24174). On February 8, 2021, the United States Court of Appeals for the District of Columbia Circuit issued an order granting the Biden Administration's motion to stay litigation over Part 1 of SAFE Rule. Consistent with President Biden's executive order on Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis, USEPA and NHTSA are now evaluating whether and how to replace the SAFE Rule.

1.6.2 State

California has promulgated a series of executive orders, laws, and regulations aimed at reducing both the level of air pollutants and GHGs in the atmosphere and emissions of pollutants from commercial and private activities within the state. The major components of California's initiatives are reviewed below.

California Clean Air Act

The California Clean Air Act, signed into law in 1988, requires all areas of the State to achieve and maintain the CAAQS by the earliest practical date. The CAAQS are established to protect the health of the most sensitive groups and apply to the same criteria air pollutants as the federal CAA and also includes State-identified criteria air pollutants, which are sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride (CARB 2020a). Table 2, provided above, shows the CAAQS currently in effect for each of the federally identified criteria air pollutants as well as state recognized pollutants, such as sulfates, visibility-reducing particles, hydrogen sulfide, and vinyl chloride.

California Greenhouse Gas Reduction Targets

Through executive order, California governors have established long-term GHG reduction goals for the state.

Executive Order S-3-05

On June 1, 2005, Governor Schwarzenegger announced Executive Order S-3-05, which established the following GHG emission reduction targets:

- By 2010, California shall reduce GHG emissions to 2000 levels;
- By 2020, California shall reduce GHG emissions to 1990 levels; and
- By 2050, California shall reduce GHG emissions to 80 percent below 1990 levels.

Executive Order B-30-15

On April 29, 2015, Governor Brown issued Executive Order B-30-15, in which, the Governor:

- Established a new interim statewide reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030;
- Ordered all state agencies with jurisdiction over sources of GHG emissions to implement measures to achieve reductions of GHG emissions to meet the 2030 and 2050 reduction targets; and
- Directed CARB to update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent.

California Health and Safety Code, Division 25.5 – California Global Warming Solutions Act of 2006 (AB 32)

Following the issuance of Executive Order S-3-05, in 2006, the California State Legislature adopted the California Global Warming Solutions Act of 2006 (passed as Assembly Bill [AB] 32 and codified in the California Health and Safety Code [HSC], Division 25.5), which focuses on reducing GHG emissions in California to 1990 levels by 2020. HSC Division 25.5 defines GHGs as CO₂, CH₄, N₂O, HFCs, PFCs, and SF₆ and represents the first enforceable statewide program to limit emissions of these GHGs from all major industries with penalties for noncompliance. The law further requires that reduction measures be technologically feasible and cost effective.

Under HSC Division 25.5, CARB has the primary responsibility for reducing GHG emissions. CARB is required to adopt rules and regulations directing state actions that would achieve GHG emissions reductions equivalent to 1990 statewide levels by 2020.

Senate Bill 32

In 2016, Senate Bill (SB) 32 and its companion bill AB 197, augmented AB 32 and amended HSC Division 25.5, establishing a new climate pollution reduction target of 40 percent below 1990 levels by 2030 and including provisions to ensure the benefits of state climate policies reach into disadvantaged communities.

2008 and 2014 Climate Change Scoping Plans

A specific requirement of AB 32 was the preparation of a Climate Change Scoping Plan for achieving the maximum technologically feasible and cost-effective GHG emission reduction by 2020. CARB developed and approved the initial Scoping Plan in 2008, outlining the regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs that would be needed to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the state's long-range climate objectives (CARB 2008).

The First Update to the Scoping Plan was approved by CARB in May 2014 and built upon the initial Scoping Plan with new strategies and recommendations. In 2014, CARB revised the target using the GWP values from the IPCC AR4 and determined that the 1990 GHG emissions inventory and 2020 GHG emissions limit is 431 million metric tons of carbon dioxide equivalents (MMTCO₂e). CARB also updated the state's 2020 emissions estimate to account for the effect of the 2007–2009 economic recession, new estimates for future fuel and energy demand, and the reductions required by regulation that were adopted for motor vehicles and renewable energy (CARB 2014).

2017 Climate Change Scoping Plan Update

In response to SB 32 and the 2030 GHG reduction target, CARB approved the 2017 Climate Change Scoping Plan Update (2017 Scoping Plan Update) in December 2017 (CARB 2017a). The 2017 Scoping Plan Update outlines the proposed framework of action for achieving the 2030 GHG target of 40 percent reduction in GHG emissions relative to 1990 levels (CARB 2017a). The 2017 Scoping Plan Update identifies key sectors of the state's implementation strategy, which includes improvements in low-carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. Through a combination of data synthesis and modeling, CARB determined that the target statewide 2030 emissions limit is 260 MMTCO₂e, and that further commitments will need to be made to achieve an additional reduction of 50 MMTCO₂e beyond current policies and programs. The cornerstone of the 2017 Scoping Plan Update is an expansion of the Cap-and-Trade Program (discussed further below) to meet the aggressive 2030 GHG emissions goal and ensure achievement of the 2030 limit set forth by E.O. B-30-15.

The 2017 Scoping Plan Update's strategy for meeting the state's 2030 GHG target incorporates the full range of legislative actions and state-developed plans that have relevance to the year 2030, including the following, described elsewhere in this section:

- Extending the low-carbon fuel standard (LCFS) beyond 2020 and increasing the carbon intensity reduction requirement to 18 percent by 2030;
- SB 350, which increases the Renewables Portfolio Standard (RPS) to 50 percent by 2030 and requires the CEC to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by 2030. These targets may be achieved through energy efficiency savings and demand reductions from a variety of programs, including but not limited to appliance and building energy efficiency standards and a comprehensive program to achieve greater energy efficiency standards in existing buildings;
- The 2016 Mobile Source Strategy is estimated to reduce emissions from mobile sources including an 80 percent reduction in smog-forming emissions and a 45 percent reduction in diesel particulate matter from 2016 levels in the Air Basin, a 45 percent reduction in statewide GHG emissions (from both on-road and off-road mobile sources) and a 50 percent reduction in statewide consumption of petroleum-based fuels;
- The Sustainable Freight Action Plan to improve freight efficiency and transition to zero emission freight handling technologies (described in more detail below);
- SB 1383, which requires a 50 percent reduction in anthropogenic black carbon and a 40 percent reduction in hydrofluorocarbon and methane emissions below 2013 levels by 2030; and

- AB 398, which extends the state Cap-and-Trade Program through 2030.

In the 2017 Scoping Plan Update, CARB recommends statewide targets of no more than six MT CO₂e per capita by 2030 and no more than two metric tons CO₂e per capita by 2050. CARB acknowledges that because the statewide per capita targets are based on the statewide GHG emissions inventory that includes all emissions sectors in the state (including large industrial sources covered under the state's cap and trade program), they are not applicable for use at the local level. Rather, it is appropriate for local jurisdictions to derive evidence-based local per-capita goals based on local emissions sectors and growth projections.

To demonstrate how a local jurisdiction can achieve their long-term GHG goals at the community plan level, CARB recommends developing a geographically specific GHG reduction plan (i.e., climate action plan) consistent with the requirements of CEQA Guidelines section 15183.5(b). A so-called "CEQA-qualified" GHG reduction plan, once adopted, can provide local governments with a streamlining tool for project-level environmental review of GHG emissions, provided there are adequate performance metrics for determining project consistency with the plan. Absent conformity with such a plan, CARB recommends "that projects incorporate design features and GHG reduction measures, to the degree feasible, to minimize GHG emissions. Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development (CARB 2017a)."

On-Road and Off-Road Vehicle and Equipment Rules

Heavy-Duty Vehicles and Equipment

In 2004, CARB adopted an Airborne Toxic Control Measure to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time.

In 2008 CARB approved the Truck and Bus Regulation to reduce NO_x, PM₁₀, and PM_{2.5} emissions from existing diesel vehicles operating in California. The requirements were amended in December 2010 and apply to nearly all diesel fueled trucks and busses with a gross vehicle weight rating greater than 14,000 pounds. For the largest trucks in the fleet (i.e., those with a gross vehicle weight rating greater than 26,000 pounds), there are two methods to comply with the requirements. The first method is for the fleet owner to retrofit or replace engines, starting with the oldest engine model year, to meet 2010 engine standards, or better. This is phased over eight years, starting in 2015 and would be fully implemented by 2023, meaning that all trucks operating in the State subject to this option would need to meet or exceed the 2010 engine emission standards for NO_x and PM by 2023. The second option, if chosen, requires fleet owners, starting in 2012, to retrofit a portion of their fleet with diesel particulate filters achieving at least 85 percent removal efficiency, so that by January 1, 2016, their entire fleet is equipped with diesel particulate filters. However, diesel particulate filters do not typically lower NO_x emissions. Thus, fleet owners choosing the second method must still comply with the 2010 engine emission standards for their trucks and busses by 2020. Beginning January 1, 2020, this requirement is enforced by the California Department of Motor Vehicles (DMV). Senate Bill 1 (SB1), the Road Repair and Accountability Act of 2017, was

signed into law on April 28, 2017. SB1 authorizes the DMV to check that vehicles are compliant with or exempt from CARB's Truck and Bus Regulation. Effective January 1, 2020, if a vehicle is not compliant with the rule, DMV will no longer register that vehicle.

In addition to limiting exhaust from idling trucks, CARB promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower such as bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. The regulation adopted by CARB on July 26, 2007, aims to reduce emissions by installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission-controlled models. Implementation is staggered based on fleet size (which is the total of all off-road horsepower under common ownership or control), with the largest fleets to begin compliance by January 1, 2014. Each fleet must demonstrate compliance through one of two methods. The first option is to calculate and maintain fleet average emissions targets, which encourages the retirement or repowering of older equipment and rewards the introduction of newer cleaner units into the fleet. The second option is to meet the Best Available Control Technology (BACT) requirements by turning over or installing Verified Diesel Emission Control Strategies (e.g., engine retrofits) on a certain percentage of its total fleet horsepower. The compliance schedule requires that BACT turn overs or retrofits be fully implemented by 2023 in all equipment in large and medium fleets and across 100 percent of small fleets by 2028.

Light-Duty Vehicles

In 2002, Governor Davis signed AB 1493 (Pavley), which required CARB to set GHG emission standards for passenger vehicles, light duty trucks, and other vehicles whose primary use is non-commercial personal transportation manufactured in and after 2009. Because the Pavley standards (named for the bill's author, state Senator Fran Pavley) would impose stricter standards than those under the CAA, California applied to the USEPA for a waiver under the CAA. In 2009, the USEPA granted the waiver. The waiver has been extended consistently since 2009; however, in 2018 the USEPA and NHTSA indicated their intent to revoke California's waiver, and prohibit future state emissions standards enacted under the CAA. In response to the Federal SAFE Vehicles Rules and the One National Program on Federal Preemption of State Fuel Economy Standards, in November 2019 California and 23 other states, environmental groups, and the cities of Los Angeles and New York, filed a petition with the U.S. Court of Appeals for the District of Columbia Circuit, for the EPA to reconsider the published rule. As noted above, consistent with President Biden's executive order on Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis, USEPA and NHTSA are now evaluating whether and how to replace the SAFE Rule.

Low Carbon Fuel Standard

In January 2007, Governor Schwarzenegger enacted Executive Order S-01-07, which mandates that the state: (1) establish a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020; and (2) adopt a Low Carbon Fuel Standard (LCFS) for transportation fuels in California. The overall goal of the LCFS is to lower the carbon intensity of California transportation fuel. The 2017 Scoping Plan Update calls for the LCFS to reduce fuel carbon intensity by at least 18 percent by 2030. In September 2018, CARB extended

the LCFS program to 2030, making significant changes to the design and implementation of the Program including a doubling of the carbon intensity reduction to 20 percent by 2030.

Energy Sector

Title 24 Building Energy Efficiency Standards

CCR Title 24 establishes California’s Building Energy Efficiency Standards; Part 11 is referred to as the California Green Building Standards (CALGreen) Code. The purpose of the CALGreen Code is to “improve public health, safety and general welfare by enhancing the design and construction of buildings through the use of building concepts having a positive environmental impact and encouraging sustainable construction practices in the following categories: (1) planning and design; (2) energy efficiency; (3) water efficiency and conservation; (4) material conservation and resource efficiency; and (5) environmental air quality (CBSC 2010).” In 2016, the CALGreen Code was updated to include new mandatory measures for residential and nonresidential buildings, and the new measures took effect on January 1, 2017. The CALGreen Code was most recently updated in 2018 with new measures taking effect on January 1, 2020 (CBSC 2019).

1.6.3 Regional

South Coast Air Quality Management District

SCAQMD has jurisdiction over air quality planning for all of County of Orange, Los Angeles County except for the Antelope Valley, the non-desert portion of western San Bernardino County, and the western and Coachella Valley portions of Riverside County. The Air Basin is a subregion within SCAQMD jurisdiction. While air quality in the Air Basin has improved, the Air Basin requires continued diligence to meet the air quality standards.

SCAQMD adopted a “Policy on Global Warming and Stratospheric Ozone Depletion” on April 6, 1990. The policy commits SCAQMD to consider global impacts in rulemaking and in drafting revisions to the Air Quality Management Plan. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy to include the following directives:

- Phase out the use and corresponding emissions of chlorofluorocarbons, methyl chloroform (1,1,1-trichloroethane or TCA), carbon tetrachloride, and halons by December 1995;
- Phase out the large quantity use and corresponding emissions of hydrochlorofluorocarbons by the year 2000;
- Develop recycling regulations for hydrochlorofluorocarbons (e.g., SCAQMD Rules 1411 and 1415);
- Develop an emissions inventory and control strategy for methyl bromide; and
- Support the adoption of a California GHG emission reduction goal.

In 2008, SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds (SCAQMD 2008a). Within its October 2008 document, SCAQMD proposed the use of a percent emission reduction target to determine significance for commercial/residential projects that emit greater than 3,000 metric tons of carbon dioxide equivalents (MTCO_{2e}) per year. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance

threshold for stationary source/industrial projects where SCAQMD is the lead agency. However, SCAQMD did not adopt a GHG significance threshold for land use development projects (e.g., mixed-use/commercial projects) and formed a GHG Significance Threshold Working Group to further evaluate potential GHG significance thresholds. This Working Group has been inactive since 2011 and SCAQMD has not formally adopted any GHG significance threshold guidance for land use development projects.

Air Quality Management Plan

SCAQMD has adopted a series of AQMPs to meet the CAAQS and NAAQS, the 2012 and the 2016 AQMPs. While the 2016 AQMP is the most recent and was adopted by SCAQMD and CARB, it has not received full USEPA approval for inclusion in the SIP. Therefore, until such time as the 2016 AQMP is completely approved by the USEPA, the 2012 AQMP remains the applicable AQMP; however, this analysis considers both the 2012 and 2016 AQMPs as appropriate.

The 2012 AQMP includes a comprehensive strategy aimed at controlling pollution from all sources, including stationary sources, and on-road and off-road mobile sources. It highlights the significant amount of emission reductions needed and the urgent need to identify additional strategies, especially in the area of mobile sources, to meet all federal criteria air pollutant standards within the timeframes allowed under the CAA (SCAQMD 2013).

The key undertaking of the 2012 AQMP is to bring the Air Basin into attainment with the NAAQS for the 24-hour PM_{2.5} standard. It also intensifies the scope and pace of continued air quality improvement efforts toward meeting the 2024 8-hour ozone standard deadline with new measures designed to reduce reliance on the CAA section 182(e)(5) long-term measures for NO_x and VOC reductions. SCAQMD expects exposure reductions to be achieved through implementation of new and advanced control technologies as well as improvement of existing technologies.

The SCAQMD Governing Board adopted the 2016 AQMP on March 3, 2017 (SCAQMD 2017a). CARB approved the 2016 AQMP on March 23, 2017. Key elements of the 2016 AQMP include implementing fair-share emissions reductions strategies at the federal, state, and local levels; establishing partnerships, funding, and incentives to accelerate deployment of ZE and near-zero-emissions (NZE) technologies; and taking credit from co-benefits from greenhouse gas, energy, transportation and other planning efforts (SCAQMD 2017a). The strategies included in the 2016 AQMP are intended to demonstrate attainment of the NAAQS for the national non-attainment pollutants ozone and PM_{2.5} (SCAQMD 2018). The strategies that are particularly relevant to the project include the following:

MOB-08 – Accelerated Retirement of Older On-Road Heavy-Duty Vehicles: This measure seeks to replace up to 2,000 heavy-duty vehicles per year with newer or new vehicles that at a minimum, meet the 2010 on-road heavy-duty NO_x exhaust emissions standard of 0.2 grams per brake horsepower-hour (g/bhp-hr).

MOB-10 – Extension of the SOON Provision for Construction/Industrial Equipment: This measure continues the Surplus Off-Road Option for NO_x (SOON) provision of the Statewide In-Use Off-Road Fleet Vehicle Regulation through the 2031 timeframe.

Air Quality Guidance Documents

SCAQMD's CEQA guidelines are voluntary initiatives recommended for consideration by local planning agencies. The *CEQA Air Quality Handbook* (Handbook) published by SCAQMD provides local governments with guidance for analyzing and mitigating project-specific air quality impacts (SCAQMD 1993). SCAQMD is currently updating some of the information and methods in the Handbook, such as the screening tables for determining the air quality significance of a project and the on-road mobile source emission factors. While this process is underway, SCAQMD recommends using other approved models to calculate emissions from land use projects, such as CalEEMod (SCAQMD 2020a).

The *SCAQMD Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning* considers impacts to air quality sensitive receptors from TAC-emitting facilities (SCAQMD 2005). SCAQMD's siting distance recommendations are the same as those provided by CARB (e.g., a 500-foot siting distance for air quality sensitive receptors proposed in proximity to freeways and high-traffic roads).

The SCAQMD Final Localized Significance Threshold Methodology and Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM2.5 Significance Thresholds provides guidance when evaluating the localized effects of emissions in the CEQA evaluation (SCAQMD 2008b; SCAQMD 2006). These guidance documents were promulgated by the SCAQMD Governing Board as a tool to assist lead agencies to analyze localized impacts associated with project-specific level proposed projects. The guidance documents establish mass emission rate "look up tables" as significance thresholds for projects that are five acres or less. For projects that are larger than five acres, such as the proposed project, it is recommended that project-specific air quality dispersion modeling is completed to determine localized air quality.

Toxic Air Contaminants

At the local level, air pollution control or management districts may adopt and enforce CARB control measures. Under SCAQMD Regulation XIV (Toxics and Other Non-Criteria Pollutants), and in particular Rule 1401 (New Source Review), all sources that possess the potential to emit TACs are required to obtain permits from SCAQMD. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including new source review standards and air toxics control measures. SCAQMD limits emissions and public exposure to TACs through a number of programs. SCAQMD prioritizes TAC-emitting stationary sources based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors.

In 2000, The Air Toxics Control Plan (revised in 2004) examined the overall direction of SCAQMD's air toxics control program. It includes development and implementation of strategic initiatives to monitor and control air toxics emissions. Control strategies that are deemed viable and are within SCAQMD's jurisdiction will each be brought to the SCAQMD Board for further consideration through the normal public review process. Strategies that are to be implemented by other agencies will be developed in a cooperative effort, and the progress will be reported back to the Board periodically.

In 2015, SCAQMD completed the Multiple Air Toxics Exposure Study IV (MATES IV) (SCAQMD 2015a), which is a monitoring and evaluation study conducted in the Air Basin. MATES IV is a follow up to the 2008 MATES III study and consists of several elements including a monitoring program, an updated emissions inventory of toxic air contaminants, and a modeling effort to characterize risk across the Air Basin (SCAQMD 2008c). MATES IV focuses on the carcinogenic risk from exposure to air toxics. However, it does not estimate mortality or other health effects from particulate exposures. SCAQMD is currently in the process of updating the MATES studies series with MATES V; however, the analysis has not yet been completed.

Rules and Regulations

The SCAQMD has adopted many rules and regulations to regulate sources of air pollutant emission in the Air Basin. With respect to GHG emissions, the proposed project may be subject to the following SCAQMD rules and regulations. While the focus of these rules and regulations are on criteria pollutants and toxic air contaminants, they would nonetheless control GHG emissions as co-benefits:

Regulation IV – Prohibitions: This regulation sets forth the restrictions for visible emissions, odor nuisance, fugitive dust, various air emissions, fuel contaminants, start-up/shutdown exemptions and breakdown events. The following is a list of rules which apply to the proposed project:

Rule 401 – Visible Emissions: This rule states that a person shall not discharge into the atmosphere from any single source of emission whatsoever any air contaminant for a period or periods aggregating more than three minutes in any one hour which is as dark or darker in shade as that designated No. 1 on the Ringelmann Chart or of such opacity as to obscure an observer's view.

Rule 402 – Nuisance: This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

Rule 403 – Fugitive Dust: This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM₁₀ emissions to less than 50 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers and/or ceasing all activities. Finally, a contingency plan may be required if so determined by USEPA. As a large site, the proposed project would also be required to comply with subsection (e) of Rule 403 which includes additional requirements for large operations.

Regulation XI – Source Specific Standards: Regulation XI sets emissions standards for specific sources. The following is a list of rules which may apply to the proposed project:

Rule 1113 – Architectural Coatings: This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.

Rule 1186 – PM10 Emissions from Paved and Unpaved Roads, and Livestock Operations: This rule applies to owners and operators of paved and unpaved roads and livestock operations. The rule is intended to reduce PM10 emissions by requiring the cleanup of material deposited onto paved roads, use of certified street sweeping equipment, and treatment of high-use unpaved roads (see also Rule 403).

Regulation XIV – Toxics and Other Non-Criteria Pollutants: Regulation XIV sets requirements for new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants or other non-criteria pollutants. The following is a list of rules which may apply to the proposed project:

Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities: This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.

Rule 1470 – Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines: This rule applies to stationary compression ignition engine greater than 50 brake horsepower and sets limits on emissions and operating hours. In general, new stationary emergency standby diesel-fueled engines greater than 50 brake horsepower are not permitted to operate more than 50 hours per year for maintenance and testing.

Southern California Association of Governments

The Southern California Association of Governments (SCAG) is the Metropolitan Planning Organization for the region in which the County of Orange and City of Irvine are located. In May 2020, SCAG adopted the *2020-2045 Regional Transportation Plan/Sustainable Communities Strategy* (RTP/SCS), also referred to as *ConnectSoCal*, which is an update to the previous 2016-2040 RTP/SCS (SCAG 2020).

The 2020-2045 RTP/SCS provides a vision for transportation throughout the region for the next several decades by considering the role of transportation in the broader context of economic, environmental, and quality-of-life goals for the future, identifying regional transportation strategies to address mobility needs. The 2020-2045 RTP/SCS describe how the region can attain the GHG emission-reduction targets set by CARB by achieving an 8 percent reduction in per capita transportation GHG emissions by 2020 and a 19 percent reduction in per capita transportation GHG emissions by 2035 compared to the 2005 level on a per capita basis. Compliance with and implementation of the 2020-2045 RTP/SCS policies and strategies would have co-benefits of reducing per capita criteria air pollutant emissions (e.g. nitrogen dioxide, carbon monoxide, etc.) associated with reduced per capita vehicle miles traveled (VMT) (SCAG 2020).

1.6.4 Local

Local jurisdictions, such as the County of Orange (County) and the City of Irvine (City), have the authority and responsibility to reduce air pollution and GHG emissions through their land use decision-making authority.

Orange County General Plan

The County is responsible for the assessment and mitigation of pollutant emissions resulting from its land use decisions. The County's General Plan Resource Element sets forth the goals, objectives, and policies which guide the County in its implementation of its air quality improvement programs and strategies. A number of these goals, objectives, and policies are relevant to the proposed project, and relate to minimizing particulate emissions from construction activities, managing traffic congestion during peak hours, and increasing energy efficiency in private developments.

The Resource Element establishes the following air quality goal pertaining to the proposed project: Promote optimum sustainable environmental quality standards for air resources.

The Resource Element establishes the following goal pertaining to the proposed project's energy use: Goal 3: Maximize the conservation of energy resources in all future land use and transportation planning decisions.

City of Irvine General Plan

The City is responsible for the assessment and mitigation of pollutant emissions resulting from its land use decisions. The City's General Plan Energy Element sets forth the objectives and policies which guide the City in its implementation of its energy improvement programs and strategies. Reduction of energy use results in a reduction in GHG emissions and therefore is relevant to the GHG analysis. The Energy Element establishes the following objectives pertaining to the proposed project energy use: Goal I-1: Maximize energy efficiency through land use and transportation planning.

1.7 Environmental Setting

1.7.1 Regional Air Quality

The Air Basin's meteorological conditions, in combination with regional topography, are conducive to the formation and retention of ozone. Pollutant concentrations in the Air Basin vary with location, season, and time of day. Concentrations of ozone, for example, tend to be lower along the coast, higher in the near inland valleys, and lower in the far inland areas of the Air Basin and adjacent desert (SCAQMD 2017a). The worst air pollution conditions throughout the Air Basin typically occur from June through September.

California Health and Safety Code section 39607(e) requires CARB to establish and periodically review area designation criteria. As shown in **Table 3**, the Air Basin is designated under federal or State ambient air quality standards as nonattainment for ozone, PM10, and fine particulate matter PM2.5. It is noteworthy to mention that air quality in the Air Basin has improved substantially over

the years, primarily due to the impacts of air quality control programs at the federal, State and local levels. The ozone and PM levels have fallen significantly compared to the worst years and are expected to continue to trend downward in the future despite increases in the economy and population in the Air Basin.

With respect to the State-identified criteria air pollutants (sulfates, hydrogen sulfide, visibility reducing particles, and vinyl chloride) present in Table 3, the proposed project would either not use these pollutants in the day to day operations or during construction and therefore would not have emissions of those pollutants (hydrogen sulfide, vinyl chloride, and lead), or such emissions would be accounted for as part of the pollutants estimated in this analysis (visibility reducing particles are associated with particulate matter emissions, and sulfates are associated with SO₂). Vinyl chloride is used in the process of making PVC plastic and vinyl products and is primarily emitted from industrial processes (CARB 2020i). Vinyl chloride would not be emitted directly during operations or during construction; therefore, there would be no project emissions of vinyl chloride. In addition, CARB determined there is not sufficient scientific evidence available to support the identification of a threshold exposure level for vinyl chloride, therefore, CARB does not monitor or make status designations for this pollutant (CARB 2020p).

TABLE 3
SOUTH COAST AIR BASIN ATTAINMENT STATUS (ORANGE COUNTY)

Pollutant	National Standards (NAAQS)	California Standards (CAAQS)
Ozone (1-hour standard)	N/A ^a	Non-attainment – Extreme
Ozone (8-hour standard)	Non-attainment – Extreme	Non-attainment
CO	Attainment – Maintenance	Attainment
NO ₂	Attainment – Maintenance	Attainment
SO ₂	Attainment	Attainment
PM10	Attainment – Maintenance	Non-attainment
PM2.5	Non-attainment – Serious	Non-attainment
Lead (Pb)	Attainment (Partial) ^b	Attainment
Visibility Reducing Particles	N/A	Unclassified
Sulfates	N/A	Attainment
Hydrogen Sulfide	N/A	Unclassified
Vinyl Chloride ^c	N/A	N/A

N/A = not applicable

^a The NAAQS for 1-hour ozone was revoked on June 15, 2005, for all areas except Early Action Compact areas.

^b Partial Non-attainment designation – Los Angeles County portion of the Air Basin only for near-source monitors. Orange County is designated as attainment.

^c In 1990, the California Air Resources Board identified vinyl chloride as a toxic air contaminant and determined that it does not have an identifiable threshold. Therefore, the California Air Resources Board does not monitor or make status designations for this pollutant.

SOURCE: USEPA 2020a; CARB 2020q.

As detailed in the AQMP, the major sources of air pollution in the Air Basin are divided into four major source classifications: point and area stationary sources, and on-road and off-road mobile sources. Point and area sources are the two major subcategories of stationary sources (SCAQMD 2017a). Point sources are permitted facilities that contain one or more emission sources at an identified location (e.g., power plants, refineries, emergency generator exhaust stacks). Area sources consist of many small emission sources (e.g., residential water heaters, architectural coatings, consumer products, restaurant charbroilers and permitted sources such as large boilers), which are distributed across the region. Mobile sources consist of two main subcategories: On-road sources (such as cars and trucks) and off-road sources (such as heavy construction equipment). The main source associated with the proposed project is mobile source use during construction activities.

1.7.2 Local Air Quality

Existing Ambient Air Quality

SCAQMD maintains monitoring stations within district boundaries that monitor air quality and compliance with associated ambient standards. The project area is located in the Inland County of Orange general forecast area and specifically within the Saddleback Valley source receptor area. Currently, the nearest monitoring station to the project area is the Mission Viejo Station (26081 Via Pera Mission Viejo, CA 92691 – SCAQMD Station Number 3812). This station monitors ambient concentrations of CO, ozone, PM10 and PM2.5. The nearest monitoring station that monitors for NO₂ is the Anaheim station (SRA 17, Central County of Orange Station Number 3176). There are no stations within the Inland County of Orange general forecast area that monitor for SO₂. Historical data of ambient ozone, NO₂, CO, PM10 and PM2.5 concentrations from these monitoring stations for the most recent three years of available data (2017–2019) are shown in **Table 4**.

TABLE 4
AMBIENT AIR QUALITY IN THE PROJECT VICINITY

Pollutant/Standard ^a	2017	2018	2019
Ozone, (1-hour) – Mission Viejo			
Maximum Concentration (ppm)	0.103	0.121	0.106

SOURCE: SCAQMD 2020b.

Existing Area Health Risk

Between July 2012 and June 2013, the SCAQMD conducted the Multiple Air Toxics Exposure Study IV (MATES IV), which focuses on the carcinogenic risk from exposure to air toxics. The MATES IV Final Report was issued in May 2015. The study, based on actual monitored data throughout the Air Basin, consisted of several elements, which included a monitoring program, an updated emissions inventory of TACs, and a modeling effort to characterize carcinogenic risk across the Air Basin from exposure to TACs. As part of the MATES IV study, the SCAQMD has prepared a series of maps that show regional trends in estimated outdoor inhalation cancer risk from toxic emissions, as part of an ongoing effort to provide insight into relative risks. The maps represent the estimated number of potential cancers per million people associated with a lifetime of breathing air toxics (24 hours per day outdoors for 70 years). The background potential cancer risk per million people in the proposed project area using the updated Office of Environmental Health Hazard Assessment (OEHHA) methodology is estimated at 587 in one million (compared to an overall Air Basin-wide risk of 1,023 in one million for the average of 10 fixed monitoring sites) (SCAQMD 2015b). Generally, the risk from air toxics is lower near the coastline and increases inland, with higher risks concentrated near large diesel sources (e.g., freeways, airports, and ports).

Existing Site Emissions

The existing Syphon Reservoir activities result in negligible mobile source emissions from maintenance trips and current recreational activities. The number of maintenance and recreational

trips are nominal and are not anticipated to change with the improvements to the reservoir. Therefore, existing emissions were not modeled, and the proposed project's air quality emissions would all be considered new emissions.

Sensitive Receptors and Locations

Certain population groups, such as children, elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to the potential effects of air pollution than others. As a result, certain land uses that are occupied by these population groups, such as residences, hospitals and schools, are considered to be air quality-sensitive land uses. The proposed project site is bordered to the north and west by predominantly open space, agricultural (including a residence), and commercial/industrial uses. The proposed project site is bordered to the south by Portola Parkway with residential and school land uses directly south. The proposed project is bordered to the east by SR-133 followed by residential land uses. The nearest land uses are the residential neighborhoods approximately 180 feet southwest of the intersection of Portola Parkway and Sand Canyon Ave, which is the proposed project site entrance. The Crean Lutheran High School is located approximately 140 feet southeast of the project site at the intersection of Portola Parkway and San Canyon Road.³ Residences to the east of SR-133 are approximately 1,000 feet from onsite construction activities. Sensitive receptor locations are shown **Figure 1**.

All other air quality-sensitive uses are located at greater distances from the proposed project site and would experience lower air pollutant impacts from potential sources of pollutants from the proposed project site due to atmospheric dispersion effects.

³ While the Crean Lutheran High School Athletic Complex is located adjacent to the project site area, the athletic complex itself is not considered a sensitive receptor as it would only be occupied for a limited amount of time, similar to that of a local gym, park, or other commercial establishment. The majority of student time would be spent at the main school site and therefore that would be the closest school associated sensitive receptor.

1.7.3 Greenhouse Gases

Global Emissions Inventory

Global GHG estimates are based on country inventories developed as part of programs of the United Nations Framework Convention on Climate Change (UNFCCC). Worldwide man-made emissions of GHGs were approximately 49 billion metric tons CO₂e in 2010, including ongoing emissions from industrial and agricultural sources and emissions from land use changes (e.g., deforestation). Emissions of CO₂, primarily from fossil fuel use and industrial processes, account for 76 percent of total GHG (CO₂e) emissions. Methane emissions account for 16 percent and N₂O emissions for 6.2 percent. For comparison, worldwide emissions of GHGs in 1970 were 27 billion metric tons of CO₂e per year (IPCC 2014).

United States Emissions Inventory

In 2018, the United States emitted about 6,677 million metric tons (MMT) of CO₂e, with 75.4 percent of those emissions coming from fossil fuel combustion. Of the major sectors nationwide, transportation accounts for the highest amount of GHG emissions (approximately 28 percent), followed by electricity (27 percent), industry (22 percent), agriculture (10 percent), commercial and residential buildings (12 percent) (. Between 1990 and 2018, total US GHG emissions rose by 3.7 percent, but emissions have generally decreased since peaking in 2005. GHG emissions in 2018 are approximately 10 percent below 2005 levels. Since 1990, U.S. emissions of GHGs have increased at an average annual rate of 0.2 percent; however, GHG emissions have been decreasing at an average annual rate of 0.7 percent since 2005 (USEPA 2020b).

California Greenhouse Gas Emissions Inventory

CARB compiles GHG inventories for the state. Based on the 2017 GHG inventory data (i.e., the latest year for which data are available from CARB), California emitted 424 MMTCO₂e including emissions resulting from imported electrical power (CARB 2019). CARB's 2017 statewide inventory indicated that California's net GHG emissions in 2017 were 7 MMTCO₂e below 1990 levels, which is the 2020 GHG reduction target codified in AB 32. The overall trends in the inventory demonstrate that the carbon intensity of California's economy is declining and has decreased by 41 percent from 2001 peak emissions while increasing the gross domestic product (GDP) by 52 percent (CARB 2019).⁴ The GDP grew 3.6 percent in 2017 while emissions per GDP declined by 4.5 percent compared to 2016. **Table 5** identifies and quantifies statewide anthropogenic GHG emissions and sinks (e.g., carbon sequestration due to forest growth) in 1990 and 2017. As shown in the table, the transportation sector is the largest contributor to statewide GHG emissions at approximately 40 percent (CARB 2019).

⁴ Carbon intensity of California's economy is the amount of carbon pollution per million dollars of gross domestic product.

TABLE 5
STATE OF CALIFORNIA GREENHOUSE GAS EMISSIONS

Category	Total 1990 Emissions Using IPCC SAR (MMTCO₂e)	Percent of Total 1990 Emissions	Total 2017 Emissions Using IPCC AR4 (MMTCO₂e)	Percent of Total 2017 Emissions
Transportation	150.7	35%	169.9	40%
Electric Power	110.6	26%	62.4	15%
Commercial Use	14.4	3%	15.1	4%
Residential	29.7	7%	26.0	6%
Industrial	103.0	24%	89.4	21%
Recycling and Waste ^a	—	—	8.9	2%
High GWP/Non-Specified ^b	1.3	<1%	20.0	5%
Agriculture/Forestry	23.6	6%	32.4	8%
Forestry Sinks	-6.7	-2%	— ^c	—
Net Total (IPCC SAR)	426.6	100%^e	—	—
Net Total (IPCC AR4)^d	431	100%^e	424.1	100%^e

NOTES:

^a Included in other categories for the 1990 emissions inventory.

^b High GWP gases are not specifically called out in the 1990 emissions inventory.

^c Revised methodology under development (not reported for 2012).

^d CARB revised the state's 1990 level GHG emissions using GWPs from the IPCC AR4.

^e Total of individual percentages may not add up to 100% due to rounding

Existing Site Emissions

The existing Syphon Reservoir activities result in minimal mobile source emissions from maintenance trips. The number of maintenance are not anticipated to change with the proposed improvements to the reservoir, therefore existing emissions were not modeled and the proposed project's GHG emissions would be considered net new emissions. The existing operations on the site result in annual electrical consumption of 217,273 kilowatt hours (kWh) annually. Because the current facility at the site would be removed, the electricity would no longer be consumed. Emissions associated with the existing electrical consumption onsite were not quantified, instead net new electrical consumption was analyzed.

SECTION 2

Thresholds of Significance

The significance thresholds below are derived from the Environmental Checklist questions in Appendix G of the State CEQA Guidelines. Accordingly, a significant impact associated with air quality would occur based on the following thresholds described below:

- AIR-1:** Conflict with or obstruct implementation of the applicable air quality plan;
- AIR-2:** Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard;
- AIR-3:** Expose sensitive receptors to substantial pollutant concentrations; or
- AIR-4:** Result in other emissions (such as those leading to odors) affecting a substantial number of people.

A significant impact associated with GHG emissions would occur based on the following thresholds described below:

- GHG-1:** Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or
- GHG-2:** Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

In addition to the Appendix G significant impacts listed above, cumulative impacts with respect to air quality and GHGs are also addressed as part of the analysis.

Pursuant to the CEQA Guidelines (Section 15064.7), a lead agency may consider using, when available, significance thresholds established by the applicable air quality management district or air pollution control district when making determinations of significance. For purposes of this analysis, the potential air quality impacts of the proposed project are assessed in accordance with the most recent thresholds adopted by the SCAQMD in connection with its CEQA Air Quality Handbook, Air Quality Analysis Guidance Handbook, and subsequent SCAQMD guidance, as discussed below.⁵

⁵ While the SCAQMD CEQA Air Quality Handbook contains significance thresholds for lead, project construction and operation would not include sources of lead emissions and would not exceed the significance thresholds for lead. Unleaded fuel and unleaded paints have virtually eliminated lead emissions from projects. As a result, lead emissions are not further evaluated.

2.1 Regional Criteria Air Pollutant Emissions Thresholds

SCAQMD has established numerical significance thresholds for regional emissions during construction and operation. The numerical significance thresholds are based on the recognition that the Air Basin is a distinct geographic area with a critical air pollution problem for which ambient air quality standards have been promulgated to protect public health (SCAQMD 1993).

Given that construction impacts are temporary, SCAQMD has established significance thresholds specific to construction activity. Based on the thresholds of significance in the SCAQMD CEQA Air Quality Analysis Handbook, the proposed project would potentially cause or contribute to an exceedance of an ambient air quality standard if the following would occur (SCAQMD 2020c).

Regional construction emissions from both direct and indirect sources would exceed any of the following SCAQMD prescribed daily emissions thresholds (SCAQMD 2020c):

- 75 pounds a day for VOC,
- 100 pounds per day for NO_x,
- 550 pounds per day for CO,
- 150 pounds per day for SO_x,
- 150 pounds per day for PM₁₀, and
- 55 pounds per day for PM_{2.5}

SCAQMD has also established numeric significance thresholds for operations. SCAQMD has established significance thresholds in part based on CAA section 182(e), which identifies 10 tons per year of VOC and NO_x as a significance level for stationary source emissions in extreme non-attainment areas for ozone. The numeric significance thresholds for other pollutants are also based on federal major source thresholds, which vary depending on regional attainment status. For example, the Air Basin is in attainment for carbon monoxide, which yields a corresponding major source threshold of 100 tons per year, or 550 pounds per day (USEPA 2017f). These “major source” significance thresholds were developed under the Federal Title V Operating Permit Program (SCAQMD 2020d). SCAQMD converted these significance levels to pounds per day. The attainment status designation is based on the healthfulness of air quality and the corresponding significance thresholds are intended to be health protective (CARB 2020q).

A similar approach is applied to PM_{2.5}, where the daily limit of 55 pounds per day is based on the USEPA proposed rule to implement a PM_{2.5} NAAQS, with a significant emission rate of 10 tons per year (SCAQMD 2006).

The proposed project would potentially cause or contribute to an exceedance of an ambient air quality standard if regional operational emissions exceed any of the following SCAQMD prescribed daily emissions thresholds (SCAQMD 2019):

- 55 pounds a day for VOC,

- 55 pounds per day for NO_x,
- 550 pounds per day for CO,
- 150 pounds per day for SO_x,
- 150 pounds per day for PM₁₀, and
- 55 pounds per day for PM_{2.5}.

SCAQMD has set its CEQA significance threshold for NO_x and VOC at 10 tons per year (expressed as 55 pounds per day). because the federal CAA defines a major stationary source for extreme ozone nonattainment areas such as SCAQMD as one emitting 10 tons/year (42 U.S.C. §§ 7511a(e), 7511a(f); CAA §§ 182(e), 182(f)). Under the federal CAA, such sources are subject to enhanced control requirements (42 U.S.C. §§ 7502(c)(5), 7503; CAA §§ 172(c)(5), 173), so SCAQMD determined that 55 lb/day was an appropriate threshold for making a CEQA significance finding and requiring feasible mitigation. As, SCAQMD has stated:

“... a project source that emits 10 tons/year of NO_x or VOC is small enough that its regional impact on ambient ozone levels may not be detected in the regional air quality models that are currently used to determine ozone levels. Thus, in this case it would not be feasible to directly correlate project emissions of VOC or NO_x with specific health impacts from ozone.”(SCAQMD 2015c.)

Therefore, lead agencies that use SCAQMD thresholds of significance may determine that projects have a significant air quality impact and correspondingly are required to implement all feasible mitigation measures, yet are not able to correlate the project impact to quantifiable health effects.

2.2 Localized Significance Thresholds

SCAQMD published its Final Localized Significance Threshold Methodology in June 2003, (revised July 2008) and Final Methodology to Calculate Particulate Matter (PM) 2.5 and PM_{2.5} Significance Thresholds in October 2006, recommending that all air quality analyses include a localized assessment of both construction and operational impacts on the air quality of nearby air quality sensitive receptors (SCAQMD 2008). LSTs represent the maximum emissions from a project site that are not expected to result in an exceedance of a NAAQS or CAAQS. LSTs are based on the ambient concentrations of that pollutant within the Source Receptor Area (SRA) where a project is located and the distance to the nearest air quality sensitive receptor. LSTs are only applicable to the following criteria air pollutants: NO_x, CO, PM₁₀, and PM_{2.5}. The proposed project site is located in the central portion of SRA 19 (Saddleback Valley) (SCAQMD 2020e).

The Basin is in attainment for NO₂ and CO, meaning their ambient concentrations are below their respective air quality standards. When evaluating localized impacts for NO₂ and CO, the local ambient concentrations and the proposed project related concentrations are summed and then compared to the NAAQS and CAAQS. If the sum of the ambient concentrations and proposed project concentrations are greater than the air quality standard, this would result in a significant impact.

The Basin is in nonattainment for PM₁₀ and PM_{2.5}, meaning their ambient concentrations are above their respective air quality standards. If ambient levels already exceed a NAAQS or CAAQS,

then project impacts may be considered significant if they increase ambient concentrations in excess of the allowable increase established by SCAQMD. This would apply to PM10 and PM2.5, both of which are nonattainment pollutants in the Basin. For these latter two pollutants, the significance criteria are the pollutant concentration thresholds presented in SCAQMD Rules 403 and 1301. The Rule 403 threshold of 10.4 $\mu\text{g}/\text{m}^3$ applies to construction emissions (and may apply to operational emissions at aggregate handling facilities). The Rule 1301 threshold of 2.5 $\mu\text{g}/\text{m}^3$ applies to non-aggregate handling operational activities.

SCAQMD recommends that sites larger than 5 acres perform air dispersion modeling to determine localized air quality (SCAQMD 2008b). While the proposed project site is greater than 5 acres, the individual phases of construction are localized to smaller portions of the site on any given day (i.e. construction at the toe of the dam would not be occurring at the same time as the access road near the intersection of Sand Canyon Avenue and Portola Parkway). Based on the daily areas of disturbance, the onsite areas are analyzed as either one-acre sites or five-acre sites and screening level LSTs are used to determine significance. Operational emissions would be centralized around the proposed Treatment Facility, which is conservatively assumed to be 328 feet (100 meters) from the nearest sensitive receptor. **Table 6** shows the threshold levels used for a one-acre site located within 164 feet (50 meters) of the nearest sensitive receptor and for a five-acre site located within 164 feet of the proposed project.

TABLE 6
LOCALIZED SCREENING LEVELS

Source	NO _x	CO	PM10	PM2.5
Construction - 1-acre site at 164 feet (50 meters)	52	883	11	4
Construction - 5-acre site at 328 feet (100 meters)	112	2,763	49	16
Operational – 1-acre site at 328 feet (100 meters)	60	1,234	6	2

SOURCE: SCAQMD 2008b.

2.3 Toxic Air Contaminants

Based on the criteria set forth by SCAQMD, the proposed project would expose air quality sensitive receptors to substantial concentrations of TACs if the proposed project emits carcinogenic materials or TACs that exceed the maximum incremental cancer risk of 10 in one million or a non-cancer hazard index of 1.0. Similarly, the proposed project would result in a potentially significant impact if cancer burden corresponds to an increase in more than 0.5 excess cancer cases in areas where the proposed project-related increase in individual cancer risk exceeds 1 in one million (SCAQMD 2019).

2.4 Health Impacts

In *Sierra Club v. County of Fresno* (S219783) (Sierra Club) the Supreme Court held that CEQA requires lead agencies to either (i) make a “reasonable effort” to substantively connect the estimated amount of a given air pollutant a project will produce and the health effects associated with that

pollutant, or (ii) explain why such an analysis is infeasible (6 Cal.5th at 1165-66). However, the Court also clarified that that CEQA “does not mandate” that EIRs include “an in-depth risk assessment” that provides “a detailed comprehensive analysis ... to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations and to assess and quantify both the individual and population wide health risks associated with those levels of exposure (Sierra Club v. County of Fresno. 6 Cal.5th 502, 517-522 (2018)).”

USEPA and CARB have established AAQS at levels above which concentrations could be harmful to human health and welfare, with an adequate margin of safety. Further, California air districts, like SCAQMD, have established emission-based thresholds that provide project-level estimates of criteria air pollutant quantities that air basins can accommodate without affecting the attainment dates for the AAQS, and therefore, providing thresholds of significance for regional and localized air quality impacts from both construction and operation of projects. SCAQMD thresholds take into account that the Air Basin is a distinct geographic area that has critical air pollution problems for which AAQS have been established to protect human health and welfare (SCAQMD 2008a).

Typically, the health effect of a particular criteria pollutant is analyzed by air districts on a regional scale based on how close the area is to attaining the NAAQS. As shown by the attainment plan emissions data, it takes a large amount of additional precursor emissions to demonstrate a modeled increase in ambient levels over an entire region. Because air districts’ attainment plans and supporting air model tools are regional in nature, they are not typically used to evaluate the impacts to ambient concentrations of criteria air pollutants, or to correlate those impacts to the potential resultant impacts to public health effects, from an individual project. The complex nature of criteria air pollutant dispersion and the complex atmospheric chemistry that occurs (especially in the case of ozone and fine particulate matter) limits the usefulness of applying the available models to predict health effects at a project-level. Therefore, correlating a project’s criteria air pollutant emissions to specific health effects, particularly with respect to ozone, is speculative.

Generally, models that correlate criteria air pollutant concentrations with specific health effects focus on regulatory decision-making that will apply throughout an entire air basin or region. These models focus on the region-wide health effects of pollutants so that regulators can assess the costs and benefits of adopting a proposed regulation that applies to an entire category of air pollutant sources, rather than the health effects related to emissions from a specific proposed project or source. Because of the scale of these analyses, any one project is likely to have only very small incremental effects which may be difficult to differentiate from the effects of air pollutant concentrations in an entire air basin. In addition, such modeling efforts are costly, and the value of a project-specific analysis may be modest in relation to that cost. Furthermore, the results, while costly to produce, may not be particularly useful. For regional pollutants, it is difficult to trace a particular project’s criteria air pollutant emissions to a specific health effect. Moreover, the modeled results may be misleading because the margin of error in such modeling is large enough that, even if the modeled results report a given health effect, the model is sufficiently imprecise that the actual effect may differ from the reported results; that is, the modeled results suggest precision, when in fact available models cannot be that precise on a project level.

Writing as amicus curiae in Sierra Club, the SJVAPCD explained that “[r]unning the photochemical grid model used for predicting ozone attainment with emissions solely from one project would thus not be likely to yield valid information given the relative scale involved” (SJVAPCD 2015). Ozone is not directly emitted into the air, but is instead formed as ozone precursors undergo complex chemical reactions through sunlight exposure (SJVAPCD 2015). Given the complex nature of this process, and the fact that ozone can be transported by wind over long distances, “a specific tonnage amount of NO_x or ROG_s emitted in a particular area does not equate to a particular concentration of ozone in that area” (SJVAPCD 2015). For this reason, the photochemical analysis for ozone is done on a regional scale, and it is inappropriate to analyze ozone impacts at a local or project-level basis because a localized analysis would at most be speculative, and at worst be misleading.

Speculative analysis is not required by CEQA. The SJVAPCD stated that even a project with criteria pollutant emissions above its CEQA thresholds does not necessarily cause localized human health effects as, even with relatively high levels of emissions, the SJVAPCD cannot determine “whether and to what extent emissions from an individual project directly impact human health in a particular area” (SJVAPCD 2015). The SCAQMD also, as amicus curiae in Sierra Club, made similar points, reiterating that “an agency should not be required to perform analyses that do not produce reliable or meaningful results” (SCAQMD 2015c). With regard to particulate matter, the SCAQMD noted that while the CARB has created a methodology to predict expected mortality from large amount of PM_{2.5}, the primary author of the methodology has reported that it “may yield unreliable results due to various uncertainties” and CARB staff has been directed by its Governing Board to reassess and improve it, which factor “also counsels against setting any hard-and-fast rule” about conducting this type of analysis (SCAQMD 2015c). SCAQMD agrees that it is very difficult to quantify health effects, opining that the only possible means of successfully doing so is for a project so large that emissions would essentially equate to levels comparable to all combined regional emission increases (SCAQMD 2015c). Because the proposed project would not emit that magnitude of daily emissions, the usage of photochemical modeling to determine specific health effects of this individual project is not warranted.

The mass emissions thresholds developed by the SCAQMD and used by CEQA lead agencies throughout the SCAQMD to determine potential significance of project-related regional changes in the environment are not directly indicative of exceedances of applicable ambient air standards. Meteorology, the presence of sunlight, and other complex chemical factors all combine to determine the ultimate concentration and location of ozone or PM. The effects on ground-level ambient concentrations of pollutants that may be breathed by people are also influenced by the spatial and temporal patterns of the emission sources. In other words, the effect on ozone and PM concentrations from a given mass of pollutants emitted in one location may vary from the effect if that same mass of pollutants was emitted in an entirely different location in the Air Basin. The same effect may be observed when the daily and seasonal variation of emissions is taken into account. Regional-scale photochemical modeling, typically performed only for NAAQS attainment demonstration and rule promulgation, account for these changes in the spatial, temporal, and chemical nature of regional emissions.

As an example of the relationship between modeled regional mass emissions and modeled air basin pollutant concentrations, the most recent EPA-approved SCAQMD basin-wide emissions inventory shows VOC emissions at 162.4 tons per day and NO_x emissions at 293.1 tons per day for the baseline year of 2012 (SCAQMD 2017a). SCAQMD's AQMP shows that reducing the baseline 2008 NO_x and VOC emissions by 432 tons per day and 187 tons per day respectively, would only reduce ozone levels at the monitor stations with the greatest ozone concentrations by 9 parts per billion (ppb) (SCAQMD 2013). Additionally, SCAQMD modeling that accounts for increases in emissions due to new or modified sources within the SCAQMD between 2010 and 2030 show an increase of 6,620 pounds per day of NO_x and 89,947 pounds per day of VOC. The results of this analysis show that this level of daily pollutant increase would only increase ozone concentrations in the Air Basin by 2.6 ppb and less than 1 ppb of NO₂ (SCAQMD 2011).

Currently, the health impact of a particular criteria air pollutant is analyzed by air districts on a regional scale based on how close the area is to attaining the NAAQS. Such an analysis has generally not been performed at the project level. The SCAQMD states that an exceedance of the significance thresholds does not necessarily cause localized human health effects as, even with relatively high levels of emissions. However, the Air Basin is a distinct geographic area that has critical air pollution problems for which AAQS have been established to protect human health and welfare. Therefore, analyzing a project against these thresholds conservatively assesses whether these emissions directly contribute to regional or local exceedances of AAQS and assesses their potential to be harmful to human health. Thus, in order to determine the potential for adverse health effects, project emissions are compared to the SCAQMD's regional emissions thresholds of significance.

2.5 General Conformity Determination

A conformity determination is required for each criteria pollutant or precursor where the total of direct emissions of the criteria pollutant or precursor in a federal non-attainment or maintenance area would equal or exceed specified annual emission rates, referred to as "de minimis" thresholds." These de minimis thresholds are provided in 40 CFR 93.153(b)(1) and (2). For ozone precursor emissions, the de minimis thresholds depend on the severity of the non-attainment classification. In an extreme ozone non-attainment area, the de minimis thresholds are 10 tons per year for both NO_x and VOC. In a federal serious non-attainment area, the de minimis threshold is 70 tons per year for PM_{2.5}. In a federal attainment-maintenance area, the de minimis threshold is 100 tons per year for CO, and PM₁₀. Effective June 13, 2012, the USEPA designated the South Coast Air Basin as extreme non-attainment for the 1997 ozone standard. In 2012, the USEPA designated the Air Basin as extreme non-attainment for the 2008 ozone standard. The Air Basin is also attainment-maintenance for the federal CO and PM₁₀ standards, and serious non-attainment for the federal PM_{2.5} standards. Thus, based on the present attainment status of the Air Basin, a federal action would conform to the SIP if its annual emissions remain below 10 tons of VOC or NO_x, 100 tons of CO or PM₁₀, and 70 tons of PM_{2.5}.

2.6 Greenhouse Gas Emissions Thresholds

CEQA Guidelines section 15064.4 gives lead agencies the discretion to determine whether to assess the significance of GHG emissions quantitatively or qualitatively. Section 15064.4 recommends considering certain factors, among others, when determining the significance of a project's GHG emissions, including the extent to which the proposed project may increase or reduce GHG emissions as compared to the existing environment; whether the proposed project exceeds an applicable significance threshold; and extent to which the proposed project complies with regulations or requirements adopted to implement a reduction or mitigation of GHGs. None of the amendments establishes a threshold of significance; rather, so long as any threshold selected is supported by substantial evidence (see section 15064.7(c)), lead agencies are granted discretion to establish significance thresholds for their respective jurisdictions, including by looking to thresholds developed by other public agencies, such as air districts, or suggested by experts, such as the California Air Pollution Control Officers Association (CAPCOA).

The California Natural Resources Agency's *Final Statement of Reasons for Regulatory Action* from December 2009 similarly provides that project-level quantification of emissions should be conducted where it would assist in determining the significance of emissions, even where no numeric threshold applies. In such cases, CNRA's guidance provides that qualitative thresholds can be utilized to determine the ultimate significance of project-level impacts based on a project's consistency with plans, which can include applicable regional transportation plans. Even when using a qualitative threshold, quantification can inform "the qualitative factors" and indicate "whether emissions reductions are possible, and, if so, from which sources (CNRA 2009)."

Neither CARB nor the County of Orange has adopted quantitative significance thresholds for assessing project-level impacts related to GHG emissions. As a method for determining significance under CEQA, SCAQMD developed a draft tiered flowchart in 2008 for determining significance thresholds for GHGs for industrial projects where SCAQMD is acting as the lead agency. In December 2008, SCAQMD adopted a 10,000 MTCO₂e/year threshold for industrial facilities, but only with respect to for projects in which SCAQMD is the lead agency. SCAQMD has not adopted a threshold of significance for residential or commercial projects. Additionally, SCAQMD formed a GHG Significance Threshold Working Group to evaluate potential GHG significance thresholds and had proposed, but not adopted, a 3,000 MTCO₂e/year screening level for land use development projects. However, the aforementioned Working Group has been inactive since 2011 and no screening levels drafted by the Working Group have been formally adopted for land use development projects. Nonetheless, while the proposed project is an infrastructure project and does not fit neatly into a category (industrial, commercial, or residential/), in the absence of a formally adopted threshold applicable to this proposed project, the more stringent of the two quantitative thresholds discussed above (i.e., 3,000 MTCO₂e/year) is used to evaluate the significance for this proposed project.

2.7 Greenhouse Gas Reduction Plans, Policies and Regulations

A significant impact would occur if the proposed project would conflict with applicable regulations, plans and policies that were adopted to reduce GHG emissions that contribute to global climate change. For the proposed project, as an infrastructure project, this analysis considers the proposed project's potential to conflict with the following applicable plans, policies and regulations to reduce GHG emissions:

- The 2017 Climate Change Scoping Plan Update, CARB's plan for achieving a 40 percent reduction on GHG emissions from 1990 levels by 2030, statewide, as mandated by SB 32; and
- The SCAG 2020-2045 RTP/SCS, the regional plan for achieving sustainable land use patterns that reduce passenger vehicle GHG emissions, as mandated by SB 375.

SECTION 3

Impact Analysis

3.1 Methodology

The evaluation of potential impacts to regional and local air quality that may result from the construction and long-term operations of the proposed project is discussed below.

3.1.1 Construction Impacts

Regional Construction Emissions

Project construction activities that would have the potential to create regional air quality impacts including vehicle trips generated by construction workers, vendor trucks, and haul trucks traveling to and from the proposed project site and building activities such as the application of paint and other surface coatings. The proposed project's daily regional criteria pollutant emissions during construction have been estimated by assuming a conservative scenario for construction activities (i.e., assuming all construction occurs at the earliest feasible date) and applying the mobile source and fugitive dust emissions factors.

The emissions have been estimated using the CalEEMod software, an emissions inventory software program recommended by the SCAQMD for off-road construction equipment emissions.⁶ On-road mobile source emissions were estimated using the 2017 CARB on-road vehicle emissions factor model (EMFAC) and incorporating the adjustment factors for the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part I: One National Program (SAFE Rule Part I).

Project construction is estimated to start in 2022 and continue for approximately 41 months, ending in 2026. Construction phasing would include vegetation clearing, mobilization and creation of access road/intersection improvements, excavation of sediments and the existing dam, construction of the dam, spillway and reservoir, construction of the treatment facilities, creation of wetlands/riparian habitat, installation of recreational components (non-paved hiking trails), and demobilization. The proposed project would import approximately 100,000 cubic yards of soil with a maximum of 66 haul trucks accessing the site per day. The remaining soil needed for the new dam construction would come from soils excavated onsite. No soil removal is estimated. An

⁶ CalEEMod was developed in collaboration with the air districts of California and is recommended by SCAQMD for evaluating GHG emissions for projects under CEQA. Regional data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) were provided by the various California air districts to account for local requirements and conditions. According to the California Air Pollution Control Officers Association, the model is an established, accurate and comprehensive tool for quantifying air quality and GHG impacts from land use projects throughout California.

estimated 420,000 cubic yards of vegetation would be removed from the project site with a maximum of 78 haul trucks per day. One daily fuel delivery per day is estimated during construction activities. Worker and vendor deliveries vary by phase with a maximum of 114 worker vehicles and 29 vendor trucks accessing the site daily.⁷

The input values used in this analysis were adjusted to be proposed project-specific based on provided equipment types and the construction schedule. Haul truck trips and concrete truck trips estimates were based on information obtained from IRWD. Haul and concrete truck trip VMT were based on a 28-mile one-way trip. Worker trip and vendor truck trip estimates were based on default calculation methodologies in CalEEMod (worker trips equal 14.7 miles and vendor trips equal 6.9 miles).

Additional geotechnical work may or may not occur and the intensity of any geotechnical work is unknown. There are three potential geotechnical tests that could occur: borings, test pits, or trenches. Because the intensity of any work that will occur is unknown, the analysis determines the maximum intensity of geotechnical work that can occur concurrently and independent from the reservoir work. The *Irvine Ranch Water District Syphon Reservoir Geotechnical Investigations Project Initial Study/Mitigated Negative Declaration* was used to determine the equipment and workers that would be used to conduct the additional geotechnical investigations.

Emissions from proposed project construction activities were estimated based on the construction phase in which the activity would be occurring. The maximum daily emissions estimate the worst-case day and do not represent the emissions that would occur for every day of proposed project construction. The maximum daily emissions are compared to SCAQMD daily regional thresholds of significance. A detailed discussion of the proposed project's construction phasing and equipment list is available in Appendix A of this technical report. Emissions calculations and modeling output are included in Appendices B, D and E of this technical report.

Localized Construction Emissions

Proposed project construction activities that would have the potential to create local air quality impacts including fugitive dust from grading, demolition, and building activities such as the application of paint and other surface coatings. The localized effects from the on-site portion of the proposed project's construction emissions were evaluated at the nearby sensitive receptor locations that would be potentially impacted by proposed project construction in accordance with the SCAQMD's *Final Localized Significance Threshold Methodology* (June 2003, revised July 2008). The localized significance thresholds only address NO_x, CO, PM₁₀, and PM_{2.5} emissions. The SCAQMD has established screening criteria that can be used to determine the maximum allowable daily emissions that would satisfy the localized significance thresholds and therefore not cause or contribute to an exceedance of the applicable ambient air quality standards without the need for proposed project-specific dispersion modeling. The localized analysis for the proposed project is based on this SCAQMD screening criteria. The maximum daily onsite emissions from construction

⁷ It is unknown how many additional geotechnical tests would be required for completion of the project. The 114 maximum workers is based on the maximum geotechnical work that can occur with non-geotechnical work. Geotechnical activities would require between 9 to 12 workers per activity.

of the proposed project were compared to these screening criteria. Emissions calculations and modeling output are included in Appendices B, D, and E of this technical report.

Health Impact Assessment

Health impacts associated with the proposed project are assessed based on the estimated project's regional emissions, as discussed above for regional construction and operational emissions, in comparison to the SCAQMD regional emissions thresholds of significance.

Greenhouse Gas Emissions

The evaluation of potential impacts to GHG emissions that may result from the construction of the proposed project is consistent with CEQA Guidelines section 15064.4(a) and recent related guidance from OPR. This analysis considered GHG emissions resulting from construction activities associated with the proposed project as detailed under Regional Construction Emissions above. Because potential impacts resulting from GHG emissions would be long-term rather than acute, GHG emissions were calculated on an annual basis. In accordance with SCAQMD guidance, GHG emissions from construction have been amortized (i.e., averaged annually) over the lifetime of the proposed project. SCAQMD defines the lifetime of a project as 30 years. Therefore, the proposed project's total construction GHG emissions are divided by 30 to determine an annual construction emissions estimate comparable to operational emissions.

GHG quantification methods rely on guidance from State and regional agencies with scientific expertise in quantifying GHG emissions, including CARB and SCAQMD. Along with the air quality emissions, GHG emissions were estimated using CalEEMod Version 2016.3.2 for off-road construction equipment and Safe Rule 1 adjusted EMFAC2017 emissions for on-road vehicles as detailed above. Emissions calculations and modeling output are included in Appendices C through E of this technical report.

3.1.2 Operational Impacts

Regional Operational Emissions

The proposed project's operational activities would have minimal changes from the existing scenario. There are no new permanent maintenance or recreational trips associated with the reservoir improvements, and no natural gas emissions, water use or solid waste generation anticipated. Maintenance of the wetland/riparian area would be required for approximately 5 years after construction is complete to ensure success of the vegetated areas, and would result in infrequent trips to the project site. Operational vehicle trips during the first five years of maintenance would equal 12 to 24 round trips for 30 to 40 days per year. However, these trips would not result in substantial daily or annual emissions.

The main operational emissions associated with air quality impacts would occur from consumer product use associated with onsite maintenance activities. While electrical consumption will increase, electrical consumption does not result in direct air quality impacts and therefore are not addressed in the regional or localized air quality emissions analysis. Assumptions, calculations and modeling output are included in Appendices A, B, D and E of this technical report.

Localized Operational Emissions

The localized effects from the on-site portion of the maximum daily emissions from proposed project operation were evaluated at the nearby sensitive receptor locations that would be potentially impacted by operation of the proposed project according to the SCAQMD's Final Localized Significance Threshold Methodology (June 2003, revised July 2008). The localized impacts from operation of the proposed project were assessed similar to the construction emissions, as discussed previously. For further explanation, please see Appendices B, D and E of this report.

Carbon Monoxide Hotspots

The greatest quantities of CO are produced from motor vehicle combustion and are usually concentrated at or near ground level because they do not readily disperse into the atmosphere, particularly under cool, stable (i.e., low or no wind) atmospheric conditions. Localized areas where ambient concentrations exceed State and/or federal standards are termed "CO hotspots." As the operation of the proposed project would not result in any new mobile source emissions, the project would not result in CO hotspots. Therefore, CO hotspots are not discussed further in this analysis.

Greenhouse Gas Emissions

Existing operations at the proposed project site generate GHG emissions from electrical consumption. The proposed project would not result in new or increased use of motor vehicles, water or natural gas consumption, or wastewater or solid waste generation. The proposed project would result in the consumption of 1,300,000 kWh annually. The existing operations consist of approximately 217,273 kWh annually, therefore the annual increase in electrical consumption is approximately 1,082,727 kWh. The increase in electrical consumption was used to quantify annual operational GHG emissions. Emissions from annual electrical consumption are added to the amortized construction emissions and compared to the SCAQMD's quantitative screening level. For further explanation, please see Appendix C of this report.

3.1.3 Toxic Air Contaminant Impacts (Construction and Operation)

The proposed project would emit TACs during construction, exposure to which may result in an increase in carcinogenic and non-carcinogenic health risks on the residents and other air quality sensitive receptors in the vicinity. A Health Risk Assessment (HRA) was prepared to evaluate the risk of potential negative health outcomes (cancer, or other acute or chronic conditions) related to TACs exposure from airborne emissions during proposed project construction activities. Incremental increase in lifetime cancer risk is assessed over longer exposure time periods (i.e., 30-year for residential receptors).

The HRA followed the procedure and methods provided in the *Guidance Manual for Preparation of Health Risk Assessments* issued by OEHHA in 2015, as well as the methods the SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1, and 212, version 8.1*, used in conjunction with the associated *SCAQMD Permit Application Package "N (OEHHA 2015; SCAQMD 2017b; SCAQMD 2017c)"*. The procedure involved emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure routes, identification of

exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels. The revised 2015 OEHHA Guidance takes into account the sensitivity of children to TAC emissions, breathing rates, and time spent at home since children have higher breathing rate compared to adults and would likely spend more time at home resulting in longer exposure durations.

For construction, the potential TAC emission sources of DPM are diesel-fueled heavy-duty equipment, and on-road travel and idling emissions from diesel-fueled haul and vendor trucks. Since DPM has cancer and non-cancer health effects, the impacts of being exposed to these emissions during construction were evaluated on a short term and annual basis.

Air dispersion model runs were conducted to simulate annual air concentrations at air quality sensitive receptors for the duration of construction of the proposed project. Annual air concentrations were adjusted for OEHHA's Cancer Potency Factor (CPF) to evaluate the incremental increase in lifetime cancer risk and Recommended Exposure Level (REL) to evaluate chronic health effects. The maximum incremental increase in lifetime cancer risk is compared to the SCAQMD threshold of 10 in one million and the maximum hazard index is compared to the SCAQMD threshold for Chronic Hazard Indices (1.0). The SCAMD's thresholds for incremental increases in lifetime cancer risk and Hazard Indices apply to all regions of the Basin, regardless of the existing risks posed by exposure to ambient levels of airborne TACs.

The process of assessing health risks and impacts includes a degree of uncertainty. The level of uncertainty depends on the availability of data and the extent to which assumptions must be relied upon in cases where the data are incomplete or unknown. All HRAs rely upon scientific studies to reduce the level of uncertainty; however, it is not possible to eliminate uncertainty from the analysis. Where assumptions are used to substitute for incomplete or unknown data, it is standard practice in performing HRAs to err on the side of health protection to avoid underestimating or underreporting the risk to the public. In general, sources of uncertainty that may lead to an overestimation or an underestimation of the risk include extrapolation of toxicity data in animals to humans and uncertainty in the exposure estimates. In addition to uncertainty, there exists "a natural range or variability in measured parameters defining the exposure scenario," and that "the greatest quantitative impact is variation among the human population in such properties as height, weight, food consumption, breathing rates, and susceptibility to chemical toxicants."⁸ As mentioned previously, it is typical to err on the side of health protection by assessing risk on the most sensitive populations, such as children and the elderly, by modeling potential impacts based on high-end breathing rates, by incorporating age sensitivity factors, and by not taking into account exposure reduction measures, such as mechanical air filtration building systems.

Cancer Risk Calculation

The incremental increase in lifetime cancer risk values for TAC emissions consider exposure via the inhalation pathway. The potential exposure through other pathways (e.g., ingestion) requires

⁸ Office of Environmental Health Risk Assessment, 2015. Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015.

substance and site-specific data, and the specific parameters for DPM are not known for these pathways.⁹ The OEHHA Guidance recommends the incorporation of several factors to quantify the carcinogenic compound dose via the inhalation pathway. Once determined, the dose is multiplied by the compound-specific inhalation cancer potency factor to derive the incremental increase in lifetime cancer risk estimate. The dose takes into account the concentration at an air quality sensitive receptor. The cancer potency factor is compound specific. In performing health risk calculations, carcinogenic compounds are not considered to have threshold levels (i.e., dose levels below which there are no risks). Any exposure, therefore, will have some associated risk.

Incremental health risks associated with exposure to carcinogenic compounds is defined in terms of the probability of developing cancer as a result of exposure to a chemical at a given concentration. Under a deterministic approach (i.e., point estimate methodology), the incremental increase in lifetime cancer risk probability is determined by multiplying the chemical's annual concentration by its unit risk factor (URF). For example, the URF for DPM recommended by the Scientific Review Panel¹⁰ is 3.0×10^{-4} per microgram per cubic meter ($\mu\text{g}/\text{m}^3$). This value corresponds to a CPF of 1.1 per milligram/kilogram (body weight) per day ($\text{mg}/\text{kg}(\text{bw})\text{-day}$). The URF for DPM means that for receptors with an annual average concentration of $1 \mu\text{g}/\text{m}^3$ in the ambient air, the probability of contracting cancer over a lifetime of exposure is 300 in one million. This approach for calculating the incremental increase in lifetime cancer risk is intended to result in conservative (i.e., health protective) estimates of health impacts and is used for assessing risks to air quality sensitive receptors. The estimation of health risks is calculated as follows:

Equation 1: $\text{Dose}_{\text{RESIDENT}} (\text{mg}/\text{kg}/\text{day}) = C_{\text{AIR}} \times \text{DBR} \times A \times \text{EF} \times \text{CF}$

where:

- C_{air} = concentration in air ($\mu\text{g}/\text{m}^3$)
- DBR = daily breathing rate normalized to body weight (L/kg body weight-day)
- A = inhalation absorption factor (1 for DPM, unitless)
- EF = exposure frequency (unitless) (days/365 days)
- CF = 10^{-6} , correction factor, micrograms to milligrams conversion, liters to cubic meters conversion

Equation 2: $\text{Risk}_{\text{INH-RESIDENT}} (\text{in one million}) = \text{Dose}_{\text{AIR}} \times \text{CPF} \times \text{ASF} \times \text{ED}/\text{AT} \times \text{FAH} \times \text{CCF}$

where:

- Dose_{AIR} = daily inhalation dose ($\text{mg}/\text{kg}\text{-day}$)
- CPF = cancer potency factor ($\text{mg}/\text{kg}\text{-day}$)⁻¹
- ASF = age sensitivity factor (unitless)

⁹ California Air Resources Board, 1998. Report to the Air Resources Board on the Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant, April 22, 1998.

¹⁰ The Scientific Review Panel is charged with evaluating the risk assessments of substances proposed for identification as TACs by CARB, OEHHA, and the Department of Pesticide Regulation (DPR), and the review of guidelines prepared by OEHHA.

- ED= exposure duration (years)
- AT= averaging time for lifetime cancer risk (years)
- FAH= fraction of time spent at home (unitless)
- CCF= 10^6 , cancer conversion factor to represent risk in chances per million

Details of the exposure parameters used under this methodology as well as risk calculations and modeling output are included in Appendix F.

The estimated excess incremental increase in lifetime cancer risks for residential receptors (including the early-in-life exposure) were adjusted using the ASFs recommended in Cal/EPA OEHHA Technical Support Document and 2015 OEHHA guidance. This approach accounts for an “anticipated special sensitivity to carcinogens” of infants and children. The incremental increase in lifetime cancer risk estimates were weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to two years of age and by a factor of three for exposures that occur from 2 to 15 years of age. No weighting factor (i.e., an ASF equal to one, which is equivalent to no adjustment) is applied to ages 16 to 30 years. As a conservative risk estimate, the receptors at the Crean Lutheran High School located across Portola Parkway from the project site were analyzed as residential receptors.

Non-Cancer Health Impacts

Non-cancer effects of chronic (i.e., long- term) TAC exposures were evaluated using the Hazard Index (HI) approach consistent with the OEHHA guidance. The chronic HI was calculated by dividing the modeled annual average concentration by the Reference Exposure Level (REL). The REL is the concentration at or below which no adverse health effects are anticipated. The REL for were obtained from OEHHA and the REL for DPM is 5 for annual chronic impacts. DPM does not have an 8-hour or acute REL therefore only chronic annual impacts are discussed. SCAQMD guidance identifies a significant impact if a project would result in an incremental chronic and acute HI that is greater than 1.0. Details of the risk calculations and modeling output are included in Appendix F.

3.1.4 General Conformity Determination (Construction and Operation)

Under section 176(c)(1) of the federal CAA, federal agencies that “engage in, support in any way or provide financial assistance for, license or permit, or approve any activity” must demonstrate that such actions do not interfere with state and local plans to bring an area into attainment with the NAAQS (42 USC 7506(c)). Orange County is designated extreme non-attainment for the federal 8-hour ozone NAAQS; serious non-attainment for PM_{2.5}; and attainment for the federal CO, NO₂, SO₂, and PM₁₀ standards. The program by which a federal agency determines that its action would not obstruct or conflict with air quality attainment plans is called “General Conformity.” The implementing regulations for General Conformity are found in 40 CFR 93(B) (75 FR 17254 (April 5, 2010, amended July 6, 2010)).

Under the General Conformity regulations, both the direct and indirect emissions associated with a federal action must be evaluated. Direct emissions are defined as:

Those emissions of a criteria pollutant or its precursors that are caused or initiated by the federal action and originate in a nonattainment or maintenance area and occur at the same time and place as the action and are reasonably foreseeable (40 CFR 93.152 (as revised April 5, 2010, effective July 6, 2010; 75 FR 17273).

Indirect emissions are defined as:

Those emissions of a criteria pollutant or its precursors:

- 1. That are caused or initiated by the federal action and originate in the same nonattainment or maintenance area, but occur at a different time or place as the action;*
- 2. That are reasonably foreseeable;*
- 3. That the agency can practically control; and*
- 4. For which the agency has continuing program responsibility (40 CFR 93.152 (as revised April 5, 2010, effective July 6, 2010; 75 FR 17273).*

For purposes of this definition, even if a federal licensing, rulemaking, or other approving action is a required initial step for a subsequent activity that causes emissions, such initial steps do not mean that a federal agency can practically control any resulting emissions ((40 CFR 93.152 (as revised April 5, 2010, effective July 6, 2010; 75 FR 17273))).

When describing the 2010 revisions to the definition of indirect emissions, USEPA offered the following explanation:

EPA is revising the definition for indirect emissions to clarify that only indirect emissions originating in a nonattainment or maintenance area need to be analyzed for conformity with the applicable SIP. In addition, EPA is revising the definition of “indirect emissions” to clarify what is meant by “the agency can practically control” and “for which the agency has continuing program responsibility.”

This clarification represents USEPA's long standing position that Congress did not intend for conformity to apply to “cases where although licensing or approving action is a required initial step for a subsequent activity that causes emissions, the agency has no control over that subsequent activity, either because there is no continuing program responsibility or ability to practically control (40 CFR 93.152 (as revised April 5, 2010, effective July 6, 2010; 75 FR 17273)).”

The General Conformity regulations incorporate a stepwise process, beginning with an applicability analysis. According to USEPA guidance, before any approval is given for a federal action to go forward, the regulating federal agency must apply the applicability requirements found at 40 CFR 93.153(b) to the federal action to evaluate whether, on a pollutant-by-pollutant basis, a determination of General Conformity is required. The guidance states that the applicability analysis can be (but is

not required to be) completed concurrently with the NEPA analysis. If the regulating federal agency determines that the General Conformity regulations do not apply to the federal action, no further analysis or documentation is required. If the General Conformity regulations do apply to the federal action, the regulating federal agency must next conduct a conformity evaluation in accordance with the criteria and procedures in the implementing regulations, publish a draft determination of General Conformity for public review, and then publish the final determination of General Conformity.

The General Conformity regulations require that a General Conformity determination analyze the following emissions scenarios: (1) the attainment year specified in the SIP, or if the SIP does not specify an attainment year, the latest attainment year possible under the Act; or (2) the last year for which emissions are projected in the maintenance plan; (3) the year during which the total of direct and indirect emissions from the action is expected to be the greatest on an annual basis; and (4) any year for which the applicable SIP specifies an emissions budget (40 CFR 93.159(d), as amended, effective July 6, 2010).

Each year of construction (2022 through 2026) are analyzed against the *de minimis* thresholds. Annual emissions for the construction activities are quantified for both the unmitigated and mitigated scenarios. Operational emissions are discussed qualitatively as there is a minimal operational component.

3.2 Air Quality Impacts

Threshold AIR-1 Conflict with or obstruct implementation of the applicable air quality plan.

Impact AIR-1: Implementation of the proposed project would not conflict with or obstruct implementation of the applicable air quality plan. (Less than Significant with Mitigation).

The proposed project is located within the Air Basin, which is under the jurisdiction of the SCAQMD. As such, SCAQMD's 2016 AQMP is the applicable air quality plan for the proposed project. Projects that are consistent with the regional population, housing, and employment forecasts identified by SCAG are considered to be consistent with the AQMP growth projections, since the forecast assumptions by SCAG forms the basis of the land use and transportation control portions of the AQMP. Additionally, because SCAG's regional growth forecasts are based upon, among other things, land uses designated in general plans, a project that is consistent with the land use designated in a general plan would also be consistent with the SCAG's regional forecast projections, and thus also with the AQMP growth projections.

The proposed project would result in an increase in short-term employment compared to existing conditions. Also, construction employees are typically employees of the construction firm and are not hired specifically for any one construction job. Being relatively small in number and temporary in nature, construction jobs under the project would not conflict with the long-term employment projections upon which the AQMP is based. Control strategies in the AQMP with applicability to short-term emissions from construction activities include strategies denoted in the 2016 AQMP as MOB-08 and MOB-10 and are intended to reduce emissions from on-road and off-road heavy-duty vehicles and equipment by accelerating replacement of older, emissions-prone engines with newer

engines meeting more stringent emission standards. Construction contractors would be required to comply with the CARB Air Toxic Control Measure that limits heavy duty diesel motor vehicle idling to no more than five minutes at any given location with certain limited exceptions defined in the regulation for equipment in which idling is integral to the function of the equipment or activity (such as concrete trucks and concrete pouring). In addition, contractors would be required to comply with required and applicable BACT and the CARB In-Use Off-Road Diesel Vehicle Regulation to use lower emitting equipment in accordance with the phased-in compliance schedule for equipment fleet operators. The proposed project would not conflict with implementation of these strategies. The proposed project is also required to comply with SCAQMD regulations for controlling fugitive dust pursuant to SCAQMD Rule 403. Compliance with these requirements is consistent with and meets or exceeds the AQMP requirements for control strategies intended to reduce emissions from construction equipment and activities.

Nonetheless, as discussed further below in the analysis for Impact AIR-2, even though the proposed project would be consistent with applicable strategies in the AQMP, local and state regulations, and other voluntary measures designed to reduce non-attainment pollutants, regional emissions during construction of the proposed project would exceed the significance threshold for NO_x. Therefore, impacts related to consistency with air quality plans during construction of the proposed project would be potentially significant.

As detailed in Impact AIR-2 below, construction-related daily emissions would be reduced to below the SCAQMD threshold of significance of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of mitigation would increase the emissions of CO, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. For all other criteria pollutants, emission levels would remain below the applicable thresholds of significance. As the proposed project's maximum regional emissions from construction would not exceed the regional thresholds of significance with implementation of mitigation measures, the proposed project would be consistent with the AQMP, and impacts would be reduced to a less than significant level.

Mitigation:

AIR-1: IRWD shall require the construction contractor to implement construction equipment features for equipment operating at the project site during certain construction phases. Construction features will include the following: The proposed project shall utilize off-road diesel-powered construction equipment that meet or exceed CARB and USEPA Tier 4 off-road emissions standards for standard construction equipment rated at 50 horsepower (hp) or greater during project construction. Such equipment will be outfitted with BACT devices including a CARB certified Level 3 Diesel Particulate Filter or equivalent. At a minimum, this measure shall apply during implementation of the following construction sub-phases: upstream

Significance Determination: Less than Significant Impact with Mitigation.

Threshold AIR-2 Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.

Impact AIR-2: Implementation of the proposed project would not result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard. (Less than Significant with Mitigation)

The proposed project would contribute to local and regional air pollutant emissions during construction (short-term or temporary) and operation (long-term).

Construction

Regional Emissions Analysis

Construction of the proposed project has the potential to generate temporary regional criteria pollutant emissions through the use of heavy-duty construction equipment, such as excavators and forklifts, through vehicle trips generated by workers and haul trucks traveling to and from the proposed project site, and through building activities such as the application of paint and other surface coatings. In addition, fugitive dust emissions would result from demolition and various soil-handling activities. Mobile source emissions, primarily NO_x, would result from the use of construction equipment such as dozers and loaders. Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of construction activity, and prevailing weather conditions.

The maximum daily construction emissions for the proposed project were estimated for each construction phase. Some individual construction phases could potentially overlap; therefore, the estimated maximum daily emissions include these potential overlaps by combining the relevant construction phase emissions. The maximum daily emissions are predicted values for a representative worst-case day, and do not represent the actual emissions that would occur for every day of construction, which would likely be lower on many days. As stated above, in order to provide a conservative emissions analysis, for modeling purposes, construction emissions were modeled beginning in 2022. Detailed emissions calculations are provided in Appendix B of this report.

The results of the criteria pollutant calculations are presented in **Table 7** and include dust control measures required to be implemented by SCAQMD Rule 403 (Control of Fugitive Dust), including subsection (e) – Additional Requirements for Large Operations, and fugitive VOC control measures required to be implemented by architectural coating emission factors based on SCAQMD Rule 1113 (Architectural Coatings). As shown in Table 7, construction-related daily emissions would exceed the SCAQMD threshold of significance for NO_x. For all other criteria pollutants, emission levels would be below the applicable thresholds of significance. As the proposed project's maximum regional emissions from construction would exceed the regional threshold of significance for NO_x, regional construction emissions impacts would be potentially significant.

^a Totals may not add up exactly due to rounding in the modeling calculations. Detailed emissions calculations are provided in Appendix B of this report.

^b Emissions include fugitive dust control measures consistent with SCAQMD Rule 403, including subsection (e) – Additional Requirements for Large Operations.

^c Set-up includes preconstruction activities and access routes/intersection improvement. Excavation includes excavation of sediment and excavation of dam. Construction includes Construction of Dam/Spillway/Reservoir, construction of facility, wetlands/riparian installation, recreational facilities installation, and demobilization.

SOURCE: ESA 2020.

The results of the mitigated criteria pollutant calculations are presented in **Table 8** and include dust control measures required to be implemented by SCAQMD Rule 403 (Control of Fugitive Dust), including subsection (e) – Additional Requirements for Large Operations and fugitive VOC control measures required to be implemented by architectural coating emission factors based on SCAQMD Rule 1113 (Architectural Coatings). As shown in Table 8, construction-related daily emissions would be reduced to below the SCAQMD threshold of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of Mitigation Measure AIR-1 would slightly increase the emissions of CO due to the emissions control technology used, but would not result in CO emissions exceeding the SCAQMD’s threshold of significance. For all other criteria pollutants, emission levels would remain below the applicable thresholds of significance. As the proposed project’s maximum regional emissions from construction would not exceed the regional thresholds of significance with implementation of mitigation measures, the proposed project’s regional construction emissions impacts would be less than significant.

General Conformity Determination

Annual emissions for unmitigated and mitigated emissions were compared to the General Conformity *de minimis* levels for NAAQS non-attainment areas (see **Table 9**). In the unmitigated scenario, annual construction emissions of NO_x, would exceed the 10 tons per year General Conformity threshold. With implementation of Mitigation Measure AIR-1, annual construction emissions of VOC, CO, NO_x, PM10, and PM2.5 would be below applicable General Conformity *de minimis* levels and thus would not conflict with implementation of the SIP. Additionally, short-term direct construction emissions associated with the project would not conflict with or obstruct implementation of applicable long-term air quality management plans. Therefore, no further conformity analysis is required for any of the pollutants because their emissions would be less than the conformity *de minimis* levels, and no significant adverse effect from the project would occur.

Operations

Regional Emissions Analysis

As discussed previously, operational activities would result in area source emissions and an increase in electrical consumption. No new permanent vehicle trips would occur as maintenance and recreational activities are anticipated to remain the same as the existing conditions. Operational vehicle trips during the first five years of maintenance would equal 12 to 24 round trips for 30 to 40 days per year. However, these trips would not result in substantial daily or annual emissions. Operational regional criteria pollutant emissions were calculated for the proposed project's buildout year of 2026 and emissions were assumed not to exceed 1 pound per day for all criteria pollutants during operational activities. Detailed emissions calculations are provided in Appendix B of this

report. The proposed project's operational-related daily emissions would not exceed the SCAQMD thresholds of significance for any criteria pollutants. As the proposed project's maximum regional emissions from operational activities would be below the regional thresholds of significance, regional operation-related emissions impacts would be less than significant.

General Conformity Analysis

Daily operational emissions are less than one pound per day for all criteria pollutants. Therefore, annual emissions would be less than 0.2 tons per year, well below any of the de minimis thresholds, thus in conformance with the SIPs. Additionally, operational emissions associated with the proposed project would not conflict with or obstruct implementation of applicable long-term air quality management plans. Therefore, no further conformity analysis is required for any of the pollutants because their emissions would be less than the conformity thresholds and no significant adverse effect from the project would occur.

Health Impact Assessment

NO_x and VOC emissions from projects are directly related to the increase in ozone in the local area/region which aggravate respiratory diseases, leading to respiratory symptoms (such as coughing, wheezing or difficulty breathing), hospital admissions and visits to emergency rooms and may contribute to the development of asthma and potentially increase susceptibility to respiratory infections. As shown in Table 7, unmitigated project-related construction emissions would potentially exceed regional thresholds for NO_x. Accordingly, elevated levels of criteria air pollutants as a result of a project's emissions could cause adverse health effects associated with this pollutant. All other criteria pollutants would be below the thresholds of significance. Implementation of Mitigation Measure AIR-1 would reduce both localized (discussed in detail in Impact 3 below) and regional project generated construction emissions (with the exception of CO, which increases slightly with Mitigation Measure AIR-1 but still remains below the threshold of significance), and therefore would reduce the potential to result in regional health effects associated with ozone precursors (VOC and NO_x). As shown in Table 8, mitigated project construction emissions would not exceed the thresholds of significance. As a result, construction of the proposed project would not have the potential to result in additional quantifiable health impacts, and impacts would be reduced to a less than significant level with implementation of Mitigation Measure AIR-1.

As discussed under operational emissions above, unmitigated project-related operational emissions would not exceed regional thresholds for any criteria pollutant. Accordingly, levels of criteria air pollutants as a result of a project's emissions are not anticipated to cause adverse health effects. Impacts would be less than significant.

Mitigation:

Implement Mitigation Measure AIR-1.

Significance Determination: Less than Significant Impact with Mitigation.

Threshold AIR-3 Expose sensitive receptors to substantial pollutant concentrations.

Impact AIR-3: Implementation of the proposed project would not expose sensitive receptors to substantial pollutant concentrations. (Less than Significant with Mitigation)

Localized Construction

The maximum daily localized emissions for each of the construction phases and the localized significance thresholds are presented in **Table 10**. The same phasing, equipment assumptions, and compliance with SCAQMD Rule 403 and Rule 1113 were used as for the regional emissions calculations discussed above. As shown in Table 10, maximum localized construction emissions for sensitive receptors would exceed the localized threshold of significance for NO_x, therefore, with respect to localized construction emissions, impacts to sensitive receptors would be potentially significant. All other criteria pollutants of local concern (CO, PM₁₀, and PM_{2.5}) would not exceed the localized thresholds of significance. Detailed emissions calculations are provided in Appendix B of this report.

The results of the mitigated localized emissions calculations are presented in **Table 11**. And include dust control measures required to be implemented by SCAQMD Rule 403 (Control of Fugitive Dust), including subsection e – Additional Requirements for Large Operations and fugitive VOC control measures required to be implemented by architectural coating emission factors based on SCAQMD Rule 1113 (Architectural Coatings). As shown in Table 11, construction-related daily emissions would be reduced to below the SCAQMD threshold of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of Mitigation Measure AIR-1 would slightly increase CO emissions due to the emissions control technology used, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. For all other criteria pollutants, emissions levels would remain below the applicable thresholds of significance. As the proposed project's maximum localized emissions from construction would not exceed the localized thresholds of significance, localized construction emissions impacts would be less than significant with the incorporation of Mitigation Measure AIR-1.

Localized Operations

The localized operational air quality analysis was conducted using the methodology prescribed in the SCAQMD Localized Significance Threshold Methodology (June 2003, revised July 2008). The screening criteria provided in the Localized Significance Threshold Methodology were used to determine the localized operational thresholds of significance for the proposed project. The maximum daily localized emissions would not exceed 1 pound per day and therefore would not

exceed localized significance thresholds. Detailed emissions calculations are provided in Appendix B of this report. As the proposed project's maximum localized operational emissions would not exceed the localized thresholds of significance for NO_x, CO, PM₁₀, or PM_{2.5}, operational emissions impacts to sensitive receptors would be less than significant.

Toxic Air Contaminants

Carcinogenic Health Risk

Excess lifetime cancer risk is estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to carcinogens. As the individual incremental increase in lifetime cancer risk is assessed over long exposure time periods (i.e., 30-year for residential receptors), the potential effects of proposed project-related carcinogenic TAC emissions must include the combination of exposure to construction-related activities and exposure to operation-related activities. For cancer risk, SCAQMD guidance identifies a significant impact if a project would result in an incremental cancer risk that is greater than 10 in one million for any receptor.

The TAC emissions of the proposed project would be generated from mobile sources including diesel-powered heavy-duty trucks and construction equipment. These sources generate DPM from combustion of diesel fuels. The analysis uses exhaust PM₁₀ emissions associated with each construction phase as a surrogate for DPM emissions. The potential emission sources of DPM would be diesel-fueled heavy-duty equipment, on-road travel and idling emissions from diesel-fueled haul trucks. For operational activities the proposed project would not result in new TAC sources and therefore would not contribute to the cumulative health risk of the local sensitive receptors.

The maximum health risk impacts to exposed sensitive receptors was determined through placing receptor locations around the proposed project site and haul truck routs. The estimated incremental cancer risks for the proposed project's construction activities over a maximum 30-year exposure in line with OEHHA guidance starting with the first year of construction as analyzed. Cancer risk for the maximum impacted sensitive receptor is 11.16 per million which would exceed the SCAQMD's threshold of 10 per million. As the cancer risk would exceed the SCAQMD's significance thresholds, the lifetime cancer risk that would result from construction and operation of the proposed project would result in significant impacts without mitigation.

Implementation of Mitigation Measure AIR-1, would reduce DPM emissions from the proposed project's construction activities. The estimated incremental cancer risk for the proposed project's construction activities with implementation of Mitigation Measure AIR-1 would be between 1.43 per million and 3.44 per million depending on the level at which the mitigation is implemented. This range is below the significance threshold of 10 per million. Therefore, with mitigation impacts would be less than significant.

Non-carcinogenic Health Risk

As previously discussed, an HRA was prepared to evaluate the risk of potential non-carcinogenic negative health outcomes related to TACs exposure from airborne emissions during the

construction of the proposed project. For construction, the potential TAC emission sources were heavy-duty equipment and haul/vendor trucks used during the improvements to the reservoir. Non-cancer effects of chronic (i.e., long-term) exposure were evaluated using the HI approach consistent with the OEHHA and SCAQMD guidance.

A chronic HI equal to or greater than 1.0 represents a significant chronic health hazard. A chronic health effect could include irritation to eyes, throat, lungs or neurological damage. Construction of the proposed project would result in non-carcinogenic health risk of 0.02 under the unmitigated scenario and between 0.004 and 0.02 with implementation of mitigation. Both unmitigated and mitigated non-carcinogenic health risk would be below the significance threshold of a chronic HI of 1.0 for the maximum impacted receptor. Therefore, this impact would be less than significant.

Mitigation:

Implement Mitigation Measure AIR-1.

Significance Determination: Less than Significant Impact with Mitigation.

Threshold AIR-4 Result in other emissions (such as those leading to odors) affecting a substantial number of people.

Impact AIR-4: Implementation of the proposed project would not result in other emissions (such as those leading to odors adversely affecting a substantial number of people). (Less than Significant)

Construction

Potential activities that may emit odors during the proposed project's construction include the use of architectural coatings and solvents, as well as the combustion of diesel fuel in on-and off-road equipment. SCAQMD Rule 1113 would limit the amount of VOCs in architectural coatings and solvents. In addition, the proposed project would comply with the applicable provisions of the CARB Air Toxics Control Measure regarding idling limitations for diesel trucks. Through mandatory compliance with SCAQMD Rules, no construction activities or materials are expected to create objectionable odors affecting a substantial number of people. Furthermore, as shown in Table 7, construction emissions would not exceed the SCAQMD regional significance thresholds for attainment, maintenance, or unclassifiable criteria air pollutants (i.e., CO and SO₂). Therefore, the proposed project's construction activities would result in less than significant impacts with respect to other emissions, including those leading to odors.

Operations

According to the SCAQMD *CEQA Air Quality Handbook*, land uses associated with odor complaints typically include agricultural uses, wastewater treatment plants, food processing plants,

chemical plants, composting, refineries, landfills, dairies, and fiberglass molding. The proposed project would not include any uses identified by the SCAQMD as being associated with substantial odors. As a result, the proposed project is not expected to discharge contaminants into the air in quantities that would cause a nuisance, injury, or annoyance to the public or property pursuant to SCAQMD Rule 402. Furthermore, as discussed under Impact AIR-2 above, operational emissions would not exceed the SCAQMD regional significance thresholds for attainment, maintenance, or unclassifiable criteria air pollutants (i.e., CO and SO₂). Therefore, operation of the proposed project would result in less than significant impacts with respect to other emissions, including those leading to odors.

Mitigation: None required.

Significance Determination: Less Than Significant Impact.

3.3 Greenhouse Gas Impacts

Threshold GHG-1 Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.

Impact GHG-1: Implementation of the proposed project would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. (Less than Significant)

According to SCAQMD methodology, because GHG emissions are a cumulative impact, project significance is determined by the combined amortized construction and operational emissions. The proposed project's total estimated GHG emissions during construction are identified in **Table 12**. As shown, estimated GHG emissions would be approximately 9,567 MTCO_{2e} over the entire lifetime of the project. This would equal approximately 319 MTCO_{2e} per year after amortization over 30 years per SCAQMD methodology.

Operational GHG emissions result from area sources and the increased electrical use as a result of daily activities once the proposed improved reservoir is operational. **Table 13** shows the total annual GHG emissions associated with the combined construction and operation of the proposed project. As shown in Table 13, operational emissions result in 161 MTCO_{2e} annually, which is attributed almost exclusively to increased electrical use.

SOURCE: ESA 2020.

Furthermore, the objectives of the proposed project include reducing the need to purchase supplemental imported untreated water from MWD by storing recycled water that is already produced. Conveying imported untreated water from the State Water Project (SWP) and the Colorado River to Orange County requires a tremendous amount of energy for pumping. Replacing imported water with locally generated recycled water reduces the overall energy associated with imported water since there would be less energy needed for conveyance. Approximately 1,890 kWh per acre foot is required for water supply and conveyance in the IRWD service area due to importing water from outside of the region from the SWP and the Colorado River (IRWD 2019). Without the proposed project, approximately 4,500 AF of untreated water would be imported through MWD, resulting in approximately 8,505,000 kWh/year of electricity consumption. Under the proposed project, the provision of approximately 4,500 AF of locally-produced recycled water would result in approximately 4,806,000 kWh/year of electricity consumption, which is an approximate savings of 3,699,000 kWh annually.

The combined annual construction and operational emissions from the proposed project result in approximately 480 MTCO_{2e}. The district-wide savings in approximately 3,699,000 kWh annually results in a reduction in district emissions of approximately 535 MT CO_{2e} annually and results in a district wide reduction in GHG emissions of approximately 55 MTCO_{2e} annually.¹¹ As the proposed project's annual GHG emissions would not exceed the threshold of significance, emissions impacts with respect to the generation of GHGs would be less than significant.

Mitigation: None required.

Significance Determination: Less Than Significant Impact.

Threshold GHG-2 Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs.

Impact GHG-2: Implementation of the proposed project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs. (Less than Significant)

Consistency with the Climate Change Scoping Plan

The CARB Climate Change Scoping Plan was designed to reduce GHG emissions from new land use projects. The proposed project would be subject to the Scoping Plan requirements. The majority of the Scoping Plan measures target measures that reduce energy and transportation emissions from residential and commercial/industrial development and therefore the majority of the Scoping Plan measures are not applicable to the proposed project. Out of the Recommended Actions contained in CARB's Scoping Plan, the actions that are most applicable to the proposed program would be reducing diesel-fueled commercial motor vehicle idling, and reducing energy associated with water

¹¹ 1,082,727 kWh of net increase in electrical use results in 157 MTCO_{2e} annually. 3,699,000 kWh of electric use results in approximately 535 MTCO_{2e} annually. Project emissions (480 MTCO_{2e}) minus the district emissions (535 MTCO_{2e}) equals a 55 MTCO_{2e} annual reduction in district emissions from the implementation of the project.

use. The proposed project would be designed to comply with the California regulations to limit idling of onsite vehicles to 5 minutes or less per location.

The objectives of the proposed project include reducing the need to purchase imported water from MWD by storing and using additional recycled water stored by the proposed project and maximize the use of recycled water produced by IRWD for the benefit of IRWD customers. Once operational, the proposed project would increase the amount of recycled water available within IRWD and therefore would reduce the emissions associated with the transport of non-potable water from other sources. Replacing purchased imported water with locally generated recycled water for use by local customers reduces the overall energy-related GHG emissions associated with the purchase of imported water since there would be less GHG emissions from water supply and conveyance. Approximately 1,890 kWh per acre foot is required for water supply and conveyance in the IRWD service area due to importing water from outside of the region from the SWP and the Colorado River (IRWD 2019). Without the proposed project approximately 4,500 AF of untreated water would be imported through MWD, resulting in approximately 8,505,000 kWh/year of electricity consumption district-wide. Treatment and transport of approximately 4,500 AF of locally-produced recycled water would result in approximately 4,806,000 kWh/year of district-wide electricity consumption, which is an approximate savings of 3,699,000 kWh annually. By providing IRWD customers with recycled water stored under the proposed project, electricity used for water supply and conveyance from imported water would be offset by the recycled water, thus reducing district-wide GHG emissions. The 2017 Climate Change Scoping Plan recognizes the nexus between water and energy consumption. The water-energy nexus provides opportunities for reducing energy demand and reducing emissions of GHGs. The 2017 Climate Change Scoping Plan, states that “recycled water has the potential to reduce GHGs if it replaces, and not merely serves as an alternative to, an existing, higher-carbon water supply” (CARB 2017a). Thus, the proposed project would be consistent with the Scoping Plan’s strategy to reduce water-related GHG emissions.

As the proposed project would not increase traffic within the region, and would reduce the overall energy-related GHG emissions associated with the use of imported water, the proposed project would not conflict with the Scoping Plan. That combined with the reduction in vehicle idling, the proposed project would be consistent with the Scoping Plan measures applicable to the project. Therefore, the proposed project would result in less than significant impacts.

Consistency with SB 375

The key goal of the Sustainable Communities Standard is to achieve GHG emission reduction targets through integrated land use and transportation strategies. The focus of these reductions is on transportation and land use strategies that influence vehicle travel. The proposed project would not significantly or permanently increase vehicle traffic within the County or the region. While the proposed project would result in an increase in short-term employment compared to existing conditions, the project would not result in long-term employment growth in excess of regional projections by SCAG. Therefore, the proposed project would not conflict with the implementation of SB 375 nor the 2020-2045 RTP/SCS and impacts would be less than significant.

Consistency with Applicable Regulations

The Heavy-Duty Vehicle and Light-Duty vehicle rules have been established to reduce CO₂ emissions from the combustion of fossil fuels. The proposed project would not involve the manufacture of vehicles or production of vehicle fuels. However, vehicles that are purchased and used within the project site would comply with any vehicle and fuel standards that the CARB adopts or has adopted. Therefore, the construction and operation of the proposed project would not conflict with these regulations.

CARB's ATCM limits heavy-duty diesel motor vehicle idling to reduce DPM and other TACs and applies to all the haul trucks, heavy duty vendor trucks, and construction equipment that would be used on the project site. CARB also implemented the Truck and Bus Regulation to further reduce NO_x, PM₁₀ and PM_{2.5} from on-road diesel operating vehicles. CARB has also promulgated emissions standards for off-road diesel construction equipment greater than 24 horsepower to reduce criteria pollutant emissions. The proposed project would operate both on- and off-road trucks and construction equipment. These vehicles would comply with all of the CARB regulations and onsite trucks and equipment would be monitored to ensure that idling would occur for only five minutes at any given time. Therefore, the proposed project would be consistent with the applicable regulations for heavy-duty, light-duty and off-road vehicles and equipment and impacts would be less than significant.

Mitigation: None required.

Significance Determination: Less Than Significant Impact.

3.4 Cumulative Air Quality Impacts

The following cumulative impact analysis is based on the recommendations provided by SCAQMD in the Potential Control Strategies to Address Cumulative Impacts from Air Pollution White Paper. SCAQMD's guidance for assessing a project's cumulative impacts recommends the use of two alternative methodologies: (1) that project-specific air quality impacts be used to determine the project's potential cumulative impacts to regional air quality; or (2) that a project's consistency with the AQMPs are used to determine its potential cumulative impacts.

Under SCAQMD's guidance, "[p]rojects that exceed the project-specific significance thresholds are considered by SCAQMD to be cumulatively considerable. This is the reason project-specific and cumulative significance thresholds are the same. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant." Therefore, consistent with this guidance, the potential for the Proposed Project to result in cumulative impacts from regional emissions is assessed based on SCAQMD thresholds.

Consistency with AQMP

As described above under Impact AIR-1, construction of the proposed project would not be consistent with the AQMP as the proposed project would generate emissions of nonattainment pollutants or precursors (i.e., NO_x) that exceed the applicable significance thresholds. Based on

SCAQMD guidance, the exceedance of these thresholds indicates that the proposed project would have a considerable contribution to a significant impact. Construction-related daily emissions would be reduced to below the SCAQMD threshold of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of this mitigation measure would slightly increase the emissions of CO due to the emissions control technology used, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. For all other criteria pollutants, emission levels would remain below the applicable thresholds of significance. As the proposed project's maximum regional emissions from construction would not exceed the regional thresholds of significance, the proposed project would be consistent with the AQMP and cumulative impacts would be less than significant.

Operation of the proposed project would be consistent with the AQMP as the proposed project would not generate emissions of nonattainment pollutants or precursors (i.e., VOC, NO_x, CO, SO_x, PM10, and PM2.5) that exceed the applicable significance thresholds. Therefore, the proposed project would result in a less than significant cumulative operational impact.

Project-Specific Impacts

Construction

As described above under Impact AIR-2 and Impact AIR-3, regional and localized emissions during construction of the proposed project would exceed the SCAQMD significance threshold for NO_x. Thus, based on SCAQMD methodology, the proposed project construction emissions would represent a considerable contribution to a cumulative impact, resulting in a potentially significant cumulative impact. The proposed project's construction-related daily emissions would be reduced to below the SCAQMD regional and local thresholds of significance for NO_x with the implementation of Mitigation Measure AIR-1. Implementation of Mitigation Measure AIR-1 would slightly increase the emissions of CO due to the emissions control technology used, but would not result in CO emissions exceeding the SCAQMD's threshold of significance. As the proposed project's maximum mitigated regional emissions from construction would not exceed the regional thresholds of significance, the proposed project would not represent a considerable contribution to a cumulative impact, resulting in a less than cumulative impact.

Operation

As discussed under Impact AIR-2 and Impact AIR-3, above, regional and localized operational emissions of VOC, NO_x, CO, PM10, and PM2.5 would not exceed the SCAQMD significance thresholds. Thus, based on SCAQMD methodology, the proposed project operational emissions would not represent a considerable contribution to a cumulative impact, resulting in a less than significant cumulative impact.

Mitigation

Implement Mitigation Measure AIR-1.

Significance Determination: Less than Significant Impact with Mitigation

3.5 Cumulative GHG Impacts

The GHG emissions of the proposed project alone would not cause a direct physical change in the environment. According to CAPCOA, “GHG impacts are exclusively cumulative impacts; there are no non-cumulative GHG emission impacts from a climate change perspective. (CAPCOA 2008)” It is global GHG emissions in their aggregate that contribute to climate change, not any single source of GHG emissions alone. The impact analysis of the project’s GHG emissions and consistency with existing plans and policies related to GHG emissions provided above for the proposed project serves as a cumulative impact analysis. Therefore, as discussed above, the proposed project would be consistent with applicable plans, policies or regulations adopted for the purpose of reducing GHG emissions and the proposed project would not generate GHG emissions that would have a significant impact on the environment. As such, the proposed project would result in a less than cumulatively considerable impact related to applicable GHG emissions and GHG reduction plans and policies and cumulative impacts would be less than significant.

Mitigation Measures

None required

Significance Determination: Less than Significant Impact

SYPHON RESERVOIR IMPROVEMENT PROJECT

Biological Resources Technical Report

1.0 Introduction

This report presents the findings of a biological resources assessment conducted by Environmental Science Associates (ESA) for the Syphon Reservoir Improvement Project (proposed project) within an approximately 265-acre study area (“study area”) located in unincorporated Orange County, California. The Syphon Reservoir is an existing recycled water storage reservoir in Irvine Ranch Water District’s (IRWD) service area. IRWD is limited in its ability to supply recycled water to its customers year-round with its existing recycled water storage capacity. The proposed project would increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam, while meeting or exceeding the current safety and design requirements. The proposed project would allow the storage of additional recycled water by expanding the reservoir’s storage capacity from the current 500 acre-feet (AF) to approximately 5,000 AF, which would help IRWD become more self-sufficient and increase IRWD’s water supply reliability by reducing its dependence on costly and less-reliable imported water.

This report documents the results of a literature review, biological surveys, and describes the environmental setting of the study area, including plant communities, habitats, and special-status biological resources that have been documented on-site or have the potential to occur on-site. In addition, the report includes an analysis of potential direct or indirect project-related impacts to special-status biological resources within the context of applicable environmental regulations and provides recommendations to mitigate these effects. The purpose of this study is to satisfy the requirements of the California Environmental Quality Act (CEQA), and to supplement subsequent regulatory processing pursuant to Section 1602 of the California Fish and Game Code (FGC) and potential coordination with State and federal agencies regarding Sections 404 and 401 of the Clean Water Act (CWA). Syphon Reservoir is located within the Orange County Central & Coastal Subregions Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) and is recognized as an operating reservoir in the NCCP/HCP Reserve. Implementation of expanded seasonal storage for recycled water purposes was also anticipated and identified as a permitted use in the NCCP/HCP.

1.1 Project Location

The study area is located in central Orange County in southern California (**Figure 1**). Specifically, the study area is located northeast of Portola Parkway between Bee Canyon Access Road and State Route 133 (SR-133) (**Figure 2**). IRWD owns the majority of the property bounded by these thoroughfares. An athletic complex including tennis courts and parking area is also located between Portola Parkway and the base of the existing dam. Residential neighborhoods are located southwest of Portola Parkway. The land-form surrounding the reservoir is moderately hilly with ridgelines and terraced slopes. Elevations at the site range from approximately 320 feet above mean sea level (amsl) at Portola Parkway immediately below the existing reservoir to approximately 675 feet amsl in the northeast corner of the study area.

1.2 Project Purpose and Background

The purpose of the proposed project is to increase the recycled water storage capacity at Syphon Reservoir in order to meet the seasonal demand of recycled water customers and to enhance IRWD's water supply reliability. Water recycling is an essential component of IRWD's water supply portfolio, as any demand met with recycled water reduces the demand for high-quality drinking water. The expansion of Syphon Reservoir would assist in meeting projected demands within the service area by allowing the storage of additional recycled water produced at IRWD's Michelson Water Recycling Plant (WRP) during periods of low demand (winter months) for use during periods of high demand (summer months). Although IRWD's existing recycled water reservoirs provide some storage for recycled water, once the storage reservoirs are full to capacity in winter months, recycled water supplies are either diverted to Orange County Sanitation District (OCSD) or discharged to the ocean. During the dry summer season, when irrigation demands are highest, service area demand for recycled water depletes existing reservoir storage and exceeds the rate at which new recycled water is produced by the WRPs. IRWD must then purchase costly supplemental imported water from Metropolitan Water District of Southern California (MWD) to meet the seasonal demands of IRWD's recycled water customers. Based on projected demands and supplies, IRWD estimates that it will need 4,500 AF of additional recycled water storage capacity by the year 2030 to meet demand. The expansion of Syphon Reservoir's storage capacity from the current 500 AF to approximately 5,000 AF would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water during summer months, and would increase the use of recycled water to maintain community landscaping, as well as agricultural, business, and industrial uses. IRWD produces up to 28 million gallons of recycled water every day at its WRPs. Every gallon of recycled water IRWD uses for these non-drinking water purposes saves a gallon of drinking water. The proposed project would prepare IRWD for the future by storing more drought-proof water, helping the region better withstand future water shortages. By expanding water recycling infrastructure, the proposed project would be consistent with California Water Code Section 13512, which states, "[i]t is the intention of the Legislature that the state undertake all possible steps to encourage development of water recycling facilities so that recycled water may be made available to help meet the growing water requirements of the state."

Siphon Reservoir Improvement Project

Figure 2
Vicinity Map

IRWD acquired Syphon Reservoir in 2010 from the Irvine Company (TIC). Multiple studies and activities have occurred within the study area to support use of the reservoir to store recycled water. In 2012, IRWD prepared the Syphon Reservoir Expansion Engineering Feasibility Study (GEI 2012), which provided baseline geotechnical information for the study area. This study was limited in the location and number of borings conducted due to requirements to remain within existing roadways on-site and to avoid vegetation disturbance. In 2013, IRWD implemented the Syphon Reservoir Interim Facilities Project, which included minor improvements to integrate the reservoir into IRWD's recycled water system. In 2016, IRWD conducted a dry lakebed geotechnical exploration to obtain information on the extent and character of sediments that have accumulated in the reservoir over time (GEI 2016). In 2019, IRWD implemented the Syphon Reservoir Geotechnical Investigations Project, which provided details about the geologic and geotechnical baseline conditions at Syphon Reservoir in order to inform the design of an enlarged reservoir (ESA 2019b). The existing reservoir has been operated for many years based on the supply and demand for recycled water. Generally, this means water levels tend to be high in the winter months when demand is lower and the reservoir level is typically lower in the spring and summer as demand increases. Despite considerable fluctuation of water levels in the reservoir, this fairly typical operation where average water levels are higher in the winter and early spring, has resulted in the establishment of a substantial fringe of freshwater marsh and woody riparian habitat around the perimeter of the reservoir. It is important to recognize that the presence of natural habitat areas within this artificial system is completely incidental to the purpose of the reservoir, and may be considered an unintended benefit to wildlife in the area.

In addition, part of the area surrounding the reservoir was previously used by the Transportation Corridor Agencies (TCA) to mitigate impacts to natural areas associated with construction of part of the Eastern Transportation Corridor Project (Dudek 2012). Between 1995 and 2000, approximately 102 acres of the study area were preserved and 112 acres were restored to native coastal sage scrub habitat as mitigation for the TCA Eastern Transportation Corridor Project's impacts to coastal California gnatcatcher. Restoration activities involved removal of orchard trees, native coastal sage scrub planting, temporary irrigation, and monitoring. The revegetation was successfully completed in accordance with regulatory requirements and supported mature coastal sage scrub suitable for California gnatcatcher (Dudek 2012). When IRWD acquired Syphon Reservoir from TIC, the Conveyance Agreement included a Grant Deed over 219 acres of the property with use restrictions to provide for the conservation of biological resources associated with that mitigation. The Grant Deed includes provisions to "install, maintain, repair and replace improvements to enhance the safety or capacity of the Reservoir Facilities," that are "subject to receipt of approvals from applicable governmental agencies." Coordination with the third-party beneficiaries of the Grant Deed (i.e., TCA and U.S. Fish and Wildlife Service [USFWS]) is required. Since 2018, IRWD has been engaged with USFWS and CDFW regarding appropriate options that will satisfy these agencies with regard to mitigation for upland habitat in consideration of the Grant Deed provisions as well as the relevant NCCP/HCP requirements.

1.3 Project Description

The proposed project primarily involves the expansion of three on-site facilities: Syphon Reservoir Dam, Syphon Reservoir, and Syphon Reservoir Treatment Facilities (**Figure 3A**).

Other operational design features would include an internal seepage control system within the new engineered dam; a circulation/aeration system for the reservoir; new on-site access and maintenance roads; wetland and riparian mitigation areas; and potential recreational facilities. These proposed project facilities and components are described further below. It should be noted that sizes, dimensions, and locations of the various project components and configurations as further described herein, are based on feasibility-level evaluations and are subject to change with final design.

The delivery of recycled water to and from Syphon Reservoir would be accomplished with existing off-site facilities. Modifications to off-site facilities would be limited to the addition of pumps within the existing structures as further described below. The existing Highline Canal would be abandoned in place and no longer used to deliver water to Syphon Reservoir from IRWD's Rattlesnake Reservoir. Under normal operating conditions, all flow out of Syphon Reservoir would be conveyed back to the Eastwood Recycled Water Pump Station through the same 36-inch recycled water pipeline, for connection to IRWD's recycled water distribution system.

1.3.1 Dam Replacement

The proposed project would replace the existing engineered dam with a new engineered dam, increasing the existing 59-foot dam height to 136 feet and increasing the elevation of the dam crest from the existing 388 feet amsl to 466 feet amsl. The new dam would be an earthen fill embankment. The embankment slopes would provide adequate stability including for seismic loading conditions. The crest of the new dam would be approximately 20 feet wide and approximately 1,300 feet long. Figure 3A shows the preliminary footprint of the proposed dam, which would be constructed primarily from on-site materials, although the importation of some specialty materials is anticipated. On-site materials would be obtained from excavation of the existing earthen embankment dam and spillway, excavation below the new dam footprint and borrow excavations within the existing and proposed reservoir area. Slope protection for the new dam would consist of rip-rap on the upstream slope and vegetation on the downstream slope. The rip-rap on the upstream slope would provide erosion protection from wave action resulting from water in the reservoir. Similar to the existing dam, the vegetation on the downstream slope would consist of grass and would provide erosion protection from rainfall runoff.

The new proposed spillway would be designed to meet or exceed the current safety and design requirements established by the Department of Water Resources (DWR), Division of Safety of Dams (DSOD). The elevation of the spillway crest would be approximately 456 feet amsl, providing 10 feet of freeboard relative to the dam crest at 466 feet amsl and thus ensuring that overtopping of the dam would not occur. In addition, IRWD would operate the reservoir with additional freeboard below the spillway to ensure the water surface elevation remains safely below the spillway crest elevation at all times. Furthermore, IRWD's current and future operating procedures include monitoring the local weather forecasts, and in the event of a major storm event, IRWD will lower the reservoir's water surface by distributing the stored water throughout IRWD's recycled water system, or sending a controlled flow to the existing storm drain in advance of the predicted storm event.

Syphon Reservoir Improvement Project

Figure 3A
Proposed Project

1.3.2 Reservoir Enlargement

The replacement dam would result in an increase in the reservoir's maximum water surface elevation from 376 feet amsl to 456 feet amsl and increase the reservoir's capacity from approximately 500 AF to 5,000 AF. As shown in Figure 3A, the proposed project would expand the reservoir's shoreline and inundate up to approximately 82 acres upstream of the dam that currently support upland and wetland vegetation communities, some of which are within the NCCP/HCP Reserve area and grant deed restricted lands. The existing reservoir ground surface would be excavated non-uniformly to obtain approximately 2.2 million cubic yards of material to construct the new engineered dam. A seepage control drainage system would be constructed on the downstream side of the dam to safely route seepage through the dam and prevent erosion in the embankment area.

1.3.3 Treatment Facilities

The existing strainer and disinfection facilities would be demolished, reconstructed and expanded at the toe of the new dam to provide filtration, chlorination and de-chlorination. The potential locations of the treatment facilities, which would be determined during detailed design, are depicted in Figure 3A (labeled as Treatment Facility Option A and Option B). Only one treatment facility in one of the optional locations will be constructed for the proposed project. The layout would consist of an enclosed masonry building. The footprint of the proposed treatment facilities would be determined during the detailed design, but is anticipated to be approximately 40 feet by 160 feet. The purpose of the treatment facilities would be to de-chlorinate the recycled water as it enters the reservoir, filter the recycled water as it leaves the reservoir to remove algae and leaves, and chlorinate the recycled water as it leaves the reservoir to provide a chlorine residual as the water is delivered through the District's recycled water distribution system.

1.3.4 Access and Maintenance Roads

The primary access point for construction traffic and future IRWD operation and maintenance is anticipated to be from the intersection at Portola Parkway and Sand Canyon Avenue. The current intersection consists of a "T" intersection, where Sand Canyon Avenue ends at the intersection with Portola Parkway. As part of the proposed project, the intersection and associated traffic lights would be modified to allow construction and future IRWD operations access through the intersection, into the District's property. Construction vehicles and IRWD vehicles would also leave the site through the same intersection.

An unpaved road currently exists on the District's property in the vicinity of the intersection at Portola Parkway and Sand Canyon Avenue, which was previously used to access and maintain the existing Highline Canal. This portion of the Highline Canal in the area has since been abandoned. As part of the proposed project, this dirt road would be utilized and improved to allow two lanes (one in each direction) for ingress and egress for the construction and IRWD operation traffic. As part of the access road improvements, it is anticipated that excavation into the existing slope and construction of a retaining wall may be necessary to allow trucks to make the left turn onto the existing Highline Canal road after passing through the intersection. Figure 3A depicts the anticipated access road location.

1.3.5 On-Site Freshwater Wetland, Riparian, and Upland Habitat Replacement Areas

The displacement of the existing woody riparian and freshwater marsh communities resulting from expansion of the current facility would be offset on site at a 1:1 ratio, at minimum. At least 12.3 riparian/wetland habitat consisting of native woody riparian vegetation and freshwater marsh habitat is proposed to be established on-site to replace habitat displaced by construction. Both freshwater marsh and woody riparian vegetation are proposed to be placed within a large patch at the northeast end of the proposed reservoir. Also, much of the woody riparian replacement habitat would be situated within a strip that would extend around the proposed reservoir at the same elevation as the planned water surface elevation when the reservoir is full, as shown in **Figure 3B**. A shallow trough would be constructed around the reservoir perimeter (excluding the dam face), which would support native trees and shrubs (e.g., willows, mule fat, etc.) forming a belt of riparian vegetation around the upper edge of the artificial lake. The trough would be formed with fine clayey material to reduce permeability and help retain water when the reservoir is periodically drained.

In addition to reserving a strip around the edge of the expanded reservoir for woody riparian habitat, an approximately 6- to 8-acre wetland area would also be established within a flat area extending northeast of the expanded reservoir (Figure 3B). Like the perimeter trough for riparian habitat creation, this wetland area would be situated at an elevation just below the maximum water surface elevation of the reservoir. The underlying material in this area would consist of slowly permeable fine soil with very high clay content to retain water for extended periods when the reservoir is drained down. Freshwater marsh vegetation consisting primarily of tules (native cattail and bulrush species) would be planted or seeded in the area subject to periodic inundation. However, based on preliminary coordination with the wildlife agencies, additional woody riparian habitat and less freshwater marsh vegetation may be established in this flat area in order to increase habitat for State and federally endangered least Bell's vireo on-site.

Significant grading would be necessary that would cut into the existing hill northeast of the future lake edge in order to create sufficient space for wetland and riparian habitat restoration in this area. This additional grading would occur in an area that is dominated by ruderal (weedy) vegetation and non-native grassland that provides relatively low wildlife habitat value. Once grading is completed, the graded slope would be seeded, planted and maintained to establish native coastal sage scrub habitat where none currently exists.

Syphon Reservoir Improvement Project

Figure 3B
Riparian and Upland Habitat Areas

1.3.6 Recreational Facilities

During project design, IRWD would consider passive recreational facilities compatible with the proposed project site. Recreational facilities could include a walking trail along existing access roads at the proposed project site. As shown on Figure 3A, this proposed walking trail could be located in the south and west portions of the proposed project site, beginning at the new permanent access road at Portola Parkway and Sand Canyon Avenue and traveling along that route, across the dam crest, and following the alignment of the existing Highline Canal, which would be abandoned with implementation of the proposed project. Final design would determine the appropriateness and location of the proposed walking trail on existing access roads and any other optional recreational facilities. Passive recreational uses on the proposed project site are allowed under the NCCP/HCP, which is referenced in the grant deed with respect to open space and habitat uses. A Recreation and Resources Management Plan (RRMP) would need to be prepared to demonstrate consistency with the NCCP/HCP allowed uses. Coordination with regulatory agencies, including USFWS and California Department of Fish and Wildlife (CDFW), would be required for on-site recreational components.

1.3.7 Additional Geotechnical Investigations

IRWD previously completed a comprehensive geotechnical investigation of the site from which the resulting data would be used during final design to develop the detailed construction documents. During the design phase, additional geotechnical investigations may need to be performed. If additional investigations are deemed necessary, the investigations may include the performance of exploratory test pits, soil borings, packer testing, and/or non-intrusive geologic investigations and observations. The additional geotechnical investigations, if needed, would remain within the proposed limits of disturbance defined by the project and would be mitigated as part of the overall project.

1.4 Project Construction

Construction of the proposed project is estimated to require a total of 41 months. The preconstruction activities would begin in the fall of 2022 and would involve approximately 5 months of access road improvements. Preconstruction would be followed by approximately 36 months for construction of the new dam, reservoir, and associated facilities, depending on weather conditions and other variables. Construction is currently anticipated to begin in the spring of 2023. Most construction activities would be limited to 7:00 a.m. to 7:00 p.m. Monday through Friday and 9:00 am to 6:00 p.m. on Saturday. If construction work is conducted outside of these hours, IRWD would secure a variance/waiver from the appropriate entity. Construction of the proposed project would include activities implemented in phases as outlined below, which may involve overlap.

1.4.1 Preconstruction Activities and Intersection Modification

Before active construction activities are initiated on-site, all water within the reservoir would be drained and vegetation cleared outside of the bird nesting season. In addition, the proposed access road would be constructed starting at the intersection of Portola Parkway and Sand Canyon Avenue. As part of the proposed project, the intersection of Portola Parkway and Sand Canyon Avenue and associated traffic lights would be modified to allow access for construction vehicles and future IRWD operation and maintenance vehicles through the intersection, into the District's property.

A dirt or paved road would be graded from the new intersection at Portola Parkway and Sand Canyon Avenue for ingress and egress for the construction and IRWD operations and maintenance traffic. As part of the access road improvements, it is anticipated that excavation into the existing slope and construction of a retaining wall may be necessary to allow trucks to make the left turn onto the existing Highline Canal road after passing through the intersection. Construction of the new access road would be completed within approximately 5 months and would require approximately 10 construction workers.

1.4.2 Construction Mobilization, Site Preparation and Staging Areas

Construction mobilization would involve initial mobilization of contractors, construction office trailers and equipment to the site, as well as initial site preparation. Stockpile and staging areas, runoff settling basins, as well as temporary construction access roads would be cleared and developed. The preliminary locations of these construction-related features are shown in **Figure 3C** and are subject to change during final project design. Initial construction areas proposed for work also would be cleared. Ingress and egress areas would be delineated, fenced, or marked so that, to the extent possible, the surrounding habitat and riparian areas would not be impacted.

The proposed stockpile/staging areas would hold reusable excavation materials, sediments, and topsoil, as well as material imported from off-site sources such as rock and gravel, and would be located primarily within the proposed reservoir inundation area to avoid disturbance to surrounding conservation lands in the NCCP/HCP. The proposed stockpile/staging areas could also be used for excavating borrow materials once stockpiles are removed. Some stockpile/staging areas could be outside the reservoir expansion area and could hold materials to be used beyond the inundation area. These stockpile/staging locations would primarily be sited in areas that would later be used for upland restoration.

The construction access roads shown in Figure 3A would be arterial roads used for the duration of the proposed project construction period, and have been designed to be located primarily within the limits of disturbance for the reservoir enlargement and the new dam. As the site is developed, and borrow excavation areas are developed, utilized, and exhausted, the location of the roads may change and additional roads would be constructed. In addition, some of the construction access roads may transition to permanent maintenance and access roads.

SOURCE: ESA, 2020; ESRI, 2020.

Syphon Reservoir Improvement Project

Figure 3C
Proposed Onsite Access, Staging, and Stockpiling

The runoff settling basins would be constructed on-site to capture sediment and runoff during construction, including nuisance flow, flows from the storm drain conduit below SR-133, and flows from dewatering operations. The basins also could be used as a water source for dust control and soil moisture conditioning.

A temporary office (trailer) would be established near the toe of the dam (see Figure 3C), which would be used by the contractor for the duration of construction. This location could also provide some level of site security since all vehicles entering and leaving the site would pass this point. Additional mobilization of equipment to distinct areas on-site may occur on an ongoing basis, for each construction phase described below, based on the particular activity occurring on-site.

1.4.3 Excavation of Material/Existing Dam and Dewatering

Approximately 2.3 million cubic yards of material would be excavated from within the proposed project site for use in construction of the proposed project components. These materials include topsoil, lake bottom sediments, alluvium, colluvium, slopewash, formational materials, as well as the existing dam. The majority of materials would be obtained from borrow excavations made within the enlarged reservoir inundation area; these reservoir area excavations also would contribute significantly to the capacity of the expanded reservoir.

During excavation activities, saturated materials and shallow groundwater would be encountered. Groundwater depth at the downstream toe of the existing dam is approximately three feet below ground surface. Groundwater relief trenches for dewatering would be installed in materials and into the alluvium as needed during excavation. The area downstream of the toe of the dam would also be dewatered.

The borrow excavation could be accomplished with large excavators and articulated trucks. This equipment is well suited to the wet and soft nature of materials in the excavated zones and stockpile areas. The processing of all excavated material would be done in the stockpile areas. Processing and drying of saturated materials would be accomplished using various methods, including use of discs and tractors to expose the material to sun and wind, and mixing drier and wetter borrow materials together. Wet materials transported to stockpile areas could be spread with a dozer, such as a low ground pressure bulldozer. The excavation phase of the proposed project would be completed within approximately 7 to 9 months.

1.4.4 Construction of New Dam, Spillway and Reservoir

The proposed new engineered dam would be an earthen fill embankment constructed primarily from on-site materials. The majority of materials for the embankment fill would be obtained from borrow excavations made in the reservoir area, as described above. Approximately 2.2 million cubic yards of compacted material would be reused on-site for construction of the new engineered dam. Approximately 0.1 million (100,000) cubic yards of material would be imported from off-site sources, including the rock, gravel and other materials required for the construction of portions of the dam, including riprap. A portion of the topsoil obtained during borrow excavation could be used on the downstream slope of the new dam to support the proposed vegetation for

downstream slope protection. However, topsoil would not be suitable for embankment fill. Lake bottom sediments would also not likely be suitable for embankment fill.

Once all sediment has been appropriately excavated, stockpiled, and processed, the new proposed embankment dam would be installed. Depending on weather conditions, approximately 12 months of work would be required to construct the embankment above elevation 340 feet amsl, up to the dam crest. Construction of the proposed embankment may be done with scrapers, or a large excavator and articulated trucks. The embankment would be spread with bulldozers and compacted with sheepsfoot and vibratory rollers, depending on the materials. Support equipment would include graders and water wagons.

The proposed new spillway would be constructed and lined with reinforced concrete to prevent erosion. The spillway would be constructed once the construction of the dam embankment is near completion (overlap may occur). Construction of the proposed dam, spillway and expanded reservoir would be completed within approximately 14 months, depending on weather conditions.

1.4.5 Construction of Treatment Facilities

The existing filtration and disinfection facilities would be demolished during construction of the new embankment dam, rebuilt and enlarged in one of the optional locations as part of the proposed project (i.e., either Treatment Facility Option A or Option B). Construction of the proposed new treatment facilities would occur once construction of the new dam embankment is largely complete and would require site preparation and grading, followed by installation of buried and exposed piping, mechanical, electrical/control, and structural facilities. Construction of the proposed new treatment facilities would last approximately 12 months, depending on weather conditions, and would require a crew of up to 16 construction workers. Construction equipment would include a front-end loader, backhoe, bobtail dump truck, transit mix concrete truck, vibratory walk-behind compactor and water truck. If water is encountered during excavation or trenching, it would be dewatered and discharged to the nearby existing Portola Parkway storm drain under a permit from the Regional Water Quality Control Board (RWQCB). Trench width would vary depending upon the size (diameter) of the pipeline but would generally be between 2 to 6 feet. Excavated soils would be placed back within the trench and spread over the site in other disturbed areas.

1.4.6 Construction of Wetland, Riparian, and Upland Areas

A minimum of approximately 12.3 acres of riparian/wetland on-site habitat consisting of at least 6.4 acres of native woody riparian vegetation, or more, with up to 5.9 acres of freshwater marsh habitat, would be established at the eastern end and around the perimeter of the reservoir. These areas would be graded and contoured at the same time excavation and grading occurs as described under Section 1.4.3. A shallow trough would be constructed around the reservoir perimeter and would be formed with fine clayey material to reduce permeability and help retain water when the reservoir is periodically drained. After installation of the trough, irrigation would be installed through a series of pipelines that are around the perimeter of the reservoir, which connect to the reservoir water source. Subsequent planting and seeding of native trees and shrubs would form a belt of riparian vegetation around the upper edge of the reservoir. Additionally, up

to a 10.47-acre of on-site coastal sage scrub area would be planted on the graded slope to the northeast of the riparian and wetland habitat area. Installation of the wetlands/riparian area would require up to 50 vehicle and equipment trips over the course of 12 months. Required equipment would include a skid steer loader, pick-up trucks, ATVs, and a water wagon.

1.4.7 Installation of Recreation Facility

A proposed recreation facility may consist of a walking trail installed for the most part on existing on-site roads and access points as shown on Figure 3A. For example, the existing Highline Canal could be backfilled for installation of the proposed walking trail. Construction of a trail would occur through grading and compacting of native material. No existing vegetation would be impacted by the installation of the trail along existing roads or the Highline Canal. A potential on-site trail extension may be installed east from the existing Highline Canal and would be located on ridges or other relative gradual-sloped terrain. Up to 10 workers would be required to install the on-site trail over the course of 3 months.

1.4.8 Site Restoration/Demobilization

Site restoration/demobilization would involve removal of all equipment, debris and personnel from the site. Site restoration would occur over the course of one month. Required equipment would include an excavator, rubber-tired loaders, a tool carrier, pick-up trucks, and a water truck.

1.4.9 Site Access, Workers, and Equipment Usage

As stated previously, the main access point to the proposed project site would be from the intersection of Sand Canyon Avenue and Portola Parkway. The majority of materials for the embankment fill would be obtained from borrow excavations made in the reservoir area (Figure 3C). Construction of the proposed project would involve the use of a variety of heavy construction machinery on-site. The majority of equipment and vehicles would be associated with the intensive earthwork and the structural and paving phases of construction. Large construction equipment such as backhoes, compactors, cranes, excavators, scrapers, haul trucks, pavers, and rollers would be used during the construction phase of the proposed project.

1.5 Operation and Maintenance

Once operational, all proposed project components would operate and be monitored via IRWD's Supervisory Control and Data Acquisition (SCADA) system. Similar to the current reservoir, operation of the proposed project would not require daily on-site staffing but, rather, would require only periodic maintenance. Water levels at Syphon Reservoir would fluctuate seasonally; water would be stored in winter when recycled water supply exceeds demand, and the reservoir would be drawn down in summer when recycled water demand exceeds supply. The estimated minimum operating capacity of the reservoir would be about 180 AF to maintain water quality. However, IRWD would develop an operating plan for Syphon Reservoir, updated each year to set targets for the volume of water to be contained in the reservoir on a daily, monthly, annual, or seasonal basis. Reservoir operations would vary with time, and would need to consider a wide variety of factors, such as: seasonal storage needs, water quality considerations, impound

requirements based on rainfall projections, and operational compatibility with the IRWD recycled water system.

As mentioned previously, during precipitation events, IRWD would maintain reservoir levels well below the spillway crest to create sufficient space for stormwater runoff to enter the reservoir and avoid the need for outflow through the spillway. The annual operating plan would identify a maximum water surface elevation that would ensure overtopping of reservoir and spillway would not occur due to stormwater inflow, wave action, or overfilling of the reservoir from IRWD's recycled water system. Reservoir operations would be adjusted by IRWD during the year based on changes in projected demands, and other factors as needed. Under normal operating conditions, all flow in or out of the reservoir would be conveyed through the existing 36-inch inlet/outlet pipeline. In the event of an emergency, IRWD can draw down the reservoir through the existing 48-inch pipeline that discharges the recycled water to the existing storm drain, located in Portola Parkway. IRWD Operations and Maintenance staff would continue to conduct daily safety and security checks of the site, similar to existing conditions.

Maintenance of the proposed wetland/riparian areas would be required for up to 5 years after construction is complete to ensure success of the vegetated areas. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to approximately one crew, 30 days per year for the subsequent two to three years. The wetland/riparian areas would be irrigated as needed using the series of pipelines installed around the perimeter of the reservoir that connect to the reservoir water source.

If IRWD includes a recreational walking trail as part of the proposed project, hours of operation may be restricted to daily or seasonal use.

2.0 Methodology

2.1 Literature Review

Relevant literature resources were reviewed prior to conducting field surveys to determine if special-status biological resources occur within the study area or the surrounding vicinity. The California Natural Diversity Database (CNDDDB), a CDFW species account database, was queried for information regarding known observations of special-status species and habitats within the study area and vicinity, which included the following U.S. Geological Survey (USGS) topographic quadrangles: Orange, Black Star Canyon, Corona South, Tustin, El Toro, Santiago Peak, Laguna Beach, San Juan Capistrano, and Canada Gobernadora (CDFW 2020). Species data provided by the USFWS Information for Planning and Consultation (IPaC) and the California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants were also reviewed (USFWS 2020a, CNPS 2020). Other data sources reviewed included USFWS critical habitat maps (USFWS 2020b), National Wetland Inventory maps (USFWS 2020c), the United States Department of Agriculture Natural Resources Conservation Service (NRCS) soils mapping (2018), eBird (2012), current and historical aerial photographs (Google Earth 2018), and regional flora and fauna field guides to assist in the identification of species and suitable habitats.

Additional literature sources included the following references:

- *Syphon Reservoir Expansion Engineering Feasibility Study – Geotechnical Data Report* (GEI 2012)
- *Preliminary Draft Syphon Reservoir Environmental Regulatory Evaluation* (Dudek 2012)

A list of all relevant references reviewed is included in Section 7.0 of this report.

2.2 General Biological Surveys

A general biological survey, habitat assessment, and vegetation mapping to document natural communities and existing conditions of the study area was conducted by ESA biologists Maile Tanaka and Tommy Molioo on April 24 and 25, 2018, and by Maile Tanaka on April 26, 2018. Prior to the field visit, ESA reviewed the *Syphon Reservoir Environmental Regulatory Evaluation Preliminary Draft*, which included a reconnaissance-level vegetation map previously prepared by Dudek in January 2011 (Dudek 2012). This information was reviewed in conjunction with recent aerials available on Google Earth. Natural communities were then verified directly in the field, and from vantage points using binoculars for areas with limited accessibility, based on the presence of dominant plant species observed on-site following CDFW's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW 2018) and *Methods Used to Survey the Vegetation of Orange County Parks and Open Space Areas and The Irvine Company Property* (Jones & Stokes 1993). Natural communities were mapped directly in the field utilizing a 200-scale (1" = 200') aerial photograph.

Natural community classifications and descriptions follow *A Manual of California Vegetation, Second Edition* (Sawyer et al. 2009), and comparable names used in the Orange County Habitat Classification System (OCHCS) for the same communities were included in natural community descriptions (Gray and Bramlet 1992). After completing the fieldwork, the natural community polygons were digitized using Geographic Information System (GIS) technology to calculate acreages.

An inventory of all plant and wildlife species observed was compiled during the field surveys. Plant species observed during surveys were either identified in the field or collected and later identified using taxonomic keys. Plant taxonomy followed Baldwin et al. (2012). Common plant names, when not available from Baldwin, were taken from Calflora (2020). Wildlife species were identified during the field reconnaissance by sight and call or other evidence of presence, such as tracks, nests, scat, and remains, and with use of binoculars and taxonomic keys where appropriate. Vertebrate taxonomy followed Crother (2020), CalHerps (2020), and Stebbins (2003) for amphibians and reptiles, the American Ornithological Society for birds (AOS 2020), and Kaufman et al. (2004) for mammals. Because common names vary significantly between references, scientific names are included upon initial mention of each species; common names consistent throughout the report are employed thereafter.

During the surveys, a habitat evaluation was also conducted to determine the potential for each habitat area to support native species. Special attention was paid to habitats having the potential to support special-status biological resources (e.g., special-status plant and wildlife species and sensitive natural communities). Aerial photography and global positioning system (GPS)

technology was used to accurately locate and map any sensitive biological resources encountered. However, no focused protocol surveys were conducted during the general biological surveys.

In addition, the evaluation of potential wildlife habitat linkages (i.e., wildlife movement corridors) within or through the study area and immediate vicinity was based on the conditions documented during the field surveys, as well as information compiled from literature and analysis of physical barriers observed on aerial photographs. This information was used to identify whether the study area and immediate vicinity could function as an important wildlife movement corridor connecting large open space areas in the vicinity of the study area.

2.3 Jurisdictional Delineation

ESA conducted a jurisdictional delineation to identify features within the study area that may or may not be subject to U.S. Army Corps of Engineers (USACE), RWQCB, and CDFW jurisdiction and regulatory authority.

Prior to the field survey, ESA reviewed available background information pertaining to Syphon Reservoir and its geography and topography. The following resources were also reviewed prior to the field surveys:

- Color aerial photography for vegetative, topographic, and hydrologic features (Google Earth 2018);
- *El Toro, California 7.5-minute topographic quadrangle map* (USGS 1968);
- *Web Soil Survey*, queried to determine the soils mapped in the study area (NRCS 2018);
- *Hydric Soils List of California* (NRCS 2016);
- *National Wetlands Inventory* (USFWS 2018);
- *Preliminary Draft Syphon Reservoir Environmental Regulatory Evaluation* (Dudek 2012); and
- *Habitat Classification System, Natural Resources, Geographic Information System (GIS) Project* (Gray and Bramlet 1992).

Site maps were generated with available aerial photographs, and potentially jurisdictional features were identified and marked with lines and GPS coordinates to assist in field verification.

ESA biologists May Lau and Tommy Molioo conducted a site visit on April 24, 2018, to evaluate potential jurisdictional features within the study area. The limits of potential jurisdictional features were recorded in the field within accessible areas using aerial maps and a hand-held GPS with sub-foot accuracy. Vegetation communities were described using *A Manual of California Vegetation, Second Edition* (Sawyer et al. 2009). The delineation used the “Routine Determination Method” as described in the *1987 Corps of Engineers Wetland Delineation Manual*, hereafter called the “1987 Manual” (Environmental Laboratory 1987). The 1987 Manual was used in conjunction with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)*, hereafter called the “Arid West Supplement” (USACE 2008a). For areas where the 1987 Manual and the Arid West Supplement differ, the Arid West Supplement was followed. Wetlands and waters were classified using

commonly accepted habitat types; however, the Cowardin classification of each feature type was noted (Cowardin et al. 1979).

All features, including data points, wetland boundaries, and channels were recorded using a GPS unit (Trimble GeoXT) with real-time differential correction and an instrument-rated mapping accuracy of +/- 1 meter, or were delineated on aerial photography using GIS software (ArcGIS 10.2) and site-specific topographic data and aerial imagery.

In the office, data from data points and wetland boundaries were downloaded from the GPS unit and mapped using GIS software on an overlay of topographic contours and geo-referenced aerial photography. GPS-determined wetland boundaries and data points were visually confirmed. Acreage of wetland and waters of the U.S. polygons, and the length of linear features were determined using ArcGIS. Detailed field methods and data sheets are included in the Preliminary Jurisdictional Delineation Report provided in **Appendix A**.

2.4 Special-Status Species Surveys

2.4.1 Special-Status Plant Surveys

ESA biologists Maile Tanaka, Julie Stout, Alanna Sullivan, and Dale Hameister conducted focused special-status plant surveys on May 8, 11, and August 10, 2018. Due to the heavy rainy season from 2018-2019, focused special-status plant surveys were updated by ESA biologists Maile Tanaka and Doug Gordon-Blackwood on April 30, 2019 and by Daryl Koutnik and Maile Tanaka on May 24, 2019. Surveys were conducted using wandering transects, with special attention paid to areas of suitable habitat. Any observed plant species were recorded in the field, and the locations of any special-status plants observed were collected using a GPS unit.

2.4.2 Special-Status Wildlife Surveys

ESA conducted focused surveys for western spadefoot (*Spea hammondi*), least Bell's vireo (*Vireo bellii pusillus*), and southwestern willow flycatcher (*Empidonax traillii extimus*).

Western spadefoot is an upland species of toad that requires water for breeding purposes only. Although there is no formal survey protocol issued by CDFW, generally accepted survey methods were used by qualified biologists with experience surveying for this species. Surveys included two diurnal (day time) surveys of the water margins around the wetted surface of the reservoir to search for egg clusters, and two nocturnal (night time) surveys immediately after rain events to search for individuals detectable by calls or eye-shine and visual identification. On January 18, 2019, ESA biologists Lily Sam and Robert Sweet conducted a diurnal and nocturnal survey for western spadefoot after substantial rainfall occurred with nearly 1" of precipitation recorded in the area over the preceding 3 days. A second diurnal and nocturnal survey was conducted on March 7, 2019 by ESA biologists Lily Sam and Douglas Gordon-Blackwood, after another rain event with at least 0.4" of rain on March 6, 2019.

Surveys for least Bell's vireo were conducted by ESA biologists Maile Tanaka, Jaclyn Catino-Davenport, and/or Karl Fairchild on April 10, 22; May 3, 15; June 5, 17, 27; and on July 8, 2019 in conformance with USFWS *Least Bell's Vireo Survey Guidelines* (USFWS 2001). Surveys for southwestern willow flycatcher were also conducted by ESA biologist Karl Fairchild on May 29;

June 5, 17, 27; and July 8, 2019 in conformance with USFWS *A Natural History Summary and Survey Protocol for the Southwestern Willow Flycatcher* (Sogge et al. 2010).

Prior to the geotechnical investigations that commenced in September 2019 on the site, ESA also conducted pre-activity surveys for coastal California gnatcatcher (*Polioptila californica*) and coastal cactus wren (*Campylorhynchus brunneicapillus*) on August 29-30, 2019.

In addition, an inventory of all plant and wildlife species observed was compiled during all field surveys, including special-status wildlife species that were observed on-site. Biological resources data collected from recent surveys conducted by ESA in 2018 and 2019, as well as previous documentation of biological resources within the study area (Dudek 2012) are utilized in this analysis. In addition, focused protocol presence/absence surveys for coastal California gnatcatcher (*Polioptila californica*) were conducted by Dudek in 2011.

3.0 Environmental Setting

3.1 Regional Setting

The study area is located within central Orange County, California. The study area is within the Central Subregion of the County of Orange NCCP/HCP. Although the study area is located within the NCCP/HCP Reserve (**Figure 4**), the existing reservoir is not actually within the NCCP/HCP Reserve; rather, it is surrounded by it. Significant regional geographic features around the area include the Santa Ana Mountains to the northeast, the Tustin plain and the City of Irvine to the north and southwest. The study area is within the Newport Bay watershed. The climate in the region is Mediterranean, with dry summers and moderately wet winters; however, the region has experienced severe drought conditions in recent years.

The study area was previously part of the Irvine Ranch and was subject to disturbance in the 1940s for planting of orchards and construction of the reservoir to provide irrigation for agricultural uses. In the 1970s, agriculture was expanded within the eastern and northern portions of the study area, mainly for citrus orchards. Following construction of the dam, impounded water accumulated from direct runoff from the Highline Canal. Currently within the study area, a portion of the Highline Canal conveys recycled water flows from IRWD's Rattlesnake Reservoir into Syphon Reservoir. The Highline Canal located southwest of the Syphon Reservoir was historically used for irrigation but has been abandoned. Additionally, a culvert inlet in the northeast portion of the study area conveys stormwater runoff from a portion of the open space area east of the reservoir (under SR-133 and SR-241), and multiple culverts within the study area drain the upland portions of the reservoir. The central drainage supports riparian habitat and conveys intermittent flow through the center of the study area to the reservoir. With the exception of limited seasonal inflows from rain events, IRWD controls all flows in and out of the reservoir, as part of their recycled water storage and management. The reservoir currently drains through a series of underground pipes that convey flows through a strainer and chlorination facility, before being distributed to customers through IRWD's recycled water system.

SOURCE: ESRI, 2016

Syphon Reservoir Improvement Project

Figure 4
Study Area Location within NCCP/HCP

Between 1995 and 2000, approximately 102 acres of the study area were preserved and 112 acres were restored to native coastal sage scrub habitat as mitigation for the TCA Eastern Transportation Corridor Project's impacts to coastal California gnatcatcher. Restoration activities involved removal of orchard trees, native coastal sage scrub planting, temporary irrigation, and monitoring. The revegetation was successfully completed in accordance with regulatory requirements and supported mature coastal sage scrub suitable for California gnatcatcher (Dudek 2012). When IRWD acquired Syphon Reservoir from TIC, the Conveyance Agreement included a Grant Deed with use restrictions to protect biological resources within the area that was used for mitigation for the TCA (as shown in Figure 4).

Since completion of the restoration program in 2000, on-site management of biological resources was limited to annual cowbird trapping (which is required in perpetuity) and few additional studies, including a cactus transplantation and subsequent cactus wren monitoring in the northwest portion of the property. In October 2007, the entire study area burned in the Santiago Fire and was in post-fire succession (Dudek 2012). The study area supports native vegetation communities, restored coastal sage scrub, and some disturbed communities.

It should be noted that the majority of the proposed project site was burned again in the October 2020 Silverado Fire, and much of the vegetation on-site was destroyed by the fire. However, since native natural communities such as coastal sage scrub are adapted to fire, it is anticipated most of the vegetation should regrow to pre-fire conditions or similar, though it is possible the habitat quality may be degraded by opportunistic non-native invasive plant species. To provide a conservative assessment, this analysis presents the biological conditions at the time the Notice of Preparation (NOP) was published and analyzes proposed project impacts against those conditions.

3.2 Topography

The study area is characterized by steep topography of rolling hills, ridgelines and terraced slopes (from previous agricultural activities) surrounding the reservoir in the center of the study area. Within the study area, elevations range from 326 to 654 feet (99 to 200 meters) above mean sea level.

3.3 Soils

Based on review of the NRCS *Web Soil Survey* (2018), the study area contains 16 soil series (Figure 5). The following is a brief description of mapped soils within the study area.

3.3.1 Alo Clay

Alo clay, 15 to 30 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay in the first 22 inches, and weathered bedrock from 22 to 59 inches. Alo clay loam is not considered hydric by the NRCS.

3.3.2 Anaheim Clay Loam

Anaheim clay loam, 15 to 30 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay loam in the first 26 inches, and weathered bedrock from 26 to 59 inches. Anaheim clay loam is not considered hydric by the NRCS.

SOURCE: ESRI, 2016; USDA, 2018

Syphon Reservoir Improvement Project

Figure 5
Soils

Anaheim clay loam, 30 to 50 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay loam in the first 26 inches, and bedrock from 26 to 59 inches. Anaheim clay loam is not considered hydric by the NRCS.

3.3.3 Bosanko Clay

Bosanko clay, 15 to 30 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is slightly alkaline to moderately acidic. The profile consists of clay in the first 31 inches, and weathered bedrock from 31 to 59 inches. Bosanko clay is not considered hydric by the NRCS.

3.3.4 Botella Clay Loam

Botella clay loam, 2 to 9 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is slightly alkaline to moderately acidic. The profile consists of clay loam in the first 8 inches, silty clay loam between 8 and 35 inches, and clay loam from 35 to 66 inches. Botella clay loam is not considered hydric by the NRCS.

Botella clay loam, 9 to 15 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay loam in the first 8 inches, silty clay loam between 8 and 35 inches, and sandy clay loam from 35 to 66 inches. Botella clay loam is not considered hydric by the NRCS.

3.3.5 Calleguas Clay Loam

Calleguas clay loam, 50 to 75 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of clay loam in the first 11 inches, very channery clay loam between 11 and 15 inches, and bedrock from 15 to 42 inches. Calleguas clay loam is not considered hydric by the NRCS.

3.3.6 Capistrano Sandy Loam

Capistrano sandy loam, 9 to 15 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is neutral to medium acidic. The profile consists of sandy loam in the first 27 inches and fine sandy loam between 27 and 65 inches. Capistrano sandy loam is not considered hydric by the NRCS.

3.3.7 Cieneba Sandy Loam

Cieneba sandy loam, 15 to 30 percent slopes, is a somewhat excessively-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of sandy loam in the first 17 inches, and weathered bedrock from 17 to 59 inches. Cieneba sandy loam is not considered hydric by the NRCS.

Cieneba sandy loam, 30 to 75 percent slopes, is a somewhat excessively drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is neutral to strongly acidic. The profile consists of sandy loam in the first 17 inches and weathered bedrock between 17 and 59 inches. Cieneba sandy loam is not considered hydric by the NRCS.

3.3.8 Metz Loamy Sand

Metz loamy sand is a somewhat excessively-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of loamy sand in the first 17 inches, and stratified sand to fine sandy loam from 17 to 63 inches. Metz loamy sand is not considered hydric by the NRCS.

3.3.9 Mocho Loam

Mocho loam, 2 to 9 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of loam in the first 60 inches. Mocho loam is not considered hydric by the NRCS.

3.3.10 Pits

Pits consist of concave igneous, metamorphic, and sedimentary rock. The profile consists of extremely gravelly coarse sand in the first 6 inches, and extremely gravelly sand, extremely gravelly coarse sand, or very gravelly coarse sand from 6 to 60 inches. Pits are not considered hydric by the NRCS.

3.3.11 San Emigdio Fine Sandy Loam

San Emigdio fine sandy loam, 2 to 9 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of fine sandy loam in the first 7 inches, and stratified gravelly loamy coarse sand to fine sandy loam from 7 to 61 inches. San Emigdio fine sandy loam is not considered hydric by the NRCS.

3.3.12 Soper Gravelly Loam

Soper gravelly loam, 30 to 50 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is mildly alkaline to slightly acidic. The profile consists of gravelly loam in the first 8 inches, gravelly clay loam between 8 and 29 inches, and bedrock from 29 to 79 inches. Soper gravelly loam is not considered hydric by the NRCS.

3.3.13 Sorrento Loam

Sorrento loam, 0 to 2 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The profile consists of loam in the first 12 inches, silty clay loam between 12 and 62 inches, and sandy loam from 62 to 72 inches. Sorrento loam is not considered hydric by the NRCS.

3.4 Natural Communities

The upland parts of the study area primarily exhibit forms of coastal sage scrub and non-native herbaceous communities with variable levels of native versus non-native plant species cover. The most prevalent forms include the California sagebrush alliance and non-native herbaceous cover/California sagebrush alliance (i.e., communities intermixed with both native and non-native species) in the upland areas. Woody riparian vegetation (e.g., arroyo willow and mule fat) and patches of tules (i.e., a form of freshwater marsh habitat dominated by cat tails and bulrushes) occur around the fringe of the existing reservoir in areas that are frequently inundated.

Natural communities are mapped in **Figure 6**. The natural communities are described below according to the *Methods Used to Survey the Vegetation of Orange County Parks and Open Space Areas and The Irvine Company Property* (Jones & Stokes Associates 1993), *Orange County Habitat Classification System* (Gray and Bramlet 1992) and California natural alliances described in *A Manual of California Vegetation, Second Edition* (Sawyer et al. 2009). Acreages of each natural community in the study area are summarized in **Table 1**. Alternate names for communities are indicated in parentheses. Natural communities considered that are identified as sensitive on the California Natural Community List (CDFW 2019b) are also noted as such.

**TABLE 1
NATURAL COMMUNITIES**

Natural Community	Acres	State Rank¹
Riparian Communities		
Arroyo Willow Thicket*	0.24	S4
Black Willow Thicket*	4.13	S3
Mule Fat Scrub	2.25	S4
Freshwater Marsh	5.87	S4
Native Upland Communities		
Coyote Brush Scrub**	0.91	S5
Chaparral Bushmallow Scrub**	0.45	S4
Chaparral Bushmallow Scrub/Coyote Brush Scrub**	0.49	S4/S5
Chaparral Bushmallow Scrub/Non-Native Herbaceous Cover**	4.72	S4/None
Sumac Chaparral	1.63	S4
California Sagebrush Scrub**	91.74	S5
California Sagebrush Scrub**/Non-Native Herbaceous Cover	7.86	S5/None
Coast Prickly Pear Scrub*	0.69	S3
Non-Native Upland Communities		
Eucalyptus Woodland	2.78	None
Non-Native Grassland	5.27	None
Non-Native Herbaceous Cover	44.16	None
Non-Native Herbaceous Cover/California Sagebrush Scrub**	71.70	None/S5
Unvegetated Areas		
Open Water	13.93	None
Disturbed	6.92	None
Total	265.74	

* Asterisk indicates that an alliance/association is considered sensitive by CDFW.

** Double asterisk indicates that an alliance/association that is a covered habitat type under the NCCP/HCP and is therefore considered a sensitive natural community.

¹ CDFW state rank denotes the rarity of a natural type within the state as follows:

S1 = Critically Imperiled – At very high risk of extirpation due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.

S2 = Imperiled – At high risk of extirpation due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.

S3 = Vulnerable – At moderate risk of extirpation due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.

S4 = Apparently Secure – At a fairly low risk of extirpation due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.

S5 = Secure - At very low or no risk of extirpation due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats.

Syphon Reservoir Improvement Project

Figure 6
Natural Communities

3.4.1 Arroyo Willow Thicket

Arroyo willow thicket (i.e., *Salix lasiolepis* Shrubland Alliance or Arroyo Willow Riparian Forest [OCHCS 7.6]) is characterized by a canopy cover dominated by mature arroyo willow (*Salix lasiolepis*) with an understory of smaller willows, and variable herbaceous layer. This alliance is typically found within stream banks and benches, slope seeps, and stringers along drainages (Sawyer et al. 2009). A total of 0.24 acre of arroyo willow thicket occurs primarily within the northern and northeastern portions of the study area.

Arroyo willow thicket is considered a sensitive natural community by CDFW (61.201.01 – *Salix lasiolepis*) (CDFW 2019b).

3.4.2 Black Willow Thicket

Black willow thicket (i.e., *Salix gooddingii* Woodland Alliance or Black Willow Riparian Forest [OCHCS 7.7]) is characterized by a canopy cover dominated by mature black willow (*Salix gooddingii*) with an understory of smaller willows, mule fat (*Baccharis salicifolia*), and variable herbaceous layer. This alliance is typically found on terraces along large rivers, canyons, and along rocky floodplains of small, intermittent streams, seeps, and springs (Sawyer et al. 2009). Species associated with this alliance include native arroyo willow and non-native tamarisk (*Tamarix ramosissima*) and red gum (*Eucalyptus camaldulensis*). A total of 4.13 acres of black willow thicket was mapped around the northern and northeastern perimeter of the reservoir within the center of the study area.

Black willow thicket is considered a sensitive natural community by CDFW (61.211.01 – *Salix gooddingii*) (CDFW 2019b).

3.4.3 Mule Fat Scrub

Mule fat scrub (i.e., mulefat thickets [*Baccharis salicifolia* Shrubland Alliance]; OCHCS 7.3) is characterized by large shrub cover dominated by mule fat and variable herbaceous layer. This alliance is typically found within canyon bottoms, floodplains, lake margins, and stream channels with soils of mixed alluvium (Sawyer et al. 2009). Species associated with this alliance include native black willow, California sagebrush (*Artemisia californica*), laurel sumac (*Malosma laurina*), cocklebur (*Xanthium strumarium*), and non-native Spanish false fleabane (*Pulicaria paludosa*), and black mustard (*Brassica nigra*). A total of 2.25 acres of black willow thicket were mapped around the northern and northeastern perimeter of the reservoir within the center of the study area.

Mule fat scrub is not considered a sensitive natural community by CDFW (63.510.01 – *Baccharis salicifolia*) (CDFW 2019b).

3.4.4 Freshwater Marsh

Freshwater marsh (i.e., California Bulrush Marsh [*Schoenoplectus californicus* Herbaceous Alliance]; OCHCS 6.4) is characterized by a dominance of dense stands of California bulrush (*Schoenoplectus californicus*) in the herbaceous layer. This alliance is typically found within freshwater or brackish marshes, shores, bars, and channels of river mouth estuaries, within areas

with soils that have a high organic contents and are poorly aerated (Sawyer et al. 2009). Dried cattails (*Typha* sp.) were also observed within this alliance. A total of 5.87 acres of freshwater marsh occur around the northern and northeastern perimeter of the reservoir in the center of the study area.

Freshwater marsh is not considered a sensitive natural community by CDFW (52.114.02 – *Schoenoplectus californicus*) (CDFW 2019b).

3.4.5 Coyote Brush Scrub

Coyote brush scrub (i.e., *Baccharis pilularis* Shrubland Alliance; Coyote Brush [OCHCS 2.3.9]) is characterized by a dominance of coyote brush (*Baccharis pilularis*) in the shrub layer. This alliance is typically found within river mouths, stream sides, terraces, open slopes, and ridges, within variable soils (Sawyer et al. 2009). A total of 0.91 acre of coyote brush scrub was mapped around the northern and northeastern portions of the study area.

Coyote brush scrub is not considered a sensitive natural community by CDFW (32.060.23 – *Baccharis pilularis*) (CDFW 2019b).

3.4.6 Chaparral Bushmallow Scrub

Chaparral bushmallow scrub (i.e., bush mallow scrub [*Malacothamnus fasciculatus* Shrubland Alliance]; Bush Mallow [OCHCS 2.3.11]) is dominated by chaparral bushmallow (*Malacothamnus fasciculatus*) in the shrub layer. This alliance is typically found within gentle to very steep slopes of variable aspect within loam or clay soils (Sawyer et al. 2009). Species associated with this alliance include native laurel sumac, California brittlebush (*Encelia californica*), California matchweed (*Gutierrezia californica*), giant wild rye (*Elymus condensatus*), and non-native short-podded mustard (*Hirschfeldia incana*). A total of 0.45 acre of chaparral bushmallow scrub was mapped around the northeastern and western portions of the study area.

Chaparral bushmallow scrub is not considered a sensitive natural community by CDFW (45.450.01 – *Malacothamnus fasciculatus*) (CDFW 2019b).

3.4.7 Chaparral Bushmallow Scrub/Coyote Brush Scrub

Chaparral bushmallow scrub/coyote brush scrub (OCHCS 2.3.11/2.3.9) is characterized by a shrub layer with a dominance of chaparral bushmallow and a sub-dominance of coyote brush. A total of 0.49 acre of chaparral bushmallow scrub/coyote brush scrub was mapped in the southern portion of the study area.

Chaparral bushmallow scrub/coyote brush scrub is not considered a sensitive natural community by CDFW (45.450.01 – *Malacothamnus fasciculatus*/32.060.23 – *Baccharis pilularis*) (CDFW 2019b).

3.4.8 Chaparral Bushmallow Scrub/Non-Native Herbaceous Cover

Chaparral bushmallow scrub/non-native herbaceous cover (OCHCS 2.3.11; *Brassica (nigra)* and Other Mustards [Semi-Natural Herbaceous Stand]; Ruderal [OCHCS 4.6]) is characterized by a shrub layer with a dominance of chaparral bushmallow and a sub-dominance of non-native

herbaceous cover. A total of 4.72 acres of chaparral bushmallow scrub/non-native herbaceous cover were mapped in the western portion of the study area.

Chaparral bushmallow scrub/non-native herbaceous cover is not considered a sensitive natural community by CDFW (45.450.01 – *Malacothamnus fasciculatus*) (CDFW 2019b).

3.4.9 Sumac Chaparral

Sumac chaparral (i.e., *Malosma laurina* Shrubland Alliance; Toyon-Sumac [OCHCS 3.12]) is characterized by large shrub cover dominated by laurel sumac with a variable understory of coastal sage scrub species and/or herbaceous grassy layer. This alliance is typically found on slopes, which are often steep, within soils that are shallow and fine-textured (Sawyer et al. 2009). Species associated with this alliance include native California sagebrush. A total of 1.63 acres of sumac chaparral were mapped throughout the eastern portion of the study area.

Sumac chaparral is not considered a sensitive natural community by CDFW (45.455.01 – *Malosma laurina*) (CDFW 2019b).

3.4.10 California Sagebrush Scrub

California sagebrush scrub (i.e., *Artemisia californica* Shrubland Alliance; Sagebrush [OCHCS 2.3.6]) is characterized by a dominance of by California sagebrush intermixed with coastal sage scrub species and a variable herbaceous layer. This alliance is typically found on slopes that are usually steep and rarely flooded within soils that are alluvial or colluvial derived shallow (Sawyer et al. 2009). Species associated with this alliance include native California buckwheat (*Eriogonum fasciculatum*), laurel sumac, California brittle bush, California matchweed, deerweed (*Acmispon glaber*), lemonadeberry (*Rhus integrifolia*), chaparral bushmallow, coast live oak (*Quercus agrifolia*), toyon (*Heteromeles arbutifolia*), Island false bindweed (*Calystegia macrostegia*), foothill needlegrass (*Stipa lepida*), black sage (*Salvia mellifera*), white sage (*Salvia apiana*), soap plant (*Chlorogalum pomeridianum*), prickly pear (*Opuntia littoralis*), common goldenstar (*Bloomeria crocea*), false rosinweed (*Osmadenia tenella*), California plantain (*Plantago erecta*), and Ladies' tobacco (*Pseudognaphalium californicum*), and non-native black mustard, foxtail chess (*Bromus madritensis*), Mexican fan palm (*Washingtonia robusta*), giant yucca (*Yucca gigantea*), oleander (*Nerium oleander*), Chinese elm (*Ulmus parvifolia*), and fountaingrass (*Pennisetum setaceum*). A total of 91.74 acres of California sagebrush scrub occurs throughout the study area.

California sagebrush scrub is not considered a sensitive natural community by CDFW (32.010.01 – *Artemisia californica*) (CDFW 2019b). However, this alliance is recognized as a covered habitat type within the Central & Coastal NCCP/HCP, and is therefore considered a sensitive natural community.

3.4.11 California Sagebrush Scrub/Non-Native Herbaceous Cover

California sagebrush scrub/non-native herbaceous cover (i.e., *Artemisia californica* Shrubland Alliance; Sagebrush [OCHCS 2.3.6]; *Brassica (nigra)* and Other Mustards [Semi-Natural Herbaceous Stand]; Ruderal [OCHCS 4.6]) is characterized by a dominance of California

sagebrush intermixed with a sub-dominance of non-native herbaceous cover primarily comprised of black mustard. Species associated with this alliance include native California buckwheat, chaparral bushmallow, fasciated tarweed (*Deinandra fasciculata*), black sage, prickly pear, splendid mariposa lily (*Calochortus splendens*), wishbone bush (*Mirabilis laevis*), golden yarrow (*Eriophyllum confertiflorum*), and non-native tocalote (*Centaurea melitensis*), slender oat (*Avena barbata*), Australian saltbush (*Atriplex semibaccata*). A total of 7.86 acres of California sagebrush scrub/non-native herbaceous cover occurs throughout the study area.

California sagebrush scrub/non-native herbaceous cover is not considered a sensitive natural community by CDFW (32.010.01 – *Artemisia californica*) (CDFW 2019b). However, this alliance is recognized as a covered habitat type within the Central & Coastal NCCP/HCP, and is therefore considered a sensitive natural community.

3.4.12 Coast Prickly Pear Scrub

Coast prickly pear scrub (i.e., *Opuntia littoralis* Shrubland Alliance; Southern Cactus [OCHCS 2.4]) is characterized by a dominance of by prickly pear intermixed with coastal sage scrub species. This alliance is typically found on south-facing slopes within soils that are shallow loams and clays that may be rocky (Sawyer et al. 2009). Species associated with this alliance include native laurel sumac, lemonadeberry, California sagebrush, California buckwheat, deerweed, blue elderberry (*Sambucus nigra* ssp. *caerulea*), and non-native fountaingrass and tree tobacco (*Nicotiana glauca*). A total of 0.69 acre of coast prickly pear scrub occurs within the western portion of the study area.

Coast prickly pear scrub is considered a sensitive natural community by CDFW (32.150.02 – *Opuntia littoralis* – mixed coastal sage scrub) (CDFW 2019b).

3.4.13 Eucalyptus Woodland

Eucalyptus woodland (i.e., eucalyptus groves [*Eucalyptus* Semi-Natural Woodland Stands]; Ornamental Landscaping [OCHCS 15.5]) is dominated of by planted rows of gum trees. Associated species include native coyote brush and laurel sumac. A total of 2.78 acres of eucalyptus woodland occurs within the central and northeastern portion of the study area.

Eucalyptus woodland is not considered a sensitive natural community by CDFW (CDFW 2019b).

3.4.14 Non-Native Grassland

Non-native grassland (i.e., *Bromus madritensis* [Semi-Natural Herbaceous Stands]; Annual [OCHCS 4.1]) is dominated of by foxtail chess with a mix of non-native and native grasses and forbs. Species associated with this alliance include native telegraph weed (*Heterotheca grandiflora*), Island false bindweed, California buckwheat, deerweed, Menzies' goldenbush (*Isocoma menziesii* var. *menziesii*), blue elderberry, prickly pear, fiddleneck (*Amsinckia* sp.), and non-native red-stemmed filaree (*Erodium cicutarium*), Russian thistle (*Salsola tragus*), castor bean (*Ricinus communis*), and fountaingrass. A total of 5.27 acres of non-native grassland occurs within the southern portion of the study area.

Non-native grassland is not considered a sensitive natural community by CDFW (CDFW 2019b).

3.4.15 Non-Native Herbaceous Cover

Non-native herbaceous cover (i.e., *Brassica (nigra)* and other mustard species [Semi-Natural Herbaceous Stand]; Ruderal [OCHCS 4.6]) is characterized by a dominance of by black mustard. This alliance is typically associated with fallow fields, grasslands, roadsides, disturbed scrublands, riparian areas, and waste places (Sawyer et al. 2009). Species associated with this alliance include native telegraph weed, laurel sumac, fascicled tarweed, Our Lord's candle (*Hesperoyucca whipplei*), foothill needlegrass, mule fat, western prickly pear (*Opuntia occidentalis*), and non-native foxtail chess, Peruvian pepper (*Schinus molle*), ripgut brome (*Bromus diandrus*), horehound (*Marrubium vulgare*), and tuna cactus (*Opuntia ficus-indica*). A total of 44.16 acres of non-native herbaceous cover coast occurs throughout the study area.

Non-native herbaceous cover is not considered a sensitive natural community by CDFW (CDFW 2019b).

3.4.16 Non-Native Herbaceous Cover/California Sagebrush Scrub

Non-native herbaceous cover/California sagebrush scrub (i.e., *Brassica (nigra)* and Other Mustards [Semi-Natural Herbaceous Stand]; Ruderal [OCHCS 4.6]; *Artemisia californica* Shrubland Alliance; Sagebrush [OCHCS 2.3.6]) is dominated by black mustard with a sub-dominance of intermixed coastal sage scrub species. A total of 71.70 acres of non-native herbaceous cover/California sagebrush scrub coast occurs throughout the study area.

Non-native herbaceous cover/California sagebrush scrub is not considered a sensitive natural community by CDFW (CDFW 2019b). Although California sagebrush scrub is recognized as a covered habitat type within the Central & Coastal NCCP/HCP and is considered to have value to covered species in that context, this non-native herbaceous cover/California sagebrush scrub community is predominantly disturbed and dominated by non-native herbaceous cover; thus, it is not considered a sensitive natural community.

3.4.17 Open Water

Open water (OCHCS 12.2) consists of the reservoir, and natural vegetation present within this area is negligible. A total of 13.93 acres of open water occurs within the study area.

Open water is not considered a sensitive natural community by CDFW (CDFW 2019b).

3.4.18 Disturbed

Disturbed (i.e., Disturbed or Barren [OCHCS 16.1]) includes lands that have been significantly disturbed as the result of human activity, and natural vegetation is very sparse or absent from these areas. Associated species found occasionally may include non-native foxtail chess, short-podded mustard, yellow sweetclover (*Melilotus officinalis*), Mexican sprangletop (*Leptochloa fusca* ssp. *uninervia*), fountaingrass, tree tobacco, red-stemmed filaree, and Mediterranean grass (*Schismus barbatus*). Disturbed areas within the study area include unpaved dirt trails that provide access around the perimeter of the reservoir and also include the earthen dam which is

actively maintained to limit any vegetation from becoming established. A total of 6.92 acres of disturbed areas occur within the study area.

Disturbed areas are not considered a sensitive natural community by CDFW (CDFW 2019b).

3.5 Jurisdictional Resources

The USACE issued an Approved Jurisdictional Determination letter (**Appendix B**), which confirmed the determination that waters of the U.S. do not occur within the study area since Syphon Reservoir is an intrastate isolated water with no apparent interstate or foreign commerce connection (USACE 2018). Thus, the study area only includes features potentially subject to the jurisdiction of the State (i.e., RWQCB wetlands and non-wetland waters of the State, and CDFW lakes, streams, and associated vegetation). **Table 2** and **Figures 7A and 7B** identify and quantify the areas regulated by the RWQCB and CDFW within the study area.

TABLE 2
POTENTIALLY JURISDICTIONAL AREAS

Jurisdiction Types	Acres
RWQCB Wetlands	4.33
RWQCB Non-Wetland Waters of the State	13.95
CDFW Lakes, Streams, and Associated Vegetation	26.55

SOURCE: ESA, 2018

3.5.1 RWQCB Wetlands and Waters of the State

3.5.1.1 Wetlands

The freshwater wetlands within the study area are largely dominated by native plant species including California bulrush (OBL¹), black willow (FACW²), and yellow sweetclover (*Melilotus officinalis*, FACU³). This habitat also supports a range of non-native plant species including seaside heliotrope (*Heliotropium curassavicum*, FACU), spiny cocklebur (*Xanthium strumarium*, FAC), short-podded mustard (UPL⁴), and telegraph weed (UPL). The wetlands occur along the margins of Syphon Reservoir (Figure 7A). Although not mapped as hydric soils according to NRCS, hydric soil indicators were observed in the wetlands include the presence of muck, hydrogen sulfide, depleted below dark surface, redox dark surface, and sandy gleyed matrix. The wetland areas generally had very silty loam, clay soils, while sandy soils were encountered at one soil pit. Indicators of wetland hydrology include a high water table, saturation, biotic crust, and hydrogen sulfide odor.

¹ OBL – obligate. Plant species with this wetland indicator status occur almost always under natural conditions in wetlands.

² FACW – facultative wetland. Plant species with this wetland indicator status usually occur in wetlands but are occasionally found in non-wetlands.

³ FACU – facultative upland. Plant species with this wetland indicator status usually occur in non-wetlands but are occasionally found in wetlands.

⁴ UPL – upland. Plant species with this wetland indicator status occur in wetlands in another region, but occur almost always under natural conditions in non-wetlands in the Arid West Region.

3.5.1.2 Waters of the State

The OHWM of the reservoir was determined to be along the edge of the reservoir where surface water was observed at the time of the delineation, or based on physical characteristics of water fluctuation, such as downed emergent vegetation (**Figure 7A**). The water surface elevation of the reservoir is influenced by IRWD's management of the recycled water system. The reservoir functions as a seasonal recycled water storage facility; as such, the reservoir includes areas where open water persists throughout the year at a minimum water surface elevation but fluctuates seasonally up to a maximum water surface elevation based on demands for recycled water. The reservoir captures runoff from adjacent areas, including a primary drainage in the central portion of the study area that supports intermittent flows and riparian vegetation north of the reservoir and wetlands. However, there was no OHWM observed in this central drainage and the primary drainage was not mapped as potential waters of the State.

In addition, two ephemeral drainages (Ephemeral Drainage 1 and Ephemeral Drainage 2) were mapped north of the reservoir. These drainages convey stormwater runoff from upland areas to the central drainage via a culvert under the existing dirt road that runs along the west and north sides of the reservoir. The OHWM was an average of two feet wide, based on evidence of shelving. Ephemeral Drainage 1 supports a mix of non-native herbaceous cover and California sagebrush scrub, while Ephemeral Drainage 2 supports a mix of non-native herbaceous cover, California sagebrush scrub, and laurel sumac scrub. No surface water was observed in either drainage.

3.5.2 CDFW Lakes, Streams, and Associated Vegetation

Areas within CDFW jurisdiction typically refer to streambeds and associated wetland or riparian vegetation. Within the study area, the potential extent of CDFW limits was taken to the outer edge of the overhanging riparian or wetland vegetation adjacent to the reservoir, and to the top of bank for the ephemeral drainages (**Figure 7B**). Therefore, as shown in **Table 2**, approximately 26.55 acres of the study area are deemed to be subject to CDFW jurisdiction.

3.6 Plant Species

The study area currently supports native vegetation communities, restored coastal sage scrub, and natural communities that are moderately to substantially dominated by non-native species. A compendium of the plant species observed within the study area is included in **Appendix C**. Special-status plant species are discussed in **Section 3.8.2**.

3.7 Wildlife Species

The upland and riparian communities within the study area provide suitable habitat for a variety of wildlife species including reptiles, birds, and mammals, and many species were observed during surveys conducted in the study area. A compendium of the wildlife species observed within the study area is included in **Appendix C**. Special-status wildlife species are discussed in **Section 3.8.2**.

3.8 Special-Status Biological Resources

3.8.1 Sensitive Natural Communities

Sensitive natural communities are designated as such by various resource agencies, such as the CDFW, or in local policies and regulations. These communities are generally considered to have important functions or values for wildlife and/or are recognized as declining in extent or distribution and may be considered threatened enough to warrant some level of protection. Sensitive natural communities include those that are identified in the CDFW *California Natural Community List* (CDFW 2019b). The CDFW state rank denotes the rarity and endangerment of a vegetation type within the state as described below, with S1 through S3 considered to be a sensitive natural community by CDFW.

3.8.1.1 State Conservation Rank

- S1** = Critically Imperiled – At very high risk of extirpation due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.
- S2** = Imperiled – At high risk of extirpation due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- S3** = Vulnerable – At moderate risk of extirpation due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- S4** = Apparently Secure – At a fairly low risk of extirpation due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.
- S5** = Secure - At very low or no risk of extirpation due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats.

Based on the state ranks, ten sensitive natural communities occur within the study area: arroyo willow thicket, black willow thicket, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/coyote brush scrub, chaparral bushmallow scrub/non-native herbaceous cover, California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coast prickly pear scrub, and non-native herbaceous cover/California sagebrush scrub (**Figure 8**).

3.8.2 Special-Status Species

“Special-status” species are plants and animals that are listed under the California Endangered Species Act (CESA) or Federal Endangered Species Act (FESA), as well as species protected under other regulations and species that are considered sufficiently rare or sensitive by the scientific community to be considered rare. Special-status species are categorized as follows:

- Species listed or proposed for listing as threatened or endangered, or designated as candidates for possible future listing as threatened or endangered, under CESA or FESA.
- Species protected under the federal Bald and Golden Eagle Protection Act.
- Species that meet the definitions of rare or endangered under CEQA (State CEQA Guidelines § 15380).
- Plants designated as rare or endangered in accordance with the California Native Plant Protection Act (NPPA) (Fish and Game Code § 1900 et seq.).

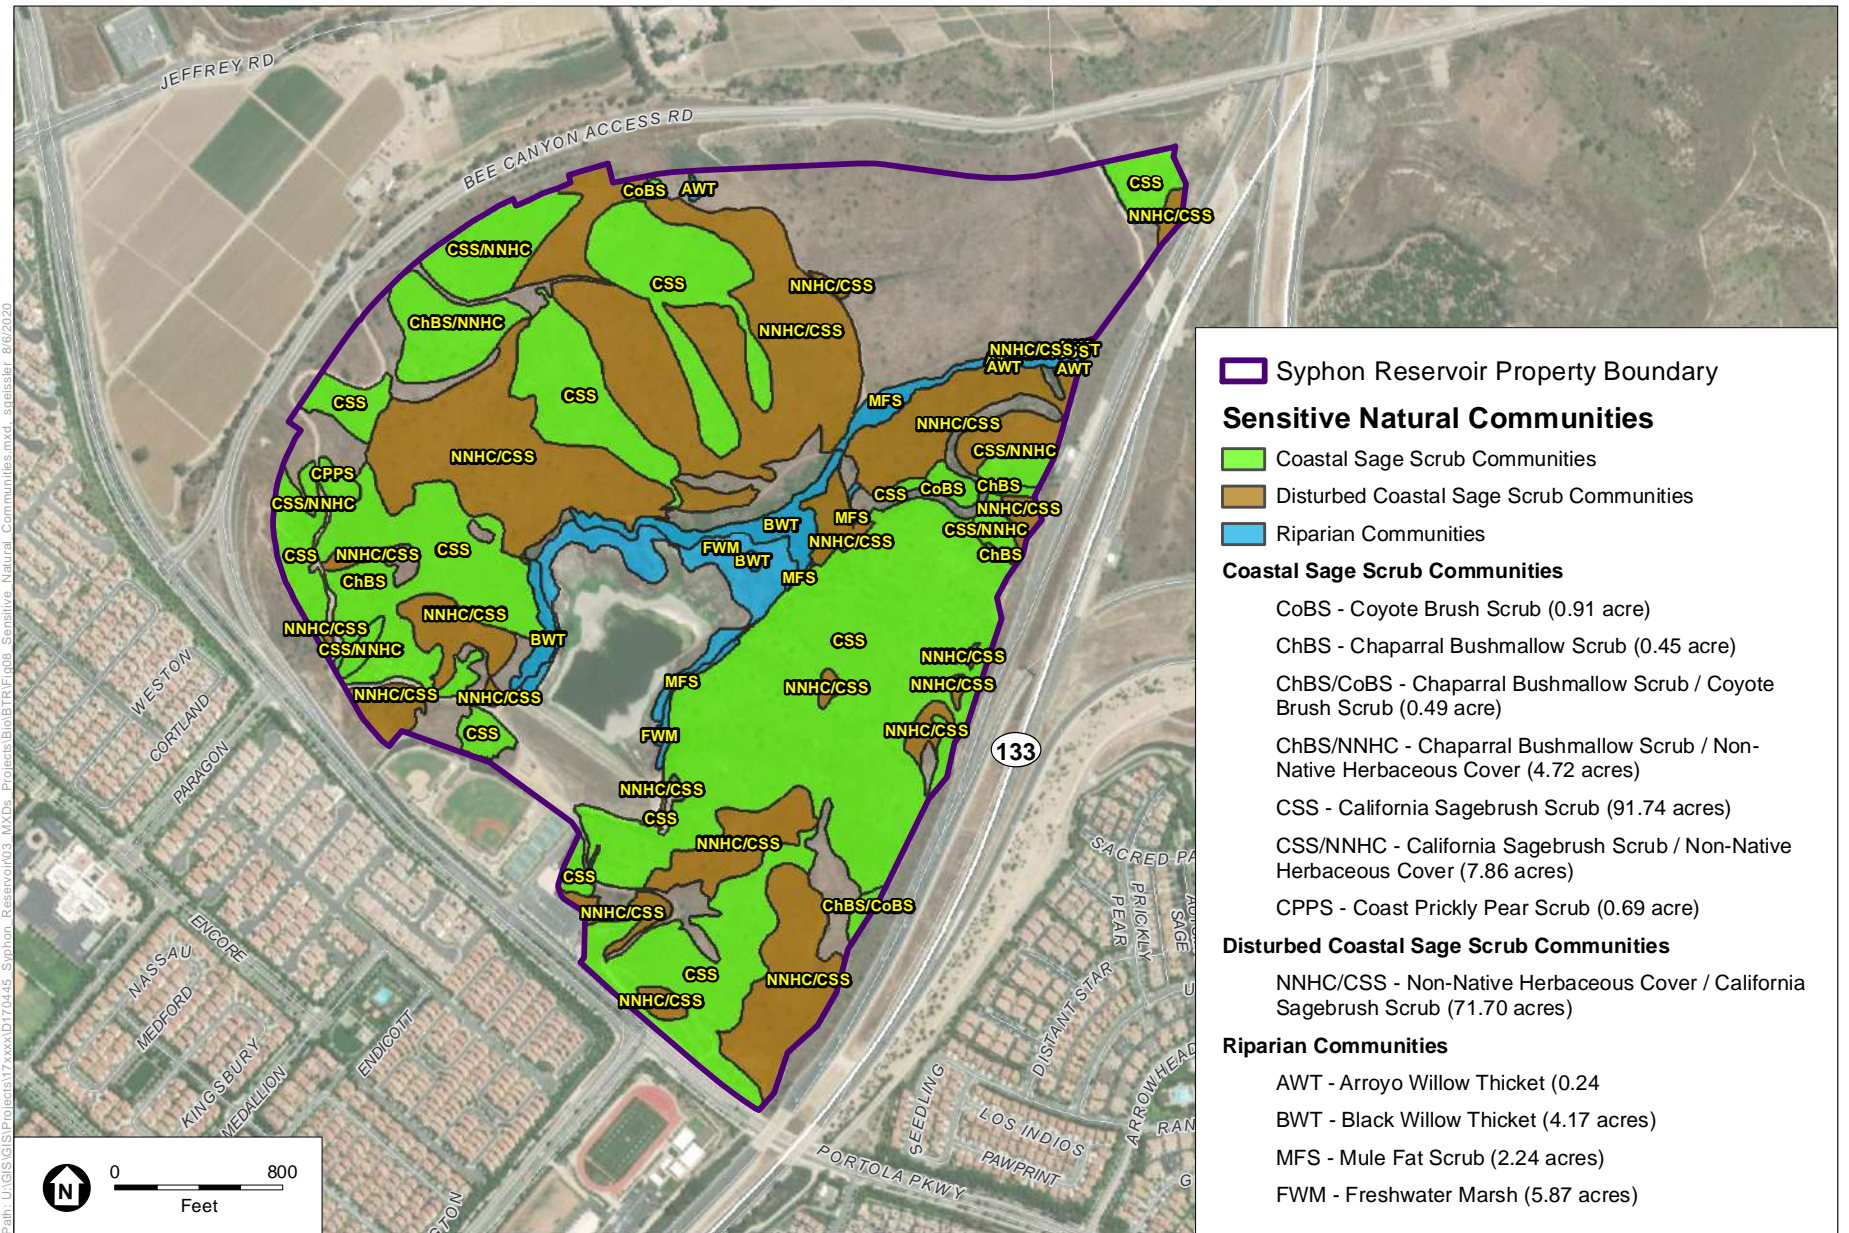

SOURCE: ESRI, 2016

Syphon Reservoir Improvement Project

Figure 7B
CDFW Jurisdictional Areas

SOURCE: ESRI, 2016

Syphon Reservoir Improvement Project
Figure 8
 Sensitive Natural Communities

- Plants considered by CDFW and the CNPS to be rare (California Rare Plant Ranks [CRPR] 1A, 1B, 2A, and 2B) in California.
- Species covered under an adopted Natural Community Conservation Plan (NCCP)/Habitat Conservation Plan (HCP).
- Species identified by CDFW and designated as Special Animals, including wildlife species designated as species of special concern in California (SC).
- Wildlife species listed as fully protected in California (California Fish and Game Code § 3511, 4700, and 5050).

Based on the literature review and field reconnaissance, special-status species were evaluated for their potential to occur within the study area or immediate vicinity, using the following definitions:

Unlikely: The study area or immediate vicinity do not support suitable habitat for a particular species, and therefore the species is unlikely to occur within the study area.

Low Potential: The study area or immediate vicinity only provide low-quality or very limited habitat for a particular species. In addition, the study area may lie outside the known geographic or elevational range for a particular species.

Moderate Potential: The study area or immediate vicinity provide suitable habitat for a particular species. However, the habitat or substrate may be limited or the desired vegetation assemblage or density is less than ideal.

High Potential: The study area or immediate vicinity provides high-quality suitable habitat conditions for a particular species. Additionally, known populations of the species may occur in the study area or immediate vicinity.

Present: The species was observed within the study area during relevant biological surveys or other project visits.

Based on the database search results, a list of potentially occurring special-status species was developed and evaluated for the study area. Special-status species with potential to occur were defined as those species whose geographic and elevational range include the study area and that require habitat similar to habitat present within the study area or immediate vicinity.

3.8.2.1 Special-Status Plant Species

Of the 56 special-status plant species considered for their potential to occur within the study area, 37 species are unlikely to occur and 15 species were assessed as having low potential to occur because the study area is outside of the known elevation range for these species and/or lacks suitable habitat to support these species. None of the special-status plant species with a low potential to occur were observed during focused surveys conducted in 2018 and 2019. Species determined to be unlikely or to have only a low potential to occur are included in **Appendix D**. These species are not discussed further in this analysis.

Four special-status plant species were observed within the study area during focused surveys in 2018 and 2019, including Catalina mariposa lily (*Calochortus catalinae*) (CRPR 4.2, NCCP/HCP Covered), intermediate mariposa lily (*Calochortus weedii* var. *intermedius*) (CRPR 1B.2), multi-stemmed dudleya (*Dudleya multicaulis*) (CRPR 1B.2), and San Diego County viguiera (*Bahiopsis laciniata*) (CRPR 4.3).

Approximately 309 Catalina mariposa lily individuals were observed on-site in the western and southeastern portions of the study area. This species was also observed on-site during previous surveys by Harmsworth Associates in 1998 (Dudek 2012). Approximately 19 intermediate mariposa lily individuals were observed on-site in the western portion of the study area. Approximately 109 multi-stemmed dudleya above-ground specimens were observed on-site in the western portion of the study area. San Diego County viguiera was not noted by the CNDDDB and CNPS database searches as a plant with potential to occur; however, one individual was observed on-site in the easternmost portion of the study area.

Appendix D provides details of each special-status species, their habitat, and their potential to occur within the study area. Special-status species noted in the USFWS and CNDDDB databases in the vicinity of the study area are shown in **Figures 9A and 9B**. Special-status plant species observed on-site are shown in **Figure 10A**.

3.8.2.2 Special-Status Wildlife Species

Of the 68 special-status wildlife species considered regarding their potential to occur within the study area, 37 species are deemed unlikely to occur due to the lack of any potentially suitable habitat and 14 species were assessed as having low potential to occur because the study area lacks suitable habitat to support these species and/or is outside of the known geographic or elevational range for these species. Species considered but determined to be unlikely or to have a low potential to occur are still included in **Appendix D**. It should be noted that coastal cactus wren (*Campylorhynchus brunneicapillus cousei*) (SC, NCCP/HCP Covered Species) was previously observed on-site in 1999 and reported in the CNDDDB and also around 2000, prior to the Santiago Fire that burned the entire site in October 2007 (Dudek 2012). However, there are currently very limited, isolated coast prickly pear cactus plants on-site so this species has a low potential to occur due to presence of a negligible amount of cacti-dominated vegetation on-site or within the immediate vicinity. These species are not discussed further in this analysis.

ESA conducted focused surveys for western spadefoot, least Bell's vireo, and southwestern willow flycatcher in 2019. No western spadefoot (Species of Special Concern [SC], NCCP/HCP Covered Species) or southwestern willow flycatcher (Federally Endangered [FE], State Endangered [SE], NCCP/HCP Conditionally Covered) were detected during focused surveys.

Seven special-status species were observed within the study area during 2018 and/or 2019 surveys, including least Bell's vireo (FE, SE, NCCP/HCP Conditionally Covered Species), coastal California gnatcatcher (*Polioptila californica californica*) (Federally Threatened [FT], SC, NCCP/HCP Covered Species), yellow warbler (*Setophaga petechia*) (SC), yellow-breasted chat (*Icteria virens*) (SC), southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*) (NCCP/HCP Covered Species), Vaux's swift (*Chaetura vauxi*) (SC), and orange-throated whiptail (*Aspidoscelis hyperythra*)

(NCCP/HCP Covered Species). In addition, coastal cactus wren and seven other special-status species have been observed within the study area during previous surveys or were reported in the CNDDDB, including grasshopper sparrow (*Ammodramus savannarum*) (SC), red-shouldered hawk (*Buteo lineatus*) (NCCP/HCP Covered Species), northern harrier (*Circus cyaneus*) (SC, NCCP/HCP Covered Species), white-tailed kite (*Elanus leucurus*) (State Fully Protected [FP]), prairie falcon (*Falco mexicanus*) (NCCP/HCP Conditionally Covered Species), American peregrine falcon (*Falco peregrinus anatum*) (FP, NCCP/HCP Covered Species), and coyote (*Canis latrans*) (NCCP/HCP Covered Species) (Dudek 2012). It must be recognized that among the raptors (birds of prey) noted above, the prairie falcon and American peregrine falcon are noted as species that may soar above or occasionally forage in this area but that have a negligible potential to nest on-site.

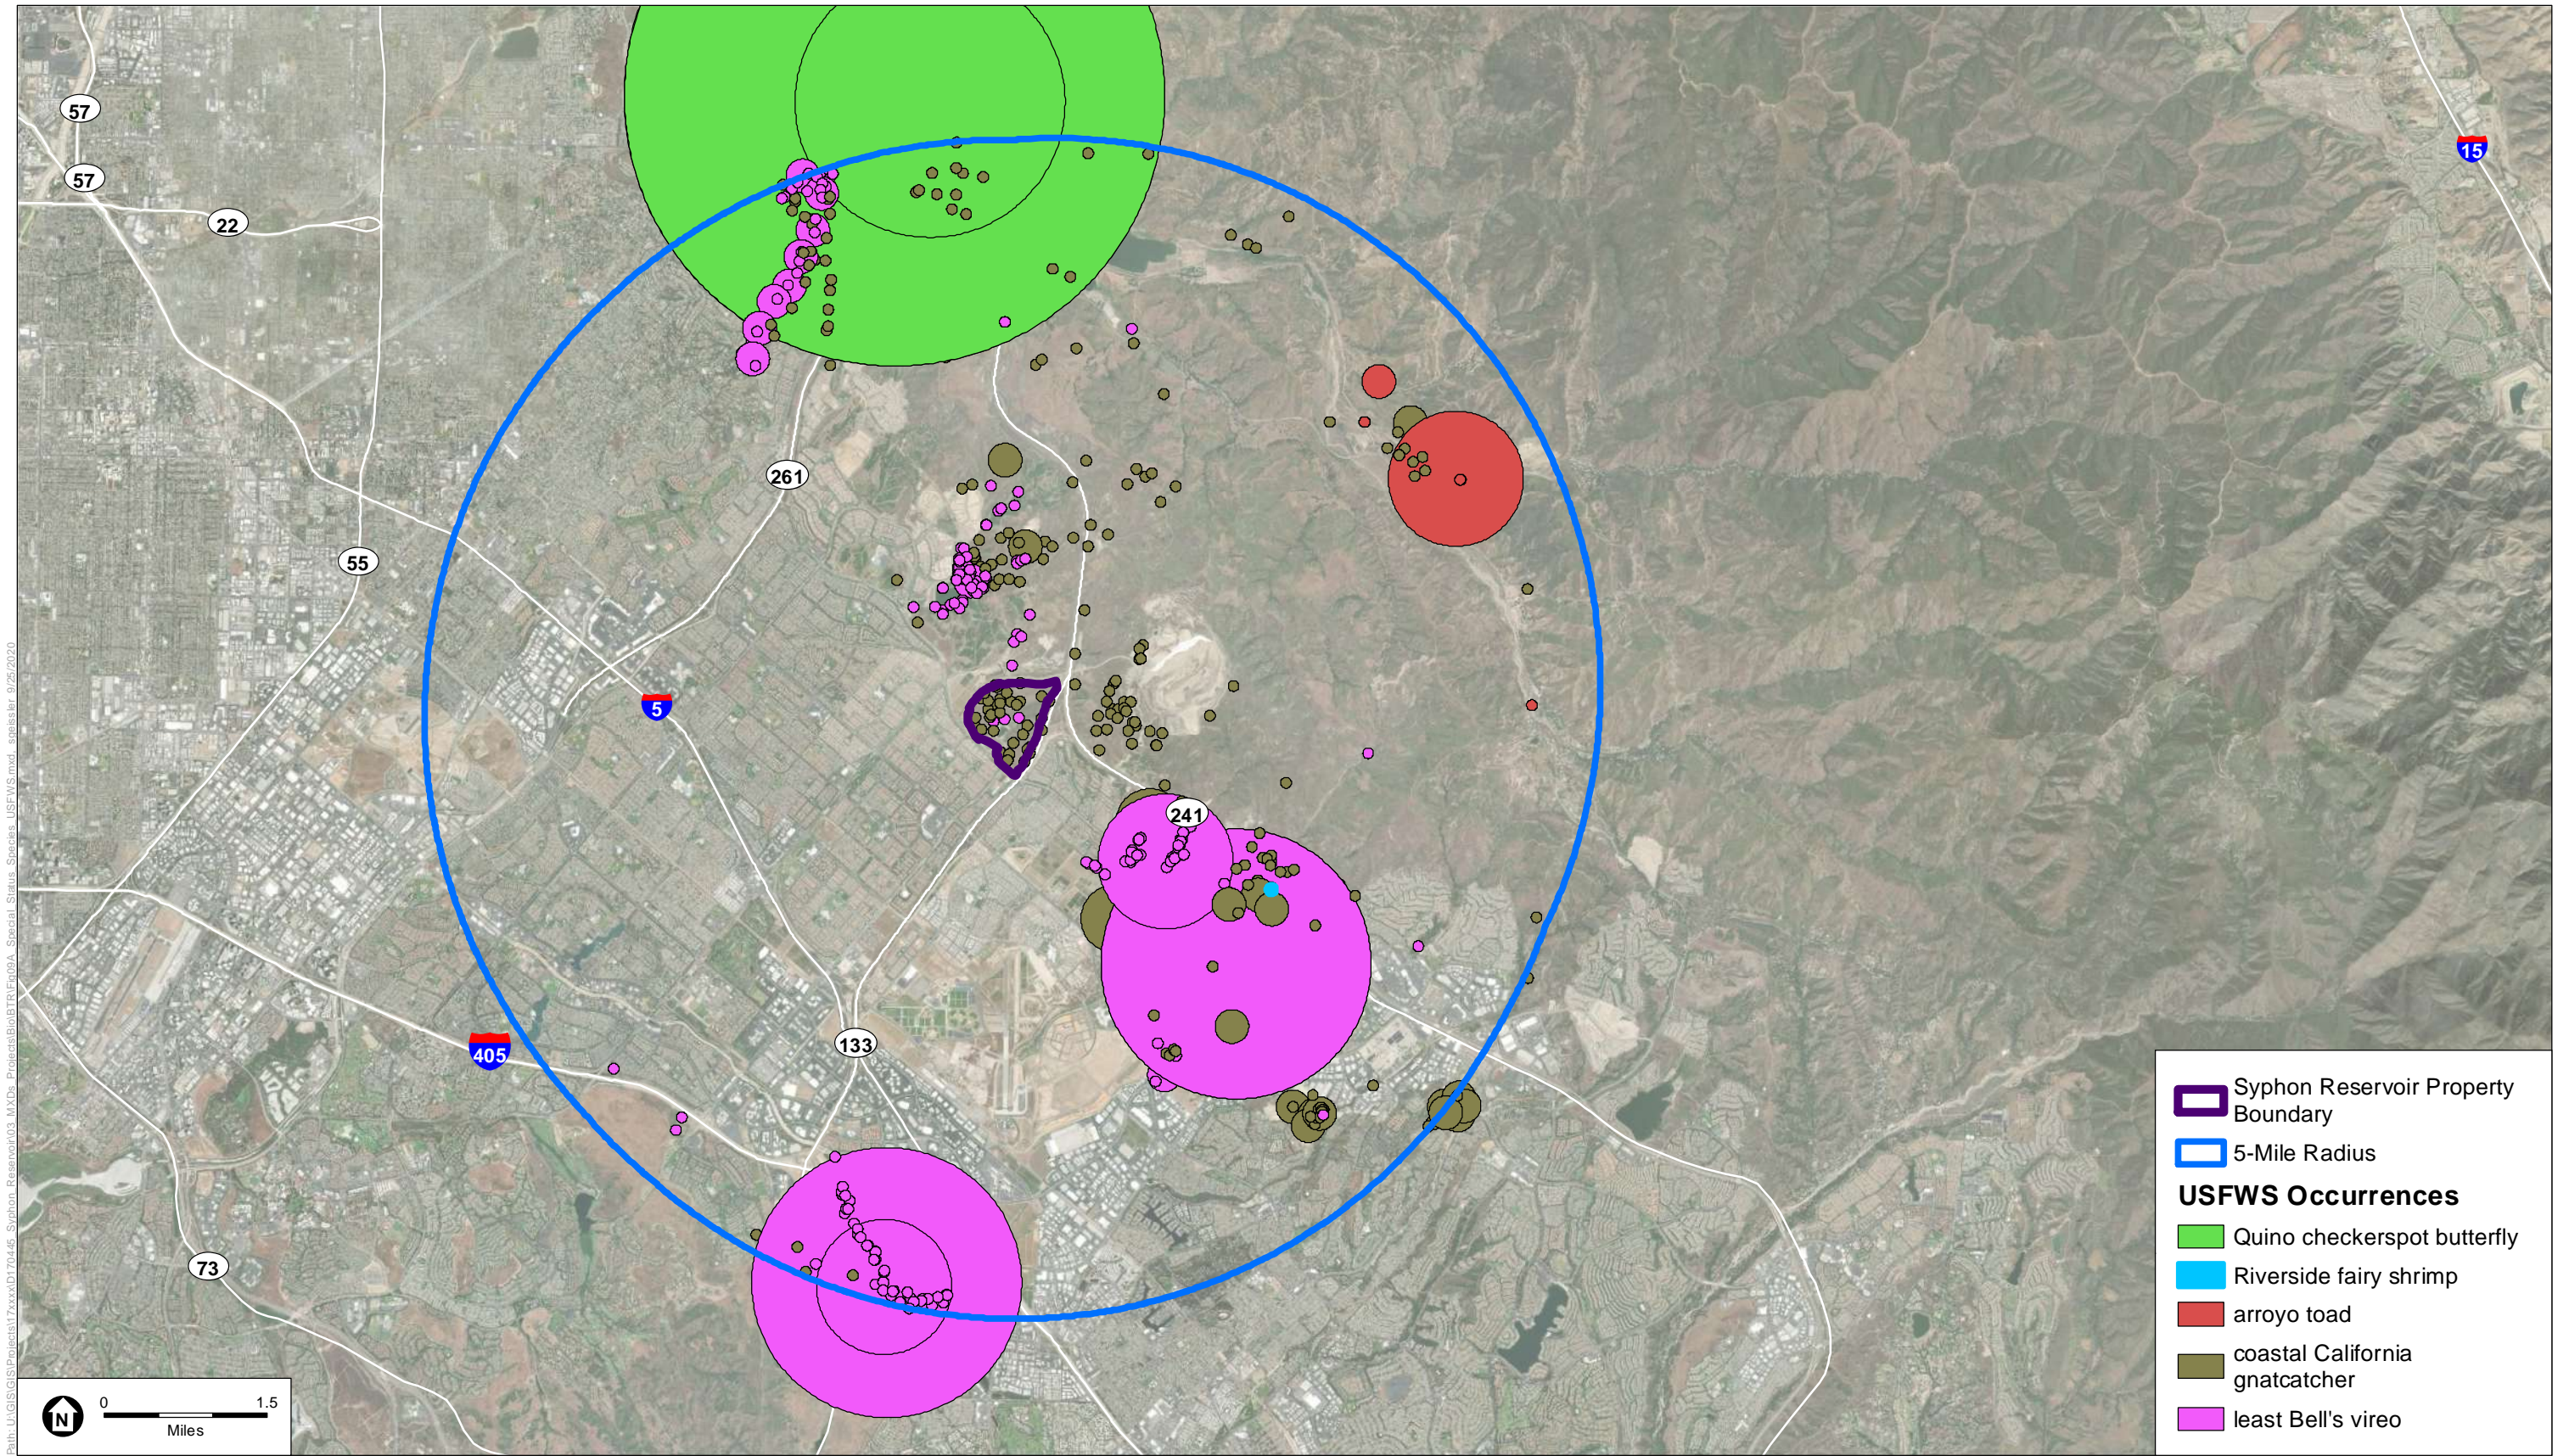

In addition, one special-status species, sharp-shinned hawk (*Accipiter striatus*) (NCCP/HCP Covered Species), has a high potential to occur. Two special-status species, coastal whiptail (*Aspidoscelis tigris stejnegeri*) (SC, NCCP/HCP Covered Species) and San Diego desert woodrat (*Neotoma lepida intermedia*) (SC, NCCP/HCP Covered Species), have a moderate potential to occur.

Appendix D provides details for each special-status species, their habitat associations, and a determination regarding their potential to occur within the study area. Special-status species occurrences from the USFWS and CNDDDB occurrences databases within the vicinity of the study area are shown in Figures 9A and 9B. Special-status wildlife species observed on-site are shown in **Figure 10B**.

3.9 Critical Habitat

Under the FESA, when species are proposed for listing as Threatened or Endangered, the USFWS is required to consider whether there are geographic areas that contain essential features or areas that are essential to conserve the specie, and if so, USFWS may propose designating these areas as critical habitat. Critical habitat is defined as areas that contain the physical or biological features that are essential to the conservation of endangered and threatened species and that may need special management or protection. Critical habitat may also include areas that were not occupied by the species at the time of listing but are essential to its conservation. Critical habitat designations affect only Federal agency actions or federally funded or permitted activities. Critical habitat designations do not affect activities by private landowners if there is no Federal “nexus”—that is, no Federal funding or authorization (USFWS 2017).

The study area does not occur within or overlap any USFWS-designated critical habitat areas (USFWS 2020b). The nearest designated critical habitat areas are both located a bit more than 2 miles to the southeast, on the south side of the SR-241 where a very small area is designated as Critical Habitat for the Federally Endangered Riverside fairy shrimp (*Streptocephalus wootoni*) and larger area is designated for the Federally Threatened coastal California gnatcatcher.

Special-Status Wildlife Species Observed
Within the Study Area in 2018 and 2019

3.10 Wildlife Movement

Effective wildlife movement is essential for dispersal, genetic exchange, migration, foraging, and breeding. Wildlife movement corridors or habitat linkages are linear habitat features that connect blocks of habitat that are otherwise disconnected. Functional wildlife movement corridors are especially important in highly fragmented habitat, such as developed or agricultural areas. Wildlife movement corridors are generally used by terrestrial animals, although they may also be important for aquatic species, avian dispersal, and as avenues for genetic exchange in plants. On a regional scale, movement corridors can include bird flyways, such as wetland areas that provide essential habitat to be used as a stopover for several days during migration.

The study area lies within central Orange County between the City of Irvine and the foothills of the Santa Ana Mountains. The study area is not identified as a Missing Linkage in the *South Coast Missing Linkages* report (South Coast Wildlands 2008). However, the study area is identified as a Small Natural Area in the California Essential Habitat Connectivity Project (CEHC) (CalTrans and CDFG 2010). CEHC is a CDFW and California Department of Transportation (CalTrans) project that ran a statewide assessment of essential habitat connectivity using spatial analyses and modeling techniques to identify large remaining blocks of intact habitat or natural landscape and model linkages between them that need to be maintained, particularly as corridors for wildlife.

The study area is located within the Central Subregion of the County of Orange NCCP/HCP, and the majority is located within the NCCP/HCP Reserve (i.e., the central portion of the reservoir is excluded from the Reserve) (**Figure 11**). Although the study area is bordered by dense residential development to the southwest and southeast, as well as by the SR-133 and SR-241 and interchange to the east and northeast, it is contiguous to agricultural and undeveloped areas to the west along Loma Ridge in the Orchard Hills planning area. Additionally, the study area includes upland and riparian habitat that provides important resources for wildlife, such as foraging habitat, potential nesting and denning sites, and cover. Although terrestrial wildlife movement through the study area is extremely restricted to the northeast, east, or south, the study area lies at the southeastern limit of a larger contiguous block of habitat that may be used by local terrestrial wildlife movement and provides a small part of regional habitat connectivity for avian species (e.g., dispersal habitat for coastal California gnatcatcher within this region). The reservoir is also an important regional water source that attracts a number of avian species. Thus, from a regional perspective, the study area functions as a part of a wildlife movement corridor, particularly for avian species.

SOURCE: ESRI, 2016

Syphon Reservoir Improvement Project
Figure 11
 Regional Wildlife Movement

On a local scale, the study area provides live-in habitat for a variety of invertebrate, fish, amphibian, reptile, bird, and mammal species, and movement habitat for invertebrate, reptile, bird, and mammal species. Immediately surrounding the study area, the City of Irvine is located to the south, and human activity and dense development within these residential and commercial areas do not provide suitable habitat or resources for most native wildlife, with the exception of a few wide-ranging species that are adapted to urban environments (e.g., raccoon, skunk, coyote, some birds). In addition, the SR-133 and Bee Canyon Landfill Access Road, which is frequented by trucks hauling trash to the landfill, are hazards to wildlife. However, the study area is undeveloped, contains natural habitats, and wildlife movement is not restricted within the study area or to and from other undeveloped and agricultural areas to the north with the exception of a chain-link fence around the perimeter of the property. Thus, although some wildlife movement (e.g., more secretive wildlife that require larger home ranges, such as mountain lion and deer) may be deterred by the human activity and development nearby, these barriers to movement (e.g., development and roads) would not preclude smaller wildlife that are better adapted to urbanized areas from moving through the study area or the surrounding region.

In summary, the study area supports live-in and movement habitat for species on a local scale, and likely functions to facilitate movement for a number of avian species on a regional scale.

4.0 Regulatory Framework

The following provides a general description of the applicable regulatory requirements for the proposed project, including federal, state, and local policies and guidelines.

4.1 Federal

4.1.1 Endangered Species Act (USC, Title 16, § 1531 through 1543)

The FESA and subsequent amendments provides for the conservation and protection of wildlife and plant species that are listed or proposed for listing as endangered or threatened species and the ecosystems upon which they depend. The FESA also provides statutory framework for the conservation and recovery of threatened and endangered species as well as for the conservation of designated critical habitat that USFWS determines is required for the survival and recovery of these listed species.

Section 7 of the FESA requires federal agencies, in consultation with and assistance from the Secretary of the Interior or the Secretary of Commerce, as appropriate, to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of threatened or endangered species or result in the destruction or adverse modification of critical habitat for these species. The USFWS and National Marine Fisheries Service (NMFS) share responsibilities for administering the FESA. Regulations governing interagency cooperation under Section 7 are found in CCR Title 50, Part 402. The opinion issued at the conclusion of consultation will include a statement authorizing “take” (to harass, harm, pursue, hunt, wound, kill, etc.) that may occur incidental to an otherwise legal activity. Although federal funding is not expected, if the proposed project were to receive federal funding the funding agency would be required to initiate a consultation with USFWS under Section 7. The consultation process would then lead to issuance

of a Biological Opinion from USFWS. In most cases, a Biological Opinion addresses the proposed project's potential to result in "take" of listed species (as defined below), and includes mandatory conditions that would allow for limited incidental take to occur subject to prescribed conditions.

Section 9 lists those actions that are prohibited under the FESA. Although take of a listed species is prohibited, it is allowed when it is incidental to an otherwise legal activity. Section 9 prohibits take of listed species of fish, wildlife, and plants without special exemption. The definition of "harm" includes significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns related to breeding, feeding, or shelter. "Harass" is defined as actions that create the likelihood of injury to listed species by disrupting normal behavioral patterns related to breeding, feeding, and shelter significantly.

Section 10 provides a means whereby a non-federal action with the potential to result in take of a listed species can be allowed under an incidental take permit which may be issued once a HCP is approved. Application procedures are found at 50 CFR 13 and 17 for species under the jurisdiction of USFWS and 50 CFR 217, 220, and 222 for species under the jurisdiction of NMFS.

In addition, a local regulatory program established by the NCCP/HCP and associated governing documents provides for regional conservation of many species while also allowing limited impacts to biological resources in association with planned development. The NCCP/HCP establishes an alternative pathway to the Section 10 and Section 7 procedures by which local projects in the Plan Area may receive both State and federal incidental take authorization for species identified as "covered" and "conditionally covered", based on compliance with relevant conditions set forth in the plan. Further details about the regional NCCP/HCP and its provisions for incidental take coverage are discussed in Section 4.3.1 below.

4.1.2 Migratory Bird Treaty Act (16 USC 703 through 711)

The Migratory Bird Treaty Act (MBTA) is the domestic law that affirms, or implements, a commitment by the U.S. to four international conventions (with Canada, Mexico, Japan, and Russia) for the protection of a shared migratory bird resource. The MBTA makes it unlawful at any time, by any means, or in any manner to pursue, hunt, take, capture, or kill migratory birds. "Migratory bird" means any bird protected by any of the treaties and currently includes 1,027 bird species in the United States (50 CFR 10.13), regardless of whether the particular species actually migrates. The law also applies to the removal of nests occupied by migratory birds during the breeding season. The MBTA makes it unlawful to take, pursue, molest, or disturb these species, their nests, or their eggs anywhere in the United States.

4.1.3 Federal Clean Water Act (33 USC 1251 through 1376)

The USACE regulates "discharge of dredged or fill material" into "waters" of the United States, which includes tidal waters, interstate waters, and "all other waters, interstate lakes, rivers, streams (including intermittent streams), mud flats, sand flats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes or natural ponds, the use, degradation, or destruction of which could

affect interstate or foreign commerce or which are tributaries to waters subject to the ebb and flow of the tide" (33 C.F.R. 328.3(a)), pursuant to provisions of Section 404 of the CWA. The CWA also excludes certain features from this regulation, including "wastewater recycling facility constructed on dry land" (see 33 CFR §230.3 (o)(2)(vii)). Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not considered waters of the U.S. The USACE determination stated that they do not consider the site to contain waters of the U.S. (Appendix B).

4.1.4 Fish and Wildlife Conservation Act

The Fish and Wildlife Conservation Act declares that fish and wildlife are of ecological, educational, esthetic, cultural, recreational, economic, and scientific value to the United States. The purposes of this Act are to encourage all federal departments and agencies to utilize their statutory and administrative authority, to the maximum extent practicable and consistent with each agency's statutory responsibilities and to conserve and to promote conservation of non-game fish and wildlife and their habitats. Another purpose is to provide financial and technical assistance to the states for the development, revision, and implementation of conservation plans and programs for nongame fish and wildlife.

4.2 State

4.2.1 California Endangered Species Act (California Fish and Game Code § 2050 et seq.)

CESA establishes the policy of the state to conserve, protect, restore, and enhance threatened or endangered species and their habitats. CESA mandates that state agencies should not approve projects that would jeopardize the continued existence of threatened or endangered species if reasonable and prudent alternatives are available that would avoid jeopardy. There are no state agency consultation procedures under CESA. For projects that would affect a listed species under both CESA and FESA, compliance with FESA would satisfy CESA if CDFW determines that the federal incidental take authorization is "consistent" with CESA under California Fish and Game Code Section 2080.1. For projects that would result in take of a species listed under the CESA only, the project operator would have to apply for a take permit under Section 2081(b). Further details about the regional NCCP/HCP are discussed in Section 4.3.1 below.

4.2.2 California Fish and Game Code § 1600 et seq.

CDFW is responsible for protecting and conserving fish and wildlife resources, and the habitats upon which they depend. Under Section 1600 of the California Fish and Game Code, CDFW administers the Lake and Streambed Alteration (LSA) Program and regulates all substantial diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake (which typically include reservoirs), which supports fish or wildlife.

Applicants proposing changes to such regulated water resources must submit a Lake or Streambed Alteration Notification to CDFW for such projects. CDFW will then determine if the proposed activity may substantially adversely affect an existing fish or wildlife resource and will

issue a final agreement for the applicant's signature that includes reasonable measures necessary to protect the resource. Preliminary notification to, and project review by CDFW may occur during or after the CEQA environmental review process but prior to project implementation.

4.2.3 California Fish and Game Code §§ 2080 and 2081

Section 2080 of the California Fish and Game Code states that “No person shall import into this state [California], export out of this state, or take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the Commission [State Fish and Game Commission] determines to be an endangered species or threatened species, or attempt any of those acts, except as otherwise provided in this chapter, or the Native Plant Protection Act, or the California Desert Native Plants Act.” Pursuant to Section 2081, CDFW may authorize individuals or public agencies to import, export, take, or possess state-listed endangered, threatened, or candidate species. These otherwise prohibited acts may be authorized through Incidental Take permits or Memoranda of Understanding if the take is incidental to an otherwise lawful activity, impacts of the authorized take are minimized and fully mitigated, the permit is consistent with any regulations adopted pursuant to any recovery plan for the species, and the project operator ensures adequate funding to implement the measures required by CDFW, which makes this determination based on available scientific information and considers the ability of the species to survive and reproduce.

Since the NCCP/HCP provides coverage for take of some State-listed species, there would not be a need for an additional 2081 permit process unless a project does not comply with NCCP/HCP requirements and may result in take of a State-listed species or if a State-listed species not covered by the NCCP/HCP were to result in take. Further details about the regional NCCP/HCP are discussed in Section 4.3.1 below.

4.2.4 California Fish and Game Code §§ 3503 and 3503.5

Under these sections of the California Fish and Game Code, the project operator is not allowed to conduct activities that would result in the taking, possessing, or destroying of any birds of prey; the taking or possessing of any migratory nongame bird as designated in the MBTA; the taking, possessing, or needlessly destroying of the nest or eggs of any raptors or nongame birds protected by the MBTA; or the taking of any nongame bird pursuant to California Fish and Game Code Section 3800.

4.2.5 California Environmental Quality Act Guidelines, § 15380

Although threatened and endangered species are protected by specific federal and state statutes, CEQA Guidelines § 15380(b) provides that a species not listed on the federal or state list of protected species may be considered rare or endangered if the species can be shown to meet certain specified criteria. These criteria have been modeled after the definition in FESA and the section of the California Fish and Game Code dealing with rare or endangered plants or animals. This section was included in CEQA primarily to deal with situations in which a public agency is reviewing a project that may have a significant effect on, for example, a candidate species that has not been listed by either USFWS or CDFW. Thus, CEQA provides an agency with the ability to protect a species from the potential impacts of a project until the respective government

agencies have an opportunity to designate the species as protected, if warranted. CEQA also calls for the protection of other locally or regionally significant resources, including natural communities. Although natural communities do not at present have legal protection of any kind, CEQA calls for an assessment of whether any such resources would be affected and requires findings of significance if there would be substantial losses. Natural communities listed by CNDDDB as sensitive are considered by CDFW to be significant resources and fall under the State CEQA Guidelines for addressing impacts. Local planning documents such as General Plans often identify these resources as well.

4.2.6 California Water Quality Control Act (Porter-Cologne California Water Code Section 13260)

The State Water Resources Control Board (SWRCB) and the RWQCB (together “Boards”) are the principal State agencies with primary responsibility for the coordination and control of water quality. The Boards regulate activities pursuant to Section 401(a)(1) of the federal CWA as well as the Porter Cologne Water Quality Control Act (Porter-Cologne) (Water Code Section 13260). Section 401 of the CWA specifies that certification from the State is required for any applicant requesting a federal license or permit to conduct any activity including but not limited to the construction or operation of facilities that may result in any discharge into navigable waters. The certification shall originate from the State in which the discharge originates or will originate, or, if appropriate, from the interstate water pollution control agency having jurisdiction over the navigable water at the point where the discharge originates or will originate. Any such discharge will comply with the applicable provisions of Sections 301, 302, 303, 306, and 307 of the CWA.

In Porter-Cologne, the Legislature declared that the “State must be prepared to exercise its full power and jurisdiction to protect the quality of the waters in the State from degradation...” (California Water Code Section 13000). Porter-Cologne grants the Boards the authority to implement and enforce the water quality laws, regulations, policies and plans to protect the groundwater and surface waters of the State. It is important to note that enforcement of the State's water quality requirements is not solely the purview of the Boards and their staff. Other agencies (e.g., CDFW) have the ability to enforce certain water quality provisions in state law.

The State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (procedures), adopted by the State Water Resources Control Board on April 2, 2019, became effective May 28, 2020. Based on the procedures, artificial wetlands greater than or equal to one acre in size constructed for purposes of treatment, storage, or distribution of recycled water are not waters of the State unless specifically identified in a water quality control plan as a wetland or other water of the State. Since Syphon Reservoir is identified in the 1995 Water Quality Control Plan for the Santa Ana River Basin (most recently updated in June 2019; California Regional Water Quality Control Board 2019) as a water of the State, the wetlands would likely also be considered waters of the State.

4.3 Local

4.3.1 County of Orange Central & Coastal Subregion NCCP/HCP

In 1996, the Orange County Central & Coastal Subregion NCCP/HCP, a comprehensive natural resources conservation and management plan for central and coastal Orange County, was adopted. The purpose of the NCCP/HCP was to create a multiple-species and multiple-habitat reserve system and to implement a long-term conservation program on a subregional level to primarily protect coastal sage scrub and the species that use this habitat, while allowing for social and economic uses compatible with the protection of these resources.

The NCCP/HCP was prepared in cooperation with the UFSWS and CDFW, who are the agencies responsible for implementing the FESA and CESA, respectively. Implementation of the NCCP/HCP in accordance with the terms of the Implementation Agreement allows for the conservation of large, diverse areas of natural habitat, including habitat for the coastal California gnatcatcher and other federally-listed species; provides for the conservation, protection, and management of three “Target Species” and 36 “Identified Species” and their habitats; and satisfies federal and state mitigation requirements for designated development.

IRWD and the County of Orange, among others, are participating landowners of the Central & Coastal NCCP/HCP. As a participating landowner that contributed significant funding toward land acquisition, management, and the implementation of the NCCP/HCP Reserve System, IRWD was allotted 60 acres of Incidental Take Credits from within the NCCP/HCP Reserve and 27 acres of Incidental Take Credits outside of the NCCP/HCP Reserve (i.e., non-Reserve lands) for impacts to coastal sage scrub communities (Dudek 2012). An additional 9 acres of Incidental Take Credits from within the NCCP/HCP Reserve were acquired through IRWD’s consolidation with Santiago County Water District (SCWD). For participating landowners, development activities and uses that are addressed by the NCCP/HCP are considered fully mitigated under the NCCP Act, FESA, and CESA for impacts to habitat occupied by listed and other species “identified” by the NCCP/HCP and Implementation Agreement. Satisfactory implementation of the NCCP/HCP under the terms of the Implementation Agreement means that no additional mitigation is required of the participating landowners for impacts to “identified” species and their habitat, or for species residing in specified non-coastal sage scrub habitats, or covered habitats.

The NCCP/HCP included provisions for IRWD to build a future reservoir “as a permitted use within the Reserve System” (R.J. Meade Consulting 1996a). At the time that the NCCP/HCP was prepared, IRWD was considering four alternative locations (including the Syphon Reservoir site) for seasonal recycled water storage reservoirs, all of which were located within the subregional Reserve System, though only one reservoir would ultimately be needed. The need for a future reservoir was identified as “a permitted use within the Reserve System in the event that public health, safety, and welfare require such a facility in the future. At the time such a facility is needed, IRWD will review the plans with appropriate agencies and propose a specific mitigation plan or pay fees adequate to mitigate the Incidental Take associated with the new reservoir” (R.J. Meade Consulting 1996a).

5.0 Potential Effects

This section describes the potential effects of the proposed project (Figures 3A, 3B, and 3C) on biological resources that may occur as a result of project implementation, including net ecological benefits. Direct, indirect, temporary, and/or permanent effects to biological resources may occur as a result of project implementation, as defined below:

- **Direct Effects:** Any alteration, disturbance, or destruction of biological resources that would result from project-related activities is considered a direct effect. Examples include loss of individual species and/or their associated plant communities, diversion of surface water flows, and encroachment into wetlands. Under FESA, direct effects are defined as the immediate effects of a project on a species or its habitat, including construction noise disturbance, sedimentation, or habitat loss.
- **Indirect Effects:** Biological resources may also be affected in an indirect manner as a result of project-related activities. Under FESA, indirect effects are defined as those effects that are caused by, or would result from, a proposed project but occur later in time and are reasonably certain to occur [50 C.F.R. §402-02]. An example of indirect effects may include irrigation runoff from a developed area into surrounding natural vegetation. Indirect effects could also include increased wildfire frequency as a result of power line failures.
- **Temporary Effects:** Any effects to biological resources that are considered reversible can be viewed as temporary. Examples include the generation of fugitive dust during construction activities.
- **Permanent Effects:** All effects that result in the irreversible removal of biological resources are considered permanent. Examples include constructing a building or permanent road on an area with native vegetation, such that the native vegetation is permanently removed and replaced with a developed structure.

A project is generally considered to have a significant effect if it proposes or results in any of the effects or conditions described in the significance thresholds discussed below (in italics), absent specific evidence to the contrary. Conversely, if a project does not propose or result in any of the following effects or conditions, it would generally not be considered to have a significant effect on biological resources, absent specific evidence of such an effect. These significance thresholds are taken from Appendix G of the State CEQA Guidelines.

5.1 Special-Status Species

5.1.1 Significance Threshold

The project would have an adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

5.1.2 Analysis of Project Effects

5.1.2.1 Special-Status Plant Species

Four special-status plant species, Catalina mariposa lily (CRPR 4.2, NCCP/HCP Covered), intermediate mariposa lily (CRPR 1B.2), multi-stemmed dudleya (CRPR 1B.2), and San Diego County viguiera (CRPR 4.3), were observed within the study area during focused surveys in 2018 and 2019. The proposed project will avoid removal or damage to any specimens of intermediate mariposa lily, multi-stemmed dudleya, and San Diego County viguiera. Therefore, the proposed project would not impact these special-status plant species, and no mitigation is required.

The proposed project will avoid more than 90 percent of the Catalina mariposa lily specimens identified on-site, and would remove approximately 24 of the total 309 Catalina mariposa lily individuals during construction (shown in **Figure 12A**). The number affected comprises less than 8 percent of the total population on-site. Impacts to 24 individuals is not considered a substantial loss for this species which is known to occur over a wide area in southern California. This loss would not threaten the existence of the on-site population, and would not be significant. Moreover, Catalina mariposa lily is a covered species under the NCCP/HCP provided that the proposed project complies with the NCCP/HCP provisions, and thus this species is considered conserved since the NCCP/HCP Reserve provides for the regional conservation for this and other covered species. Although the majority of the study area is within the NCCP/HCP Reserve and potential impacts to any Catalina mariposa lily would occur within the Reserve, at the time that the NCCP/HCP was prepared the NCCP/HCP included provisions for IRWD to build a future reservoir, and the proposed project is “a permitted use within the Reserve System” (R.J. Meade Consulting 1996a). Thus, even with potential impacts to this species within the Reserve, this species is considered adequately covered under the NCCP/HCP. Therefore, impacts to Catalina mariposa lily are less than significant, and no mitigation is required.

5.1.2.2 Special-Status Wildlife Species

Special-status wildlife species observed, or considered to have a moderate or high potential to occur within the study area, include the following NCCP/HCP Covered Species: coastal California gnatcatcher, orange-throated whiptail, southern California rufous-crowned sparrow, red-shouldered hawk, northern harrier, American peregrine falcon, sharp-shinned hawk, coastal whiptail, San Diego desert woodrat, and coyote. Two species that are Conditionally Covered under the NCCP/HCP, least Bell’s vireo and prairie falcon, were also observed. Several other species that are not “covered species” under the NCCP/HCP were also identified, including yellow warbler, yellow-breasted chat, grasshopper sparrow, Vaux’s swift, and the California fully protected white-tailed kite. It should be noted that the two falcons and Vaux’s swift may fly over the site but have virtually no potential to nest on site. Likewise, white-tailed kite has only been observed foraging or flying over but is not known to nest in the study area. Locations where special-status wildlife species were observed in the study area in 2018 and 2019 are shown in **Figure 12B**.

SOURCE: ESRI, 2016

Syphon Reservoir Improvement Project

Figure 12B
 Impacts to Special-Status Wildlife Species Observed
 Within the Study Area in 2018 and 2019

The coastal California gnatcatcher, orange-throated whiptail, southern California rufous-crowned sparrow, red-shouldered hawk, northern harrier, prairie falcon,⁵ American peregrine falcon, sharp-shinned hawk, coastal whiptail, San Diego desert woodrat, and coyote, as covered species under the NCCP/HCP, are considered to be conserved within the NCCP/HCP region provided that the project complies with the NCCP/HCP provisions. As previously mentioned, although the majority of the study area is within the NCCP/HCP Reserve and potential impacts to NCCP/HCP Covered Species may occur within the Reserve, the NCCP/HCP included provisions for IRWD to build a future reservoir.

As a future infrastructure improvement that was originally recognized by the NCCP/HCP and for which IRWD has a credit allotment that can be “spent” or exchanged for the displacement of areas within the NCCP Reserve, the proposed project is considered a permitted use within the Reserve System. Potential impacts to Covered Species within the Reserve are considered adequately covered under the NCCP/HCP provided that the proposed project complies with relevant and applicable NCCP/HCP provisions. The proposed project would permanently impact a total of 28.37 acres (with Treatment Facility Option A⁶)/28.49 acres (with Treatment Facility Option B) of coastal sage scrub communities.⁷ The proposed project would temporarily impact 0.85 acre of California sagebrush scrub. Implementation of mitigation measure MM BIO-1 (to spend allotted Incidental Take Credits for participating landowners), MM BIO-2, and MM BIO-3, prescribed in Section 6.0 below, would reduce impacts to a less than significant level.

The least Bell’s vireo is federal and state Endangered and is a Conditionally Covered species under the NCCP/HCP. This species is found in riparian habitat, and 17 least Bell’s vireo individuals and/or territories were observed on-site in 2019 (point locations and territories are shown in Figure 12B). The proposed reservoir improvement project will include dam replacement, reservoir enlargement, and the installation of an on-site riparian and upland habitat area around the perimeter of the reservoir. The proposed project would displace approximately 6.41 acres of woody riparian communities (including 0.09 acre of arroyo willow thicket, 4.07 acres of black willow thicket, and 2.25 acres of mule fat scrub). However, the proposed project would also create at least 6.58 acres of on-site woody riparian habitat that would provide replacement nesting habitat for the least Bell’s vireo and will also create up to approximately 5.88 acres consisting of additional on-site woody riparian vegetation and/or freshwater marsh habitat that would replace the other wetland habitat values impacted by construction. The new riparian and wetland habitat areas will be maintained with supplemental irrigation and will not depend on

⁵ Prairie falcon is a conditionally covered under the NCCP/HCP. Planned activities are authorized if the habitat is more than one-half mile from an active or historically active nesting site, and this species is currently not known to nest within Orange County, and have not occurred within the county for over a decade (CDFW 2020, Catino-Davenport 2019).

⁶ Indicates impact acreages for Treatment Facility Option A/Option B. The potential locations of the treatment facilities, which would be determined during detailed design, are depicted in Figure 12B (labeled as Treatment Facility Option A and Option B). Only one treatment facility in one of the optional locations will be built-out as part of the proposed project.

⁷ This total includes 26.37 acres (Treatment Facility Option A)/26.49 acres (Treatment Facility Option B) of California sagebrush scrub, 0.98 acre of California sagebrush scrub/non-native herbaceous cover, 0.06 acre of chaparral bushmallow scrub/non-native herbaceous cover, 0.19 acre of chaparral bushmallow scrub, and 0.77 acre of coyote brush scrub.

the reservoir being full or nearly full to be sustained. Woody riparian and freshwater marsh habitats around the larger reservoir perimeter, once established will provide both foraging and nesting opportunities that would benefit least Bell's vireo and other species.

Ultimately, there will be no net loss of woody riparian habitat for least Bell's vireo, and no net loss of any wetland habitat, with the creation of both riparian and wetland habitat areas on-site as part of the proposed project. IRWD is engaged with the Wildlife Agencies and is collaboratively developing a comprehensive program to address potential impacts to least Bell's vireo. Based on provision of acceptable mitigation, the Wildlife Agencies have indicated that the NCCP/HCP conditional coverage will apply for the proposed project's impacts to least Bell's vireo.⁸ Nevertheless, there will be a temporary loss of these habitats until construction is completed and riparian habitat can be reestablished that the species can use again. This temporary loss would be potentially significant in terms of the temporary reduction to the amount of habitat available in the local region. Implementation of mitigation measures MM BIO-3 and MM BIO-4, prescribed in Section 6.0 below, would reduce impacts to a less than significant level.

The yellow warbler, yellow-breasted chat, and grasshopper sparrow are species of special concern, Vaux's swift, and white-tailed kite is a state fully protected species. The yellow warbler and yellow-breasted chat occur within the riparian habitat on-site; the grasshopper sparrow favors native grasslands on rolling hills with a mix of grasses, forbs, and scattered shrubs; Vaux's swift inhabits redwood and Douglas-fir habitat in northern California and the Sierra Nevada; and the white-tailed kite prefers grasslands, meadows, or marshes for foraging next to deciduous woodland with dense-topped trees for nesting and perching. Since Vaux's swift was observed flying over and likely a migrant that is not expected to nest on-site, it is not discussed further in this analysis.

For yellow warbler and yellow-breasted chat, which utilize woody riparian habitat similar to the least Bell's vireo, several of each species were observed on-site in 2019. The locations of yellow warbler and yellow-breasted chat observed within the study area are shown in Figure 12B; many of these are multiple point locations of the same individual taken on multiple dates, but based on the clustering of point locations, there are likely eight yellow warbler territories and nine yellow-breasted chat territories. The proposed project would have both impacts and benefits to the riparian and marsh habitat that supports these special-status species. As stated above, the proposed project would permanently impact 12.28 acres of woody riparian (6.37 acres) and freshwater marsh communities (5.88 acres). However, the proposed project would also create at least 6.58 acres of on-site woody riparian and will also provide approximately 5.88 acres of on-site woody riparian and/or freshwater marsh habitat that would be maintained to consistently provide habitat year-round. Construction of the larger reservoir would also expand the open water areas that may be used for foraging, which would also be a benefit to these and other species. As noted previously, although there will ultimately be no net loss of riparian habitat for these special-status species with the creation of riparian habitat areas on-site, the temporal loss of habitat for

⁸ This determination was made over the course of extensive discussions between IRWD, ESA, and the Wildlife Agencies, which considered multiple factors to arrive at this determination, including but not limited to IRWD being a Participating Landowner, Syphon Reservoir being a man-made waterbody sustained by an artificial water source, consideration of least Bell's vireo population distribution within the NCCP/HCP plan area, and because impacts will be temporary as riparian habitat will be replaced on-site.

yellow warbler and yellow-breasted chat may be considered potentially significant as it would reduce the amount of available habitat for these species in the local region until an equivalent habitat area is reestablished. Implementation of mitigation measures MM BIO-3 and MM BIO-4, prescribed in Section 6.0 below, would reduce impacts to a less than significant level.

Grasshopper sparrow was previously observed on-site; however, there are no recent records or observations of this species during the numerous surveys conducted in 2018 and 2019. For grasshopper sparrow, which favors native grasslands with a mix of grasses, forbs, and scattered shrubs, the proposed project will impact 2.53 acres of non-native grassland but will avoid 2.74 acres. In addition, the proposed project will impact 27.25 acres of non-native herbaceous cover and 28.18 acres of non-native herbaceous cover/California sage scrub, but avoid 67.31 acres of mixed grass and forblands with scattered shrubs (16.91 acres of non-native herbaceous cover, 43.52 acres of non-native herbaceous cover/California sagebrush scrub, and 6.88 acres California sagebrush scrub/non-native herbaceous cover) that would remain available to this species within the approximately 265-acre study area. Given the potentially suitable habitat acreage that will be avoided by the proposed project, as well as natural areas within the surrounding vicinity, the limited potential impacts to foraging and/or nesting habitat for this species if still present on-site is not expected to threaten regional populations.

White-tailed kite was previously observed on-site; however, there were no recent records or observations of this species during the numerous surveys conducted in 2018 and 2019 and this species has not been documented to nest on-site. For white-tailed kite, which uses grasslands and marshes for foraging and isolated, dense-topped trees for nesting, the proposed project would impact 2.53 acres of non-native grassland, 5.87 acres of freshwater marsh, 0.09 acre of arroyo willow thicket, 4.07 acres of black willow thicket, and 2.67 acres of eucalyptus woodland. The proposed project would avoid 2.74 acres of non-native grassland, 0.15 acre of arroyo willow thicket, 0.06 acres of black willow thicket, and 0.11 acre of eucalyptus woodland, which would provide habitat for this species if still present on-site, as well as natural areas within the surrounding vicinity; thus, potential impacts to foraging and/or nesting habitat for these species are not expected to threaten regional populations. The proposed project would also create at least 6.58 acres of riparian woodland and an additional 5.88 acres of woody riparian and/or freshwater marsh wetland habitat.

Direct impacts to avian species during the non-breeding season would not be potentially significant as these species are mobile and would be expected to fly away from the construction area, if present. However, if construction and maintenance work cannot be scheduled outside of nesting season, impacts to nesting special-status bird species would be potentially significant. Implementation of mitigation measure MM BIO-3, prescribed in Section 6.0 below, would reduce impacts to a less than significant level.

In addition, a walking trail is proposed to be made available for passive recreation along the south and western sides of the study area. The trail will begin at the new permanent access road at Portola Parkway and Sand Canyon Avenue and traveling along that route, then across the dam crest. A large portion of the walking trail will then follow the existing dirt access road along the Highline Canal alignment, and an additional extension is being considered to continue northeast past the

Highline Canal to a northern access road. The proposed walking trail traverses through coastal sage scrub and disturbed coastal sage scrub communities. Three least Bell's vireo territories, three California gnatcatcher occurrences, and one yellow-breasted chat occurrence were observed during 2019 surveys along habitat areas immediately adjacent to the existing Highline Canal and the associated dirt access road. No special-status wildlife species were observed along the alignment of the portion of the proposed trail from the existing Highline Canal along the northwestern boundary of the study area to a northern access road. However, this area also contains coastal sage scrub and disturbed coastal sage scrub communities and, although not directly along the alignment, one least Bell's vireo territory, one California gnatcatcher occurrence, and one yellow-breasted chat occurrence were observed in the vicinity of the northern extent of the proposed walking trail during 2019 surveys. The property is currently closed to public use, so opening a walking trail would increase human use of the area. Noise from pedestrian use would be relatively minimal, and the northwestern boundary of the study area is already subject to considerable noise from truck traffic on the adjacent Bee Canyon Access Road. Nevertheless, pedestrians on the trail could indirectly impact special-status wildlife species and such impacts may occasionally be potentially significant. Implementation of mitigation measure MM BIO-5, prescribed in Section 6.0 below, would reduce impacts to a less than significant level.

Maintenance of the created riparian and upland habitat areas around the perimeter at the maximum fill level is expected to continue for up to 5 years after construction is complete for the proposed habitat areas to meet success criteria and provide good quality wildlife habitat. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. The riparian and upland habitat areas would be irrigated as needed from a main supply line installed around the perimeter of the reservoir that connects to the reservoir water source. When maintenance of the riparian and upland habitat areas involves vegetation removal (e.g., weeding) and cannot be scheduled outside of nesting season, such work could impact nesting special-status bird species, which could be potentially significant. Implementation of Mitigation Measure BIO-3, prescribed in Section 6.0 below, would reduce impacts to a less than significant level.

It is anticipated that a strip of opportunistic herbaceous vegetation and some woody riparian species may develop intermittently just below the reservoir's upper inundation limit during periods when the reservoir is not full. If a fringe of incidental vegetation occasionally arises during periods when the reservoir is partly drained, such intermittent vegetation would be purely incidental and would not be associated with the proposed riparian woodland and freshwater marsh that are intended to be established around the perimeter of the reservoir. Any temporary habitat values provided by adventive vegetation below the "rim" of the filled reservoir would not be subject to protection or maintenance and are expected to be very short-lived since soils would not be expected to retain sufficient moisture for extended periods when the water level drops. Also, adventive vegetation below the upper fill level would disappear whenever the reservoir is completely refilled. As any vegetation that may develop around the fringe of the reservoir would not be maintained and is not expected to persist since soils will dry out quickly, it is not likely that such vegetation would provide suitable habitat for special-status species. However, it is possible that special-status birds, such as least Bell's vireo, yellow warbler, or yellow-breasted

chat, could use such incidental fringe vegetation. Due to its operational requirements, it will not be practical, and IRWD will be under no obligation, to manage or protect such areas, and removal of such vegetation to avoid creating potential nesting habitat will not be considered a “new” impact as this area is not meant to be vegetated and should not provide potentially suitable nesting habitat that, if occupied, might interfere with operational requirements.

IRWD’s operations and maintenance of the expanded Syphon Reservoir may not be construed to result in a “take” of a listed species. Rather, any incidental vegetation that may be allowed to develop briefly during drawdown of the reservoir would be considered to be an unintended indirect benefit to special-status wildlife species.

With implementation of Mitigation Measures MM BIO-1, MM BIO-2, MM BIO-3, MM BIO-4, and MM BIO-5, impacts to special-status species would be less than significant.

5.2 Riparian Habitat or Sensitive Natural Communities

5.2.1 Significance Threshold

The project would not have a substantial adverse effect on riparian habitat or other sensitive natural communities identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.

5.2.2 Analysis of Project Effects

Table 3 summarizes the permanent and temporary impacts on natural communities from the proposed project (shown in **Figure 13**). Ten sensitive natural communities occur within the study area: arroyo willow thicket, black willow thicket, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/coyote brush scrub, chaparral bushmallow scrub/non-native herbaceous cover, California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coast prickly pear scrub, and non-native herbaceous cover/California sagebrush scrub (shown in **Figure 14**).

The proposed project would permanently impact 61.56 acres (with Treatment Facility Option A⁹)/61.68 acres (with Treatment Facility Option B) acres of sensitive natural communities, including 0.09 acre of arroyo willow thicket, 4.07 acres of black willow thicket, 0.77 acre of coyote brush scrub, 0.19 acre of chaparral bushmallow scrub, 0.06 acre of chaparral bushmallow scrub/non-native herbaceous cover, 27.22 acres (with Option A)/27.34 acres (with Option B) of California sagebrush scrub, 0.98 acre of California sagebrush scrub/non-native herbaceous cover, and 28.18 acres of non-native herbaceous cover/California sagebrush scrub. The proposed project would temporarily impact 0.85 acre of California sagebrush scrub. The proposed project would avoid 121.37 acres (with Option A)/121.25 acres (with Option B) of sensitive natural communities (including 0.15 acre of arroyo willow thicket, 0.06 acre of black willow thicket, 0.14 acre of coyote brush scrub, 0.26 acre of chaparral bushmallow scrub, all 0.49 acre of

⁹ The potential locations of the treatment facilities, which would be determined during detailed design, are depicted in Figures 13 and 14 (labeled as Treatment Facility Option A and Option B). Only one treatment facility in one of the optional locations will be built-out as part of the proposed project.

chaparral bushmallow scrub/coyote brush scrub, 4.66 acres of chaparral bushmallow scrub/non-native herbaceous cover, 64.52 acres [with Option A]/64.40 acres [with Option B] of California sagebrush scrub, 6.88 acres of California sagebrush scrub/non-native herbaceous cover, all 0.69 acre of coast prickly pear scrub, and 43.52 acres of non-native herbaceous cover/California sagebrush scrub within the study area.

TABLE 3
IMPACTS TO NATURAL COMMUNITIES

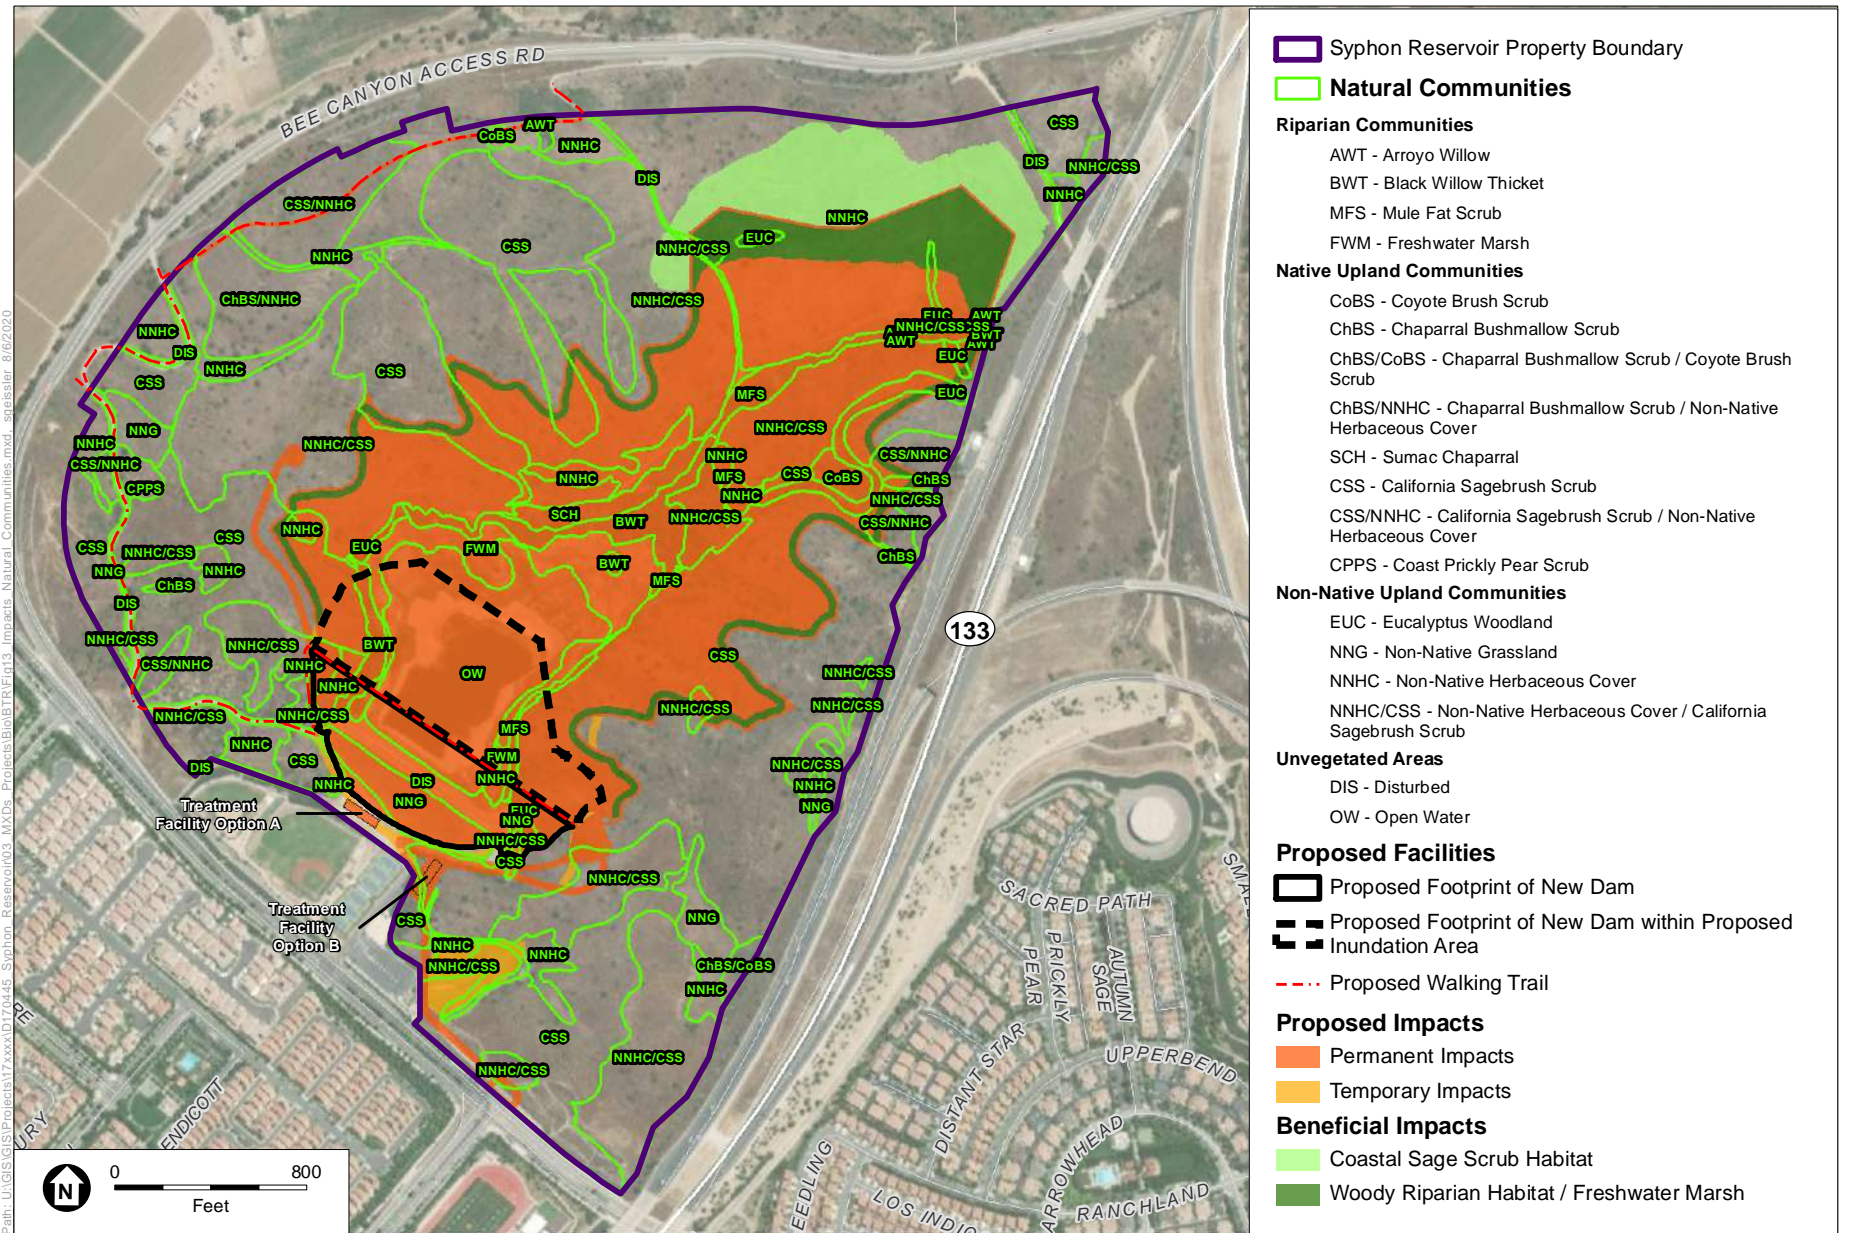

Natural Community	Existing (Acres)	Permanent Impacts (Acres)	Permanent Beneficial Impacts*** (Acres)	Temporary Impacts (Acres)	Total Impacts (Acres)	Avoided (Acres)

Syphon Reservoir Geotechnical Investigations Project

Figure 15B
Impacts to RWQCB Jurisdictional Areas

The proposed project would also create at least 6.58 acres of riparian woodland, and approximately 5.88 acres of additional woody riparian and/or freshwater marsh habitat. The proposed project would also potentially add more than 10 acres of coastal sage scrub habitat where it is planned to be restored on the slope that will be cut northeast of the proposed reservoir to make space for the on-site riparian/wetland habitat areas.

Impacts to sensitive natural communities that would result from the proposed project would be potentially significant. Implementation of mitigation measure MM BIO-6, prescribed in Section 6.0 below, would reduce impacts to a less than significant level.

In addition, a large portion of the study area contains riparian and freshwater marsh habitat as well as the open water associated with the existing reservoir, which are all considered to be subject to CDFW jurisdiction, which includes lakes, streams, and associated vegetation. The proposed project would temporarily impact 26.35 acres of CDFW jurisdictional lakes, streams, and associated vegetation, of which 0.05 acre would be considered a beneficial impact (i.e., the areas will be impacted to create riparian woodland or freshwater marsh habitat). **Table 4** summarizes the temporary impacts on CDFW jurisdictional riparian habitat from the proposed project (shown in **Figure 15A**). The proposed project would avoid 0.20 acre of CDFW jurisdictional lakes, streams, and associated vegetation within the study area. The proposed project would also create at least 6.58 acres of on-site riparian woodland and approximately 5.88 acres of additional on-site woody riparian and/or freshwater marsh habitat and enlarge the reservoir, which would expand the open water resources on-site. Thus, the proposed project would result in a beneficial impact, which would increase the amount of CDFW jurisdictional riparian habitat, and impacts would be less than significant. Because the proposed project will be altering a substantial area subject to CDFW jurisdiction, the proposed project must comply with MM BIO-7, prescribed in Section 6.0 below, to obtain a Streambed Alteration Agreement from CDFW.

TABLE 4
IMPACTS TO CDFW POTENTIALLY JURISDICTIONAL AREAS

Jurisdiction Types	Existing (Acres)	Permanent Impacts (Acres)	Permanent Beneficial Impacts* (Acres)	Temporary Impacts (Acres)	Total Impacts (Acres)	Avoided (Acres)
CDFW Lakes, Streams, and Associated Vegetation	26.55	26.30	0.05	-	26.35	0.20
Total	26.55	26.30	0.05	0.0	26.35	0.20

* Although these areas will be permanently impacted by the proposed project, they will have the beneficial effect of creating riparian and upland habitat areas on-site.

Maintenance of the created riparian/wetland habitat areas, which will include creation of sensitive riparian communities that include riparian habitat subject to CDFW regulatory jurisdiction, would be required for up to 5 years after construction is complete for the proposed habitat areas to meet success criteria and provide good quality wildlife habitat. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. The work will promote establishment of the habitat that will replace the existing riparian/wetland habitat area currently subject to CDFW jurisdiction. Reestablishing an equivalent or greater area of such habitat would be considered to have a beneficial impact as it would result in no net loss of CDFW jurisdictional area.

With implementation of Mitigation Measure MM BIO-6, impacts to sensitive natural communities would be less than significant and impacts to riparian habitat would be less than significant.

5.3 Jurisdictional Wetlands

5.3.1 Significance Threshold

The project would not have a substantial adverse effect on federal- or state-protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.

5.3.2 Analysis of Project Effects

In response to a request to review the resources on site as described in the delineation report, the USACE issued an Approved Jurisdictional Determination letter (Appendix B), which confirmed that waters of the U.S. do not occur within the study area since Syphon Reservoir is an intrastate isolated water with no apparent interstate or foreign commerce connection (USACE 2018). The CWA also excludes certain features from this regulation, including “wastewater recycling facility constructed on dry land” (see 33 CFR §230.3 (o)(2)(vii)). Thus, jurisdictional features identified are only subject to the jurisdiction of the State (i.e., wetlands and non-wetland waters of the State [discussed in this section below], and CDFW lakes, streams, and associated vegetation [previously discussed in Section 5.2 above]).

The proposed project would permanently impact 18.28 acres of wetlands and waters of the State (4.33 acres of wetlands, 13.95 acres of non-wetland waters of the State). **Table 5** summarizes the impacts on wetlands and waters of the State from the proposed project (shown in **Figure 15B**). The proposed project would also create 5.88 acres of freshwater marsh wetland habitat and enlarge the reservoir, which would expand the open water resources on-site. Thus, the proposed project would result in a beneficial impact, which would increase the amount of potential RWQCB jurisdictional wetlands and water of the State, and impacts would be less than significant.

TABLE 5
IMPACTS TO RWQCB POTENTIALLY JURISDICTIONAL AREAS

Jurisdiction Types	Existing (Acres)	Permanent Impacts (Acres)	Permanent Beneficial Impacts* (Acres)	Temporary Impacts (Acres)	Total Impacts (Acres)	Avoided (Acres)
Wetland Waters of the State	4.33	4.33	-	-	4.33	-
Non-Wetland Waters of the State	13.95	13.95	-	-	13.95	-
Total	18.28	18.28	0.0	0.0	18.28	0.0

* Although these areas will be permanently impacted by the proposed project, they will have the beneficial effect of creating riparian and upland habitat areas on-site.

Maintenance of the created wetland areas would be required for up to 5 years after construction is complete to ensure success of the vegetated areas. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. Operations and maintenance efforts to establish and maintain the proposed riparian/wetland habitat around the fringe of the future reservoir would avoid a net loss of areas subject to RWQCB jurisdiction and would therefore have a beneficial impact.

Impacts to wetlands and waters would be less than significant.

5.4 Wildlife Movement and Nursery Sites

5.4.1 Significance Threshold

The project could interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.

5.4.2 Analysis of Project Effects

The existing toll roads (SR-133 and SR-241) effectively stop most terrestrial wildlife movement from the study area to the west and Portola Parkway and dense suburban development also block most wildlife from proceeding to the south. Nevertheless, the study area lies at the southeastern edge of a large contiguous block of habitat that is an important element in the context of regional wildlife movement, particularly for avian species (e.g., dispersal habitat for coastal California gnatcatcher within this region). The reservoir is also one of several local water sources that attracts a number of avian species and provides habitat for migrating birds. Thus, the study area functions as a part of a wildlife movement corridor from a regional perspective, as well as providing live-in and movement habitat for a variety of species on a local scale.

The proposed project would temporarily drain the reservoir, which is used by a number of birds and other wildlife for water supply and foraging. IRWD already periodically drains the reservoir as part of its current normal operations; however, the reservoir will be drained until project completion. It should be noted that there is another nearby water feature, Rattlesnake Reservoir, which lies 1.1 miles to the north-northwest that could be utilized as a water source and for riparian habitat by migratory species moving through the region. The proposed project would impact 121.43 acres of natural communities during construction on-site, which could disrupt local movement and displace wildlife within the proposed project's footprint, particularly within the riparian habitats on-site. The proposed project would avoid 144.31 acres of natural communities; thus, displaced wildlife utilizing upland habitats can disperse to other upland areas on-site, and the impacted areas would not inhibit local or regional movement of wildlife within these avoided areas of the study area, though wildlife that is more sensitive to human disturbances and noise may be deterred by the nearby construction activities. Once completed, the enlarged reservoir will provide greater water storage capacity and an expanded open water area for migrating birds, and the proposed project will create at least 6.58 acres of on-site riparian woodland and approximately 5.88 acres of additional on-site woody riparian and/or freshwater marsh habitat that would be maintained to consistently provide habitat year-round, which would be a benefit to migratory species. In addition, approximately 10.47 acres of coastal sage scrub habitat would be created in an area northeast of the reservoir that currently exhibits predominantly low-value ruderal grassland. Therefore, with the creation of the on-site riparian and upland habitat, impacts to local movement are not expected to be significant. Thus, impacts to regional and local wildlife movement are considered less than significant, and no mitigation is required.

In addition, a walking trail is proposed along the northwestern boundary of the study area. The proposed walking trail traverses through coastal sage scrub and disturbed coastal sage scrub communities. The property is currently closed to public use, but a proposed walking trail would increase human use of the area. However, the level of activity and disturbance associated with people occasionally using the proposed trail would not impede local wildlife movement through the area. Thus, impacts would be less than significant and no mitigation is required.

Regarding the proposed project's potential to "impede the use of native wildlife nursery sites", to the extent mass grading and construction activities occur during the breeding season and in close proximity to active nests or suitable nesting habitat, the proposed project may have potentially significant direct impacts. Nesting activity typically occurs from February 15 to August 31 (or January 15 to June 31 for raptors). Active nests and eggs are protected under Fish and Wildlife Code Section 3503. Impacts to any active songbird or raptor nests would violate State law and may be considered potentially significant, particularly with regard to special status bird species. Implementation of mitigation measure MM BIO-3, prescribed in Section 6.0 below, would avoid violation of the Fish and Game Code and reduce potential impacts to special status birds to a less than significant level.

Maintenance of the created riparian and upland habitat areas would be required for up to 5 years after construction is complete for the proposed habitat areas to meet success criteria and provide good quality wildlife habitat. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year

for the subsequent two to three years. The riparian and upland habitat areas would be irrigated as needed from a main supply line installed around the perimeter of the reservoir that connects to the reservoir water source. When maintenance of the riparian and upland habitat areas involves vegetation removal (e.g., weeding) and cannot be scheduled outside of nesting season, such work could impact nesting bird species, which could be potentially significant. Implementation of Mitigation Measure BIO-3 would reduce impacts to a less than significant level.

With implementation of Mitigation Measures MM BIO-3, impacts to wildlife movement and nursery sites would be less than significant.

5.5 Local Policies, Ordinances, and Adopted Plans

5.5.1 Significance Threshold

The project would not conflict with one or more local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance, and/or would not conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

5.5.2 Analysis of Project Effects

The study area is within the Central Subregion of the County of Orange NCCP/HCP, and is located with the NCCP/HCP Reserve. IRWD is participating landowner and a signatory of the Central & Coastal Subregion NCCP/HCP. The NCCP/HCP included provisions for IRWD to build a future reservoir “as a permitted use within the Reserve System” (R.J. Meade Consulting 1996a). At the time that the NCCP/HCP was prepared, IRWD had identified and was considering four alternative seasonal recycled water storage reservoirs (including the Syphon Reservoir site), all of which were located within the subregional Reserve System, though only one reservoir would ultimately be needed. Thus, the need for a future reservoir was identified as “a permitted use within the Reserve System in the event that public health, safety, and welfare require such a facility in the future. At the time such a facility is needed, IRWD will review the plans with appropriate agencies and propose a specific mitigation plan or pay fees adequate to mitigate the Incidental Take associated with the new reservoir” (R.J. Meade Consulting 1996a).

The proposed Syphon Reservoir Improvement Project is a permitted use within the Reserve System. Compliance with specific conditions required for NCCP/HCP conditionally covered species (i.e., least Bell’s vireo) are discussed in Section 5.1. However, the removal of coastal sage scrub communities would be considered potentially significant. Implementation of mitigation measures MM BIO-1 and MM BIO-2, prescribed in Section 6.0 below, would reduce impacts to a less than significant level.

Maintenance of the created upland habitat areas would be required for up to 5 years after construction is complete to ensure success of the vegetated areas. Approximately 2 crews of 6 workers each would be required 40 days per year for the first two years, with level of effort tapering off to one crew 30 days per year for the subsequent two to three years. The upland habitat areas would be irrigated from a main supply line installed around the perimeter of the

reservoir that connects to the reservoir water source. When maintenance of the riparian and upland habitat areas involves vegetation removal (e.g., weeding) and cannot be scheduled outside of nesting season, such work could impact nesting special-status bird species, which could be potentially significant. Implementation of Mitigation Measure BIO-3 would reduce impacts to a less than significant level, and thus would not conflict with the provisions of the Central & Coastal Subregion NCCP/HCP.

With implementation of Mitigation Measures MM BIO-1, MM BIO-2, and MM BIO-3, the project would not conflict with the provisions of any local policies or ordinances protecting biological resources or any adopted NCCP/HCPs.

6.0 Mitigation Measures

To minimize and avoid significant impacts to sensitive biological resources as a result of proposed project implementation, the following mitigation measures are recommended.

6.1 Measures to Mitigate Potentially Significant Impacts to Special-Status Species

MM BIO-1: IRWD has been engaged in close coordination with the Wildlife Agencies (i.e., USFWS and CDFW) since 2018 to develop a multi-faceted mitigation strategy to address impacts to California gnatcatcher, as well as to address the additional mitigation the agencies mandate to compensate for displacement of habitat and land previously set aside for mitigation and subject to the restrictions and requirements imposed under the Mitigation Grant Deed, of which USFWS is a third party beneficiary. To date, IRWD has researched numerous off-site lands with high value habitat and biological resources, and initiated negotiations with landowners for possible acquisition. IRWD shall implement one, or a combination, of the following measures to mitigate permanent impacts to special-status wildlife species:

- a. Use of Incidental Take Credits for participating landowners (within the Reserve, or outside of the Reserve) to offset permanent impacts to coastal sage scrub (e.g., California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/non-native herbaceous cover, and non-native herbaceous cover/California sagebrush scrub) at a 1:1 impact-to-mitigation ratio.
- b. On- and/or off-site creation, restoration, and/or enhancement containing natural communities suitable for special-status species or comparable, as determined acceptable by the USFWS and CDFW.
- c. Off-site land acquisition, preservation, creation, restoration, and/or enhancement containing natural communities suitable for special-status species or comparable, as determined acceptable by the USFWS and CDFW.
- d. Areas where temporary impacts occur would be returned to pre-project conditions (i.e., pre-project elevation contours and revegetated with native upland scrub species) within one-year after construction is completed, and will be monitored for three years, or until a qualified biologist determines that the project site has returned to pre-project conditions. A revegetation plan would be prepared to re-seed/re-plant the area

with local species, and would include performance standards, success criteria, maintenance, and future monitoring.

MM BIO-2: IRWD will implement the following:

- a. In accordance with the NCCP/HCP, certain construction-related mitigation measures are required to minimize impacts to the coastal California gnatcatcher and other coastal sage scrub species. The removal of coastal sage scrub communities will be conducted in compliance with the NCCP/HCP's Construction Related Minimization Measures:
 1. To the maximum extent practicable, no grading of coastal sage scrub habitat that is occupied by nesting gnatcatchers will occur during the breeding season (February 15 through July 15).
 2. Prior to the commencement of grading operations or other activities involving significant soil disturbance, all areas of coastal sage scrub habitat to be avoided under the provisions of the NCCP/HCP shall be identified with temporary fencing or other markers clearly visible to construction personnel. Additionally, prior to the commencement of grading operations or other activities involving disturbance of coastal sage scrub, a survey will be conducted to locate gnatcatchers and cactus wrens within 100 feet of the outer extent of projected soil disturbance activities and the locations of any such species shall be clearly marked and identified on the construction/grading plans.
 3. A monitoring biologist, acceptable to USFWS/CDFW, will be on-site during any clearing of coastal sage scrub. IRWD will advise USFWS/CDFW at least seven calendar days (and preferably fourteen calendar days) prior to the clearing of any habitat occupied by Identified Species¹⁰ to allow USFWS/CDFW to work with the monitoring biologist in connection with bird flushing/capture activities. The monitoring biologist will flush Identified Species (avian or other mobile Identified Species) from occupied habitat areas immediately prior to brush-clearing and earth-moving activities. If birds cannot be flushed, they will be captured in mist nets, if feasible, and relocated to areas of the site to be protected or to the NCCP/HCP Reserve System. It will be the responsibility of the monitoring biologist to assure that Identified bird species will not be directly impacted by brush-clearing and earth-moving equipment in a manner that also allows for construction activities on a timely basis.
 4. Following the completion of initial grading/earth moving activities, all areas of coastal sage scrub habitat to be avoided by construction equipment and personnel will be marked with temporary fencing and other appropriate markers clearly visible to construction personnel. No construction access, parking, or storage of equipment or materials will be permitted within such marked areas.
 5. In areas bordering the NCCP Reserve System or Special Linkage/Special Management areas containing significant coastal sage scrub identified in the NCCP/HCP for protection, vehicle/equipment transportation routes and staging areas will be restricted to a minimum number during construction consistent with

¹⁰ NCCP/HCP Identified Species that occur, or have potential to occur, on-site include the following: coastal California gnatcatcher, coastal cactus wren, orange-throated whiptail, coastal western whiptail, red-diamond rattlesnake, coast horned lizard, northern harrier, sharp-shinned hawk, prairie falcon, American peregrine falcon, red-shouldered hawk, southern California rufous-crowned sparrow, San Diego desert woodrat, gray fox, and coyote.

project construction requirements. Waste dirt or rubble will not be deposited on adjacent coastal sage scrub identified in the NCCP/HCP for protection. Pre-construction meetings involving the monitoring biologist, construction supervisors, and equipment operators will be conducted and documented to ensure maximum practicable adherence to these measures.

6. Coastal sage scrub identified in the NCCP/HCP for protection and located within the likely dust drift radius of construction areas shall be periodically sprayed with water to reduce accumulated dust on the leaves as recommended by the monitoring biologist.

MM BIO-3: Impacts to nesting birds would be avoided by conducting all clearing and grubbing outside of the bird nesting season (i.e., work should occur September 1 to February 14, or July 1 to January 14 for raptors). If clearing and grubbing cannot avoid the bird nesting season, the following measures would be implemented:

- a. Prior to work during the bird nesting season (February 15 to August 31, or January 15 to June 31 for raptors), a qualified biologist should conduct a pre-construction survey of all suitable habitat for the presence of nesting birds no more than 7 days prior to construction and/or maintenance activities. The results of the pre-construction survey would be valid for 7 days; if vegetation removal activities do not commence within 7 days following the survey, a new pre-construction nesting bird survey should be conducted before these activities begin again. If no active nests are found, then no further mitigation is required.
- b. If any active nests are found during a pre-construction nesting bird survey, a buffer of 300 feet (500 feet for raptors), or as determined appropriate by the qualified biologist (based on species-specific tolerances and site-specific conditions) in consultation with IRWD, would be delineated, flagged, and avoided until the nesting cycle is complete (i.e., the qualified biologist determines that the young have fledged or the nest has failed). The qualified biologist may also recommend other measures to minimize disturbances to the nest, which may include, but are not limited to, erection of sound barriers (e.g., noise blankets), erection of visual barriers (e.g., hay bales), or full-time monitoring by a qualified biologist.

MM BIO-4: With the creation of on-site riparian and wetland habitat areas, as part of the proposed project, there will be no net loss of woody riparian habitat for least Bell's vireo and no net loss of any wetland habitat. Nevertheless, there will be a temporary loss of these habitats until construction is completed and riparian habitat can be reestablished that the species can use again. IRWD is engaged with the Wildlife Agencies and is collaboratively developing a comprehensive program to address temporal impacts to least Bell's vireo and other riparian-associated special-status wildlife species (e.g., yellow warbler, yellow-breasted chat). IRWD shall implement the following measure to compensate for impacts to least Bell's vireo and associated riparian special-status wildlife species (e.g., yellow warbler, yellow-breasted chat):

- a. Off-site land acquisition and preservation, and/or creation, restoration, and/or enhancement, of areas containing habitat suitable for least Bell's vireo and associated riparian special-status wildlife species (e.g., yellow warbler, yellow-breasted chat) to compensate for temporal loss in an amount or at a ratio determined acceptable by the USFWS and CDFW. Any private lands acquired and/or restored for this mitigation would be permanently preserved and dedicated for habitat conservation.

MM BIO-5: IRWD shall implement the following measure to mitigate indirect impacts to special-status wildlife species:

- a. Educational signage shall be posted at the entrances of the proposed walking trail to inform the public about the sensitive biological resources in the area and local wildlife in the area (e.g., rattlesnakes, coyotes). Signage would also be posted periodically along the proposed trail to remind public to keep on the trail and out of sensitive habitat areas.
- b. The proposed trail shall only be open during daylight hours (e.g., dawn to dusk).
- c. A Resource Management Plan (RMP) shall be prepared to outline long-term maintenance and management responsibilities for the preservation of the biological resources on-site (e.g., invasive species management, monitoring access issues, off-trail use, erosion, trash). The RMP should also provide guidance to ensure that all operations and maintenance activities performed on-site must also comply with all applicable requirements of the NCCP/HCP and the preservation of the biological resources on-site. The RMP would also outline monitoring requirements for species populations for federal and state-listed species (i.e., least Bell's vireo and California gnatcatcher).

6.2 Measures to Mitigate Potentially Significant Impacts to Riparian Habitat and Sensitive Natural Communities

MM BIO-6: IRWD shall implement one, or a combination, of the following measures to mitigate impacts to sensitive natural communities:

- a. Use of Incidental Take Credits for NCCP/HCP participating landowners (within the Reserve, or outside of the Reserve) to offset permanent impacts to coastal sage scrub (e.g., California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/non-native herbaceous cover, and non-native herbaceous cover/California sagebrush scrub) at a 1:1 impact-to-mitigation ratio.
- b. On- and/or off-site land acquisition and preservation, and/or creation, restoration, and/or enhancement of sensitive natural communities comparable or equivalent to a 1:1 impact-to-mitigation ratio, as determined acceptable by the USFWS and CDFW.
- c. Areas where temporary impacts occur to sensitive natural communities (e.g., California sagebrush scrub) would be returned to pre-project conditions (i.e., pre-project elevation contours and revegetation initiated) within one-year after the construction is completed, and will be monitored for three years, or until a qualified biologist determines that affected natural communities have been restored to equivalent or better condition as compared to pre-project conditions. A revegetation plan would be prepared to re-seed/re-plant the area with locally indigenous native species, and would include performance standards, success criteria, maintenance, and future monitoring.

MM BIO-7: IRWD shall negotiate and execute a Lake or Streambed Alteration Agreement under Section 1602 of the California Fish and Game Code with CDFW.

Section 1

Introduction

1.1 Introduction and Purpose

Environmental Science Associates (ESA) conducted a jurisdictional delineation for the Irvine Ranch Water District's (IRWD) Syphon Reservoir Improvement Project (project). The study area includes approximately 266 acres of the Syphon Reservoir property, including 241 acres of deed-restricted parcels within the Central and Coastal Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) reserve boundary. The purpose of conducting a jurisdictional delineation in the study area was to determine the location and size of the areas defined as waters of the United States, waters of the State, and habitats subject to the California Department of the Fish and Wildlife's (CDFW) jurisdiction. The collected data will be used to determine which jurisdictional regulations apply and to calculate project impacts to jurisdictional waters and habitat during the permitting process. The results from this analysis will be used to prepare any necessary permits from the regulatory agencies.

IRWD is seeking to expand the recycled water storage capacity of Syphon Reservoir to meet the demand of its recycled water customers, enhance IRWD's water supply reliability, and reduce the need for imported water. The total storage capacity of Syphon Reservoir would be expanded from 500 acre-feet to approximately 5,000 acre-feet by raising the existing dam. In addition to an expanded dam footprint and inundation level up to the 456-foot elevation, the project would include infrastructure facilities constructed between the toe of the new dam and the IRWD property boundary, as well as roadways in order to connect the reservoir with the recycled water system.

1.2 Study Area Location

Syphon Reservoir is located in the northern portion of Irvine, California, within IRWD's service area, within Orange County, California, as shown on **Figure 1-1**. Syphon Reservoir is a 60-year-old facility historically used to store irrigation water supplies. Currently, the reservoir functions as a seasonal storage facility within the IRWD recycled water system.

The study area is within the El Toro U.S. Geological Survey 7.5-minute quadrangle map and within the land grant Lomas de Santiago (**Figure 1-2**). Coordinates for the study area are: 33°43'0.10"N, 117°43'20.83"W for the northeast corner and 33°42'41.00"N, 117°44'7.85"W for the southwest corner.

Section 2

Environmental Setting

2.1 Wetland Delineation Study Area

The 266-acre study area was historically part of the Irvine Ranch and was initially subject to disturbance in the 1940s for construction of the reservoir to provide irrigation for agricultural lands. Irvine Ranch Water District purchased the reservoir and surrounding land in 2010 for the purpose of storing recycled water. In 2014, IRWD completed a project which integrated the existing capacity of the reservoir into its recycled water system as a small storage facility for recycled water, with the intent of increasing storage capacity in the future. Syphon Reservoir is currently a recycled water storage reservoir surrounded by sensitive upland, wetland, and riparian vegetation communities. The IRWD property surrounding the reservoir has been the subject of previous habitat restoration and mitigation activity as part of state and federal regulatory approvals and is within the reserve boundary of the NCCP/HCP. Consistency with the NCCP/HCP is discussed in Syphon Reservoir Environmental Regulatory Evaluation Preliminary Draft (Dudek, 2012).

2.2 Soils

Based on review of the Natural Resources Conservation Services (NRCS) web soil survey, the study area contains 16 soil series (**Figure 2-1**) (NRCS, 2017). The following is a brief description of mapped soils within the study area underlain by potential waters of the U.S.:

Soper gravelly loam, 30 to 50 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is mildly alkaline to slightly acidic. The profile consists of gravelly loam in the first 8 inches, gravelly clay loam between 8 and 29 inches, and bedrock from 29 to 79 inches. Soper gravelly loam is not considered hydric by the Natural Resources Conservation Service (NRCS) (NRCS, 2016).

Botella clay loam, 2 to 9 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is slightly alkaline to moderately acidic. The profile consists of clay loam in the first 8 inches, silty clay loam between 8 and 35 inches, and clay loam from 35 to 66 inches. Botella clay loam is not considered hydric by the NRCS (NRCS, 2016).

Cieneba sandy loam, 30 to 75 percent slopes, is a somewhat excessively drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is neutral to strongly acidic. The profile consists of sandy loam in the first 17 inches and weathered bedrock between 17 and 59 inches. Cieneba sandy loam is not considered hydric by the NRCS (NRCS, 2016).

SOURCE: ESRI, 2016; USDA, 2018

IRWD Syphon Reservoir

Figure 2-1
Soils

Capistrano sandy loam, 9 to 15 percent slopes, is a well-drained soil that is unlikely to pond or flood with an average depth of over 80 inches to the water table. The soil is neutral to medium acidic. The profile consists of sandy loam in the first 27 inches and fine sandy loam between 27 and 65 inches. Capistrano sandy loam is not considered hydric by the NRCS (NRCS, 2016).

2.3 Hydrology

Syphon Reservoir's total basin area is approximately 205 acres within the central drainage and reservoir area. A culvert inlet in the northeast portion of the study area conveys stormwater runoff from a portion of the open space area east of the reservoir (under SR-133 and SR-241). The central drainage supports riparian habitat and conveys intermittent flow through the center of the study area to the reservoir. In addition, multiple culverts within the study area drain the upland portions of the reservoir.

With the exception of limited seasonal inflows from rain events, IRWD controls all flows in and out of the reservoir, as part of their recycled water storage and management. Following construction of the dam in the 1940s, impounded water accumulated from direct runoff from the Highline Canal. Currently, within the study area, a portion of the Highline Canal conveys periodic recycled water overflows from IRWD's Rattlesnake Reservoir into Syphon Reservoir. The Highline Canal located southwest of the Syphon Reservoir was historically used for irrigation but has been abandoned. The reservoir currently drains through a series of underground pipes that convey flows through a strainer and chlorination facility, before getting distributed to customers through IRWD's recycled water system.

2.4 Vegetation Communities

The study area is dominated by California sagebrush alliance and non-native herbaceous cover/California sagebrush alliance (i.e., communities intermixed with both native and non-native species) in the upland areas, and arroyo willow thicket within the riparian areas immediately adjacent to open water within the reservoir. Vegetation communities are mapped in **Figure 2-2**.

Acreages of each vegetation community in the study area are summarized in **Table 2-1**, and are listed according to the Orange County Habitat Classification System (Gray and Bramlet, 1992) and California vegetation alliances (Sawyer et al., 2009). Vegetation communities considered a special-status vegetation community by CDFW as listed in the California Natural Community List (CDFW, 2018) are also identified with an asterisk. Vegetation communities that are habitat type under the Central and Coastal Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) and also considered a special-status vegetation community are identified with a double asterisk.

**TABLE 2-1
VEGETATION COMMUNITIES**

Vegetation Community	Acres	State Rank¹
Arroyo Willow Thicket*	0.24	S4
Black Willow Thicket*	6.28	S3
Mule Fat Scrub	2.55	S4
Freshwater Marsh	6.62	S4
Coyote Brush Scrub	0.90	S5
Chaparral Bushmallow Scrub	0.45	S4
Chaparral Bushmallow Scrub/Coyote Brush Scrub	0.49	S4/S5
Chaparral Bushmallow Scrub/Non-Native Herbaceous Cover	4.72	S4/None
Laurel Sumac Scrub	9.20	S4
Lemonadeberry Scrub*	0.15	S3
California Sagebrush Scrub**	85.50	S5
California Sagebrush Scrub**/Non-Native Herbaceous Cover	7.86	S5/None
Coast Prickly Pear Scrub*	0.69	S3
Eucalyptus Woodland	2.78	None
Non-Native Grassland	5.27	None
Non-Native Herbaceous Cover	44.27	None
Non-Native Herbaceous Cover/California Sagebrush Scrub	66.61	None/S5
Non-Native Herbaceous Cover/Laurel Sumac Scrub	1.02	None/S4
Open Water	13.21	None
Disturbed	6.93	None
Grand Total	265.74	

* Asterisk indicates that an alliance/association is considered special-status by CDFW.

** Double asterisk indicates that an alliance/association that is a covered habitat type under the NCCP/HCP and is therefore considered a special-status vegetation community.

¹ CDFW state rank denotes the rarity of a vegetation type within the state as follows:

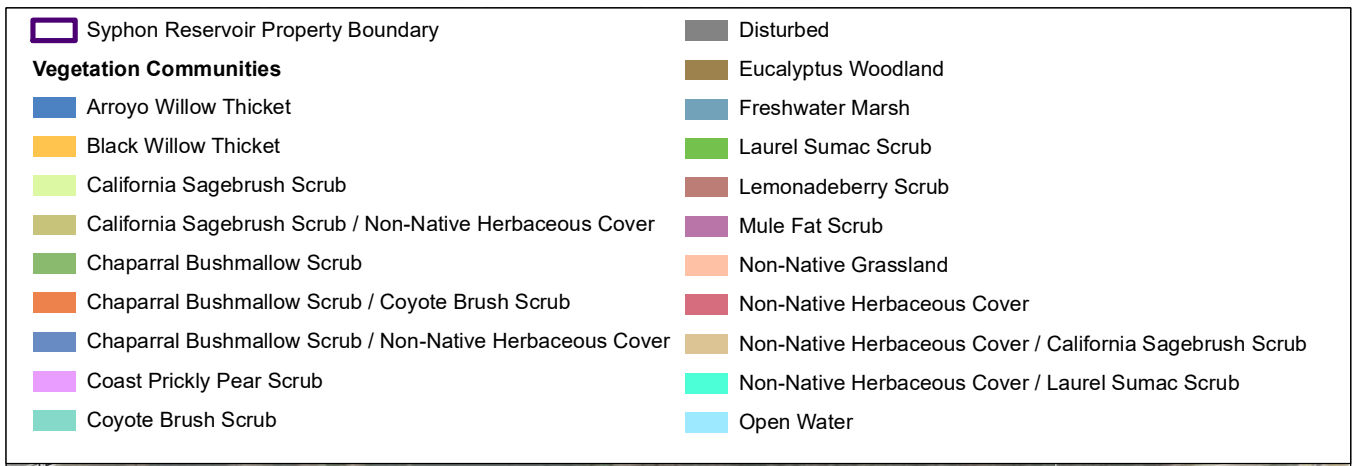

S1 = Critically Imperiled – At very high risk of extirpation due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.

S2 = Imperiled – At high risk of extirpation due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.

S3 = Vulnerable – At moderate risk of extirpation due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.

S4 = Apparently Secure – At a fairly low risk of extirpation due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.

S5 = Secure - At very low or no risk of extirpation due to a very extensive range, abundant populations or occurrences, with little to no concern from declines or threats.

Vegetation Communities

Section 3

Regulatory Framework

3.1 Waters of the U.S.

The U.S. Army Corps of Engineers (USACE) and the Environmental Protection Agency (EPA) have issued a set of guidance documents detailing the process for determining Clean Water Act (CWA) jurisdiction over waters of the United States (waters of the U.S.) following the 2008 Rapanos decision. The EPA and USACE issued a summary memorandum of the guidance for implementing the Supreme Court’s decision in Rapanos that addresses the jurisdiction over waters of the United States under the CWA. The complete set of guidance documents, summarized as key points below, were used to collect relevant data for evaluation by the EPA and the USACE to determine CWA jurisdiction over the project and to complete the “significant nexus test” as detailed in the guidelines.

The significant nexus test includes consideration of hydrologic and ecologic factors. For circumstances such as those described in point (B) below, the significant nexus test would take into account physical indicators of flow (evidence of an ordinary high water mark [OHWM]), if a hydrologic connection to a Traditionally Navigable Water (TNW) exists, and if the aquatic functions of the water body have a significant effect (more than speculative or insubstantial) on the chemical, physical, and biological integrity of a TNW. The USACE and EPA will apply the significant nexus standard to assess the flow characteristics and functions of the tributary drainage to determine if it significantly affects the chemical, physical, and biological integrity of the downstream TNW.

Based on the 2003 joint legal memorandum signed by General Counsels of EPA and the Department of the Army regarding the Supreme Court’s decision in *Solid Waste Agency of Northern Cook County vs. United States Army Corps of Engineers*, 531 U.S. 159 (2001) (‘SWANCC’), geographically isolated waters, including wetlands, are generally not considered to be jurisdictional under the CWA because they lack links to interstate commerce. However, for each specific request for isolated waters (i.e., approved jurisdictional determination), the USACE and EPA will need to make a case by case determination on the jurisdictional status of the resource.

Rapanos Key Points Summary

- (A) The USACE and EPA will assert jurisdiction over the following waters:
- TNWs.
 - Wetlands adjacent to TNW.

- Non-navigable tributaries of TNWs that are relatively permanent.
 - Where the tributaries typically flow year-round or have continuous flow at least seasonally (e.g., typically three months).
 - Wetlands that directly abut such tributaries.
- (B) The USACE and EPA will decide jurisdiction over the following waters based on a fact-specific analysis to determine whether they have a significant nexus with a TNW:
- Non-navigable tributaries that are not relatively permanent.
 - Wetlands adjacent to non-navigable tributaries that are not relatively permanent.
 - Wetlands adjacent to but that do not directly abut a relatively permanent non-navigable tributary.
- (C) The USACE and EPA generally will not assert jurisdiction over the following features:
- Swales or erosion features (e.g., gullies, small washes characterized by low volume, infrequent, or short duration flow).
 - Ditches (including roadside ditches) excavated wholly in and draining only uplands and that do not carry a relatively permanent flow of water.

3.2 Waters of the State

Most projects involving water bodies or drainages are regulated by the Regional Water Quality Control Board (RWQCB), the principal State agency overseeing water quality of the State at the local/regional level. The study area is located within the jurisdiction of the Santa Ana RWQCB. The State Water Resources Control Board (State Water Board) directly regulates multi-regional projects and supports the Section 401 certification and wetlands program statewide. The RWQCB regulates activities pursuant to Section 401(a)(1) of the federal CWA, which specifies that certification from the State is required for any applicant requesting a federal license or permit to conduct any activity including but not limited to the construction or operation of facilities that may result in any discharge into navigable waters. The certification shall originate from the State or appropriate interstate water pollution control agency in/where the discharge originates or will originate. Any such discharge will comply with the applicable provisions of Sections 301, 302, 303, 306, and 307 of the CWA.

Absent any federal jurisdiction pursuant to Section 404 of the CWA, the RWQCB regulates discharges under the Porter-Cologne Water Quality Control Act primarily through issuance of NPDES permits for point source discharges and waste discharge requirements (WDRs) for non-point source discharges. Anyone discharging or proposing to discharge materials that could affect water quality (other than to a community sanitary sewer system regulated by an NPDES permit) must file a report of waste discharge. The Porter-Cologne Water Quality Control Act applies to the project since grading, filling, and other construction-related activities could affect the water quality of waters of the State.

3.3 Lakes, Streams, and Associated Vegetation

Pursuant to Division 2, Chapter 6, Section 1602 of the Fish and Game Code, California Department of Fish and Wildlife (CDFW) regulates all diversions, obstructions, or changes to the natural flow or bed, channel or bank of any river, stream, or lake which supports fish or wildlife. A notification of a Lake or Streambed Alteration Agreement must be submitted to CDFW for “any activity” that may substantially change the bed, channel, or bank of any river, stream, or lake.” In addition, CDFW has jurisdiction over wetland and riparian habitats associated with watercourses. The CDFW reviews proposed actions, and if necessary, submits to the applicant a proposal that includes measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by CDFW and the applicant is the Lake or Streambed Alteration Agreement (LSAA).

Section 4

Methodology

4.1 Database and Literature Review

Prior to conducting the jurisdictional delineation, ESA conducted a review of available background information pertaining to Syphon Reservoir, geography, and topography. The following resources were also reviewed or used prior to the field surveys:

Natural Resources Conservation Service's (NRCS) *Web Soil Survey*, queried to determine the soils mapped in the study area (NRCS, 2017);

Hydric Soils List of California, 2016 (2018);

El Toro, CA USGS 7.5-minute topographic quadrangle maps;

Color aerial photography for vegetative, topographic, and hydrologic features (Google Earth, 2017);

The National Wetlands Inventory (U.S. Department of the Interior, 2018); and

Preliminary Draft Syphon Reservoir Environmental Regulatory Evaluation (Dudek, 2012).

Habitat Classification System, Natural Resources, Geographic Information System (GIS) Project (Gray and Bramlet, 1992).

Site maps were generated with available aerial photographs, and potentially jurisdictional features were identified and marked with lines and global positioning system (GPS) coordinates to assist in field verification.

4.2 Field Survey Methods

ESA biologists May Lau and Tommy Molioo conducted a site visit on April 24, 2018, to evaluate potentially jurisdictional features within the study area. The limits of potential jurisdictional features were recorded in the field within accessible areas using aerial maps and a hand-held GPS with sub-foot accuracy. Vegetation communities were described using *A Manual of California Vegetation, Second Edition* (Sawyer et al., 2009).

Delineating Waters of the U.S.

The delineation used the “Routine Determination Method” as described in the *1987 Corps of Engineers Wetland Delineation Manual* (Environmental Laboratory, 1987), hereafter called the “1987 Manual.” The 1987 Manual was used in conjunction with the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (U.S. Army Corps of Engineers, 2008), hereafter called the “Arid West Supplement.” For areas where the 1987 Manual and the Arid West Supplement differ, the Arid West Supplement was followed. Wetlands and waters were classified using commonly accepted habitat types; however, the Cowardin classification (Cowardin et al., 1979) of each feature type is noted in the discussion in Chapter 5.

Wetlands

To determine the extent of potential jurisdictional wetlands on a project site, the Corps of Engineers *Wetlands Delineation Manual* (USACE, 1987) and *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE, 2008b) was used as a guide for identifying wetland characteristics.

Three positive wetland parameters must normally be present for an area to be considered a wetland: 1) a dominance of wetland vegetation, 2) presence of hydric soils, and 3) presence of wetland hydrology. Presence or absence of positive indicators for wetland vegetation, soils and hydrology was assessed per the 1987 Manual and Arid West Supplement guidelines. Data points were taken within suspected wetlands and a paired point was taken (where applicable) in nearby uplands. Data points were recorded on Arid West wetland determination data forms. Data forms are provided in **Appendix A**.

At each data point, a visual assessment of the dominant plant species within a 6-foot radius was made. Dominant species were assessed using the recommended “50/20” rule per the Arid West Supplement. Plants were identified to species using the *The Jepson manual: Vascular plants of California, second edition* (Baldwin et al., 2012). The *Arid West 2016 Regional Wetland Plant List* (Lichvar et al., 2016) was used to determine the wetland indicator status of all plants. Hydric soils were identified using soil indicators presented in the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0)* (USACE 2008b) and the *Field Indicators of Hydric Soils in the United States, Version 7.0, 2010* (NRCS 2010). Soils at each data point were characterized by color, texture, organic matter accumulation, and the presence or absence of hydric soil indicators. The coloration of the soil samples, matrix, and mottles is assessed using the *Munsell Soil Color Charts* (Munsell, 2000). Presence of wetland hydrology was determined at each data point by presence of one or more of the primary and/or secondary indicators, per guidance of the Arid West Supplement.

Other Waters of the U.S.

Federal jurisdiction over a non-wetland waters of the U.S. extends to the ordinary high-water mark (OHWM), defined in 33 C.F.R. § 328.3 as the line on the shore established by fluctuations of water and indicated by physical characteristics such as a clear, natural line impressed on the bank, shelving, changes in the character of the soil, destruction of terrestrial vegetation, or the

presence of litter and debris. In the Arid West region of the United States, waters are variable and include ephemeral/intermittent and perennial channel forms. The most problematic ordinary high-water (OHW) delineations are associated with the commonly occurring ephemeral/intermittent channel forms that dominate the Arid West landscape. Delineation methods were completed in accordance with *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE, 2008a), and the *Updated Datasheet for the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE, 2010).

Delineating Waters of the State

Waters of the State have been delineated using the same methodology as waters of the U.S.

Delineating Lakes, Streams, and Associated Vegetation

Potential CDFW-jurisdictional waters were delineated by the top of the bank of a stream, and the outer dripline of riparian vegetation or wetlands supported by the lake or stream.

4.3 Mapping and Acreage Calculations

All features, including data points, wetland boundaries, and channels were recorded using a GPS unit (Trimble GeoXT) with real-time differential correction and an instrument-rated mapping accuracy of +/- 1 meter, or were delineated on aerial photography using Geographic Information System (GIS) software (ArcGIS 10.2) and site-specific topographic data and aerial imagery.

In the office, data from data points and wetland boundaries were downloaded from the GPS unit and mapped using GIS software on an overlay of topographic contours and geo-referenced aerial photography. GPS-determined wetland boundaries and data points were visually confirmed. Acreage of wetland and waters of the U.S. polygons, and the length of linear features were determined using ArcGIS.

Section 5

Results and Conclusions

The results of the database/literature review and jurisdictional delineation are discussed in this section. Representative photographs from the field delineation are located in **Appendix B**.

This jurisdictional delineation identified 18.28 acres of potentially jurisdictional waters of the U.S., subject to jurisdiction under Section 404 of the CWA. Potentially jurisdictional features include 4.33 acres of wetlands and 13.95 acres of other waters of the U.S. Potentially jurisdictional features within the study area include Syphon Reservoir, riverine and wetland habitats. **Table 5-1** provides the total extent of potentially jurisdictional wetlands and waters of the U.S. within the study area. Potentially jurisdictional features are depicted in detailed maps provided in **Figure 5-1** and **Figure 5-2**. Each type of wetland and other waters is described in greater detail in Section 5.1.

**TABLE 5-1
POTENTIALLY JURISDICTIONAL WATERS OF THE U.S. IN THE STUDY AREA**

Feature Type	Cowardin Classification	Extent	
		Linear feet	Area (acres)
Wetland Waters of the U.S.			
Wetlands	Palustrine emergent wetlands (semipermanently flooded)	N/A	4.33
Total Wetlands			4.33
Other Waters of the U.S.			
Reservoir	Palustrine (diked/impounded, permanently flooded)	N/A	13.93
Drainage 1	Riverine (ephemeral)	243	0.01
Drainage 2	Riverine (ephemeral)	201	0.01
Total Other Waters		444	13.95
Total Waters of the U.S./State		444	18.28

NOTE: Area subtotals subject to rounding.

5.1 Potentially Jurisdictional Wetlands

The following is a discussion of those areas identified to be potentially jurisdictional wetland waters of the U.S., based upon observations or inferences of wetland hydrology, soils, and vegetation.

Wetlands

The freshwater wetlands within the study area are classified as *Palustrine Emergent Wetlands, Semipermanently Flooded* according to the Cowardin classification system (Cowardin et al., 1979). These are areas that become at least partially inundated all year, support facultative (or wetter) annual plants, and are located along the edges of the reservoir. Data points that correspond with freshwater wetland are DP2, DP3, DP5, DP8, and DP10. Corresponding upland points are DP1, DP4, DP6, DP7, and DP9.

The wetlands are largely dominated by native plant species including California bulrush (*Schoenoplectus californicus*, OBL¹), black willow (*Salix gooddingii*, FACW²), and yellow sweet clover (*melilotus officinalis*, FACU³). This habitat also supports a range of non-native plant species including seaside heliotrope (*Heliotropium curassavicum*, FACU), spiny cocklebur (*Xanthium spinosum*, FACU), short podded mustard (*Hirschfeldia incana*, UPL⁴), and telegraph weed (*Heterotheca grandiflora*, UPL).

The wetlands occur along the margins of Syphon Reservoir (see Figures 2-2 and 5-1). Although not mapped as hydric soils according to NRCS, hydric soil indicators observed in the wetlands include the presence of muck (A9), hydrogen sulfide (A4), depleted below dark surface (A11), redox dark surface (F6), and sandy gleyed matrix (S4). The wetland areas generally had very silty loam, clay soils, while sandy soils were encountered at DP8. Indicators of wetland hydrology include a high water table (A2), saturation (A3), biotic crust (B12), and hydrogen sulfide odor (C1).

5.2 Potentially Jurisdictional Other Waters of the U.S.

Following is a discussion of those areas identified to be potentially jurisdictional waters of the U.S., based upon observations or inferences of wetland hydrology, soils, and vegetation.

-
- ¹ OBL – obligate. Plant species with this wetland indicator status occur almost always under natural conditions in wetlands.
 - ² FACW – facultative wetland. Plant species with this wetland indicator status usually occur in wetlands but are occasionally found in non-wetlands.
 - ³ FACU – facultative upland. Plant species with this wetland indicator status usually occur in non-wetlands but are occasionally found in wetlands.
 - ⁴ UPL – upland. Plant species with this wetland indicator status occur in wetlands in another region, but occur almost always under natural conditions in non-wetlands in the Arid West Region.

IRWD Syphon Reservoir

Figure 5-2
Jurisdictional Delineation Map – Potential CDFW Jurisdiction

Reservoir

Syphon Reservoir is considered *Lacustrine* habitat according to the Cowardin classification system (Cowardin et al., 1979). Lacustrine habitats are inland depressions or dammed riverine channels containing standing water. The OHWM of the reservoir was determined to be along the edge of the reservoir where surface water was observed at the time of the delineation, or based on physical characteristics of water fluctuation such as downed emergent vegetation. The water surface elevation of the reservoir is influenced by IRWD's management of the recycled water system. The reservoir functions as a seasonal recycled water storage facility; as such, the reservoir includes areas where open water persists throughout the year at a minimum water surface elevation but fluctuates seasonally up to a maximum water surface elevation based on demands for recycled water. The reservoir captures runoff from adjacent areas, including a primary drainage in the central portion of the study area that supports intermittent flows and riparian vegetation north of the reservoir and wetlands shown in **Figure 5-1**. However, there was no OHWM observed in this central drainage and the primary drainage was not mapped as potential other waters of the U.S.

Ephemeral Drainages

Two ephemeral drainages (Nos. 1 and 2) are considered *Riverine* habitat according to the Cowardin classification system (Cowardin et al., 1979). Riverine habitats include rivers, streams, and creeks, and can occur in association with many terrestrial habitats. Riverine habitats are also found contiguous to lacustrine and fresh emergent wetland habitats. Both ephemeral drainages were mapped north of the reservoir (Figure 5-1). These drainages convey stormwater runoff from upland areas to the central drainage via a culvert under the existing dirt road that runs along the west and north sides of the reservoir. The OHWM was an average of two feet wide, based on evidence of shelving. Ephemeral Drainage 1 supports a mix of non-native herbaceous cover and California sagebrush scrub, while Ephemeral Drainage 2 supports a mix of non-native herbaceous cover, California sagebrush scrub, and laurel sumac scrub. No surface water was observed in either drainage.

5.3 Potentially Jurisdictional Section 1602 Lakes, Streams and Associated Vegetation

Areas within CDFW jurisdiction typically refer to streambeds and associated wetland or riparian vegetation. Within the study area, the potential extent of CDFW limits was taken to the outer edge of the overhanging riparian or wetland vegetation adjacent to the reservoir, and to the top of bank for the ephemeral drainages (**Figure 5-2**). Therefore, as shown in **Table 5-2**, approximately 27.26 acres of the study area could be subject to CDFW jurisdiction.

**TABLE 5-2
SUMMARY OF SECTION 1602 LAKES, STREAMS, AND ASSOCIATED VEGETATION**

Feature	Stream/Riparian Limits Acres	Length (feet)	Average Stream Width	Vegetation/Habitat Type
Syphon Reservoir	13.93	N/A	N/A	Open water
Riparian	8.93	N/A	N/A	Blackwillow thicket, arroyo willow thicket, mulefat scrub
Freshwater Marsh	4.33	N/A	N/A	Freshwater marsh
Ephemeral Drainage 1	0.04	243	7	Non-native herbaceous cover/California sagebrush scrub
Ephemeral Drainage 2	0.03	201	7	Non-native herbaceous cover/California sagebrush scrub, and laurel sumac scrub
Totals:	27.26	444	N/A	

5.4 Jurisdictional Analysis

The following analysis discusses the delineated water features within the study area and which regulatory agencies could require approvals/permits prior to impacts. This includes wetland and riparian vegetation, Syphon Reservoir, and the two ephemeral drainages within the study area.

Wetlands

The wetlands within the study area are fringe wetlands associated with the reservoir. These wetlands are isolated from downstream waters of the U.S. and lack hydrologic connectivity to interstate commerce. As discussed in Section 3.1 above, geographically isolated waters, including wetlands, are generally not considered to be jurisdictional under the CWA because they lack links to interstate commerce. However, for each specific request for isolated waters (i.e., approved jurisdictional determination), the USACE and EPA will need to make a case by case determination on the jurisdictional status of the resource, which would dictate the appropriate permitting requirements.

Other Waters of the U.S.

As previously discussed, the reservoir currently drains through a series of underground pipes that convey flows through the strainer and chlorination facility, before being distributed to customers through IRWD's recycled water system. As such, the waters within Syphon Reservoir and the two ephemeral drainages do not exhibit hydrologic connectivity to downstream waters of the U.S. or the Pacific Ocean (TNW), and are considered isolated waters. As discussed in Section 3.1 above, geographically isolated waters, including wetlands, are generally not considered to be jurisdictional under the CWA because they lack links to interstate commerce. However, for each specific request for isolated waters (i.e., approved jurisdictional determination), the USACE and EPA will need to make a case by case determination on the jurisdictional status of the resource, which would dictate the appropriate permitting requirements.

Waters of the State

All areas mapped as potential waters of the U.S./State are regulated by the Santa Ana RWQCB pursuant to the Porter-Cologne Water Quality Control Act. Assuming the USACE and EPA will determine absence of federal jurisdiction (waters of the U.S.) onsite, a WDR and/or a WDR amendment will be required from the RWQCB for the project.

Lakes, Streams, and Associated Vegetation

Within the study area, Syphon Reservoir, wetland and riparian vegetation, and the two ephemeral drainages could be subject to CDFW jurisdiction. A Streambed Alteration Agreement (SAA) will be required from the CDFW per Section 1602 of the Fish and Game Code.

5.5 Conclusions

Based on the jurisdictional analysis presented in Section 5.4 above, it is presumed that there are no waters of the U.S. within the study area. A total of 18.28 acres of potentially jurisdictional wetlands and other waters of the State occur within the 266-acre study area, consisting of 4.33 acres of wetlands and 13.95 acres of other waters. A total of 27.26 acres of lakes, streams and associated vegetation occur within the study area that are potentially subject to Section 1602 of the Fish and Game Code.

This report documents the wetland boundary delineation and best professional judgment of ESA investigators. All conclusions presented for waters of the U.S. should be considered preliminary and subject to change pending official review and preliminary jurisdictional determination in writing by the USACE. All conclusions presented for Section 1602 lakes, streams and associated vegetation should be considered preliminary and subject to change pending official review by the CDFW.

Section 6

Supplemental Information

6.1 Directions to the Study Area

From Los Angeles, take Interstate 5 South for approximately 31 miles. Use the right 2 lanes to take exit 96B to merge onto CA-133 North toward Santa Margarita. Take exit 12 for Irvine Boulevard and turn left onto Irvine Boulevard. Turn right onto Sand Canyon Avenue and use the left 2 lanes to turn left onto Portola Parkway. Syphon Reservoir will be on your right behind the Crean Lutheran High Athletic Complex.

6.2 Project Applicant Contact Information

Appendix B

Representative Photographs

Photograph 1-Photo facing south across open water habitat in Syphon Reservoir.

Photograph 2-Photo facing west at Data Point 3. This sample met all 3 wetland criteria to be considered a USACE wetland.

Photograph 3-Photograph facing east at Data Point 4. DP4 is an upland sample that supports hydrophytic vegetation, but lacks both hydric soils and wetland hydrology.

Photograph 4-Photograph facing west at Data Point 6. DP6 is an upland sample that supports hydrophytic vegetation and hydric soils, but lacks wetland hydrology.

Photograph 5-Photo facing north at Data Point 8. This sample met all 3 wetland criteria to be considered a USACE wetland. Note the high water table in the soil pit.

Photograph 6- Photo facing southeast at Data Point 10. This sample met all 3 wetland criteria to be considered a USACE wetland.

Photograph 7- Photo facing north from dirt access road at Ephemeral Drainage 1.

Photograph 8- Photo facing south at the head of Ephemeral Drainage 2.

Photograph 9-Photo facing north along the central drainage's riparian corridor. Note no ordinary high water mark or bed or bank features.

Photograph 10-Photo west along the abandoned Highland Canal located in the southwest portion of the study area.

**Approved Jurisdictional
Determination**

DEPARTMENT OF THE ARMY
CORPS OF ENGINEERS, LOS ANGELES DISTRICT
915 WILSHIRE BOULEVARD, SUITE 930
LOS ANGELES, CA 90017

December 17, 2018

SUBJECT: Approved Jurisdictional Determination

Jo Ann Corey
Irvine Ranch Water District
15600 Sand Canyon Avenue
Irvine, CA 92618

Dear Ms. Corey:

I am responding to your request (File No. SPL-2018-00528-MY) dated August 9, 2018, for an approved Department of the Army jurisdictional determination (JD) for the Syphon Reservoir Improvement Project (lat. 34.710547°N, long. -117.731105°W) located near the city of Irvine, Orange County, California.

The Corps' evaluation process for determining whether or not a Department of the Army permit is needed involves two tests. If both tests are met, a permit would likely be required. The first test determines whether or not the proposed project is located within the Corps' geographic jurisdiction (i.e., it is within a water of the United States). The second test determines whether or not the proposed project is a regulated activity under Section 10 of the Rivers and Harbors Act or Section 404 of the Clean Water Act. This evaluation pertains only to geographic jurisdiction.

Based on available information, I have determined waters of the United States do not occur on the project site. The basis for our determination can be found in the enclosed Approved Jurisdictional Determination (JD) form(s).

The aquatic resource identified as Syphon Reservoir in project documentation you provided is an intrastate isolated water with no apparent interstate or foreign commerce connection. As such, this aquatic resource is not currently regulated by the Corps of Engineers. This disclaimer of jurisdiction is only for Section 404 of the Clean Water Act. Other federal, state, and local laws may apply to your activities. In particular, you may need authorization from the California State Water Resources Control Board, the California Department of Fish and Wildlife, and/or the U.S. Fish and Wildlife Service.

This letter includes an approved jurisdictional determination for the Syphon Reservoir Improvement project site. If you wish to submit new information regarding this jurisdictional determination, please do so within 60 days. We will consider any new information so submitted and respond within 60 days by either revising the prior determination, if appropriate, or reissuing the prior determination. If you object to this or any revised or reissued jurisdictional determination, you may request an administrative appeal under Corps regulations at 33 CFR Part 331. Enclosed you will find a Notification of Appeal Process (NAP) and Request for Appeal (RFA) form. If you wish to appeal this decision, you must submit a completed RFA form within

60 days of the date on the NAP to the Corps South Pacific Division Office at the following address:

Tom Cavanaugh
Administrative Appeal Review Officer
U.S. Army Corps of Engineers
South Pacific Division, CESPDPDS-O, 2042B
1455 Market Street
San Francisco, California 94103-1399

In order for an RFA to be accepted by the Corps, the Corps must determine that it is complete, that it meets the criteria for appeal under 33 CFR Part 331.5 (see below), and that it has been received by the Division Office by **January 29, 2018**.

This determination has been conducted to identify the extent of the Corps' Clean Water Act jurisdiction on the particular project site identified in your request, and is valid for five years from the date of this letter, unless new information warrants revision of the determination before the expiration date. This determination may not be valid for the wetland conservation provisions of the Food Security Act of 1985. If you or your tenant are USDA program participants, or anticipate participation in USDA programs, you should request a certified wetland determination from the local office of the Natural Resources Conservation Service prior to starting work.

Thank you for participating in the regulatory program. If you have any questions, please contact me at (213) 452-3411 or via e-mail at Miriam.Yemane@usace.army.mil. Please help me to evaluate and improve the regulatory experience for others by completing the customer survey form at http://corpsmapu.usace.army.mil/cm_apex/f?p=regulatory_survey.

Sincerely,

Corice Farrar.
Chief, South Coast Branch
Regulatory Division
Los Angeles District

Enclosure(s)

**NOTIFICATION OF ADMINISTRATIVE APPEAL OPTIONS AND PROCESS AND
REQUEST FOR APPEAL**

Applicant: Jo Ann Corey		File Number: SPL-2018-00528-MY	Date: December 17, 2018
Attached is:			See Section below
	INITIAL PROFFERED PERMIT (Standard Permit or Letter of permission)		A
	PROFFERED PERMIT (Standard Permit or Letter of permission)		B
	PERMIT DENIAL		C
X	APPROVED JURISDICTIONAL DETERMINATION		D
	PRELIMINARY JURISDICTIONAL DETERMINATION		E

SECTION I - The following identifies your rights and options regarding an administrative appeal of the above decision. Additional information may be found at http://www.usace.army.mil/cecw/pages/reg_materials.aspx or Corps regulations at 33 CFR Part 331.

A: INITIAL PROFFERED PERMIT: You may accept or object to the permit.

- **ACCEPT:** If you received a Standard Permit, you may sign the permit document and return it to the district engineer for final authorization. If you received a Letter of Permission (LOP), you may accept the LOP and your work is authorized. Your signature on the Standard Permit or acceptance of the LOP means that you accept the permit in its entirety, and waive all rights to appeal the permit, including its terms and conditions, and approved jurisdictional determinations associated with the permit.
- **OBJECT:** If you object to the permit (Standard or LOP) because of certain terms and conditions therein, you may request that the permit be modified accordingly. You must complete Section II of this form and return the form to the district engineer. Your objections must be received by the district engineer within 60 days of the date of this notice, or you will forfeit your right to appeal the permit in the future. Upon receipt of your letter, the district engineer will evaluate your objections and may: (a) modify the permit to address all of your concerns, (b) modify the permit to address some of your objections, or (c) not modify the permit having determined that the permit should be issued as previously written. After evaluating your objections, the district engineer will send you a proffered permit for your reconsideration, as indicated in Section B below.

B: PROFFERED PERMIT: You may accept or appeal the permit

- **ACCEPT:** If you received a Standard Permit, you may sign the permit document and return it to the district engineer for final authorization. If you received a Letter of Permission (LOP), you may accept the LOP and your work is authorized. Your signature on the Standard Permit or acceptance of the LOP means that you accept the permit in its entirety, and waive all rights to appeal the permit, including its terms and conditions, and approved jurisdictional determinations associated with the permit.
- **APPEAL:** If you choose to decline the proffered permit (Standard or LOP) because of certain terms and conditions therein, you may appeal the declined permit under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer. This form must be received by the division engineer within 60 days of the date of this notice.

C: PERMIT DENIAL: You may appeal the denial of a permit under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer. This form must be received by the division engineer within 60 days of the date of this notice.

D: APPROVED JURISDICTIONAL DETERMINATION: You may accept or appeal the approved JD or provide new information.

- **ACCEPT:** You do not need to notify the Corps to accept an approved JD. Failure to notify the Corps within 60 days of the date of this notice means that you accept the approved JD in its entirety, and waive all rights to appeal the approved JD.

- **APPEAL:** If you disagree with the approved JD, you may appeal the approved JD under the Corps of Engineers Administrative Appeal Process by completing Section II of this form and sending the form to the division engineer. This form must be received by the division engineer within 60 days of the date of this notice.

E: PRELIMINARY JURISDICTIONAL DETERMINATION: You do not need to respond to the Corps regarding the preliminary JD. The Preliminary JD is not appealable. If you wish, you may request an approved JD (which may be appealed), by contacting the Corps district for further instruction. Also you may provide new information for further consideration by the Corps to reevaluate the JD.

SECTION II - REQUEST FOR APPEAL or OBJECTIONS TO AN INITIAL PROFFERED PERMIT

REASONS FOR APPEAL OR OBJECTIONS: (Describe your reasons for appealing the decision or your objections to an initial proffered permit in clear concise statements. You may attach additional information to this form to clarify where your reasons or objections are addressed in the administrative record.)

ADDITIONAL INFORMATION: The appeal is limited to a review of the administrative record, the Corps memorandum for the record of the appeal conference or meeting, and any supplemental information that the review officer has determined is needed to clarify the administrative record. Neither the appellant nor the Corps may add new information or analyses to the record. However, you may provide additional information to clarify the location of information that is already in the administrative record.

POINT OF CONTACT FOR QUESTIONS OR INFORMATION:

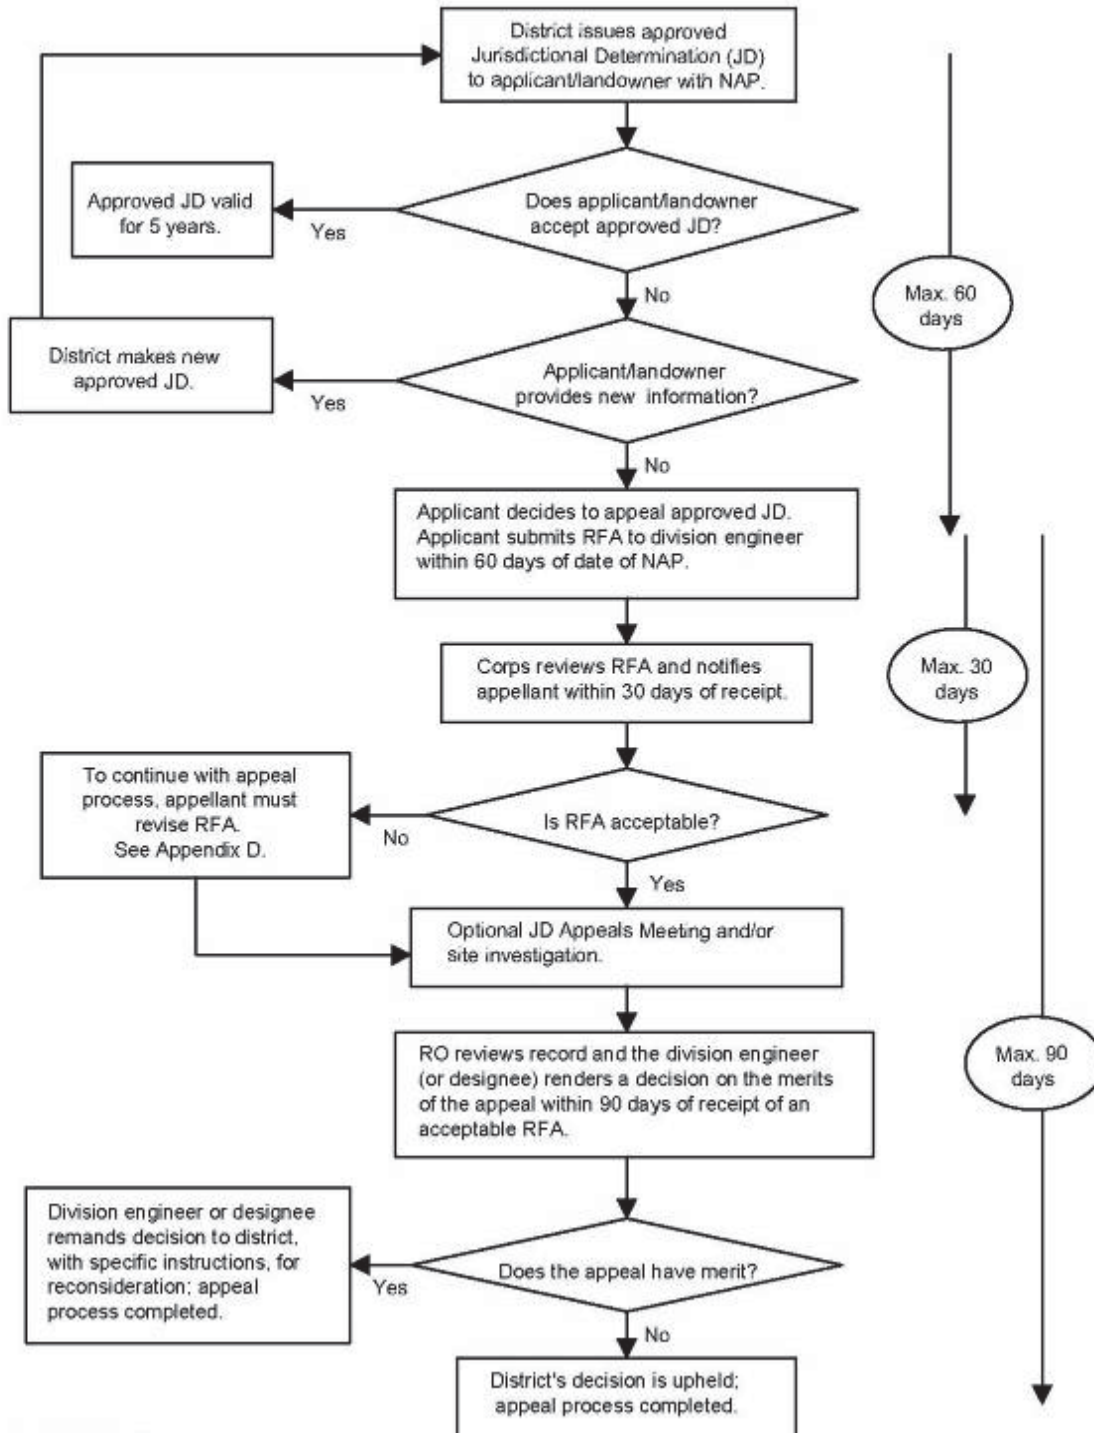

If you have questions regarding this decision and/or the appeal process you may contact:
 Miriam Yemane
 U.S. Army Corps of Engineers
 Los Angeles District
 915 Wilshire Boulevard., Suite 930
 Los Angeles, CA 90017
 Phone: (213) 452-3411
 Email: Miriam.Yemane@usace.army.mil

If you only have questions regarding the appeal process you may also contact: Thomas J. Cavanaugh
 Administrative Appeal Review Officer,
 U.S. Army Corps of Engineers
 South Pacific Division
 1455 Market Street, 2052B
 San Francisco, California 94103-1399
 Phone: (415) 503-6574
 Fax: (415) 503-6646
 Email: thomas.j.cavanaugh@usace.army.mil

RIGHT OF ENTRY: Your signature below grants the right of entry to Corps of Engineers personnel, and any government consultants, to conduct investigations of the project site during the course of the appeal process. You will be provided a 15 day notice of any site investigation, and will have the opportunity to participate in all site investigations.

--	--------------	--------------------------

Administrative Appeal Process for Approved Jurisdictional Determinations

§ 331.5 Criteria.

(a) *Criteria for appeal* —(1) *Submission of RFA*. The appellant must submit a completed RFA (as defined at §331.2) to the appropriate division office in order to appeal an approved JD, a permit denial, or a declined permit. An individual permit that has been signed by the applicant, and subsequently unilaterally modified by the district engineer pursuant to 33 CFR 325.7, may be appealed under this process, provided that the applicant has not started work in waters of the United States authorized by the permit. The RFA must be received by the division engineer within 60 days of the date of the NAP.

(2) *Reasons for appeal*. The reason(s) for requesting an appeal of an approved JD, a permit denial, or a declined permit must be specifically stated in the RFA and must be more than a simple request for appeal because the affected party did not like the approved JD, permit decision, or the permit conditions. Examples of reasons for appeals include, but are not limited to, the following: A procedural error; an incorrect application of law, regulation or officially promulgated policy; omission of material fact; incorrect application of the current regulatory criteria and associated guidance for identifying and delineating wetlands; incorrect application of the Section 404(b)(1) Guidelines (see 40 CFR Part 230); or use of incorrect data. The reasons for appealing a permit denial or a declined permit may include jurisdiction issues, whether or not a previous approved JD was appealed.

(b) *Actions not appealable*. An action or decision is not subject to an administrative appeal under this part if it falls into one or more of the following categories:

(1) An individual permit decision (including a letter of permission or a standard permit with special conditions), where the permit has been accepted and signed by the permittee. By signing the permit, the applicant waives all rights to appeal the terms and conditions of the permit, unless the authorized work has not started in waters of the United States and that issued permit is subsequently modified by the district engineer pursuant to 33 CFR 325.7;

(2) Any site-specific matter that has been the subject of a final decision of the Federal courts;

(3) A final Corps decision that has resulted from additional analysis and evaluation, as directed by a final appeal decision;

(4) A permit denial without prejudice or a declined permit, where the controlling factor cannot be changed by the Corps decision maker (e.g., the requirements of a binding statute, regulation, state Section 401 water quality certification, state coastal zone management disapproval, etc. (See 33 CFR 320.4(j)));

(5) A permit denial case where the applicant has subsequently modified the proposed project, because this would constitute an amended application that would require a new public interest review, rather than an appeal of the existing record and decision;

(6) Any request for the appeal of an approved JD, a denied permit, or a declined permit where the RFA has not been received by the division engineer within 60 days of the date of the NAP;

(7) A previously approved JD that has been superseded by another approved JD based on new information or data submitted by the applicant. The new approved JD is an appealable action;

(8) An approved JD associated with an individual permit where the permit has been accepted and signed by the permittee;

(9) A preliminary JD; or

(10) A JD associated with unauthorized activities except as provided in §331.11.

**Plant and Wildlife Species
Compendia**

Appendix C: Plant and Wildlife Species Compendia

Scientific Name	Common Name	Special Status
EUDICOTS		
Adoxaceae - Muskroot Family		
<i>Sambucus nigra</i> ssp. <i>caerulea</i>	blue elderberry	
Amaranthaceae - Amaranth Family		
<i>Amaranthus blitoides</i>	procumbent pigweed	
<i>Amaranthus californicus</i>	California amaranth	
Anacardiaceae - Sumac or Cashew Family		
<i>Malosma laurina</i>	laurel sumac	
<i>Rhus integrifolia</i>	lemonadeberry	
* <i>Schinus molle</i>	Peruvian pepper	
* <i>Searsia lancea</i>	African sumac	
<i>Toxicodendron diversilobum</i>	poison oak	
Apiaceae - Carrot Family		
<i>Daucus pusillus</i>	wild carrot	
<i>Sanicula</i> sp.	sanicle	
Apocynaceae - Dogbane Family		
<i>Funastrum cynanchoides</i> var. <i>hartwegii</i>	climbing milkweed	
* <i>Nerium oleander</i>	oleander	
Asteraceae - Sunflower Family		
<i>Acourtia microcephala</i>	sacapellote	
<i>Anaphalis margaritacea</i>	western pearly everlasting	
<i>Artemisia californica</i>	California sagebrush	
<i>Baccharis pilularis</i>	coyote brush	
<i>Baccharis salicifolia</i>	mule fat	
<i>Bahiopsis laciniata</i>	San Diego County viguiera	CRPR 4.3
<i>Brickellia californica</i>	California brickellbush	
* <i>Carduus pycnocephalus</i>	Italian thistle	
* <i>Centaurea melitensis</i>	tocalote	
* <i>Cynara cardunculus</i> ssp. <i>flavescens</i>	cardoon	
<i>Deinandra fasciculata</i>	fascicled tarweed	
* <i>Dimorphotheca</i> sp.	African daisy	
<i>Eclipta prostrata</i>	false daisy	
<i>Encelia californica</i>	California brittlebush	

Scientific Name	Common Name	Special Status
<i>Encelia farinosa</i>	brittlebush	
<i>Ericameria pinifolia</i>	pine-bush	
* <i>Erigeron bonariensis</i>	flax-leaved horseweed	
<i>Erigeron canadensis</i>	horseweed	
<i>Erigeron foliosus</i>	leafy fleabane	
<i>Eriophyllum confertiflorum</i>	golden yarrow	
* <i>Gazania rigens</i>	African daisy	
<i>Gnaphalium palustre</i>	lowland cudweed	
<i>Gutierrezia californica</i>	California matchweed	
* <i>Helminthotheca echioides</i>	bristly ox-tongue	
<i>Heterotheca grandiflora</i>	telegraph weed	
* <i>Hypochaeris glabra</i>	smooth cat's ear	
<i>Isocoma menziesii</i> var. <i>menziesii</i>	Menzies' goldenbush	
<i>Isocoma menziesii</i> var. <i>vernonioides</i>	coastal goldenbush	
* <i>Lactuca serriola</i>	prickly lettuce	
<i>Laennecia coulteria</i>	Coulter's horseweed	
<i>Lagfia gallica</i>	narrowleaf cottonrose	
<i>Lasthenia</i> sp.	goldfields	
* <i>Oncosiphon piluliferum</i>	stinknet	
<i>Osmadenia tenella</i>	false rosinweed	
<i>Pseudognaphalium biolettii</i>	two-color rabbit-tobacco	
<i>Pseudognaphalium californicum</i>	Ladies' tobacco	
<i>Pseudognaphalium canescens</i>	Wright's cudweed	
* <i>Pulicaria paludosa</i>	Spanish false fleabane	
<i>Pseudognaphalium luteoalbum</i>	Jersey cudweed	
* <i>Pulicaria paludosa</i>	Spanish false fleabane	
* <i>Senecio vulgaris</i>	common groundsel	
* <i>Sonchus asper</i>	spiny sow thistle	
* <i>Sonchus oleraceus</i>	common sow thistle	
<i>Stebbinsoseris heterocarpa</i>	grassland silverpuffs	
<i>Stephanomeria virgata</i>	rod wirelettuce	
<i>Uropappus lindleyi</i>	silver puffs	
<i>Xanthium strumarium</i>	cocklebur	
Boraginaceae - Borage Family		
<i>Amsinckia menziesii</i>	common fiddleneck	

Scientific Name	Common Name	Special Status
<i>Cryptantha</i> sp.	cryptantha	
<i>Heliotropium curassavicum</i> var. <i>oculatum</i>	seaside heliotrope, alkali heliotrope	
<i>Phacelia cicutaria</i>	caterpillar phacelia	
<i>Phacelia minor</i>	wild Canterbury bells	
<i>Plagiobothrys</i> sp.	popcornflower	
Brassicaceae - Mustard Family		
* <i>Brassica nigra</i>	black mustard	
* <i>Hirschfeldia incana</i>	short-podded mustard	
<i>Lepidium lasiocarpum</i>	shaggyfruit pepperweed	
<i>Rorippa curvisiliqua</i>	curvepod yellowcress	
* <i>Sisymbrium altissimum</i>	tumble mustard	
* <i>Sisymbrium irio</i>	London rocket	
* <i>Sisymbrium orientale</i>	Oriental hedge mustard	
Boraginaceae - Borage Family		
<i>Eucrypta chrysanthemifolia</i>	common eucrypta	
Cactaceae - Cactus Family		
<i>Cylindropuntia prolifera</i>	coast cholla	
<i>Opuntia ficus-indica</i>	tuna cactus	
<i>Opuntia littoralis</i>	coastal prickly pear	
<i>Opuntia occidentalis</i>	western prickly pear	
<i>Opuntia vaseyi</i>	Vasey's prickly pear	
Caryophyllaceae - Pink Family		
* <i>Cerastium glomeratum</i> .	sticky mouse-ear chickweed	
* <i>Polycarpon tetraphyllum</i>	four-leaved allseed	
<i>Silene gallica</i>	small-flower catchfly	
Chenopodiaceae - Goosefoot Family		
* <i>Atriplex semibaccata</i>	Australian saltbush	
* <i>Chenopodium macrospermum</i>	largeseed goosefoot	
* <i>Chenopodium murale</i>	nettle leaf goosefoot	
* <i>Salsola tragus</i>	Russian thistle	
Cleomaceae - Spiderflower Family		
<i>Peritoma arborea</i>	bladderpod	
Convolvulaceae - Morning-glory Family		
<i>Calystegia macrostegia</i>	Island false bindweed	

Scientific Name	Common Name	Special Status
* <i>Convolvulus arvensis</i>	field bindweed	
Crassulaceae - Stonecrop Family		
<i>Crassula connata</i>	pigmy weed	
<i>Dudleya lanceolata</i>	lance-leaved dudleya	
<i>Dudleya multicaulis</i>	many-stemmed dudleya	
Cucurbitaceae - Gourd Family		
<i>Cucurbita foetidissima</i>	calabazilla	
<i>Marah macrocarpa</i>	chilicothe	
Euphorbiaceae - Spurge Family		
<i>Croton setigerus</i>	turkey-mullein	
<i>Euphorbia albomarginata</i>	rattlesnake weed	
* <i>Euphorbia maculata</i>	spotted spurge	
<i>Euphorbia polycarpa</i>	smallseed sandmat	
* <i>Euphorbia prostrata</i>	prostrate sandmat	
* <i>Euphorbia serpens</i>	matted sandmat	
<i>Euphorbia serpillifolia</i>	thyme-leaved spurge	
* <i>Ricinus communis</i>	castor bean	
Fabaceae - Legume Family		
* <i>Acacia redolens</i>	bank catclaw	
<i>Acmispon glaber</i>	deerweed	
<i>Acmispon micranthus</i>	small flowered lotus	
<i>Acmispon strigosus</i>	strigose lotus	
<i>Lupinus bicolor</i>	miniature lupine	
<i>Lupinus succulentus</i>	arroyo lupine	
<i>Lupinus truncatus</i>	blunt leaved lupine	
* <i>Medicago polymorpha</i>	California burclover	
* <i>Melilotus indicus</i>	sourclover	
* <i>Melilotus officinalis</i>	yellow sweetclover	
<i>Trifolium sp.</i>	clover	
Fagaceae - Oak Family		
<i>Quercus agrifolia</i>	coast live oak	
Gentianaceae - Gentian Family		
<i>Zeltnera venusta</i>	California centaury	

Scientific Name	Common Name	Special Status
Geraniaceae - Geranium Family		
* <i>Erodium botrys</i>	broad leaf filaree	
* <i>Erodium cicutarium</i>	red-stemmed filaree	
Lamiaceae - Mint Family		
* <i>Marrubium vulgare</i>	horehound	
<i>Salvia apiana</i>	white sage	
<i>Salvia columbariae</i>	chia	
<i>Salvia mellifera</i>	black sage	
<i>Trichostema lanceolata</i>	vinegarweed	
Malvaceae - Mallow Family		
<i>Malacothamnus fasciculatus</i>	chaparral mallow	
* <i>Malva parviflora</i>	cheeseweed	
Montiaceae – Miner’s Lettuce Family		
<i>Claytonia perfoliata</i>	Miner’s lettuce	
Myrsinaceae - Myrsine Family		
* <i>Lysimachia arvensis</i>	scarlet pimpernel	
Myrtaceae - Myrtle Family		
* <i>Eucalyptus camaldulensis</i>	red gum	
Nyctaginaceae - Four O'clock Family		
<i>Mirabilis laevis</i> var. <i>crassifolia</i>	wishbone bush	
Onagraceae - Evening Primrose Family		
<i>Camissoniopsis intermedia</i>	intermediate sun cups	
<i>Epilobium canum</i>	California fuchsia	
<i>Ludwigia repens</i>	creeping primrose-willow	
Orobanchaceae - Broomrape Family		
<i>Castilleja exserta</i>	purple owl’s-clover	
Phrymaceae - Lopseed Family		
<i>Diplacus aurantiacus</i>	orange bush monkeyflower	
Plantaginaceae - Plantain Family		
<i>Antirrhinum nuttallianum</i>	Nuttall's snapdragon	
<i>Plantago erecta</i>	California plantain	
Polygonaceae - Buckwheat Family		
<i>Chorizanthe staticoides</i>	Turkish rugging	
<i>Eriogonum fasciculatum</i>	California buckwheat	

Scientific Name	Common Name	Special Status
<i>Persicaria hydropiperoides</i>	false waterpepper	
<i>Persicaria lapathifolia</i>	willow weed	
* <i>Persicaria maculosa</i>	lady's thumb	
* <i>Rumex crispus</i>	curly dock	
<i>Pterostegia drymarioides</i>	fairy mist	
Portulacaceae - Purslane Family		
* <i>Portulaca oleracea</i>	purslane	
Rosaceae - Rose Family		
<i>Heteromeles arbutifolia</i>	toyon	
Rubiaceae - Madder Family		
<i>Galium angustifolium</i>	narrow leaved bedstraw	
Rutaceae - Rue Family		
<i>Heteromeles arbutifolia</i>	wilga	
Salicaceae - Willow Family		
<i>Salix gooddingii</i>	Goodding's black willow	
<i>Salix lasiolepis</i>	arroyo willow	
Saxifragaceae - Saxifrage Family		
<i>Jepsonia parryi</i>	Parry's jepsonia	
Scrophulariaceae - Figwort Family		
<i>Penstemon spectabilis</i>	showy penstemon	
Solanaceae - Nightshade Family		
<i>Datura wrightii</i>	sacred thorn-apple	
* <i>Nicotiana glauca</i>	tree tobacco	
<i>Nicotiana quadrivalvis</i>	Indian tobacco	
<i>Solanum americanum</i>	American black nightshade	
<i>Solanum douglasii</i>	greenspot nightshade	
* <i>Solanum nigrum</i>	black nightshade	
Tamaricaceae - Tamarisk Family		
* <i>Tamarix ramosissima</i>	tamarisk	
Ulmaceae - Elm Family		
<i>Ulmus parvifolia</i>	Chinese elm	
Verbenaceae - Vervain Family		
<i>Verbena bracteata</i>	bigbract verbena	
<i>Verbena lasiostachys</i>	western vervain	

Scientific Name	Common Name	Special Status
Zygophyllaceae - Caltrop Family		
* <i>Tribulus terrestris</i>	puncture vine	
MONOCOTS		
Agavaceae - Century Plant Family		
* <i>Agave americana</i>	American century plant	
<i>Chlorogalum pomeridianum</i> var. <i>pomeridianum</i>	wavyleaf soap plant	
<i>Hesperoyucca whipplei</i>	chaparral yucca	
<i>Yucca gigantea</i>	giant yucca	
<i>Yucca gloriosa</i>	moundlily yucca	
Areaceae - Palm Family		
* <i>Phoenix canariensis</i>	Canary Island palm	
* <i>Washingtonia robusta</i>	Mexican fan palm	
Cyperaceae - Sedge Family		
<i>Cyperus eragrostis</i>	tall cyperus	
* <i>Cyperus involucratus</i>	umbrella plant	
<i>Schoenoplectus californicus</i>	California bulrush	
Juncaceae - Rush Family		
<i>Juncus bufonius</i>	toad rush	
Liliaceae - Lily Family		
<i>Bloomeria crocea</i>	common goldenstar	
<i>Calochortus catalinae</i>	Catalina mariposa lily	CRPR 4.2
<i>Calochortus splendens</i>	splendid mariposa lily	
<i>Calochortus weedii</i> var. <i>intermedius</i>	intermediate mariposa lily	CRPR 1B.2
Poaceae - Grass Family		
* <i>Avena barbata</i>	slender oat	
* <i>Avena fatua</i>	wild oat	
* <i>Brachypodium distachyon</i>	false brome	
* <i>Bromus diandrus</i>	ripgut brome	
* <i>Bromus hordeaceus</i>	soft chess	
* <i>Bromus madritensis</i> ssp. <i>rubens</i>	foxtail brome	
<i>Distichlis spicata</i>	salt grass	
<i>Elymus condensatus</i>	giant wild rye	
* <i>Festuca myuros</i>	rattail sixweeks grass	
* <i>Hordeum murinum</i>	wall barley	

Scientific Name	Common Name	Special Status
<i>Leptochloa fusca</i> ssp. <i>uninervia</i>	Mexican sprangletop	
<i>Melica imperfecta</i>	little California melica	
<i>Muhlenbergia microsperma</i>	littleseed muhly	
* <i>Pennisetum setaceum</i>	fountain grass	
<i>Poa secunda</i>	Nevada blue grass	
* <i>Polypogon monspeliensis</i>	rabbitfoot grass	
<i>Schismus barbatus</i>	Mediterranean grass	
* <i>Setaria viridis</i>	green bristle grass	
<i>Stipa coronata</i>	crested needlegrass	
<i>Stipa lepida</i>	foothill needlegrass	
<i>Stipa pulchra</i>	purple needlegrass	
Themidaceae - Brodiaea Family		
<i>Bloomeria crocea</i>	common goldenstar	
<i>Dichelostemma capitatum</i>	blue dicks	
Typhaceae - Cattail Family		
<i>Typha domingensis</i>	narrowleaf cattail	

Legend

<i>Anaxyrus boreas halophilus</i>	California toad	
Hylidae – Treefrogs		
<i>Pseudacris hypochondriaca hypochondriaca</i>	Baja California treefrog	
REPTILES		
Teiidae – Whiptail Lizards		
<i>Aspidoscelis hyperythra</i>	orange-throated whiptail	
Phrynosomatidae – Zebratail, Earless, Horned, Spiny, Fringe-Toed Lizards		
<i>Sceloporus occidentalis</i>	western fence lizard	
<i>Uta stansburiana</i>	side-blotched lizard	
Viperidae – Vipers		
<i>Crotalus oreganus helleri</i>	southern Pacific rattlesnake	
BIRDS		
Anatidae – Waterfowl		
<i>Anas platyrhynchos</i>	mallard	
<i>Aythya americana</i>	redhead	
<i>Branta canadensis</i>	Canada goose	
<i>Oxyura jamaicensis</i>	ruddy duck	
Odontophoridae – Quails		
<i>Callipepla californica</i>	California quail	
Podicipedidae – Grebes		
<i>Aechmophorus occidentalis</i>	western grebe	
Phalacrocoracidae – Cormorants		
<i>Phalacrocorax auritus</i>	double-crested cormorant	

Scientific Name	Common Name	Special Status
Ardeidae – Herons		
<i>Ardea alba</i>	great egret	
<i>Ardea herodias</i>	great blue heron	
<i>Butorides virescens</i>	green heron	
<i>Egretta thula</i>	snowy egret	
Threskiornithidae – Ibises		
<i>Plegadis chihi</i>	white-faced ibis	
Cathartidae – New World Vultures		
<i>Cathartes aura</i>	turkey vulture	
Pandionidae – Ospreys		
<i>Pandion haliaetus</i>	osprey	
Accipitridae – Hawks		
<i>Accipiter cooperii</i>	Cooper's hawk	
<i>Buteo jamaicensis</i>	red-tailed hawk	
Rallidae – Rails and Gallinules		
<i>Fulica americana</i>	American coot	
Charadriidae – Plovers		
<i>Charadrius vociferous</i>	killdeer	
Recurvirostridae – Stilts and Avocets		
<i>Himantopus mexicanus</i>	black-necked stilt	
Scolopacidae – Sandpipers		
<i>Calidris minutilla</i>	least sandpiper	
<i>Tringa melanoleuca</i>	greater yellowlegs	
Laridae – Gulls and Terns		
<i>Hydroprogne caspia</i>	Caspian tern	
<i>Sterna forsteri</i>	Forster's tern	
Columbidae – Pigeons and Doves		
<i>Columba livia</i>	rock pigeon	
<i>Zenaida macroura</i>	mourning dove	
Cuculidae – Cuckoos and Roadrunners		
<i>Geococcyx californianus</i>	greater roadrunner	
Caprimulgidae – Goatsuckers		
<i>Chordeiles acutipennis</i>	lesser nighthawk	
Apodidae – Swifts		
<i>Aeronautes saxatalis</i>	white-throated swift	
<i>Chaetura vauxi</i>	Vaux's swift	SSC
Trochilidae – Hummingbirds		
<i>Calypte anna</i>	Anna's hummingbird	
<i>Selasphorus rufus</i>	rufous hummingbird	
<i>Selasphorus sasin</i>	Allen's hummingbird	

Scientific Name	Common Name	Special Status
Picidae – Woodpeckers		
<i>Colaptes auratus</i>	northern flicker	
<i>Picoides nuttallii</i>	Nuttall's woodpecker	
Tyrannidae – Tyrant Flycatchers		
<i>Empidonax difficilis</i>	Pacific-slope flycatcher	
<i>Myiarchus cinerascens</i>	ash-throated flycatcher	
<i>Sayornis nigricans</i>	black phoebe	
<i>Sayornis saya</i>	Say's phoebe	
<i>Tyrannus vociferans</i>	Cassin's kingbird	
Vireonidae – Vireos		
<i>Vireo bellii pusillus</i>	least Bell's vireo	FE, SE
Corvidae – Jays and Crows		
<i>Corvus brachyrhynchos</i>	American crow	
<i>Corvus corax</i>	common raven	
Alaudidae – Larks		
<i>Eremophila alpestris</i>	horned lark	
Hirundinidae – Swallows		
<i>Hirundo rustica</i>	barn swallow	
<i>Petrochelidon pyrrhonota</i>	cliff swallow	
<i>Stelgidopteryx serripennis</i>	northern rough-winged swallow	
<i>Tachycineta bicolor</i>	tree swallow	
Aegithalidae – Bushtits		
<i>Psaltriparus minimus</i>	bushtit	
Troglodytidae – Wrens		
<i>Thryomanes bewickii</i>	Bewick's wren	
<i>Troglodytes aedon</i>	house wren	
Poliopitidae – Gnatcatchers		
<i>Poliopitila caerulea</i>	blue-gray gnatcatcher	
<i>Poliopitila californica</i>	California gnatcatcher	FT, SC
Sylviidae – Wrentits		
<i>Chamaea fasciata</i>	wrentit	
Mimidae – Thrashers		
<i>Mimus polyglottos</i>	northern mockingbird	
<i>Toxostoma redivivum</i>	California thrasher	
Bombycillidae – Waxwings		
<i>Bombycilla cedrorum</i>	cedar waxing	
Parulidae – Wood Warblers		
<i>Dendroica petechia</i>	yellow warbler	SSC
<i>Dendroica townsendi</i>	Townsend's warbler	

Scientific Name	Common Name	Special Status
<i>Geothlypis trichas</i>	common yellowthroat	
<i>Icteria virens</i>	yellow-breasted chat	SSC
<i>Oreothlypis celata</i>	orange-crowned warbler	
<i>Wilsonia pusilla</i>	Wilson's warbler	
Emberizidae – Emberizine Sparrows		
<i>Aimophila ruficeps canescens</i>	Southern California rufous-crowned sparrow	
<i>Melospiza melodia</i>	song sparrow	
<i>Melospiza crissalis</i>	California towhee	
<i>Pipilo maculatus</i>	spotted towhee	
Cardinalidae – Buntings, Grosbeaks, and Tanagers		
<i>Passerina amoena</i>	Lazuli bunting	
<i>Passerina caerulea</i>	blue grosbeak	
<i>Pheucticus melanocephalus</i>	black-headed grosbeak	
<i>Piranga ludoviciana</i>	western tanager	
Icteridae – Blackbirds		
<i>Icterus bullockii</i>	Bullock's oriole	
<i>Icterus cucullatus</i>	hooded oriole	
<i>Quiscalus mexicanus</i>	great-tailed grackle	
<i>Sturnella neglecta</i>	western meadowlark	
Fringillidae – Finches		
<i>Carpodacus mexicanus</i>	house finch	
<i>Carduelis psaltria</i>	lesser goldfinch	
<i>Spinus lawrencei</i>	Lawrence's goldfinch	
<i>Spinus tristis</i>	American goldfinch	
Estrildidae – Mannikins		
<i>*Lonchura punctulata</i>	scaly-breasted munia	
MAMMALS		
Canidae – Canines		
<i>Canis latrans</i>	coyote	
Didelphidae – Opossums		
<i>Didelphis virginiana</i>	Virginia opossum	
Leporidae – Hares and Rabbits		
<i>Sylvilagus audubonii</i>	desert cottontail	
Procyonidae – Ringtails and Raccoons		
<i>Procyon lotor</i>	raccoon

**Special-Status Plant and
Wildlife Species with Potential
to Occur Within the Study Area**

SPECIAL-STATUS PLANT SPECIES WITH POTENTIAL TO OCCUR WITHIN THE STUDY AREA

Species	Status ¹ Federal/State, CRPR/County	Habitat Requirements	Potential to Occur
chaparral sand-verbena (<i>Abronia villosa</i> var. <i>aurita</i>)	-/1B.1/Not Covered	Found in sandy areas, chaparral, desert dunes, and coastal scrub habitats from 75 – 1600 m elevation. Blooming period is January to September.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
Munz's onion (<i>Allium munzii</i>)	FE/ST,1B.1/Not Covered	Perennial herb found in chaparral, foothill woodlands, pinyon-juniper woodlands, and valley grasslands. Grassy openings in coastal sage scrub. Blooming period is March to May, and this species is found at elevation between 300 and 900m.	Unlikely. Although some suitable habitat is present on site, the study area is outside of the known elevation range for this species and suitable soils are not present on-site or within the immediate vicinity. No records or collections of this species has been made within Orange County.
Aphanisma (<i>Aphanisma blitodes</i>)	-/1B.2/Not Covered	Annual herb found in coastal bluff scrub, coastal dunes, and coastal scrub; sandy soils. Blooming period is March to June and found at elevations from 1 - 305 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. The project site is not a coastal setting.
Braunton's milk-vetch (<i>Astragalus brauntonii</i>)	-/1B.1/Not Covered	A perennial herb found within disturbed areas within chaparral, valley grassland, coastal sage scrub, closed-cone pine forest habitats. Blooming period is January to August. Occurs at elevations less than 650m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
Coulter's saltbush (<i>Atriplex coulteri</i>)	-/1B.2/Not Covered	Found on alkaline or clay substrate within coastal bluff scrub, coastal dune, coastal scrub and valley and foothill grassland habitats. Blooming period is March to October. Occurs at elevations from 3 - 460 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
South Coast saltscale (<i>Atriplex pacifica</i>)	-/1B.2/Not Covered	Found within chenopod scrub, coastal bluff and coastal scrub habitats. Blooming period is March to October. Occurs at elevations up to 140 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
Parish's brittescale (<i>Atriplex parishii</i>)	-/1B.1/Not Covered	Found in alkali meadows, vernal pools, playas and chenopod scrub. Associated with alkaline soils. Blooming period is June to October. Occurs at 25 – 1900 m elevation.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. This species has not been collected in Orange County since 1881.
Davidson's saltscale (<i>Atriplex serenana</i> var. <i> davidsonii</i>)	-/1B.2/Not Covered	Found on alkaline substrate within coastal bluff scrub and coastal scrub habitats. Blooming period is from April to October and occurs at elevations from 10 - 200 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. The project site is not a coastal setting.
Malibu baccharis (<i>Baccharis malibuensis</i>)	-/1B.1/Not Covered	A shrub found within grassy openings of chaparral habitats. Blooming period is in August and occurs at elevations between 50 to 300m.	Low. Although some suitable habitat is present on site, suitable sedimentary substrates are absent within the study area. This perennial species was not observed during special-status plant surveys conducted in 2018 and 2019.
thread-leaved brodiaea (<i>Brodiaea filifolia</i>)	-/1B.1/Not Covered	A perennial herb found within grasslands and vernal pools in valley grassland, foothill woodland, coastal sage scrub, freshwater wetlands, and wetland-riparian habitats. Blooming period is March to June. Occurs at elevations between 25 to 860m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.

Species	Status ¹ Federal/State, CRPR/County	Habitat Requirements	Potential to Occur
Catalina mariposa lily (<i>Calochortus catalinae</i>)	-/4.2/Covered	Occurs in heavy soils in chaparral, cismontane woodland, coastal scrub and valley and foothill grassland below 700 m. When occurring on slopes, it is usually associated with coastal scrub vegetation. Blooming period is February to June.	Present. This species was observed on-site during special-status plant surveys conducted in 2018 and 2019. Approximately 309 individuals were observed on-site in the western and southeastern portions of the study area. This species was also observed on-site during previous surveys by Harmsworth Associates in 1998 (Dudek 2012).
intermediate mariposa lily (<i>Calochortus weedii</i> var. <i>intermedius</i>)	-/1B.2/Conditionally Covered	Found in coastal scrub, chaparral, and valley and foothill grassland on dry, rocky open slopes and rock outcrops. Blooming period is May to July, and this species occurs at elevations of 120 - 850 m.	Present. This species was observed on-site during special-status plant surveys conducted in 2019. Approximately 19 individuals were observed on-site in the western portion of the study area.
southern tarplant (<i>Centromadia parryi</i> ssp. <i>australis</i>)	-/1B.1/Not Covered	Found in the margins of marshes and swamps, vernal mesic valley and foothill grasslands, and vernal pool habitats. This species is commonly found in disturbed areas, in relatively close proximity to a seasonal or perennial water source. Blooming period is May to November; and this species occurs at elevations up to 425 m.	Unlikely. Suitable alkali/vernal habitat and soils are not present on-site or within the immediate vicinity.
smooth tarplant (<i>Centromadia pungens</i> ssp. <i>laevis</i>)	-/1B.1/Not Covered	Annual herb found within open, poorly drained flats, depressions, waterway banks and beds, grassland, and disturbed sites in shadscale scrub, alkali sink, and valley grassland habitats. Blooming period is April to September, and this species occurs at elevations between 90 – 500 m.	Unlikely. Suitable alkali/vernal habitat and soils are not present on-site or within the immediate vicinity.
small-flowered mountain mahogany (<i>Cercocarpus minutiflorus</i>)	-/-/Covered	Found in chaparral, at elevations of less than 1400 m. Blooming period is March to May.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity. Project site is north of the recorded distribution.
Orcutt's pincushion (<i>Chaenactis glabriuscula</i> var. <i>orcuttiana</i>)	-/1B.1/Not Covered	Found in coastal bluff scrub and coastal dunes, on sandy sites at elevations of 3 -100 m. Blooming period is January to August.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. The project site is not a coastal setting.
salt marsh bird's-beak (<i>Chloropyron maritimum</i> ssp. <i>maritimum</i>)	FE/SE,1B.2/Not Covered	Found within coastal dune, salt marsh, and swamp habitats, at elevations up to 1400 m. Blooming period is May to October.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. The project site is not a coastal setting.
San Fernando Valley spineflower (<i>Chorizanthe parryi</i> var. <i>fernandina</i>)	FC/SE,1B.1/Not Covered	Annual herb found within sandy coastal scrub and valley and foothill grassland. Blooming period is April to July; this species occurs at 150 – 1220 m elevation.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. Single collection of species in Orange County is 100 years old and is likely outside of geographic range.
long-spined spineflower (<i>Chorizanthe polygonoides</i> var. <i>longispina</i>)	-/1B.2/Not Covered	Annual herb found in sandy meadows within chaparral, valley grassland, and coastal sage scrub habitats. Blooming period is April to June within elevations between 30 and 1500 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
white-bracted spineflower (<i>Chorizanthe xanti</i> var. <i>leucotheca</i>)	-/1B.2/Not Covered	Annual herb found within sandy or gravelly soils in creosote bush scrub or pinyon-juniper woodland habitats. Blooming period is April to June, and this species occurs at elevations of 400 – 1300 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. Elevation constraints further limit suitability.

Species	Status ¹ Federal/State, CRPR/County	Habitat Requirements	Potential to Occur
San Miguel savory (<i>Clinopodium chandleri</i>)	-/1B.2/Not Covered	Perennial herb found in riparian habitats or rocky slopes of chaparral, foothill woodland, coastal sage scrub, and valley grassland communities. Blooming period in March to July, and this species occurs at elevations less than 1100 m.	Low. Low quality habitat is present on-site or within the immediate vicinity. No recent collections made within 5 miles of project area. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
summer holly (<i>Comarostaphylis diversifolia</i> ssp. <i>diversifolia</i>)	-/1B.2/Not Covered	Perennial evergreen shrub found in chaparral and cismontane woodland. Blooming period is April to June, and this species is found at elevations of 30 – 790 m.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity. No recent collections made within 5 miles of project area.
slender-horned spineflower (<i>Dodecahema leptoceras</i>)	FE/SE,1B.1/Not Covered	Annual herb found in sandy or gravelly soils of alluvial fans within chaparral and coastal sage scrub communities. Blooming period is May to June, and this species occurs at elevations between 200 – 700 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity, and the study area is outside of known distribution and elevation range for this species.
Santa Monica Mountains dudleya (<i>Dudleya cymosa</i> ssp. <i>ovatifolia</i>)	FT/1B.1/Covered	Perennial herb found in shaded rocky outcrops and slopes within chaparral and coastal sage scrub communities. Blooming period is March to June, and this species occurs at elevations between 150 and 500m.	Unlikely. No suitable habitat is present on-site or within the immediate vicinity.
many-stemmed dudleya (<i>Dudleya multicaulis</i>)	-/1B.2/Not Covered	Found on clay substrate within chaparral, coastal scrub and valley and grassland habitats. Blooming period is April to July; this species occurs at elevations from 15 - 790 m.	Present. This species was observed on-site during special-status plant surveys conducted in 2019. Approximately 109 individuals were observed on-site in the western portion of the study area.
Laguna Beach dudleya (<i>Dudleya stolonifera</i>)	FT/ST,1B.1/Covered	Found on rocky substrate within chaparral, cismontane woodland, coastal scrub and valley and grassland habitats at elevations from 10 to 260 m. Blooming period is May to July.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
sticky dudleya (<i>Dudleya viscida</i>)	-/1B.2/Not Covered	Perennial herb found on bluffs and rocky cliffs on coastal habitat within chaparral and coastal sage scrub communities. Blooming period is May to June and occurs at elevations less than 450 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. The project site is not a coastal setting.
Santa Ana River woollystar (<i>Eriastrum densifolium</i> ssp. <i>sanctorum</i>)	FE/SE,1B.1/Not Covered	Perennial herb found in chaparral or coastal scrub habitats (alluvial fans); sandy or gravelly soil. Blooming period is April to September; this species occurs at elevations from 90 – 610 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. Plants generally restricted to Santa Ana River.
cliff spurge (<i>Euphorbia misera</i>)	-/2B.2/Not Covered	Perennial shrub found in coastal bluff scrub, coastal scrub, and Mojavean desert scrub; rocky soils. Blooming period is December to October, and this species occurs at elevations of 10 – 500 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity. The project site is not a coastal setting.
Los Angeles sunflower (<i>Helianthus nuttallii</i> var. <i>parishii</i>)	-/1A/Not Covered	Perennial rhizomatous herb occurs in coastal salt and freshwater marshes and swamps. Blooming period is August to October, and this species occurs at 10 – 1675 m elevation.	Low. Very limited habitat is present on-site or within the immediate vicinity. Species has not been observed since 1933 and is likely extinct. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
Tecate cypress (<i>Hesperocyparis forbesii</i>)	-/1B.1/Covered	Small perennial evergreen tree found in chaparral and closed-cone coniferous forest; clay, gabbroic or metavolcanic, mostly in Santa Ana Mountains and south to Baja California. This species occurs from 80 – 1500 m elevation.	Low. Marginally suitable habitat is present on-site. This species is recorded about 6 miles north of the project site but was not observed during special-status plant surveys conducted in 2018 and 2019.

Species	Status ¹ Federal/State, CRPR/County	Habitat Requirements	Potential to Occur
mesa horkelia (<i>Horkelia cuneata</i> ssp. <i>puberula</i>)	-/1B.1/Not Covered	Perennial herb found in chaparral, cismontane woodland and coastal scrub habitats; found in gravelly or sandy sites from 70 – 810 m elevation. Blooming period is February to September.	Low. Low quality habitat is present on-site but nearest observations greater than 5 miles from study area. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
California satintail (<i>Imperata brevifolia</i>)	-/2B.1/Not Covered	Perennial grass found in chaparral, coastal scrub, Mojavean desert scrub, meadows and seeps (often alkali), or riparian scrub below 500 m elevation. Blooming period is September to May.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
decumbent goldenbush (<i>Isocoma menziesii</i> var. <i>decumbens</i>)	-/1B.2/Not Covered	Perennial shrub that occurs in chaparral and coastal scrub; sandy soils (often within disturbed areas). Blooming period is April to November, and this species occurs at 10 – 135 m elevation.	Unlikely. Low quality habitat is present on-site but species does not grow far from the coast. The nearest observations are in Newport Beach, greater than 5 miles from project area.
Coulter's goldfields (<i>Lasthenia glabrata</i> ssp. <i>coulteri</i>)	-/1B.1/Not Covered	Found in wetland habitats. Microhabitats include playas and vernal pools at elevations up to 1220 m. Blooming period is February to June.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
heart-leaved pitcher sage (<i>Lepechinia cardiophylla</i>)	-/1B.2/Covered	Shrub found in chaparral, foothill woodland, and closed-cone pine forest communities. Blooming period is April to July, and this species occurs at elevations between 600 – 1200 m.	Unlikely. Low quality habitat is present on-site but nearest observations greater than 5 miles from study area. The study area is outside of the known elevation range for this species.
intermediate monardella (<i>Monardella hypoleuca</i> ssp. <i>intermedia</i>)	-/1B.3/Not Covered	Perennial herb found on dry slopes of chaparral, oak woodland, and occasionally conifer forest at elevations between 200 and 1250m. Blooming period in June to September.	Unlikely. No suitable habitat is present on-site or within the immediate vicinity, and the study area is outside of the known elevation range for this species.
felt-leaved monardella (<i>Monardella hypoleuca</i> ssp. <i>lanata</i>)	-/1B.2/Not Covered	Perennial rhizomatous herb found on rocky or granitic slopes in chaparral and foothill woodland communities. Blooming period is June to August, and this species occurs at elevations of 300 – 1500 m.	Unlikely. No suitable habitat is present on-site or within the immediate vicinity, and the study area is outside of the known elevation range for this species.
Hall's monardella (<i>Monardella macrantha</i> ssp. <i>hallii</i>)	-/1B.3/Not Covered	Perennial rhizomatous herb found in chaparral, foothill woodland communities. Blooming period is June to August, and this species occurs at elevations of 300 – 1500 m.	Unlikely. No suitable habitat is present on-site or within the immediate vicinity, and the study area is outside of the known elevation range for this species.
mud nama (<i>Nama stenocarpum</i>)	-/2B.2/Not Covered	Found along freshwater lake margins, riverbanks, marshes and swamps. Blooming period is January to July; this species occurs at elevations from 5 - 500 m.	Low. Marginal habitat is present on-site or within the immediate vicinity. Collected within adjacent Lambert reservoir. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
Gambel's water cress (<i>Nasturtium gambelii</i>)	FE/ST,1B.1/Not Covered	Perennial rhizomatous herb found in marshes and swamps (freshwater or brackish). Blooming period is April to October; this species is found at elevations of 5 - 330 m.	Low. Very limited habitat is present on-site or within the immediate vicinity. Species likely extirpated from county. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
prostrate navarretia (<i>Navarretia prostrata</i>)	-/1B.1/Not Covered	Annual herb associated with coastal scrub, valley and foothill grassland, vernal pools from 15 – 1210 m elevation. Blooming period is from April to July.	Unlikely. Not expected due to lack of suitable vernal pool habitat on-site or within the immediate vicinity.

Species	Status ¹ Federal/State, CRPR/County	Habitat Requirements	Potential to Occur
chaparral nolina (<i>Nolina cismontana</i>)	-/1B.2/Not Covered	Shrub found in dry chaparral of coastal mountains. Blooming period lasts from May to July, and this species occurs from 200 - 1200 m elevation.	Low. Marginal habitat is present on-site or within the immediate vicinity. Nearest observation of species 4 miles to east in Foothill Ranch area. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
California beardtongue (<i>Penstemon californicus</i>)	-/1B.2/Not Covered	Perennial herb found in sandy soils within chaparral, yellow pine forest and pinyon-juniper woodland communities located in elevations between 1200 and 2300 m. Blooming period is May to June.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity, and the study area is outside of known elevation range for this species.
Allen's pentachaeta (<i>Pentachaeta aurea</i> ssp. <i>allenii</i>)	-/1B.1/Not Covered	Annual herb found in coastal scrub openings and valley and foothill grasslands; often on clay. Blooming period is March to June; this species occurs at 75 – 520 m elevation.	Low. Low quality habitat is present on-site or within the immediate vicinity; suitable soils not present. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
Santiago Peak phacelia (<i>Phacelia keckii</i>)	-/1B.3/Not Covered	Annual herb found in open areas of chaparral and closed-cone pine forest. Blooming period is May to September, and this species grows at elevations of 500 – 1600 m.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity and nearest observations greater than 5 miles from study area. The study area is outside of the known elevation range for this species.
white rabbit-tobacco (<i>Pseudognaphalium leucocephalum</i>)	-/2B.2/Not Covered	Perennial herb found in sandy or gravelly benches, dry stream bottoms, and canyon bottoms within coastal sage scrub and chaparral communities. Blooming period is August to November, and this species occurs at elevations below 500 m.	Low. Limited, low quality habitat is present on-site or within the immediate vicinity. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
Nuttall's scrub oak (<i>Quercus dumosa</i>)	-/1B.1/Covered	Perennial evergreen shrub found in close-cone coniferous forest, chaparral, and coastal sage scrub; sandy, clay loam soil. Blooming period is February to August, and this species occurs at 15 – 400 m elevation.	Low. Limited, low quality habitat is present on-site or within the immediate vicinity. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
Coulter's matilija poppy (<i>Romneya coulteri</i>)	-/4.2/Covered	Perennial rhizomatous herb found near dry washes and canyons in chaparral and coastal sage scrub communities. This species occurs at elevations under 1200 m; blooming period is March to July.	Low. Marginal habitat is present on-site or within the immediate vicinity. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
chaparral ragwort (<i>Senecio aphanactis</i>)	-/2B.2/Not Covered	Annual herb found in chaparral, cismontane woodland, and coastal scrub; soil is sometimes alkaline. Blooming period is January to April, and this species occurs at 15 – 800 m elevation.	Low. Limited, low quality habitat is present on-site or within the immediate vicinity; heavy clay soils largely absent. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
Salt Spring checkerbloom (<i>Sidalcea neomexicana</i>)	-/2B.2/Not Covered	Perennial herb found in chaparral, coastal scrub, lower montane coniferous forest, Mojavean desert scrub, and playas; alkaline, mesic soils. Blooming period is March to June, and this species occurs at 15 - 1530 m elevation.	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.
estuary seablite (<i>Suaeda esteroa</i>)	-/1B.2/Not Covered	Perennial herb found in coastal salt marshes and swamps with tidal flows. Blooming period is May to January; this species occurs at sea level (up to 5 m elevation).	Unlikely. Suitable habitat and soils are not present on-site or within the immediate vicinity.

Species	Status ¹ Federal/State, CRPR/County	Habitat Requirements	Potential to Occur
San Bernardino aster (<i>Symphotrichum defoliatum</i>)	-/1B.2/Not Covered	Perennial rhizomatous herb found near ditches, streams, and springs in cismontane woodland, coastal scrub, lower montane coniferous forest, meadows and seeps, marshes and swamps, and valley and foothill grassland. This species occurs from 2 – 2040 m elevation; blooming period is July to November.	Low. Marginally suitable habitat and moist soils are present on-site. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
Parry's tetracoccus (<i>Tetracoccus dioicus</i>)	-/1B.2/Not Covered	Shrub found on dry slopes in chaparral and coastal sage scrub communities. Blooming period is April to May, and this species occurs in elevations less than 1000 m.	Low. Limited, low quality habitat is present on-site or within the immediate vicinity. Single county record observed in 1948 with poor locational accuracy. At the northern limit of its recorded distribution. This species was not observed during special-status plant surveys conducted in 2018 and 2019.
big-leaved crownbeard (<i>Verbesina dissita</i>)	-/1B.2/Not Covered	Found within chaparral and coastal scrub habitats. Blooming period is April to July, and this species occurs at elevations from 145 - 205 m.	Unlikely. Limited, low quality habitat is present on-site or within the immediate vicinity but project site is outside the recorded distribution for this species. Species records restricted to coastal bluffs near Laguna Niguel.
San Diego County viguiera (<i>Bahiopsis laciniata</i>)	-/4.3/Not Covered	Perennial shrub found on chaparral and coastal scrub. Blooming period is February to June (August), and this species occurs at elevations from 60 - 750 m.	Present. This species was observed on-site during special-status plant surveys conducted in 2018 and 2019. One individual was observed on-site in the easternmost portion of the study area.

¹ Description of status codes:
FE = Listed as endangered under the FESA
FT = Listed as threatened under the FESA
SE = Listed as endangered under the CESA
ST = Listed as threatened under the CESA
CRPR = California Rare Plant Rank (CNPS 2018)
CRPR 1A = Presumed extinct
CRPR 1B = Plants rare, threatened or endangered in California and elsewhere
CRPR 2B = Plants rare, threatened or endangered in California, but more common elsewhere
CRPR 3 = Plants about which more information is needed
CRPR 4 = Watch-list: Plants of limited distribution
.1 = Seriously threatened in California
.2 = Moderately threatened in California
.3 = Not very threatened in California
Covered = Covered under the Orange County NCCP/HCP
Conditionally Covered = Conditionally Covered under the Orange County NCCP/HCP
Not Covered = Not Covered under the Orange County NCCP/HCP

SPECIAL-STATUS WILDLIFE SPECIES WITH POTENTIAL TO OCCUR WITHIN THE STUDY AREA

Species	Status ¹ Federal/State/County	Habitat Requirements	Potential to Occur
INSECTS			
Quino checkerspot butterfly (<i>Euphydryas editha quino</i>)	FE/-/Conditionally Covered	Sunny openings within chaparral & coastal sage shrublands in parts of Riverside & San Diego counties. Hills and mesas near the coast. Need high densities of food plants <i>Plantago erecta</i> , <i>Plantago insularis</i> , and <i>Orthocarpus purpurescens</i> .	Unlikely. The study area is outside of the currently known range for this species, and outside of the protocol survey area (USFWS 2014). Nearest known occurrences documented by the UFWS are 3-4 miles to the north from 1928 and 1937.
CRUSTACEANS			
San Diego fairy shrimp (<i>Branchinecta sandiegonensis</i>)	FE/-/Conditionally Covered	Known to occur in areas of swales/earth slump basins in grassland, chaparral and coastal sage scrub. Inhabit seasonally wet pools filled by winter/spring rains. Hatch in warm water later in the season.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
Riverside fairy shrimp (<i>Streptocephalus woottoni</i>)	FE/-/Conditionally Covered	Generally restricted to vernal pools and other non-vegetated ephemeral pools greater than 12 inches in depth in Riverside, Orange, and San Diego Counties. Typically observed January through March.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
FISH			
Santa Ana sucker (<i>Catostomus santaanae</i>)	FT/-/Not Covered	Habitat generalists, but prefer sand-rubble-boulder bottoms, cool, clear water, & algae.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
tidewater goby (<i>Eucyclogobius newberryi</i>)	FE/SC/Not Covered	Found in shallow brackish water habitats, lagoons and lower stream reaches. Require fairly still but not stagnant water & high oxygen levels.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
arroyo chub (<i>Gila orcuttii</i>)	-/SC/Not Covered	Los Angeles Basin south coastal streams. Slow water stream sections with mud or sand bottoms.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
steelhead - southern California DPS (<i>Oncorhynchus mykiss irideus</i> pop. 10)	FE/-/Not Covered	Found in streams and rivers with at least 7 inches minimum depth	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
Santa Ana speckled dace (<i>Rhinichthys osculus</i> ssp. 3)	-/SC/Not Covered	Prefers south coast flowing waters	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
AMPHIBIANS			
arroyo toad (<i>Anaxyrus californicus</i>)	FE/SC/Conditionally Covered	Prefers streams and river with fine sediments and where flow rates are great enough to keep silt and clay suspended. Shallow sandy pools bordered sand and gravel flood terraces are needed for breeding	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
arboreal salamander (<i>Aneides lugubris</i>)	-/-/Covered	Occurs primarily in valley-foothill hardwood, valley-foothill hardwood-conifer, and mixed conifer habitats, but is also known from Douglas fir and redwood habitat types. May be found in chaparral in southern California. This species is only found on the surface during moist periods, when it can be common. Elevation range extends from sea level to 1520 m (5000 ft).	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.

Species	Status ¹ Federal/State/County	Habitat Requirements	Potential to Occur
black-bellied slender salamander (<i>Batrachoseps nigriventris</i>)	-/-/Covered	Found primarily near drainages associated with open oak, mixed conifer forests, and mixed chaparral.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
western spadefoot (<i>Spea hammondi</i>)	-/SC/Covered	Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains. Rain pools or shallow temporary pools, which do not contain bullfrogs, fish, or crayfish are necessary for breeding.	Low. Some suitable habitat is present on-site or within the immediate vicinity. This species was not observed during surveys conducted in 2019.
Coast Range newt (<i>Taricha torosa</i>)	-/SC/Not Covered	Found in drier chaparral, oak woodland, and grasslands.	Low. Suitable but low quality habitat is present on-site or within the immediate vicinity.
REPTILES			
southern California legless lizard (<i>Anniella stebbinsi</i>)	-/SC/Not Covered	Occurs in moist warm loose soil with plant cover. Moisture is essential. Occurs in sparsely vegetated areas of beach dunes, chaparral, pine-oak woodlands, desert scrub, sandy washes, and stream terraces with sycamores, cottonwoods, or oaks. Leaf litter under trees and bushes in sunny areas and dunes stabilized with bush lupine and mock heather often indicate suitable habitat. Often can be found under surface objects such as rocks, boards, driftwood, and logs. Can also be found by gently raking leaf litter under bushes and trees. Sometimes found in suburban gardens in Southern California.	Low. Suitable but low quality habitat is present on-site or within the immediate vicinity.
California glossy snake (<i>Arizona elegans occidentalis</i>)	-/SC/Not Covered	Inhabits arid scrub, rocky washes, grasslands, and chaparral. Appears to prefer microhabitats of open areas with friable soils for burrowing.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
orange-throated whiptail (<i>Aspidoscelis hyperythra</i>)	-/-/Covered	Species requires intact habitat within chaparral, cismontane woodland and coastal scrub plant communities. Prefers washes & other sandy areas with patches of brush & rocks. Perennial plants necessary for its major food-termites.	Present. This species was observed within the study area during 2018 biological surveys, and was documented on-site in CNDDB in 1990.
coastal whiptail (<i>Aspidoscelis tigris stejnegeri</i>)	-/SC/Covered	Found in deserts and semi-arid areas with sparse vegetation and open areas. Also found in woodland and riparian areas. Ground may be firm soil, sandy, or rocky.	Moderate. Suitable habitat is present on-site or within the immediate vicinity. This species was documented in CNDDB 2 miles to the northeast in Limestone Canyon in 1999.
red-diamond rattlesnake (<i>Crotalus ruber</i>)	-/SC/Covered	Known to occur in chaparral, Mojavean desert scrub and Sonoran Desert scrub communities. Occurs in rocky areas & dense vegetation. Needs rodent burrows, cracks in rocks or surface cover objects.	Low. Suitable habitat is present on-site or within the immediate vicinity. This species was documented in CNDDB 2 miles to the northeast in Limestone Canyon in 1999.
San Bernardino ringneck snake (<i>Diadophis punctatus modestus</i>)	-/-/Covered	Most common in open, relatively rocky areas within valley-foothill, mixed chaparral, and annual grass habitats. Often in somewhat moist microhabitats near intermittent streams. Avoids moving through open or barren areas by restricting movements to areas of surface litter or herbaceous vegetation.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity. Nearest documented occurrences in CNDDB are from Los Angeles and Riverside Counties.

Species	Status ¹ Federal/State/County	Habitat Requirements	Potential to Occur
western pond turtle (<i>Emys marmorata</i>)	-/SC/Not Covered	Known to occur in slow-moving permanent or intermittent streams, ponds, small lakes, reservoirs with emergent basking sites; adjacent uplands used during winter.	Unlikely. Suitable but low quality habitat is present on-site or within the immediate vicinity. No basking sites available within the study area, and no observation of submerged vegetation.
coastal rosy boa (<i>Lichanura trivirgata rosafusca</i>)	-/-/Covered	Rocky areas of chaparral and coastal sage scrub habitats. Attracted to water sources such as permanent and intermittent streams, but does not require permanent water.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
Coronado skink (<i>Plestiodon skiltonianus interparietalis</i>)	-/-/Covered	Grassland, chaparral, pinon-juniper and juniper sage woodland, pine-oak and pine forests in Coast Ranges of Southern California. Prefers early successional stages or open areas. Found in rocky areas close to streams and on dry hillsides.	Unlikely. Suitable habitat is not present on-site. Nearest known occurrences documented in CNDDB are in Camp Pendleton in San Diego County from 1999; no CNDDB occurrences of this species are documented in Orange County.
coast horned lizard (<i>Phrynosoma blainvillii</i>)	-/SC/Covered	Known to occur in sandy washes with within chaparral or coastal scrub habitat. Requires loose soil for burial and abundant supply of harvester ants.	Low. Suitable but low quality habitat is present on-site or within the immediate vicinity.
coast patch-nosed snake (<i>Salvadora hexalepis virgultea</i>)	-/SC/Not Covered	Known to inhabit semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains.	Low. Suitable but low quality habitat is present on-site or within the immediate vicinity.
two-striped garter snake (<i>Thamnophis hammondi</i>)	-/SC/Not Covered	Habitat includes marsh and swamp, riparian scrub, riparian woodland, and wetland. Highly aquatic, found in or near permanent fresh water. Often along streams with rocky beds and riparian growth.	Unlikely. Suitable but low quality habitat is present on-site or within the immediate vicinity.
BIRDS			
sharp-shinned hawk (<i>Accipiter striatus</i>)	-/-/Covered	Most commonly associated with woodlands and brushlands. A wide variety of habitat types are used by wintering birds.	High. Suitable habitat is present on-site.
tricolored blackbird (<i>Agelaius tricolor</i>)	-/SC/Not Covered	Known to occur in freshwater marsh, marsh, swamp, and wetland; highly colonial species, most numerous in Central Valley & vicinity. Requires open water, protected nesting substrate, and foraging area with insect prey within a few km of the colony.	Low. Limited, low quality habitat is present on-site or within the immediate vicinity.
Southern California rufous-crowned sparrow (<i>Aimophila ruficeps canescens</i>)	-/-/Covered	Known to frequent relatively steep, often rocky hillsides with grass and forb species. Resident in southern California coastal sage scrub and mixed chaparral.	Present. Suitable habitat is present on-site or within the immediate vicinity. This species was observed on-site in 2019 and during previous surveys (Dudek 2012).
grasshopper sparrow (<i>Ammodramus savannarum</i>)	-/SC/Not Covered	Known to occur in dense grasslands on rolling hills, lowland plains, in valleys & on hillsides on lower mountain slopes. Favors native grasslands with a mix of grasses, forbs, and scattered shrubs.	Present. Limited, low quality habitat is present on-site or within the immediate vicinity. One migrant species was observed on-site during previous surveys by LSA in 1999 (Dudek 2012).

Species	Status ¹ Federal/State/County	Habitat Requirements	Potential to Occur
golden eagle (<i>Aquila chrysaetos</i>)	-/FP/Conditionally Covered	Known to live in open and semi-open country featuring native vegetation across most of the Northern Hemisphere. They avoid developed areas and uninterrupted stretches of forest. They are found primarily in mountains up to 12,000 feet, canyonlands, rimrock terrain, and riverside cliffs and bluffs. Golden Eagles nest on cliffs and steep escarpments in grassland, chaparral, shrubland, forest, and other vegetated areas.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
long-eared owl (<i>Asio otus</i>)	-/SC/Not Covered	Roosts in dense vegetation and forage in open grasslands or shrublands; also open coniferous or deciduous woodlands. They occur at elevations ranging from near sea level to above 6,500 feet.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
burrowing owl (<i>Athene cunicularia</i>)	-/SC/Not Covered	Known to occur within open, dry annual or perennial grasslands, deserts, and scrublands characterized by low-growing vegetation. A subterranean nester dependent upon burrowing mammals, particularly the California ground squirrel.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity. No suitable burrows observed within the site.
rough-legged hawk (<i>Buteo lagopus</i>)	-/-/Covered	Occurs in California only during the winter months, from October through March. Occurs in prairies, semi-deserts, grassland, pastures, and marshlands that are distant from extensive woodlands and densely developed areas.	Unlikely. Suitable habitat is not present on-site.
red-shouldered hawk (<i>Buteo lineatus</i>)	-/-/Covered	Prefers mature lowland forests with open water and clearings nearby. Can sometimes nest in eucalyptus groves.	Present. Suitable habitat is present on-site. This species was observed on-site during previous surveys (Dudek 2012).
coastal cactus wren (<i>Campylorhynchus brunneicapillus</i> <i>cousei</i>)	-/SC/Covered	Known to occur in coastal scrub habitats; requires stands of prickly pear or cholla cactus for nesting and roosting.	Low (Previously Present). This species was previously documented on-site in 1990 in CNDDDB. Cactus wren were also documented on-site around 2000, prior to the 2007 Santiago Fire (Dudek 2012). There is currently very limited, isolated cactus on-site so this species has a low potential to occur due to limited suitable habitat on-site or within the immediate vicinity.
Vaux's swift (<i>Chaetura vauxi</i>)	-/SC/Not Covered	A summer resident of northern California, this species breeds in the Coast Ranges, Sierra Nevada, and possibly the Cascade Ranges. Prefers redwood and Douglas-fir habitats with nest-sites in large hollow trees and snags, especially tall, burned-out stubs. This bird is a fairly common migrant throughout most of the state in April and May, and August and September. Feeds exclusively on flying insects taken in long, continuous foraging flights; feeds high in the air over most terrains and habitats, and also commonly at lower levels in forest openings, above burns, and especially above rivers and lakes.	Present. This species was observed flying over the site during a May 2019 survey, and was likely a migrant.

Species	Status ¹ Federal/State/County	Habitat Requirements	Potential to Occur
northern harrier (<i>Circus cyaneus</i>)	-/SC/Covered	Coastal salt & fresh-water marsh. Nest & forage in grasslands, from salt grass in desert sink to mountain cienagas. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.	Present. Suitable habitat is present on-site or within the immediate vicinity. This species was observed on-site during previous surveys (Dudek 2012).
western yellow-billed cuckoo (<i>Coccyzus americanus occidentalis</i>)	FT/SE/Not Covered	Riparian forest nester, along the broad, lower flood-bottoms of larger river systems. Nests in riparian jungles of willow, often mixed with cottonwoods, with lower story of blackberry, nettles, or wild grape.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
yellow rail (<i>Coturnicops noveboracensis</i>)	-/SC/Not Covered	Known to occur within freshwater marshlands, meadows and seeps.	Unlikely. Limited suitable habitat is present on-site or within the immediate vicinity. Nearest occurrences in CNDDDB are in Newport Back Bay in 1896 and Corona in 1914.
white-tailed kite (<i>Elanus leucurus</i>)	-/FP/Not Covered	Rolling foothills and valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	Present. Suitable habitat is present on-site or within the immediate vicinity. This species was observed on-site during previous surveys by LSA in 1999 (Dudek 2012).
southwestern willow flycatcher (<i>Empidonax traillii extimus</i>)	FE/SE/Conditionally Covered	Breeds in dense willow-dominated riparian habitat near open water.	Low. Suitable but limited habitat is present on-site or within the immediate vicinity. This species was not observed during focused surveys conducted in 2019.
prairie falcon (<i>Falco mexicanus</i>)	-/-/Conditionally Covered	Grasslands and other open habitats. Foraging occurs of wide areas, but cliffs are generally required for nest sites.	Present. Suitable foraging habitat is present on-site. No suitable nesting habitat occurs on-site, and this species is currently not known to nest within Orange County, and have not occurred within the county for over a decade (CDFW 2020, Catino-Davenport 2019). This species was observed on-site during previous surveys (Dudek 2012).
American peregrine falcon (<i>Falco peregrinus anatum</i>)	-/FP/Covered	Known to occur near wetlands, lakes, rivers, or other water; on cliffs, banks, dunes, mounds; also, human-made structures. Nest consists of a scrape or a depression or ledge in an open site.	Present. Suitable foraging habitat is present on-site or within the immediate vicinity. No suitable nesting habitat occurs within the study area or immediate vicinity. This species was observed on-site during previous surveys (Dudek 2012).
bald eagle (<i>Haliaeetus leucocephalus</i>)	-/SE,FP/Not Covered	Typically nest in forested areas adjacent to large bodies of water, staying away from heavily developed areas when possible. Tolerant of human activity when feeding, and may congregate around fish processing plants, dumps, and below dams where fish concentrate. For perching, bald eagles prefer tall, mature coniferous or deciduous trees that afford a wide view of the surroundings. In winter, bald eagles can also be seen in dry, open uplands if there is access to open water for fishing.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.

Species	Status ¹ Federal/State/County	Habitat Requirements	Potential to Occur
yellow-breasted chat (<i>Icteria virens</i>)	–/SC/Not Covered	Known to occur within riparian forest, scrub and woodland habitats.	Present. This species was observed within the study area during 2018 and 2019 biological surveys.
California black rail (<i>Laterallus jamaicensis coturniculus</i>)	–/ST,FP/Not Covered	Known to occur in brackish and freshwater marshes. Inhabits riparian thickets of willow & other brushy tangles near watercourses. Needs water depths of about 1 inch that do not fluctuate during the year and dense vegetation for nesting habitat.	Unlikely. Limited suitable habitat is present on-site or within the immediate vicinity. Nearest occurrences in CNDDB are in Newport Back Bay in 1983 and near Orange in 1986.
Belding's savannah sparrow (<i>Passerculus sandwichensis beldingi</i>)	–/SE/Not Covered	Inhabits coastal salt marshes. Nests in pickleweed on and about margins of tidal flats.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
coastal California gnatcatcher (<i>Poliophtila californica californica</i>)	FT/SC/Covered	Species is an obligate, permanent resident of coastal sage scrub in southern California. Low, coastal sage scrub in arid washes, on mesas and slopes.	Present. This species was observed within the study area during 2018 and 2019 biological surveys.
light-footed Ridgway's rail (<i>Rallus obsoletus levipes</i>)	FE/SE,FP/Not Covered	Found in salt marshes traversed by tidal sloughs, where cordgrass and pickleweed are the dominant vegetation. Requires dense growth of either pickleweed or cordgrass for nesting or escape cover; feeds on molluscs and crustaceans.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
yellow warbler (<i>Setophaga petechia</i>)	–/SC/Not Covered	Riparian plant associations in close proximity to water. Frequently found nesting and foraging in willow shrubs and thickets, and in other riparian plants including cottonwoods, sycamores, ash, and alders.	Present. This species was observed within the study area during 2018 and 2019 biological surveys.
California least tern (<i>Sternula antillarum browni</i>)	FE/SE,FP/Not Covered	Known to occur in alkali playas and coastal dune and beach habitats. Colonial breeder on bare or sparsely vegetated, flat substrates: sand beaches, alkali flats, landfills, or paved areas.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
least Bell's vireo (<i>Vireo bellii pusillus</i>)	FE/SE/Conditionally Covered	Known to occur in riparian forest, scrub, and woodland habitats. Nests primarily in willow, baccharis, or mesquite habitats.	Present. This species was observed within the study area during 2018 and 2019 biological surveys, including focused surveys conducted in 2019.
MAMMALS			
Coyote (<i>Canis latrans</i>)	–/–/Covered	Occur in all wildland habitat types in the subregion, and are adaptable enough to use agricultural and developed lands.	Present. This species was observed within the study area during 2018 and 2019 biological surveys, and previous surveys (Dudek 2012).
gray fox (<i>Urocyon cinereoargenteus</i>)	–/–/Covered	Found in many habitat types, with preference for woodlands, chaparral, and coastal scrub.	Low. Suitable habitat is present on-site or within the immediate vicinity.
pallid bat (<i>Antrozous pallidus</i>)	–/SC/Not Covered	Known to occur in a wide variety of habitats including deserts, grasslands, shrublands, woodlands & forests. Most common in open, dry habitats with rocky areas for roosting; particularly associated with buildings and bridges.	Low. Suitable habitat is present on-site or within the immediate vicinity.

Species	Status ¹ Federal/State/County	Habitat Requirements	Potential to Occur
northwestern San Diego pocket mouse (<i>Chaetodipus fallax fallax</i>)	-/SC/Not Covered	Moderate canopy coverage of arid shrubland or pinyon-juniper habitats on or near rocky slopes and sandy areas.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
Mexican long-tongued bat (<i>Choeronycteris mexicana</i>)	-/SC/Not Covered	Known to occur at altitudes of 300-2,400 meters in deciduous, semi-arid thorn scrub and mixed oak-conifer forests	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity. The study area is outside of the typical range for this species.
Stephen's kangaroo rat (<i>Dipodomys stephensi</i>)	FE/SE/Not Covered	Known to occur in sparse perennial vegetation with firm soil, "neither hard nor sandy".	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity. The study area is outside of the typical range for this species.
western mastiff bat (<i>Eumops perotis californicus</i>)	-/SC/Not Covered	Known to occur in habitat consisting of extensive open areas with abundant roost locations provided by crevices in rock outcrops and buildings.	Low. Limited suitable habitat is present on-site or within the immediate vicinity. Nearest CNDDDB occurrence is an anecdotal observation from Limestone Canyon (date unknown) 2.8 miles to the northeast.
western red bat (<i>Lasiurus blossevillii</i>)	-/SC/Not Covered	Prefers edges or habitat mosaics that have trees for roosting and open areas for foraging. Requires nearby water source. Roosting habitat includes forests and woodlands from sea level up through mixed conifer forests. Feeds over a wide variety of habitats including grasslands, shrublands, open woodlands and forests, and croplands. Not found in desert areas.	Low. Limited habitat is present on-site or within the immediate vicinity. Nearest CNDDDB occurrence is from Bell Canyon (near Starr Ranch) 11 miles to the southeast in 1997.
western yellow bat (<i>Lasiurus xanthinus</i>)	-/SC/Not Covered	Known only in Los Angeles and San Bernardino Cos. south to the Mexican border. This species has been recorded below 600 m (2000 ft) in valley foothill riparian, desert riparian, desert wash, and palm oasis habitats.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
San Diego desert woodrat (<i>Neotoma lepida intermedia</i>)	-/SC/Covered	Known to occur in coastal scrub, desert scrub, chaparral, cactus, and rocky habitats.	Moderate. Some suitable habitat is present on-site or within the immediate vicinity.
pocketed free-tailed bat (<i>Nyctinomops femorosaccus</i>)	-/SC/Not Covered	Habitats used include pinyon-juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oasis. Prefers rocky desert areas with high cliffs and rock outcrops.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
big free-tailed bat (<i>Nyctinomops macrotis</i>)	-/SC/Not Covered	Prefers rugged, rocky canyons.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
southern grasshopper mouse (<i>Onychomys torridus ramona</i>)	-/SC/Not Covered	Alkali desert scrub and desert scrub habitats are preferred, with somewhat lower densities expected in other desert habitats, including succulent shrub, wash, and riparian areas. Also occurs in coastal scrub, mixed chaparral, sagebrush, low sage, and bitterbrush habitats. Uncommon in valley foothill and montane riparian, and in a variety of other habitats.	Low. Suitable habitat is present on-site or within the immediate vicinity.

Species	Status ¹ Federal/State/County	Habitat Requirements	Potential to Occur
Pacific pocket mouse (<i>Perognathus longimembris pacificus</i>)	FE/SC/Conditionally Covered	Known to occur in coastal scrub habitats. Seems to prefer soils of fine alluvial sands of coastal plains near the ocean.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
Southern California saltmarsh shrew (<i>Sorex ornatus salicornicus</i>)	-/SC/Not Covered	Known to occur in salt marsh habitat within Southern California. Requires dense vegetation and woody debris for cover.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.
American badger (<i>Taxidea taxus</i>)	-/SC/Not Covered	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.	Unlikely. Suitable habitat is not present on-site or within the immediate vicinity.

¹ Description of status codes:

FE = Listed as endangered under the FESA

FT = Listed as threatened under the FESA

SE = Listed as endangered under the CESA

ST = Listed as threatened under the CESA

FP = Listed as fully protected under CDFW code

SC = Species of Special Concern

Covered = Covered under the County of Orange NCCP/HCP

Conditionally Covered = Conditionally Covered under the County of Orange NCCP/HCP

Not Covered = Not covered under the County of Orange NCCP/HCP

Subject: Results of Focused Western Spadefoot Toad Surveys for the Syphon Reservoir Improvement Project, Unincorporated Orange County, California

Dear Ms. Corey:

This letter report presents the results of focused surveys for western spadefoot toad (*Spea hammondi*) at the Syphon Reservoir Improvement Project site within unincorporated Orange County, California. ESA biologists conducted the surveys to determine the presence or absence of the species within the approximately 265-acre study area (“study area”). The species background, project location and description, methodology used during the survey, and survey results are described below.

Background

The western spadefoot toad is currently considered by the California Department of Fish and Wildlife (CDFW) as a California Species of Special Concern, and is an “Identified Species” for which conservation and management is provided for under the County of Orange Central & Coastal Subregion Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP). The western spadefoot toad is a small greenish, brown, cream, or gray toad that has a distinct glossy black spade (i.e., shaped like a wedge or teardrop) on each hind foot. This species’ range extends from northern California south into Baja and they may occur from sea level up to 4,500’ (1365m). Western spadefoot toad adults generally only enter aquatic habitats for breeding and they spend the majority of their time in upland communities near seasonally wet pools or shallow ponds, burrowed into friable soils or small mammal burrows. This species requires seasonal rain pools that can contain water for a minimum of three to four weeks. Breeding and egg laying typically occurs in late winter until the end of March and males can be heard calling during this period. Spadefoot toad eggs require 1 to 6 days to hatch and 3 to 11 weeks to complete metamorphosis.

Based on a query of the California Natural Diversity Database (CNDDDB)¹, the nearest reported occurrence of the western spadefoot toad to the study area is located approximately a mile to the east from Bee Canyon.²

¹ CDFW. 2019. California Natural Diversity Database (CNDDDB) Commercial version, Information dated February 8, 2019.

² Exact date of occurrence was not recorded, but was documented in a source from 1985.

Ms. Corey

Page 2

Project Location and Description

The study area is located in central Orange County (**Figure 1**). Specifically, the study area is located on the northeast side of Portola Parkway between the Bee Canyon Landfill Access Road and State Route 133 (SR-133) (**Figure 2**). Irvine Ranch Water District (IRWD) owns the majority of the property bounded by these roadways. The Crean Lutheran High School maintains recreation facilities located between Portola Parkway and the toe of the existing dam slope. Residential neighborhoods are located on the southwest side of Portola Parkway. The ground surrounding the reservoir, which dominates the study area, is hilly with ridgelines and terraced slopes. Ground surface elevations within the study area range from approximately 319 feet above sea level at Portola Parkway immediately below the existing reservoir to approximately 675 feet above sea level in the northeast corner of the study area.

The Syphon Reservoir Improvement Project is intended to store additional recycled water to meet the seasonal demand of recycled water customers and to enhance IRWD's water supply reliability by increasing the existing recycled water seasonal storage capacity at Syphon Reservoir, which will allow the storage of additional recycled water produced at the water recycling plants during periods of low demand (winter months) for use during periods of high demand (summer months). A preliminary geotechnical investigations project would evaluate geologic and seismic conditions at the embankment dam, spillway, outlet, and borrow sites.³

Methodology

Prior to the site visit, ESA biologist Lily Sam reviewed topographic maps and a recently created vegetation map (**Figure 3**) of the study area, and noted the areas with relatively flat topography where potential breeding pools may have the opportunity to form. ESA also reviewed a report detailing the habitat assessment and baseline surveys conducted by United States Geological Survey (USGS) for the western spadefoot toad and the western pond turtle within the Irvine Ranch Land Reserve⁴. Upon review of the report, although USGS surveyed the Syphon Reservoir area for western pond turtle, they did not survey for the western spadefoot toad and it is assumed that the area was ruled out for the lack of suitable habitat or the presence of thick vegetation that would not provide suitable friable soils for the creation of burrows.

Since western spadefoot toad is an upland species that requires water for breeding purposes only, surveys included two diurnal surveys of water margins to search for egg clusters, and two nocturnal surveys immediately after rain events to search for individuals detectable by calls or eye-shine and visual identification. On January 18, 2019, ESA biologists Lily Sam and Robert Sweet conducted a diurnal and nocturnal survey between the hours of

³ An embankment dam is an earthen dam built by compacting successive layers of earth, using the most impervious materials to form a core and placing more permeable substances on the inner and outer sides. A spillway is a structure provided to control the release of flows from behind a dam such that the dam does not overtop. An outlet is a device used to regulate flow from a dam. A borrow site is an excavated area where material has been dug for use as fill material at another location.

Page 3

12:00 pm to 8:00 pm, after substantial rainfall occurred with nearly 1” of precipitation recorded in the area over the preceding 3 days. Weather conditions were overcast, the temperatures ranged between 56.5 to 65 degrees Fahrenheit (F) and the winds ranged from 0 to 5 miles per hour (mph). A second diurnal and nocturnal survey was conducted on March 7, 2019 by ESA biologists Lily Sam and Douglas Gordon-Blackwood between the hours of 1:00 pm and 8:00 pm, after another rain event with at least 0.4” of rain on March 6. Weather conditions were overcast with very brief light drizzle, the temperatures ranged between 56 to 59° F and the winds ranged from 0 to 3 mph. For both diurnal surveys, the study area was walked to assess the locations of standing pools of water. All locations of standing water or puddles were recorded with a GPS unit and mapped. Each of the puddles were visually inspected for eggs and larvae or the presence of western spadefoot toads. Both night surveys were conducted using eye-shine detection techniques, which involve using appropriately powered lights with the aid of binoculars to sweep the study area in order to detect eye-shine from amphibious species, as well as auditory detection of potential males calling. Water was present in the reservoir at the time of the survey and the banks were surveyed for toads, it should be noted that it is not considered likely for any spadefoot toads to be found within the open water portion of the reservoir. Western spadefoot toads do not prefer deep water, rather, they prefer shallow, turbid pools containing some vegetative matter. Therefore, the reservoir itself is not considered preferred breeding habitat for this species.

Results

A total of eight potential breeding pools were detected within the study area, but no western spadefoot toads were detected by sight or calls during either survey (**Figure 4**). Although some suitable pools were present on site, nearly all of the flat areas within the study area were densely vegetated with grasses and annual herbs, which make it difficult for adult toads to move around. Furthermore, there are very limited areas of the site that are flat. The majority of the study area is sloped, excluding the access roads and the margins or marshy areas located adjacent to the open water habitat. Furthermore, the reservoir itself is a man-made feature created in the 1940s following construction of the dam that impounded water to provide irrigation for agricultural uses for the Irvine Ranch; thus, the study area has been subject to previous disturbance and likely did not historically support suitable habitat or populations of this species. As such, it is concluded that there are currently no western spadefoot toads within the Syphon Reservoir study area. Two California toads (*Anaxyrus boreas halophilus*) were visually detected during the second survey and Baja California treefrogs (*Pseudacris hypochondriaca hypochondriaca*) calls were detected during both surveys. See **Attachment A** for photos depicting the pools/puddles found.

If there are any questions regarding this report or the results, please feel free to reach out to Maile Tanaka at 949-870-1501 or mtanaka@esassoc.com.

Subject: Results of 2019 Focused Least Bell's Vireo Surveys for the Syphon Reservoir Improvement Project, Unincorporated Orange County, California

Dear Ms. Love and Ms. Burkett:

This letter report presents the methodology and results of focused surveys conducted for least Bell's vireo (*Vireo bellii pusillus*; LBV) at the Syphon Reservoir Improvement Project site within unincorporated Orange County, California. **Environmental Science Associates (ESA)** biologists Maile Tanaka, Jaclyn Catino-Davenport, and Karl Fairchild conducted the surveys to determine the presence or absence of the species within the approximately 265-acre study area ("study area").

Project Location and Description

The study area is located in central Orange County (**Figure 1**). Specifically, the study area is located on the northeast side of Portola Parkway between the Bee Canyon Landfill Access Road and State Route 133 (SR-133) (**Figure 2**). Irvine Ranch Water District (IRWD) owns the majority of the property bounded by these roadways. The Crean Lutheran High School maintains recreation facilities located between Portola Parkway and the toe of the existing dam slope. Residential neighborhoods are located on the southwest side of Portola Parkway. The ground surrounding the reservoir, which dominates the study area, is hilly with ridgelines and terraced slopes. Ground surface elevations within the study area range from approximately 319 feet above sea level at Portola Parkway immediately below the existing reservoir to approximately 675 feet above sea level in the northeast corner of the study area.

The Syphon Reservoir Improvement Project is intended to store additional recycled water to meet the seasonal demand of recycled water customers and to enhance IRWD's water supply reliability by increasing the existing recycled water seasonal storage capacity at Syphon Reservoir, which will allow the storage of additional recycled water produced at the water recycling plants during periods of low demand (winter months) for use during

Ms. Love and Ms. Burkett
August 1, 2019
Page 2

periods of high demand (summer months). A preliminary geotechnical investigations project would evaluate geologic and seismic conditions at the embankment dam, spillway, outlet, and borrow sites.¹

Natural Communities

Natural communities found within the study area include arroyo willow thicket, black willow thicket, mule fat scrub, freshwater marsh, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/coyote brush scrub, chaparral bushmallow scrub/non-native herbaceous cover, sumac chaparral, California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coast prickly pear scrub, eucalyptus woodland, non-native grassland, non-native herbaceous cover, non-native herbaceous cover/California sagebrush scrub, open water, and disturbed areas. Vegetation communities and cover types within the study area are described below. California sagebrush alliance and non-native herbaceous cover/California sagebrush alliance are the dominant vegetation covers in the upland areas, and arroyo willow thicket is the dominant vegetation cover within the riparian areas of the study area. **Figure 3** depicts the natural communities found within the study area. A description of the potentially suitable habitat surveyed for LBV within the study area is presented below.

Arroyo Willow Thicket

Arroyo willow thicket (i.e., *Salix lasiolepis* Shrubland Alliance or Arroyo Willow Riparian Forest) is characterized by a canopy cover dominated by mature arroyo willow (*Salix lasiolepis*) with an understory of smaller willows, and variable herbaceous layer. This alliance is typically found within stream banks and benches, slope seeps, and stringers along drainages.² A total of 0.24 acre of arroyo willow thicket occurs primarily within the northern and northeastern portions of the study area.

Black Willow Thicket

Black willow thicket (i.e., *Salix gooddingii* Woodland Alliance or Black Willow Riparian Forest) is characterized by a canopy cover dominated by mature black willow (*Salix gooddingii*) with an understory of smaller willows, mule fat (*Baccharis salicifolia*), and variable herbaceous layer. This alliance is typically found on terraces along large rivers, canyons, and along rocky floodplains of small, intermittent streams, seeps, and springs.³ Species associated with this alliance include native arroyo willow and non-native tamarisk (*Tamarix ramosissima*) and red gum (*Eucalyptus camaldulensis*). A total of 4.13 acres of black willow thicket were mapped around the northern and northeastern perimeter of the reservoir within the center of the study area.

¹ An embankment dam is an earthen dam built by compacting successive layers of earth, using the most impervious materials to form a core and placing more permeable substances on the inner and outer sides. A spillway is a structure provided to control the release of flows from behind a dam such that the dam does not overtop. An outlet is a device used to regulate flow from a dam. A borrow site is an excavated area where material has been dug for use as fill material at another location.

³ Ibid.

Ms. Love and Ms. Burkett
August 1, 2019
Page 3

Mule Fat Scrub

Mule fat scrub (i.e., mulefat thickets [*Baccharis salicifolia* Shrubland Alliance]) is characterized by large shrub cover dominated by mule fat and variable herbaceous layer. This alliance is typically found within canyon bottoms, floodplains, lake margins, and stream channels with soils of mixed alluvium.⁴ Species associated with this alliance include native black willow, California sagebrush (*Artemisia californica*), laurel sumac (*Malosma laurina*), cocklebur (*Xanthium strumarium*), and non-native Spanish false fleabane (*Pulicaria paludosa*), and black mustard (*Brassica nigra*). A total of 2.25 acres of mule fat scrub were mapped around the northern and northeastern perimeter of the reservoir within the center of the study area.

Methodology

Surveys for LBV were conducted by ESA biologists Maile Tanaka, Jaelyn Catino-Davenport, and Karl Fairchild. Methods employed were in conformance with U.S. Fish and Wildlife Service (USFWS) *Least Bell's Vireo Survey Guidelines* issued January 19, 2001.⁵ Eight surveys were conducted between April 10 and July 8, 2019 within all portions of the study area containing potentially suitable habitat and adjacent habitat potentially used for foraging. Surveys were conducted no less than ten days apart between 6:10 AM and 11:00 AM. Weather conditions were suitable for surveys, with overcast to clear skies, winds of 9 miles per hour or less, and temperatures between 51 and 74 degrees Fahrenheit.

Results

Survey results are summarized in **Table 1** below and depicted on **Figure 4**. LBV were detected during all 2019 focused surveys. No brown-headed cowbirds (*Molothrus ater*), which are brood parasites, were detected within the study area during protocol LBV surveys; however, multiple brown-headed cowbird traps, installed and maintained by Leatherman BioConsulting Inc., were observed on-site with captive decoy birds inside. A complete list of avian species detected within the study area is included in **Attachment A**.

California Natural Diversity Database (CNDDDB) reporting forms for all incidental special-status species are included as **Attachment B**.

SOURCE: ESA 2019.

Incidentally-observed avian special-status species included the coastal California gnatcatcher (*Poliophtila californica californica*), yellow warbler (*Setophaga petechia*), yellow-breasted chat (*Icteria virens*), and southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*). Coastal California gnatcatcher is a federally threatened species, southern California rufous-crowned sparrow is a California Department of Fish and Wildlife (CDFW) watch list species, and yellow warbler and yellow-breasted chat are both CDFW species of special concern. These species were detected during multiple surveys.

Conclusion

Based on the results of the protocol-level LBV surveys, the study area contains LBV vireo habitat that was occupied by up to 16 LBV. Coastal California gnatcatcher, southern California rufous-crowned sparrow, yellow warbler, and yellow-breasted chat were also observed on-site, as well as brown-headed cowbirds only within the traps on-site.

**Results of 2019 Focused
Southwestern Willow Flycatcher
Surveys**

August 1, 2019

Subject: Results of 2019 Focused Southwestern Willow Flycatcher Surveys for the Syphon Reservoir Improvement Project, Unincorporated Orange County, California

Dear Ms. Love and Ms. Burkett:

This letter report presents the methodology and results of focused surveys conducted for southwestern willow flycatcher (*Empidonax traillii extimus*; SWFL) at the Syphon Reservoir Improvement Project site within unincorporated Orange County, California. **Environmental Science Associates (ESA)** biologist Karl Fairchild (TE-92799B-2) conducted the surveys to determine the presence or absence of the species within the approximately 265-acre study area (“study area”).

Project Location and Description

The study area is located in central Orange County (**Figure 1**). Specifically, the study area is located on the northeast side of Portola Parkway between the Bee Canyon Landfill Access Road and State Route 133 (SR-133) (**Figure 2**). Irvine Ranch Water District (IRWD) owns the majority of the property bounded by these roadways. The Crean Lutheran High School maintains recreation facilities located between Portola Parkway and the toe of the existing dam slope. Residential neighborhoods are located on the southwest side of Portola Parkway. The ground surrounding the reservoir, which dominates the study area, is hilly with ridgelines and terraced slopes. Ground surface elevations within the study area range from approximately 319 feet above sea level at Portola Parkway immediately below the existing reservoir to approximately 675 feet above sea level in the northeast corner of the study area.

The Syphon Reservoir Improvement Project is intended to store additional recycled water to meet the seasonal demand of recycled water customers and to enhance IRWD’s water supply reliability by increasing the existing recycled water seasonal storage capacity at Syphon Reservoir, which will allow the storage of additional recycled water produced at the water recycling plants during periods of low demand (winter months) for use during

Ms. Love and Ms. Burkett
August 1, 2019
Page 2

periods of high demand (summer months). A preliminary geotechnical investigations project would evaluate geologic and seismic conditions at the embankment dam, spillway, outlet, and borrow sites.¹

Natural Communities

Natural communities found within the study area include arroyo willow thicket, black willow thicket, mule fat scrub, freshwater marsh, coyote brush scrub, chaparral bushmallow scrub, chaparral bushmallow scrub/coyote brush scrub, chaparral bushmallow scrub/non-native herbaceous cover, sumac chaparral, California sagebrush scrub, California sagebrush scrub/non-native herbaceous cover, coast prickly pear scrub, eucalyptus woodland, non-native grassland, non-native herbaceous cover, non-native herbaceous cover/California sagebrush scrub, open water, and disturbed areas. Vegetation communities and cover types within the study area are described below. California sagebrush alliance and non-native herbaceous cover/California sagebrush alliance are the dominant vegetation covers in the upland areas, and arroyo willow thicket is the dominant vegetation cover within the riparian areas of the study area. **Figure 3** depicts the natural communities found within the study area. A description of the potentially suitable habitat surveyed for SWFL within the study area is presented below.

Arroyo Willow Thicket

Arroyo willow thicket (i.e., *Salix lasiolepis* Shrubland Alliance or Arroyo Willow Riparian Forest) is characterized by a canopy cover dominated by mature arroyo willow (*Salix lasiolepis*) with an understory of smaller willows, and variable herbaceous layer. This alliance is typically found within stream banks and benches, slope seeps, and stringers along drainages (Sawyer et al. 2009)². A total of 0.24 acre of arroyo willow thicket occurs primarily within the northern and northeastern portions of the study area.

Black Willow Thicket

Black willow thicket (i.e., *Salix gooddingii* Woodland Alliance or Black Willow Riparian Forest) is characterized by a canopy cover dominated by mature black willow (*Salix gooddingii*) with an understory of smaller willows, mule fat (*Baccharis salicifolia*), and variable herbaceous layer. This alliance is typically found on terraces along large rivers, canyons, and along rocky floodplains of small, intermittent streams, seeps, and springs (Sawyer et al. 2009)³. Species associated with this alliance include native arroyo willow and non-native tamarisk (*Tamarix ramosissima*) and red gum (*Eucalyptus camaldulensis*). A total of 4.13 acres of black willow thicket were mapped around the northern and northeastern perimeter of the reservoir within the center of the study area.

¹ An embankment dam is an earthen dam built by compacting successive layers of earth, using the most impervious materials to form a core and placing more permeable substances on the inner and outer sides. A spillway is a structure provided to control the release of flows from behind a dam such that the dam does not overtop. An outlet is a device used to regulate flow from a dam. A borrow site is an excavated area where material has been dug for use as fill material at another location.

³ Ibid.

Ms. Love and Ms. Burkett
August 1, 2019
Page 3

Mule Fat Scrub

Mule fat scrub (i.e., mulefat thickets [*Baccharis salicifolia* Shrubland Alliance]) is characterized by large shrub cover dominated by mule fat and variable herbaceous layer. This alliance is typically found within canyon bottoms, floodplains, lake margins, and stream channels with soils of mixed alluvium (Sawyer et al. 2009)⁴. Species associated with this alliance include native black willow, California sagebrush (*Artemisia californica*), laurel sumac (*Malosma laurina*), cocklebur (*Xanthium strumarium*), and non-native Spanish false fleabane (*Pulicaria paludosa*), and black mustard (*Brassica nigra*). A total of 2.25 acres of mule fat scrub were mapped around the northern and northeastern perimeter of the reservoir within the center of the study area.

Methodology

Surveys for SWFL were conducted by ESA biologist Karl Fairchild (TE-92799B-2). Methods employed were in conformance with U.S. Fish and Wildlife Service (USFWS) *A Natural History Summary and Survey Protocol for the Southwestern Willow Flycatcher* issued in 2010.⁵ Five surveys were conducted, with one survey during Period 1 (May 29), two surveys during Period 2 (June 5 and June 17), and two surveys during Period 3 (June 27 and July 8). All portions of the study area containing potentially suitable habitat and adjacent habitat potentially used for foraging were surveyed using playback of taped vocalizations. Surveys were conducted between 5:56 AM and 8:30 AM, during suitable weather conditions (overcast to clear skies, winds of 3 miles per hour or less, and temperatures between 63 and 74 degrees Fahrenheit). The permitted biologist played a 15-second recording of SWFL vocalizations (including *fitz-bew* and *britt* notes). The recording was played twice before the biologist moved approximately 100 feet and repeated the procedure. Due to the patchy nature of the habitat present at this site, the biologist frequently moved greater distances between patches of suitable habitat between playbacks.

Results

Survey results are summarized in **Table 1** below. No willow flycatchers were detected during any of the 2019 focused surveys. No brown-headed cowbirds (*Molothrus ater*), which are brood parasites, were detected within the study area during protocol SWFL surveys; however, multiple brown-headed cowbird traps, installed and maintained by Leatherman BioConsulting Inc., were observed on-site with captive decoy birds inside. A complete list of avian species detected within the study area is included in **Attachment A**.

California Natural Diversity Database (CNDDDB) reporting forms for all incidental special-status species are included as **Attachment B**. The Willow Flycatcher Survey and Detection Form is included as **Appendix C**.

SOURCE: ESA 2019.

Incidentally-observed avian special-status species included the coastal California gnatcatcher (*Poliioptila californica californica*), least Bell’s vireo (*Vireo bellii pusillus*), yellow warbler (*Setophaga petechia*), and yellow-breasted chat (*Icteria virens*). Coastal California gnatcatcher is a federally threatened species, least Bell’s vireo is a State and federally endangered species, southern California rufous-crowned sparrow is a California Department of Fish and Wildlife (CDFW) watch list species, and yellow warbler and yellow-breasted chat are both CDFW species of special concern. These species were detected during multiple surveys.

Conclusion

Based on the results of the protocol-level SWFL surveys, the study area is not occupied by SWFL. Coastal California gnatcatcher, least Bell’s vireo, southern California rufous-crowned sparrow, yellow warbler, and yellow-breasted chat were also observed on-site, as well as brown-headed cowbirds only within the traps on-site.

If there are any questions regarding this report or the results, please feel free to reach out to Maile Tanaka at 949-870-1501 or mtanaka@esassoc.com.

 Site Name _____ Date Report Completed _____

Did you verify that this site name is consistent with that used in previous years? Yes ____ No ____ Not Applicable ____
 If site name is different, what name(s) was used in the past? _____
 If site was surveyed last year, did you survey the same general area this year? Yes ____ No ____ If no, summarize below.
 Did you survey the same general area during each visit to this site this year? Yes ____ No ____ If no, summarize below.

Management Authority for Survey Area : Federal ____ Municipal/County ____ State ____ Tribal ____ Private ____
 Name of Management Entity or Owner (e.g., Tonto National Forest) _____

Length of area surveyed: _____ (meters)

Vegetation Characteristics: Mark the category that best describes the predominant tree/shrub foliar layer at this site (check one):

- _____ Native broadleaf plants (entirely or almost entirely, > 90% native, includes high-elevation willow)
- _____ Mixed native and exotic plants (mostly native, 50 - 90% native)
- _____ Mixed native and exotic plants (mostly exotic, 50 - 90% exotic)
- _____ Exotic/introduced plants (entirely or almost entirely, > 90% exotic)

Identify the 2-3 predominant tree/shrub species in order of dominance. Use scientific name.

Average height of canopy (Do not include a range): _____ (meters)

Attach copy of USGS quad/topographical map (REQUIRED) of survey area, outlining survey site and location of WIFL detections. Attach sketch or aerial photo showing site location, patch shape, survey route, location of any WIFLs or WIFL nests detected. Attach photos of the interior of the patch, exterior of the patch, and overall site; describe any unique habitat features.

Comments (attach additional sheets if necessary)

Territory Summary Table. Provide the following information for each verified territory at your site.

Territory Number	All Dates Detected	UTM N	UTM E	Pair Confirmed? Y or N	Nest Found? Y or N	Description of How You Confirmed Territory and Breeding Status (e.g., vocalization type, pair interactions, nesting attempts, behavior)

Attach additional sheets if necessary

EXECUTIVE SUMMARY

The purpose of this Noise and Vibration Technical Report is to assess and discuss the impacts of potential noise and vibration impacts that may occur with the implementation of the proposed Syphon Reservoir Improvement Project (proposed project) located in unincorporated County of Orange and within the City of Irvine's (City) sphere of influence. The Syphon Reservoir is an existing recycled water storage reservoir in Irvine Ranch Water District's (IRWD's) service area. The proposed project would increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The proposed project would allow the storage of additional recycled water produced at the Michelson Water Recycling Plant (WRP) during periods of low demand (winter months) for use during periods of high demand (summer months).

The analysis describes the existing noise environment in the vicinity of the project limits, estimates future noise and vibration levels at surrounding land uses resulting from construction and operation of the project, and identifies the potential for significant noise impacts based on applicable noise and vibration threshold of significance. Noise worksheets and technical data used in this analysis are provided in Appendices A and B of this report. The findings of the analyses are as follows:

- Construction activities would be required to comply with the City's allowable construction hours of between the hours of 7:00 A.M. to 7:00 P.M. Mondays through Fridays, and 9:00 A.M. to 6:00 P.M. on Saturdays. Therefore, construction noise impacts generated by the proposed project would be less than significant and would not require mitigation measures.
- Off-site haul truck trips and vendor deliveries would occur only during daytime hours within the allowable hours specified in the City's Municipal Code. Therefore, noise impacts from off-site construction traffic would be less than significant, and no mitigation measures are required.
- Project operational traffic would not increase from existing conditions; therefore, noise levels at off-site noise-sensitive uses in the project area would not increase with the operation of the project. Operational traffic-related noise impacts would be less than significant.
- Temporary construction-related vibration would not exceed the established threshold for building damage and human annoyance to the adjacent residential uses adjacent to the project area. Vibration generated by on-site construction activities would have a less than significant impact.
- The project area is not located within the vicinity of a private airstrip. The project is also not located within an airport land use plan or within 2 miles of a public airport or public use airport. Therefore, the project would have no impact related to public or private airport/airstrip noise levels.

This page intentionally left blank.

SECTION 1

Introduction

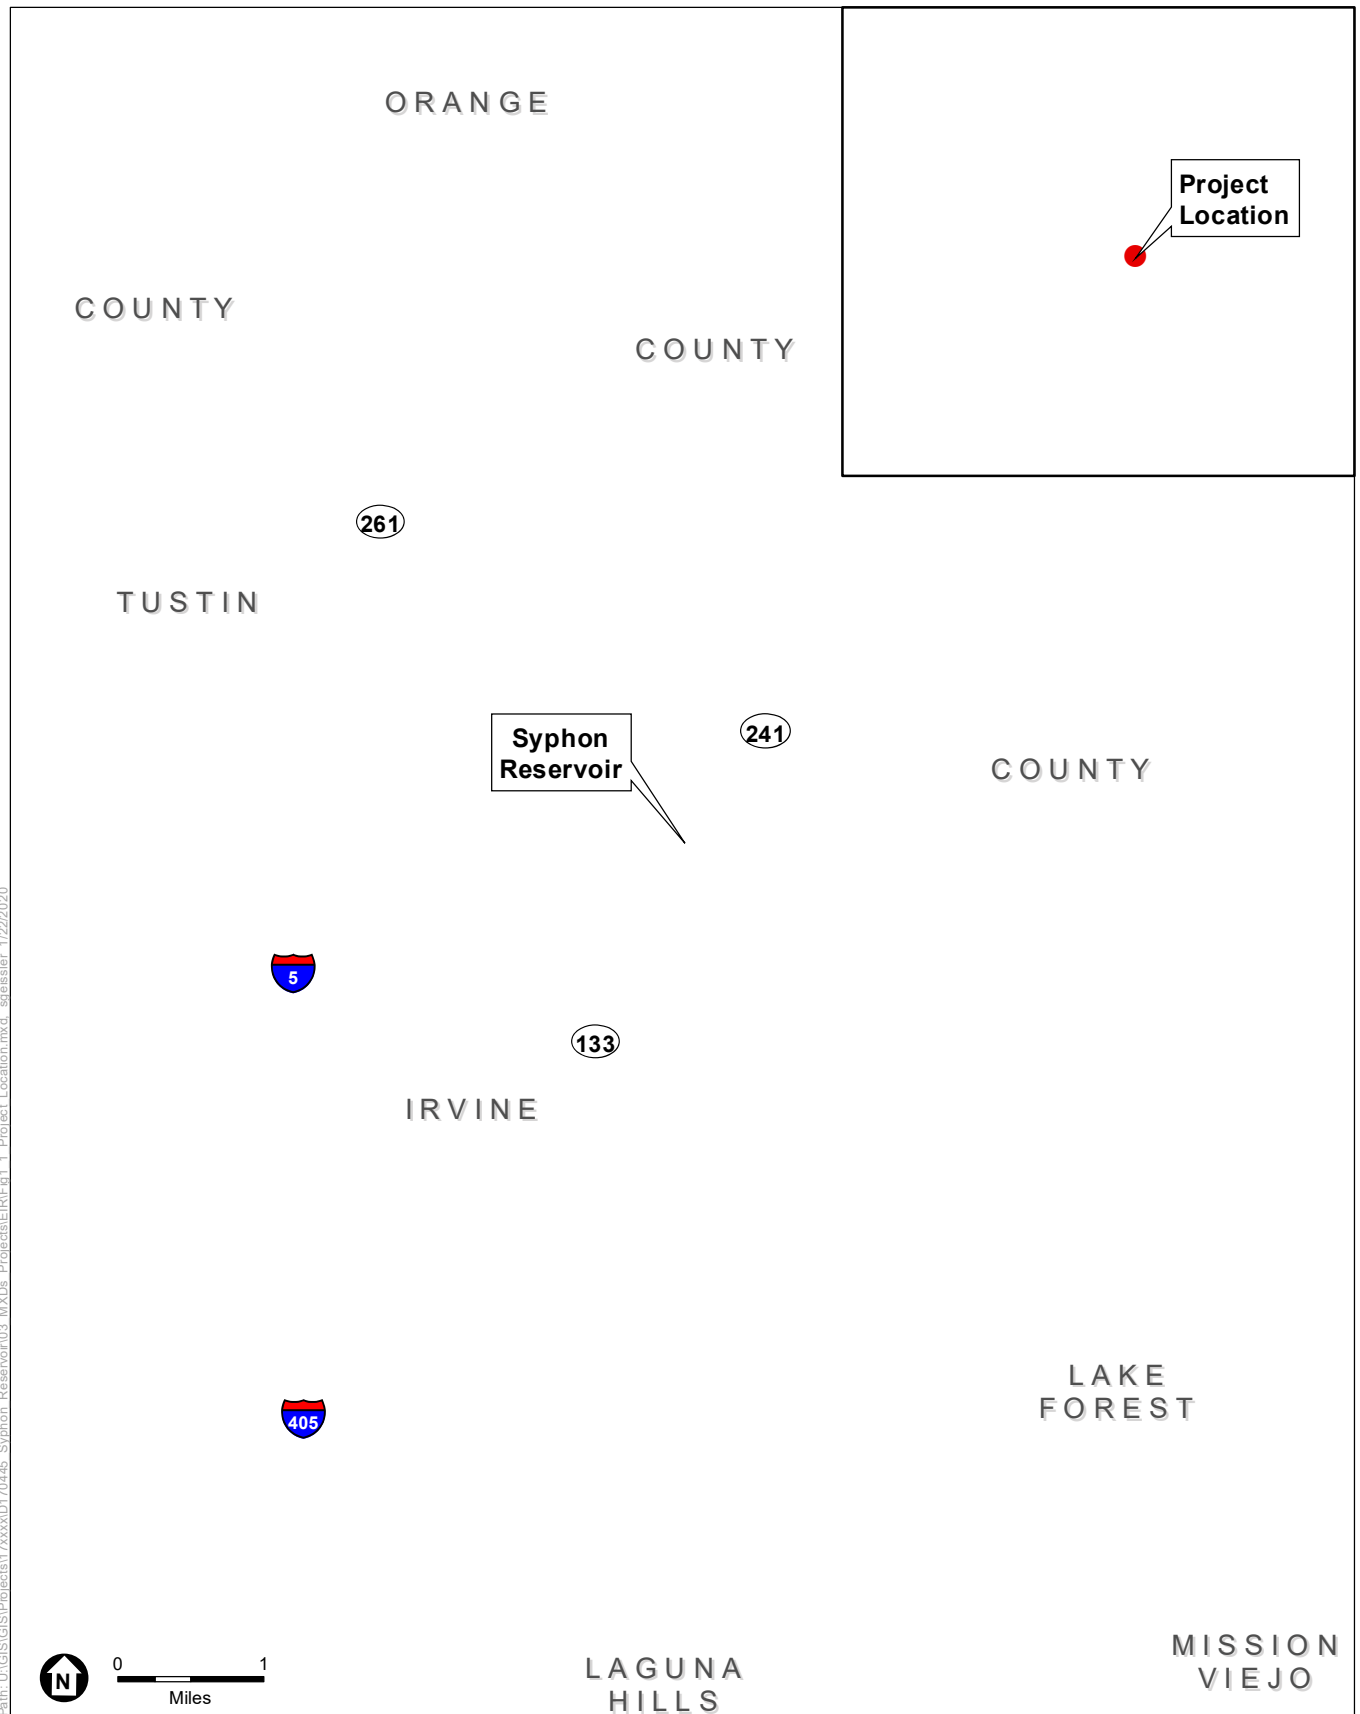

IRWD is proposing to implement the proposed project. The Syphon Reservoir is an existing recycled water storage reservoir in IRWD's service area. The proposed project would increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The proposed project would allow the storage of additional recycled water produced at the Michelson WRP during periods of low demand (winter months) for use during periods of high demand (summer months).

An acoustical study has been conducted with respect to potential noise and vibration impacts from construction activities, surface transportation, and other aspects of Project operations that are noise and vibration intensive and that have the potential to impact existing off-site noise sensitive land uses and existing on- and off-site vibration-sensitive land uses. The objectives of this noise study are to:

1. Evaluate construction-related noise and vibration impacts and the traffic and operational noise and vibration impacts to noise sensitive receptors;
2. Provide noise mitigation measures, as required, to meet applicable noise regulations and standards including interior sound level standards as specified by the City or the County.

1.1 Project Location

The proposed project would be implemented within IRWD's service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and State Route 133 (SR-133) in the County of Orange (see **Figure 1**). The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway. A single-family residence is also located north of the project site, on the north side of Bee Canyon Access Road. The ground surrounding the reservoir is hilly with ridgelines and terraced slopes.

SOURCE: ESRI, 2016; OC LAFCO, 2018

Syphon Reservoir Improvement Project

Figure 1
Project Location

1.2 Existing Site Conditions

The existing engineered dam is comprised of compacted on-site geologic materials, approximately 59 feet high, with a crest length of 843 feet and width of 10 to 12 feet. The surface area of the existing reservoir is approximately 28 acres when filled to capacity, and the current capacity of the reservoir below the existing spillway crest is approximately 535 acre-feet (AF). The 2011 topography survey of the dam indicates its crest is at an elevation of 387.7 feet above mean sea level (amsl).

The existing dam spillway was constructed as a 12-foot wide, broad-crested weir, located at the left abutment of the dam with a crest at 380 feet amsl. The reservoir does not receive water from rivers or streams. The reservoir includes a small watershed that is approximately 205 acres and not capable of generating significant amounts of runoff that need to be managed through the use of the spillway.

1.3 Project Description

The proposed project primarily involves the expansion of three on-site facilities: Syphon Reservoir Dam, Syphon Reservoir, and the Syphon Treatment Facilities. Other operational design features would include an internal seepage control system within the new engineered dam; a circulation/aeration system for the reservoir; new onsite access and maintenance roads; a wetland mitigation area; and potential recreational facilities.

The delivery of recycled water to and from Syphon Reservoir would be accomplished with existing offsite facilities. Modifications to offsite facilities would be limited to the addition of pumps within the existing structures as further described below. Existing offsite conveyance facilities would be used to deliver tertiary-treated recycled water from the Michelson WRP to the Eastwood Recycled Water Pump Station, and then to Syphon Reservoir via an existing 36-inch recycled water pipeline. The pump station structure is currently under construction. When completed, the Eastwood Recycled Water Pump Station can accommodate the Syphon Reservoir Improvement Project with additional pump equipment. Installation of the additional pump equipment would be coordinated as a separate “equipping project” in parallel to the construction of the proposed Syphon Reservoir improvements. The existing Highline Canal would be abandoned in place and no longer used to deliver water to Syphon Reservoir from IRWD’s Rattlesnake Reservoir. Under normal operating conditions, all flow out of Syphon Reservoir would be conveyed back to Eastwood Recycled Water Pump Station through the same 36-inch recycled water pipeline, for connection to IRWD’s recycled water distribution system.

1.3.1 Dam Replacement

The proposed project would replace the existing engineered dam with a new engineered dam, which would be an earthfill embankment with upstream and downstream slopes. Onsite materials would be obtained from excavation of the existing earthen embankment dam and spillway, excavation below the new dam footprint and borrow excavations within the existing and proposed reservoir area. The proposed project would require an estimated 2.3 million cubic yards of fill, of which approximately 2.2 million cubic yards would be available onsite. Approximately 0.1

million (100,000) cubic yards of material would be imported from offsite sources, including rock, gravel and other materials required to construct portions of the dam. Similar to the existing dam, it is a requirement of the California Department of Water Resources (DWR), Division of Safety of Dams requirements (DSOD) that a spillway be included with the new dam to protect the reservoir from overtopping. The new spillway would be constructed and lined with reinforced concrete to prevent erosion of the abutment and embankment materials.

1.3.2 Reservoir Enlargement

The replacement dam would increase the reservoir's capacity from approximately 500 AF to approximately 5,000 AF. The existing reservoir ground surface would be excavated non-uniformly to obtain approximately 2.2 million cubic yards of material to construct the new engineered dam.

A new approximately 42-inch inlet/outlet conduit would be constructed to connect two proposed inlet/outlet ports along the north-facing reservoir slope to the existing onsite 36-inch inlet/outlet pipeline that ends near the toe of the existing dam. Similar to the existing reservoir, the proposed project would require a water circulation/aeration system to maintain water quality within the reservoir. The water circulation/aeration system will be detailed during final design, but would likely consist of a compressed air distribution system or surface mixer/aeration system.

1.3.3 Treatment Facilities

The existing strainer and disinfection facilities would be demolished, reconstructed and expanded at the toe of the new dam to provide filtration, chlorination and de-chlorination facilities (treatment facilities). The treatment facilities could be constructed at one of two locations, both of which are located close to the toe of the existing dam. The layout would consist of an enclosed masonry building. The footprint of the proposed treatment facilities would be determined during the detailed design, but is anticipated to be approximately 40 feet by 160 feet. A masonry block wall building would house the storage tanks, metering pumps, and control system.

1.3.4 Access and Maintenance Roads

The primary access point for construction traffic and future IRWD operation and maintenance is anticipated to be from the intersection at Portola Parkway and Sand Canyon Avenue. As part of the proposed project, the existing intersection and associated traffic lights would be modified to allow construction and future IRWD access through the intersection into the District's property. Construction vehicles and IRWD vehicles would also leave the site through the same intersection. Cross walks and associated pedestrian signals would also be modified to allow safe pedestrian crossing in both directions.

An unpaved road currently exists on the District's property in the vicinity of the intersection at Portola Parkway and Sand Canyon Avenue, which was used to access and maintain the existing Highline Canal. As part of the proposed project, this dirt road would be utilized and improved to allow two lanes (one in each direction) for ingress and egress for the construction and IRWD operation traffic. As part of the access road improvements, it is anticipated that excavation into

the existing slope and construction of a retaining wall may be necessary to allow trucks to make the left turn onto the existing highline canal road after passing through the intersection. Potential secondary construction access may be considered through existing IRWD maintenance roads off of Bee Canyon Access Road. If used, these roads would be considered as one-way access points and limited to specific construction activities as further determined during the detailed design phase.

1.3.5 On-Site Wetland and Riparian Mitigation Areas

At least 12.3 acres of riparian/wetland habitat consisting of native woody riparian vegetation and freshwater marsh habitat is proposed to be established onsite to replace habitat displaced by construction. Both freshwater marsh and woody riparian vegetation are proposed to be placed within a large patch at the northeast end of the proposed reservoir. Also, much of the woody riparian replacement habitat would be situated within a strip that would extend around the proposed reservoir at the same elevation as the planned water surface elevation when the reservoir is full. A shallow trough would be constructed around the reservoir perimeter (excluding the dam face), which would support native trees and shrubs (e.g., willows, mulefat, etc.) forming a belt of riparian vegetation around the upper edge of the artificial lake. In addition to reserving a strip around the edge of the expanded reservoir for woody riparian habitat, an approximately 6- to 8-acre wetland area would also be established within a flat area extending northeast of the expanded reservoir.

1.3.6 Recreational Facilities

During project design, IRWD would consider passive recreational facilities compatible with the project site. Recreational facilities could include a walking trail along existing access roads at the project site. This proposed walking trail could be located in the south and west portions of the project site, beginning at the new permanent access road at Portola Parkway and Sand Canyon Avenue and traveling along that route, across the dam crest, and following the alignment of the existing Highline Canal, which would be abandoned with implementation of the proposed project. Offsite recreational facilities are not part of this project and would be analyzed under separate environmental review if/when future offsite recreational facilities are established. Final design would determine the appropriateness and location of the proposed walking trail on existing access roads and any other optional recreational facilities.

1.3.7 Additional Geotechnical Investigations

IRWD previously completed a comprehensive geotechnical investigation of the site from which the resulting data would be used during final design to develop the detailed construction documents. During the design phase, additional geotechnical investigations may need to be performed. If additional investigations are deemed necessary, the investigations may include the performance of exploratory test pits, soil borings, packer testing, and/or non-intrusive geologic investigations and observations. The additional geotechnical investigations, if needed, would remain within the proposed limits of disturbance defined by the project and would be mitigated as part of the overall project.

1.3.8 Technical Advisory Group

During the design phase, IRWD intends to establish an independent Technical Advisory Group (TAG) comprised of nationally recognized industry experts in the disciplines of dam geology/site characterization, seismic analysis, hydrology/hydraulics, dam construction, and potential failure mode analysis and RIDM. The purpose of the TAG is to provide an independent assessment of the design development including, but not limited to, review of design criteria, design details, technical approach, and other aspects of the design engineer's work to confirm the project design is in full compliance with governing standards and requirements.

1.4 Project Construction

Construction of the proposed project is estimated to require a total of 41 months. The preconstruction activities would begin in the fall of 2022 and would involve approximately 5 months of access road improvements. Preconstruction would be followed by approximately 36 months for construction of the new dam, reservoir, and associated facilities, depending on weather conditions and other variables. Construction is currently anticipated to begin in 2023. Most construction activities would be limited to 7:00 a.m. to 7:00 p.m. Monday through Friday and 9:00 am to 6:00 p.m. on Saturday. If construction work is conducted outside of these hours, IRWD would secure a variance/waiver from the appropriate entity. Construction of the proposed project would include activities implemented in phases as outlined below, which may involve overlap. Construction of the proposed project would include activities implemented in phases as outlined below in **Table 1**, which may involve overlap.

**TABLE 1
CONSTRUCTION SCHEDULE**

Phases	Start Date	End Date
<i>Preconstruction Activities</i>

1.5 Noise and Vibration Fundamentals

1.5.1 Noise

Sound can be described as the mechanical energy of a vibrating object transmitted by pressure waves through a liquid or gaseous medium (e.g., air). Noise is generally defined as unwanted sound (i.e., loud, unexpected, or annoying sound). Acoustics is defined as the physics of sound. In acoustics, the fundamental scientific model consists of a sound (or noise) source, a receiver, and the propagation path between the two. The loudness of the noise source and obstructions or atmospheric factors affecting the propagation path to the receiver determines the sound level and characteristics of the noise perceived by the receiver. Acoustics primarily addresses the propagation and control of sound.

Sound, traveling in the form of waves from a source, exerts a sound pressure level (referred to as sound level) that is measured in decibels (dB), which is the standard unit of sound amplitude measurement. The dB scale is a logarithmic scale that describes the physical intensity of the pressure vibrations that make up any sound, with 0 dB corresponding roughly to the threshold of human hearing and 120 to 140 dB corresponding to the threshold of feeling and pain, respectively. Pressure waves traveling through air exert a force registered by the human ear as sound.

Sound pressure fluctuations can be measured in units of hertz (Hz), which correspond to the frequency of a particular sound. Typically, sound does not consist of a single frequency, but rather a broad band of frequencies varying in levels of magnitude, with audible frequencies of the sound spectrum ranging from 20 to 20,000 Hz. The typical human ear is not equally sensitive to this frequency range. As a consequence, when assessing potential noise impacts, sound is measured using an electronic filter that deemphasizes the frequencies below 1,000 Hz and above 5,000 Hz in a manner corresponding to the human ear's decreased sensitivity to these extremely low and extremely high frequencies. This method of frequency filtering or weighting is referred to as A-weighting, expressed in units of A-weighted decibels (dBA), which is typically applied to community noise measurements. Some representative common outdoor and indoor noise sources and their corresponding A-weighted noise levels are shown in **Figure 2**.

Noise Exposure and Community Noise

An individual's noise exposure is a measure of noise over a period of time; a noise level is a measure of noise at a given instant in time. However, noise levels rarely persist at that level over a long period of time. Rather, community noise varies continuously over a period of time with respect to the sound sources contributing to the community noise environment. Community noise is primarily the product of many distant noise sources, which constitute a relatively stable background noise exposure, with many of the individual contributors unidentifiable. The background noise level changes throughout a typical day, but does so gradually, corresponding with the addition and subtraction of distant noise sources, such as changes in traffic volume. What makes community noise variable throughout a day, besides the slowly changing background noise, is the addition of short-duration, single-event noise sources (e.g., aircraft flyovers, motor vehicles, sirens), which are readily identifiable to the individual.

These successive additions of sound to the community noise environment change the community noise level from instant to instant, requiring the noise exposure to be measured over periods of time to legitimately characterize a community noise environment and evaluate cumulative noise impacts. The following noise descriptors are used to characterize environmental noise levels over time, which are applicable to the proposed project.

L_{eq} : The equivalent sound level over a specified period of time, typically, 1 hour ($L_{eq}(1)$). The L_{eq} may also be referred to as the average sound level.

L_{max} : The maximum, instantaneous noise level experienced during a given period of time.

L_{min} : The minimum, instantaneous noise level experienced during a given period of time.

CNEL: The Community Noise Equivalent Level (CNEL) is the average A-weighted noise level during a 24-hour day that includes an addition of 5 dB to measured noise levels between the hours of 7:00 a.m. to 10:00 p.m. and an addition of 10 dB to noise levels between the hours of 10:00 p.m. to 7:00 a.m. to account for noise sensitivity in the evening and nighttime, respectively.

Syphon Reservoir Improvement Project

Figure 2
Decibel Scale and Common Noise Sources

Effects of Noise on People

Noise is generally loud, unpleasant, unexpected, or undesired sound that is typically associated with human activity that is a nuisance or disruptive. The effects of noise on people can be placed into four general categories:

- Subjective effects (e.g., dissatisfaction, annoyance)
- Interference effects (e.g., communication, sleep, and learning interference)
- Physiological effects (e.g., startle response)
- Physical effects (e.g., hearing loss)

Although exposure to high noise levels has been demonstrated to cause physical, psychological, and physiological effects, the principal human responses to typical environmental noise exposure are related to subjective effects and interference with activities. Interference effects interrupt daily activities and include interference with human communication activities, such as normal conversations, watching television, telephone conversations, and interference with sleep. Sleep interference effects can include both awakening and arousal to a lesser state of sleep.

With regard to the subjective effects, the responses of individuals to similar noise events are diverse and influenced by many factors, including the type of noise, the perceived importance of the noise, the appropriateness of the noise to the setting, the duration of the noise, the time of day and the type of activity during which the noise occurs, and individual noise sensitivity. Overall, there is no completely satisfactory way to measure the subjective effects of noise, or the corresponding reactions of annoyance and dissatisfaction on people. A wide variation in individual thresholds of annoyance exists, and different tolerances to noise tend to develop based on an individual's past experiences with noise. Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted (i.e., comparison to the ambient noise environment). In general, the more a new noise level exceeds the previously existing ambient noise level, the less acceptable the new noise level will be judged by those hearing it. With regard to increases in A-weighted noise level, the following relationships generally occur¹:

- Except in carefully controlled laboratory experiments, a change of 1 dBA in ambient noise levels cannot be perceived.
- Outside of the laboratory, a 3 dBA change in ambient noise levels is considered to be a barely perceivable difference.
- A change in ambient noise levels of 5 dBA is considered to be a readily perceivable difference.
- A change in ambient noise levels of 10 dBA is subjectively heard as doubling of the perceived loudness.

¹ California Department of Transportation (Caltrans), Technical Noise Supplement (TeNS), Section 2.2.1, September, 2013.

These relationships occur in part because of the logarithmic nature of sound and the decibel scale. The human ear perceives sound in a non-linear fashion; therefore, the dBA scale was developed. Because the dBA scale is based on logarithms, two noise sources do not combine in a simple additive fashion, but rather logarithmically. Under the dBA scale, a doubling of sound energy corresponds to a 3 dBA increase. In other words, when two sources are each producing sound of the same loudness, the resulting sound level at a given distance would be approximately 3 dBA higher than one of the sources under the same conditions. For example, if two identical noise sources produce noise levels of 50 dBA, the combined sound level would be 53 dBA, not 100 dBA. Under the dBA scale, three sources of equal loudness together produce a sound level of approximately 5 dBA louder than one source, and ten sources of equal loudness together produce a sound level of approximately 10 dBA louder than the single source.²

Noise Attenuation

When noise propagates over a distance, the noise level reduces with distance depending on the type of noise source and the propagation path. Noise from a localized source (i.e., point source) propagates uniformly outward in a spherical pattern, referred to as “spherical spreading.” Stationary point sources of noise, including stationary mobile sources such as idling vehicles, attenuate (i.e., reduce) at a rate of between 6 dBA for acoustically “hard” sites and 7.5 dBA for “soft” sites for each doubling of distance from the reference measurement, as their energy is continuously spread out over a spherical surface (e.g., for hard surfaces, 80 dBA at 50 feet attenuates to 74 at 100 feet, 68 dBA at 200 feet, etc.). Hard sites are those with a reflective surface between the source and the receiver, such as asphalt or concrete surfaces or smooth bodies of water. No excess ground attenuation is assumed for hard sites and the reduction in noise levels with distance (i.e., distance loss) is simply the geometric spreading of the noise from the source. Soft sites have an absorptive ground surface, such as soft dirt, grass, or scattered bushes and trees, which in addition to geometric spreading, provides an excess ground attenuation value of 1.5 dBA (per doubling distance).³ Most sites are a combination of both hard and soft surfaces; therefore, using the hard site criteria of 6 dBA is the more conservative approach.

Roadways and highways consist of several localized noise sources on a defined path, and hence are treated as “line” sources, which approximate the effect of several point sources. Noise from a line source propagates over a cylindrical surface, often referred to as “cylindrical spreading.” Line sources (e.g., traffic noise from vehicles) attenuate at a rate between 3 dBA for hard sites and 4.5 dBA for soft sites for each doubling of distance from the reference measurement.⁴ Therefore, noise due to a line source attenuates less with distance than that of a point source with increased distance.

Additionally, receptors located downwind from a noise source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Atmospheric temperature inversion (i.e., increasing temperature with elevation) can increase

² Caltrans, Technical Noise Supplement (TeNS), Section 2.2.1.1, September, 2013.

³ Caltrans, Technical Noise Supplement (TeNS), Section 2.1.4.2, September, 2013.

⁴ Caltrans, Technical Noise Supplement (TeNS), Section 2.1.4.1, September, 2013.

sound levels at long distances (e.g., more than 500 feet). Other factors such as air temperature, humidity, and turbulence can also have significant effects on noise levels.⁵

1.5.2 Vibration

Vibration can be interpreted as energy transmitted in waves through the ground or man-made structures, which generally dissipate with distance from the vibration source. Because energy is lost during the transfer of energy from one particle to another, vibration becomes less perceptible with increasing distance from the source.

As described in the Federal Transit Administration's (FTA) *Transit Noise and Vibration Impact Assessment*, groundborne vibration can be a serious concern for nearby neighbors of a transit system route or maintenance facility, causing buildings to shake and rumbling sounds to be heard.⁶ In contrast to airborne noise, groundborne vibration is not a common environmental problem, as it is unusual for vibration from sources such as buses and trucks to be perceptible, even in locations close to major roads. Some common sources of groundborne vibration are trains, heavy trucks traveling on rough roads, and construction activities, such as blasting, pile-driving, and operation of heavy earth-moving equipment.

There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal in inches per second (in/sec), and is most frequently used to describe vibration impacts to buildings.

Groundborne noise is a result of groundborne vibration and specifically refers to the rumbling noise emanating from the motion of building room surfaces due to the vibration of floors and walls; it is perceptible only inside buildings.⁷ The relationship between groundborne vibration and groundborne noise depends on the frequency content of the vibration and the acoustical absorption characteristics of the receiving room. For typical buildings, groundborne vibration that causes low frequency noise (i.e., the vibration spectrum peak is less than 30 Hz) results in a groundborne noise level that is approximately 50 decibels lower than the velocity level. For groundborne vibration that causes mid-frequency noise (i.e., the vibration spectrum peak is 30 to 60 Hz), the groundborne noise level will be approximately 35 to 37 decibels lower than the velocity level.⁸ Therefore, for typical buildings, the groundborne noise decibel level is lower than the groundborne vibration velocity level.

1.6 Regulatory Framework

Many government agencies have established noise standards and guidelines to protect citizens from potential hearing damage and various other adverse physiological and social effects associated with noise and groundborne vibration. Federal and local policies and/or standards such as those of FTA, U.S. Environmental Protection Agency (USEPA), and regulations in the City

General Plan Noise Element, and the Irvine Municipal Code would be applicable to the project, as summarized below.

1.6.1 City of Irvine General Plan Noise Element (2015)

As shown in **Table 2**, the City has established noise guidelines in the Noise Element of the City's General Plan that are used for planning purposes. These guidelines are based, in part, on the community noise compatibility guidelines established by the California State Governor's Office of Planning and Research and are intended for use in assessing the compatibility of various land use types with a range of noise levels. Page F-11 of the Noise Element provides the guidelines of land use compatibility for community noise sources. The CNEL noise levels for specific land uses are classified into four categories: (Zone A) "clearly compatible" (Zone B) "normally compatible" (Zone C) "normally incompatible" and (Zone D) "clearly incompatible." A CNEL value of 70 dBA is considered the dividing line between a "normally compatible" and "normally incompatible" noise environment for noise sensitive land uses, including residences, transient lodgings, schools, and libraries.

Additionally, the Proposed Project is subject to the following policies provided in the Noise Element of the General Plan:

Mobile Noise:

- *Policy (c)*: Ensure that all proposed development projects are compatible with the existing and projected noise level by using the Land Use Noise Compatibility Matrix (see Table 2).
- *Policy (d)*: Require noise studies to be prepared in accordance with the City's environmental review procedure for all projects that are not "clearly compatible" with the future noise level at the site.
- *Policy (f)*: Require noise studies to identify all the mitigation measures necessary to reduce noise levels to meet the City's Municipal Code CNEL standard (see **Table 3**) and Single Event Noise Standard.

**TABLE 2
CITY OF IRVINE LAND USE NOISE COMPATIBILITY**

Land Use Categories	Uses	Energy Average (CNEL, dB)						
		≤	55	60	65	70	75	80>
RESIDENTIAL	Single-Family	A	A	B	B	C	D	D
RESIDENTIAL	Mobile Home	A	A	B	C	C	D	D
COMMERCIAL Regional	Hotel, Motel, Transient Lodging	A	A	B	B	C	C	D
COMMERCIAL Regional, Community	Commercial retail, Bank, Restaurant, Movie theater	A	A	A	A	B	B	C
COMMERCIAL Recreation INSTITUTIONAL General	Amphitheater, Concert Hall, Auditorium, Meeting hall	B	B	C	C	D	D	D
COMMERCIAL Recreation	Children's amusement park, Miniature golf, Go-cart track, Health club, Equestrian center	A	A	A	B	B	D	D
COMMERCIAL Community INDUSTRIAL General	Automobile service station, Auto dealer, Manufacturing, Warehousing, Wholesale, Utilities	A	A	A	A	B	B	B
INSTITUTIONAL General	Hospital, Church, Library, School classrooms	A	A	B	C	C	D	D
OPEN SPACE	Parks	A	A	A	B	C	D	D
OPEN SPACE	Golf course, Nature centers, Cemeteries, Wildlife reserves, Wildlife habitat	A	A	A	A	B	C	C
AGRICULTURAL	Agriculture	A	A	A	A	A	A	A

NOTES:

ZONE A
Clearly Compatible

Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements

ZONE B
Normally Compatible

New construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.

ZONE C
Normally Incompatible

New construction or development should normally be discouraged. If new construction or development does proceed, a detailed analysis of noise reduction requirements must be made and needed noise insulation features must be included in the design.

ZONE D
Clearly Incompatible

New construction or development should generally not be undertaken.

**TABLE 3
CITY OF IRVINE NOISE STANDARDS**

Zone	Location	Time Period	Noise Levels for a Period Not Exceeding (minutes/hour)				
			30	15	5	1	0 (anytime)
<i>Noise zone 1:</i> All hospitals, libraries, churches, schools and residential properties.	Exterior	7:00 a.m.—10:00 p.m.	55	60	65 ¹	70	75
		10:00 p.m.—7:00 a.m.	50	55	60	65 ¹	70
	Interior	7:00 a.m.—10:00 p.m.	--	--	55	60	65
		10:00 p.m.—7:00 a.m.	--	--	45	50	55
<i>Noise zone 2:</i> All professional office and public institutional properties.	Exterior	Anytime	55	60	65	70	75
	Interior	Anytime	--	--	55	60	65
<i>Noise zone 3:</i> All commercial properties excluding professional office properties.	Exterior	Anytime	60	65	70	75	80
	Interior	Anytime	--	--	55	60	65
<i>Noise zone 4:</i> All industrial properties.	Exterior	Anytime	70	75	80	85	90
	Interior	Anytime	--	--	55	60	65

NOTES:

- 1 This standard does not apply to multifamily residence private balconies. Multifamily developments with balconies that do not meet the 65 CNEL are required to provide occupancy disclosure notices to all future tenants regarding potential noise impacts.
- 2 It shall be unlawful for any person at any location within the City to create any noise or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person which causes the noise level when measured on any property within designated noise zones either within or without the City to exceed the applicable noise standard.
- 3 Each of the noise standards specified above shall be reduced by five dB(A) for impact, or predominant tone noise or for noises consisting of speech or music.
- 4 In the event that the noise source and the affected property are within different noise zones, the noise standards of the affected property shall apply.

SOURCE: City of Irvine, 2020.

Stationary Noise

- *Policy (a):* Require any new construction to meet the City Noise Ordinance standards as a condition of building permit approval.
- *Policy (b):* Require developers to depict, on any appropriate development application review (zone change, subdivisions, conditional use permit, site plan, and building plans), any potential noise sources known at the time of submittal and mitigation measures that ensure these noise sources meet the City Noise Ordinance standards. Such sources include, but are not limited to, the following:
 - Truck pickup and loading areas.
 - Mechanical and electrical equipment such as air conditioning, swimming pool pumps and filters, and spa pumps.
 - Exterior nuisances such as speaker boxes and outdoor public address systems.
- *Policy (c):* Condition subdivision approval of the projects adjacent to any developed/occupied uses by requiring the developer to submit a construction-related noise mitigation plan to the Director of Community Development for review and approval prior to issuance of grading permits. The plan must depict the location of construction equipment and how the noise from

this equipment will be mitigated during construction of the project, through the use of such methods as following:

- Temporary noise attenuation fences.
- Preferential location of equipment.
- Use of current technology and noise suppression equipment.

Noise Abatement

- *Policy (a)*: Coordinate efforts to reduce noise impacts with appropriate public and government agencies.

1.6.2 City of Irvine Municipal Code

Table 3 summarizes Section 6-8-204, General Provisions, of the City’s Municipal Code, which provides interior and exterior noise standards that apply to all properties within a designated zone located in the City.

The City Municipal Code Section 6.8.205.A limits construction activities between the hours of 7:00 A.M. to 7:00 P.M. Mondays through Fridays, and 9:00 A.M. to 6:00 P.M. on Saturdays. No construction activities shall be permitted outside of these hours or on Sundays and federal holidays, unless a temporary waiver is granted by the Chief Building Official or his or her authorized representative. Trucks, vehicles, and equipment that are making or are involved with material deliveries, loading, or transfer of materials, equipment service, maintenance of any devices or appurtenances for or within any construction project in the City shall not be operated or driven on City streets outside of these hours or on Sundays and federal holidays unless a temporary waiver is granted by the City. Any waiver granted shall take impact upon the community into consideration. No construction activity will be permitted outside of these hours except in emergencies including maintenance work on the City rights-of-way that might be required.

1.6.3 County of Orange Municipal Code

Section 4-6-4 and 4-6-5 of the Orange County Municipal Code provides exterior and interior noise standards, respectively, to the entire territory of Orange County, including incorporated and unincorporated territory. The County’s noise standards for exterior and interior noise levels are provided in **Table 4**.

TABLE 4
COUNTY OF ORANGE NOISE STANDARDS

Noise Zone ¹	Location	Noise Level	Time Period
1	Exterior	55 dB(A)	7:00 A.M. – 10:00 P.M.
		50 db(A)	10:00 P.M. – 7:00 A.M.
	Interior	55 dB(A)	7:00 A.M. – 10:00 P.M.
		45 dB(A)	10:00 P.M. – 7:00 A.M.

NOTES:

¹ The entire territory of Orange County, including incorporated and unincorporated territory, is hereby designated as "Noise Zone 1."

SOURCE: County of Orange, 2020.

The Orange County Municipal Code Section 4-6-7(e) exempts noise associated with construction, repair, remodeling, or grading of any real property, provided said activities take place between the hours of 7:00 A.M. to 8:00 P.M. on weekdays, including Saturday.

1.6.4 Groundborne Vibration

The effects of groundborne vibration include movement of the building floors, rattling of windows, shaking of items on shelves or hanging on walls, and rumbling sounds. In extreme cases, the vibration can cause damage to buildings. Building damage is not a factor for most Projects, with the occasional exception of blasting and pile-driving during construction. Annoyance from vibration often occurs when the vibration levels exceed the threshold of perception by only a small margin. A vibration level that causes annoyance will be well below the damage threshold for normal buildings. The City does not address vibration either in the municipal code or in the Noise Element of the General Plan. The County does not address vibration the municipal code. However, the FTA's *Transit Noise and Vibration Impact Assessment* (FTA, 2018) has identified the human annoyance response to vibration levels as 80 VdB and building damage with a threshold of 0.2 in/sec PPV for non-engineered timber buildings.⁹

1.7 Environmental Setting

1.7.1 Noise-Sensitive Receptor Locations

Some land uses are considered more sensitive to noise than others due to the amount of noise exposure and the types of activities typically involved at the receptor location. Residences, schools, motels and hotels, libraries, religious institutions, hospitals, nursing homes, and parks are generally more sensitive to noise than commercial and industrial land uses. The distance of the noise sensitive receptor locations was calculated from the property line of the receptors to the closest proposed project site boundary. Existing noise sensitive uses within 500 feet of the proposed project site are shown in **Figure 3** and include the following:

⁹ FTA, *Transit Noise and Vibration Impact Assessment*, Section 12.2.2, May, 2018.

- The Crean Lutheran High School Athletic Complex, located between Portola Parkway and the toe of the existing dam, approximately 55 feet from the project site.
- Residential neighborhoods located on the southwest side of Portola Parkway, are as close as 180 feet from the proposed access road construction. Construction of the new proposed dam, reservoir and treatment facilities would occur farther away from these sensitive receptors, approximately 700 feet.
- Crean Lutheran High School, located on the south side of Portola Parkway, east of Sand Canyon Road. This property line of the school is located approximately 140 feet from the proposed access road construction.

All other noise-sensitive uses are located at greater distances and/or shielded from activity at the proposed project by buildings closer to the project area and would experience lower noise levels associated with the proposed project. Therefore, additional sensitive receptors beyond those identified above are not evaluated in this report.

1.7.2 Ambient Noise Levels

The existing noise environment within the project area is comprised primarily of vehicle traffic including trucks, buses, etc. on Portola Parkway, Sand Canyon Avenue, Irvine Boulevard, and State Route 133 (SR-133). Secondary noise sources include nearby residential activities and activities associated with nearby schools. While the proposed project site is located within the jurisdiction of the Orange County, the residents and school that would be impacted by the noise from the project are located within the jurisdiction of the City of Irvine. Therefore, the analysis uses the City of Irvine's noise thresholds. The Noise Element of the City of Irvine's General Plan provides estimated vehicular traffic noise levels for areas throughout the City for the year 2020. The General Plan does not have estimated traffic noise levels for the local roadways directly adjacent to the proposed project site. The closest roadway segment with estimated 2020 traffic noise levels is Irvine Boulevard between Yale Avenue and Jeffrey Road. Similar to the proposed project vicinity, this area consists primarily of residential land uses, where the noise environmental is comprised primarily from vehicular traffic. The estimated 2020 traffic noise levels for this area is 71.7 dBA CNEL, 100 feet from the centerline of the roadway.

1.7.3 Vibration-Sensitive Receptor Locations

Activities associated with implementation of the proposed project have the potential to generate low levels of groundborne vibration due to the operation of equipment (i.e., rubber-tired dozer, drill rigs, and haul trucks). Groundborne vibrations propagate through the ground and rapidly diminish in intensity with increasing distance from the source. No high-impact activities, such as pile driving or blasting, would be used during construction of the proposed project. The nearest off-site buildings to the project site that could be exposed to vibration levels generated from project activities include residential uses located on the southwest side of Portola Parkway, located approximately 300 feet from the proposed project boundary.

Syphon Reservoir Improvement Project

Figure 3
Noise Sensitive Receiver Locations

SECTION 2

Thresholds of Significance

The significance thresholds below are derived from the Environmental Checklist questions in Appendix G of the State CEQA Guidelines. Accordingly, a significant impact associated with noise would occur based on the following thresholds described below:

NOI-1: Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

NOI-2: Generation of excessive groundborne vibration or groundborne noise levels?

NOI-3: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The following significance criteria are used to evaluate potential noise and vibration impacts of the project based on the regulatory framework described above. The Project would result in potentially significant impacts under the following circumstances:

- Project construction activities occur between the hours of 7:00 p.m. and 7:00 a.m. for the City and between the hours of 8:00 p.m. and 7:00 a.m. for the County.
- The Project-related operations would cause ambient noise levels to exceed the City's noise standards as stated in Section 6-8-204 of the City's Municipal Code and Section 4-6-4 and 4-6-5 of the Orange County Municipal Code (see Table 3 and 4 above in Section 1.7).
- Potential Building Damage – Project construction activities cause groundborne vibration levels to exceed 0.2 in/sec PPV at the nearest residential buildings.
- Potential Human Annoyance – Project construction activities cause groundborne vibration levels to exceed 80 VdB at nearby residential uses.

The proposed project site is located with the jurisdiction of the Orange County. However, the receptors that will be impacted by the construction and operation of the proposed project are located within the City of Irvine. Therefore, this analysis uses the City of Irvine's thresholds to determine significance.

This page intentionally left blank.

SECTION 3

Impact Analysis

3.1 Methodology

3.1.1 On-Site Construction Noise

On-site construction noise impacts were evaluated by determining the noise levels generated by the different types of construction activity anticipated, calculating the construction-related noise level at nearby sensitive receptor locations, and comparing these construction-related noise levels to existing ambient noise levels (i.e., noise levels without construction noise) at those receptors. More, specifically, the following steps were undertaken to assess construction-period noise impacts:

1. Typical noise levels for each type of construction equipment were obtained from the FHWA's Construction Noise Handbook (FHWA 2006);
2. Distances between construction site locations (noise sources) and surrounding sensitive receptors were measured using Project architectural drawings and site plans and Google Earth;
3. The construction noise level was then calculated, in terms of hourly L_{eq} , for sensitive receptor locations based on the standard point source noise-distance attenuation factor of 6.0 dBA for each doubling of distance.

3.1.2 Off-Site Roadway Noise (Construction)

Roadway noise impacts have been evaluated using the Caltrans Technical Noise Supplement (TeNS) method based on the traffic data provided in the Project's Construction Transportation Impact Analysis (Fehr & Peers 2020). The Caltrans TeNS method allows for the definition of roadway configurations, barrier information (if any), and receiver locations.

3.1.3 Groundborne Vibration (Construction and Operations)

Groundborne vibration impacts were evaluated by identifying potential vibration sources, measuring the distance between vibration sources and surrounding structure locations, and making a significance determination based on the significance thresholds described below.

3.2 Noise Impacts

Threshold NOI-1: Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

Impact NOI-1: **The proposed project could generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. (Less than Significant).**

3.2.1 Construction Noise

On-Site Construction Noise

Construction of the proposed project is estimated to require approximately 41 months (weather permitting) and would require the use of heavy equipment during the various construction phases at the proposed project site. During each stage of development, there would be a different mix of equipment. As such, construction activity noise levels at and near the proposed project area would fluctuate depending on the particular type, number, and duration of use of the various pieces of construction equipment. Additionally, as previously shown in Table 1, construction is currently anticipated to begin in the fall of 2022 with the potential of overlap for a number of phases of construction.

Additional geotechnical work may or may not occur, and the intensity of any geotechnical work is unknown at this time. There are three potential geotechnical tests that could occur: borings, test pits, or trenches. The geotechnical work would be associated with the dam upgrades and would most likely occur in the reservoir area, at a distance of 330 feet (100 meters) or more from the nearest sensitive uses. Because the intensity of any work that will occur is unknown, the analysis determines the maximum intensity of geotechnical work that can occur concurrently and independent from the reservoir work. The *Irvine Ranch Water District Syphon Reservoir Geotechnical Investigations Project Initial Study/Mitigated Negative Declaration* was used to determine the equipment and workers that would be used to conduct the additional geotechnical investigations.

Individual pieces of construction equipment anticipated during Project construction could produce maximum noise levels of 75 dBA to 85 dBA L_{max} at a reference distance of 50 feet from the noise source, as shown in **Table 5**. These maximum noise levels would occur when equipment is operating at full power. The estimated usage factor for the equipment is also shown in Table 5, which are based on FHWA's Construction Handbook (FHWA 2006). Typical or average construction noise levels account for the estimated usage factors as shown.

Construction activity would result in the loudest noise levels at ground-level sensitive land uses nearest to the proposed project area that have a direct line-of-sight to construction activities. This

is because the first tier of buildings immediately surrounding the proposed project site would act as a noise barrier to other sensitive receptors located beyond these buildings. Therefore, construction-related noise levels are only presented for receptors closest to the proposed project site, as shown in Figure 3. Specifically, the nearest off-site noise sensitive receptors include the following:

- R1: The Crean Lutheran High School Athletic Complex, located between Portola Parkway and the toe of the existing dam, approximately 55 feet from the proposed project site.
- R2 and R3: Residential neighborhoods located on the southwest side of Portola Parkway, are as close as 180 feet from the proposed access road construction. Construction of the new proposed dam, reservoir and treatment facilities would occur farther away from these sensitive receptors, approximately 700 feet.
- R4: Crean Lutheran High School, located on the south side of Portola Parkway, east of Sand Canyon Road. This property line of the school is located approximately 140 feet from the proposed access road construction.

**TABLE 5
CONSTRUCTION EQUIPMENT NOISE LEVELS**

Construction Equipment	Estimated Usage Factor, %	Noise Level at 50 Feet (dBA, Lmax)
Backhoe	40%	78

Water Truck	10%	80

SOURCE: FHWA 2006

Noise from construction activities would be generated by the operation of vehicles and equipment involved during various stages of construction: site excavation, grading, facilities construction and paving. The noise levels generated by construction equipment would vary depending on factors such as the type and number of equipment, the specific model (horsepower rating), the construction activities being performed, and the maintenance condition of the equipment. Construction noise associated with the proposed project was analyzed using a mix of typical construction equipment, estimated durations, and construction phasing, based on construction equipment data provided by IRWD and assumptions derived from similar projects. **Table 6** shows the estimated construction noise levels that would occur at the nearest off-site sensitive uses during a peak day of construction activity at the proposed project site. Details are provided in Appendix A.

^b Detailed construction noise calculations are provided in Appendix A.

^c Based on Irvine Ranch Water District Syphon Reservoir Geotechnical Investigations Project Initial Study/Mitigated Negative Declaration, February 2019.

SOURCE: ESA 2021.

As shown in Table 6, construction noise levels are estimated to reach a maximum of 89 dBA L_{eq} at the nearest sensitive receptor (R1). Existing residences and school facilities in the vicinity of the proposed project area would be exposed to temporary and sporadic increased noise from nearby construction activities. Weather permitting, the overall construction would last for approximately 36 to 41 months. However, since equipment operates intermittently and moves around the site, noise from operation of construction equipment would be sporadic and temporary during the construction period. Construction noise would be noticeable during the operation of heavy grading equipment working at the site (sporadically over the duration of construction), especially during the vegetation clearing, excavation, and construction period.

The City has not established numerical thresholds for construction noise; however, per the City Municipal Code, Section 6-8-205, construction shall only occur between the hours of 7:00 A.M. to 7:00 P.M. Mondays through Fridays, and 9:00 A.M. to 6:00 P.M. on Saturdays. The proposed project construction activities would comply with the hours allowed by the City and the duration of construction would be short term. If the proposed project's construction work is needed to be conducted outside of the allowable hours, IRWD will work with the appropriate entity to secure a variance/waiver. Thus, a significant noise impact would not occur during project construction and construction noise impacts would be less than significant.

Off-Site Construction Noise

Delivery and haul truck trips would occur throughout the construction period. Trucks traveling to and from the project area would be required to travel along the haul route approved by the City for the proposed project. The following two haul routes are being proposed for the project:

- Haul Route 1: SR-133, north on Irvine Boulevard, and east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue and south on Irvine Boulevard to SR-133 for trucks traveling outbound.
- Haul Route 2: I-5, east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue to I-5 for trucks traveling outbound.

Table 7 shows the estimated construction traffic noise levels that would occur at the nearest off-site sensitive uses along the proposed haul routes. Details are provided in Appendix B. Sensitive noise receptors along the haul route are located approximately 40 to 80 feet from the edge of the roadways. Construction traffic noise levels generated by truck trips would range from approximately 57.5 dBA, L_{eq} to 72.7 dBA, L_{eq} . Detailed traffic noise calculations are provided in Appendix B. Construction truck trips would be required to comply with the City's allowable hours as described above and would be temporary in nature. Therefore, construction activities would comply with the City's noise standard, and impacts would be less than significant.

3.2.2 Operational Noise

Operation of the proposed project would not increase the average daily traffic (ADT) volumes along the major thoroughfares within the project vicinity. Additionally, the proposed inlet and outlet pipelines that would supply and drain the reservoir would be located underground and would not result in any operational noise. The primary pumps used for water distribution are already existing and located off-site. Operation of the proposed project would introduce small pumps located within the proposed treatment facilities. A proposed masonry block wall building would house the storage tanks, metering pumps, and control system. The small pumps located on-site would not generate noise above ambient conditions at sensitive receptor property lines. Therefore, impacts from the operations of the proposed project would be less than significant.

Mitigation: None required.

Significance after Mitigation: Less Than Significant Impact.

3.3 Vibration Impacts

Threshold NOI-2: Generation of excessive groundborne vibration or groundborne noise levels.

Impact NOI-2: **The proposed project would not generate excessive groundborne vibration or groundborne noise levels. (Less than Significant).**

3.3.1 Construction Vibration

Construction activities for the proposed project have the potential to generate low levels of groundborne vibration as the operation of heavy equipment (i.e., backhoe, dozer, grader, loader, and haul trucks, etc.) generates vibrations that propagate through the ground and diminish in intensity with distance from the source. No high-impact activities, such as pile driving or blasting, would be used during the proposed project's construction. In order to evaluate potential structural damage, the nearest off-site sensitive buildings to the project area were identified. The residential buildings located on the south side of Portola Parkway are approximately from 300 feet from the proposed project boundary line. Groundborne vibrations from construction activities very rarely reach the levels that can damage structures, but they may be perceived in buildings very close to a construction site.

The PPV vibration velocities for several types of construction equipment that can generate perceptible vibration levels are identified in **Table 8**. Based on the information presented in Table 8, vibration velocities could range from 0.0014 to 0.0083 in/sec PPV at 300 feet from the source of activity.

TABLE 8
VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	Approximate PPV (in/sec)						
	25 Feet	50 Feet	60 Feet	75 Feet	100 Feet	200 Feet	300 Feet
Vibratory Roller	0.2100	0.0853	0.0673	0.0503	0.0346	0.0141	0.0083
Large Bulldozer	0.0890	0.0361	0.0285	0.0213	0.0147	0.0060	0.0035
Loaded Trucks	0.0760	0.0309	0.0244	0.0182	0.0125	0.0060	0.0035
Jackhammer	0.0350	0.0142	0.0112	0.0084	0.0058	0.0051	0.0030
Small Bulldozer	0.0030	0.0012	0.0010	0.0007	0.0005	0.0023	0.0014

SOURCE: FTA 2018; ESA 2020.

Proposed construction activities would occur throughout the project area and would not be concentrated at the point closest to the nearest structure. Based on the vibration levels presented in Table 8, at a distance of 300 feet from the proposed project area, the maximum vibration level would be up to approximately 0.0083 in/sec PPV for a vibratory roller, which would not exceed the significance threshold of 0.2 in/sec PPV. The geotechnical work would be associated with the dam upgrades and would most likely occur in the reservoir area, at a distance of 330 feet (100

meters) or more from the nearest sensitive uses, which would generate vibration levels below 0.2 in/sec PPV at sensitive receptor locations. Therefore, the use of all construction equipment would not result in a groundborne vibration velocity level above 0.2 inches per second at the nearest off-site structure. Therefore, impacts would be less than significant.

With respect to human annoyance, the nearest residential buildings located within 300 feet from the proposed project site would be exposed to vibration levels below the 80 VdB threshold for human annoyance. Therefore, impacts would be less than significant.

3.3.2 Operational Vibration

Sources of groundborne vibration would be unchanged from the existing conditions. Additionally, operational vibration impacts of the improvements at the new proposed reservoir would be consistent with the existing vibration velocity levels and with the existing ambient vibration velocity levels. As such, operational vibration impacts of the proposed Syphon Reservoir improvements would be less than significant.

Mitigation: None required.

Significance after Mitigation: Less Than Significant Impact.

3.4 Airport and Airstrip Noise Impacts

Threshold NOI-3: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.

Impact NOI-3: **The proposed project would not expose people residing or working in the project area to excessive noise levels within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport. (No Impact).**

The proposed project area is not located within the vicinity of a private airstrip. Further, the nearest airport to the project area is the John Wayne Airport, located approximately 7.7 miles to the southwest of the project area. The proposed project is not located within an airport land use plan or within 2 miles of a public airport or public use airport. Therefore, the proposed project would have no impact related to public or private airport/airstrip noise levels.

Mitigation: None required.

Significance after Mitigation: No Impact.

3.5 Cumulative Impacts

CEQA Guidelines require a discussion of cumulative impacts of a project “when the project’s incremental effect is cumulatively considerable” (2011 CEQA Guidelines, Section 15130). As defined by Section 15065 (a)(3) “cumulatively considerable” means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (2011 CEQA Guidelines, Section 15065 (a)(3)). These cumulative impacts are defined as “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts” (CEQA Guidelines Section 15355).

Two cumulative projects within 1,000 feet of the proposed project site have been identified, which include the Gateway Community Park / City of Irvine Master Parks Plan and the Truck Route Roadway Rehabilitation (CIP 311902) Project. Should all three projects undergo construction at the same time, the projects would be required to comply with the construction hours allowed by the City or comply with City restrictions imposed if a variance to the allowable construction hours for either project is issued. As described in Section 3.3, the proposed project construction and operation would comply with the City’s noise standard, and impacts would be less than significant. Therefore, the proposed project, when combined with the identified cumulative projects, would not cause a cumulatively considerable noise impact. With regard to groundborne vibration, the construction vibration levels generated by the proposed project would be substantially below the FTA thresholds. Vibration level diminish rapidly from the source and the range of vibration concern is usually limited to 50 feet from the vibration source; thus, the proposed project, when combined with the identified cumulative projects, would not cause a cumulatively considerable vibration impact. As a result, cumulative impacts would be less than significant.

Mitigation: None required.

Significance after Mitigation: Less Than Significant Impact.

Appendix B

Construction Traffic Noise

This page intentionally left blank.

TRAFFIC NOISE ANALYSIS TOOL

Project Name: IRWD Syphon
Analysis Scenario: Vegetation Removal and Access Route
Source of Traffic Volumes: Applicant

Roadway Segment	Ground Type	Distance from Roadway to Receiver (feet)	Speed (mph)			Peak Hour Volume			Peak Hour Noise Level (Leq(h) dBA)	Noise Level dBA CNEL
			Auto	MT	HT	Auto	MT	HT		
Potola Pkwy, between SR-133 and Paragon	Hard	60	55	55	55	40	0	154	70.7	71.0
Sand Canyon Ave, between Portola Pkwy and Irvine Blvd.	Hard	40	50	50	50	40	0	154	71.6	71.9
Irvine Blvd, between San Canyon Ave and Native Spring	Hard	55	60	60	60	40	0	154	72.0	72.3
SR-133, between Irvine Blvd and SR-241	Hard	80	65	65	65	40	0	154	71.2	71.5

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).

The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

TRAFFIC NOISE ANALYSIS TOOL

Project Name: IRWD Syphon
Analysis Scenario: Access Route
Source of Traffic Volumes: Applicant

Roadway Segment	Ground Type	Distance from Roadway to Receiver (feet)	Speed (mph)			Peak Hour Volume			Peak Hour Noise Level (Leq(h) dBA)	Noise Level dBA CNEL
			Auto	MT	HT	Auto	MT	HT		
Potola Pkwy, between SR-133 and Paragon	Hard	60	55	55	55	20	0	22	62.5	62.8

Analysis Scenario: Install Chimney/Remaining Embankment & Spillway Construction
Source of Traffic Volumes: Applicant

Roadway Segment	Ground Type	Distance from Roadway to Receiver (feet)	Speed (mph)			Peak Hour Volume			Peak Hour Noise Level (Leq(h) dBA)	Noise Level dBA CNEL
			Auto	MT	HT	Auto	MT	HT		
Potola Pkwy, between SR-133 and Paragon	Hard	60	55	55	55	156	0	168	71.4	71.7
Sand Canyon Ave, between Portola Pkwy and Irvine Blvd.	Hard	40	50	50	50	156	0	168	72.2	72.5
Irvine Blvd, between San Canyon Ave and Native Spring	Hard	55	60	60	60	156	0	168	72.7	73.0
SR-133, between Irvine Blvd and SR-241	Hard	80	65	65	65	156	0	168	71.9	72.2

Model Notes:

The calculation is based on the methodology described in FHWA Traffic Noise Model Technical Manual (1998).
 The peak hour noise level at 50 feet was validated with the results from FHWA Traffic Noise Model Version 2.5.

Accuracy of the calculation is within ±0.1 dB when comparing to TNM results.

Noise propagation greater than 50 feet is based on the following assumptions:

For hard ground, the propagation rate is 3 dB per doubling the distance.

For soft ground, the propagation rate is 4.5 dB per doubling the distance.

Vehicles are assumed to be on a long straight roadway with cruise speed.

Roadway grade is less than 1.5%.

CNEL levels were obtained based on Figure 2-19, on page 2-58 Caltran's TeNS 2013.

1. Executive Summary

Fehr & Peers has completed a Transportation Impact Analysis (TIA) for construction of the Irvine Ranch Water District (IRWD) Syphon Reservoir Improvement Project (Project) located near the intersection of Sand Canyon Avenue and Portola Parkway in Irvine, California. The Project proposes to increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. Pedestrian and bicycle infrastructure at the intersection will be reconstructed to maintain access like the existing condition while following the City of Irvine requirements.

As part of the TIA, consistent with California Environmental Quality Act (CEQA) requirements, a Vehicle Miles Traveled (VMT) analysis was conducted for the Project. Intersection Level of Service (LOS) was also conducted to determine intersection operations with and without the Project. The study intersections selected represent the intersections where construction traffic is proposed to travel through. Four routes are proposed for the Project.

Findings

On a peak construction activity day, approximately 232 daily trips are estimated, of which 36 trips (27 inbound/9 outbound) would occur during the AM peak hour and 18 trips (0 inbound/18 outbound) would occur during the PM peak hour. For the purpose of the intersection LOS analysis, the trip generation estimates were converted to Passenger Car Equivalent (PCE) trips. PCE reflects the additional effect larger vehicles have on intersection operations based on their larger size. A PCE factor of 1.0 was assumed for worker vehicles and a PCE factor of 3.0 was assumed for all construction trucks, based on the Highway Capacity Manual 6th Edition (HCM) (Transportation Research Board, 2017). As shown in Table 3, on a peak construction activity day, approximately 512 daily PCE trips are estimated, of which 72 PCE trips (45 inbound/27 outbound) would occur during the AM peak hour and 18 PCE trips (0 inbound/18 outbound) would occur during the PM peak hour.

The City of Irvine's *CEQA VMT Impact Analysis Guidelines* identify projects generating fewer than 250 weekday daily trips as requiring no further VMT impact analysis. All phases of construction have a daily trip generation less than 250 trips. Therefore, it can be determined that all the construction phases do not meet the daily trip screening threshold and require no further VMT impact analysis using the *CEQA VMT Impact Analysis Guidelines*.

The LOS analyses resulted in no intersection deficiencies under any of the "plus Project" scenarios. Therefore, no intersection improvements would be required.

2. Introduction

This report presents the analysis and findings of a Transportation Impact Analysis (TIA) prepared for construction of the Irvine Ranch Water District (IRWD) Syphon Reservoir Improvement Project (Project) located near the intersection of Sand Canyon Avenue and Portola Parkway in Irvine, California. This chapter discusses the TIA purpose, analysis locations and methods, scenarios, and report organization.

Study Purpose

The purpose of this study is to evaluate the temporary transportation impacts associated with the Syphon Reservoir Improvement Project. The Project proposes to increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The Project would allow the storage of additional recycled water produced at the Michelson Water Recycling Plant during periods of low demand (winter months) for use during periods of high demand (summer months). The Project would expand the reservoir's storage capacity from the current 500 Acre-Feet (AF) to approximately 5,000 AF and would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water from both Northern California and the Colorado River. The Project would help IRWD to store more drought-proof recycled water during summer months and support the increased use of recycled water for public landscaping, agricultural, business, and industrial uses. Every gallon of recycled water IRWD uses for non-drinking water purposes saves a gallon of drinking water, helping the region's existing and planned future development to better withstand future water shortages. By reducing IRWD's dependence on costly imported water, the Project would allow IRWD to replace an expensive source of water for one that is less expensive and a drought-resilient supply, which increases IRWD's water supply reliability. The proposed Project is assumed to be operational by end of 2026.

The Project would be implemented within the IRWD service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and SR-133 in the County of Orange. The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway. Figure 1 identifies the location of the Project within Irvine.

As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access during Project construction and maintenance/operations access during Project operation. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. Pedestrian and bicycle infrastructure at the intersection would be reconstructed to maintain access like the existing condition while following the City of Irvine requirements. This improvement assumes the northbound

approach at Sand Canyon Avenue and Portola Parkway would be modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach would be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal phasing that gives a green signal for all vehicle movements of one direction followed by a green signal for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations. During construction of the Project, this private roadway would be used by construction trips for ingress and egress of the construction site. Upon completion of the Project, this private roadway would be used by IRWD staff conducting maintenance and inspections as part of typical operations, similar to existing conditions. Trips by IRWD staff to the reservoir are not anticipated to increase as compared to the existing condition and are not considered to have a significant effect on the future intersection operations.

Study Area Boundary

The scope of the traffic analysis, methodology assumptions, and selection of study intersections was developed in consultation with City of Irvine staff and documented in the Scope of Work for Irvine Ranch Water District (IRWD) Syphon Reservoir Construction Transportation Impact Analysis dated June 29, 2020. The approved scope of work is included in Appendix A.

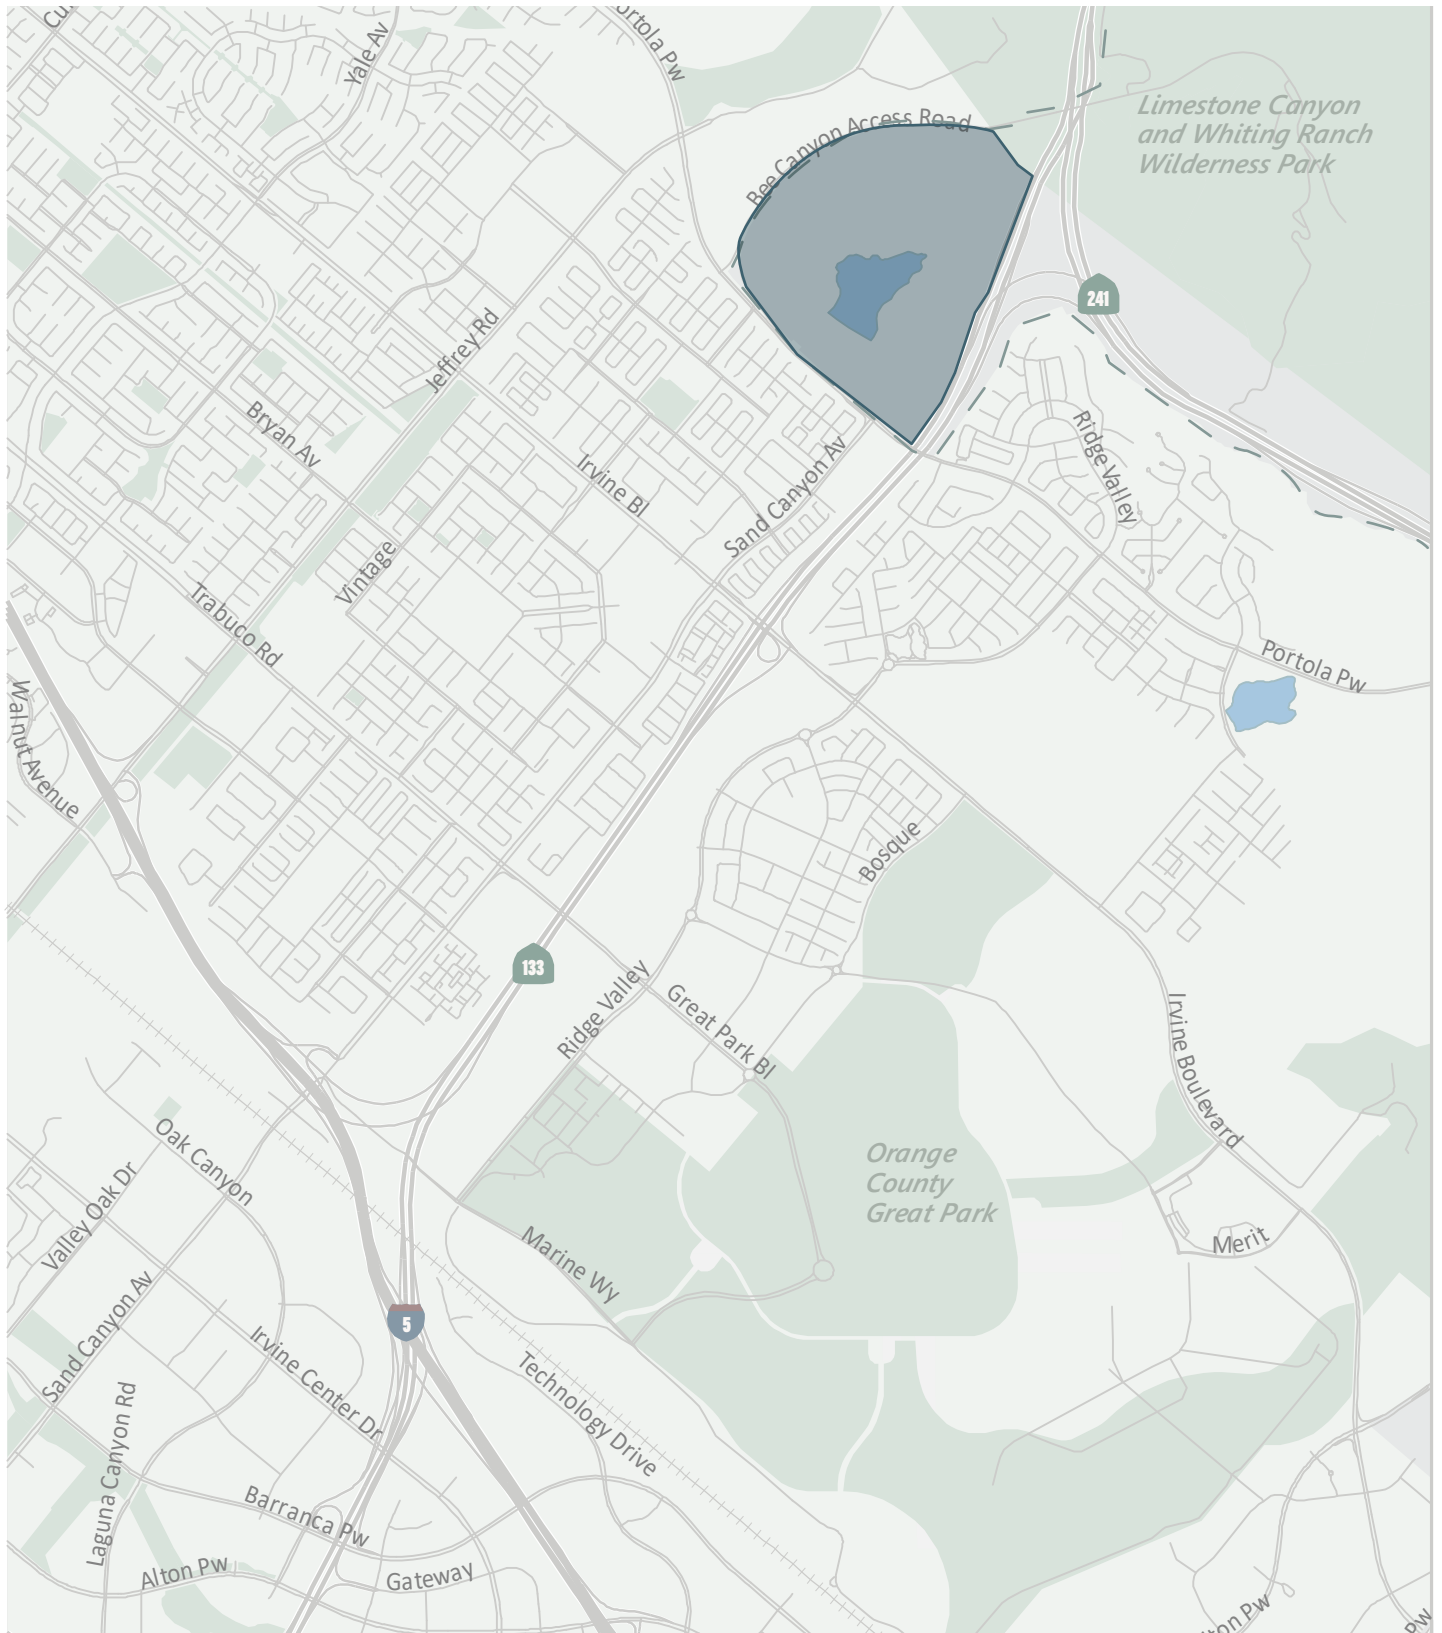

The study intersections selected represent the intersections where construction traffic is proposed to travel through. Four routes are proposed for the Project.

- Route 1A – I-5 (from the north), south on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the north) for trucks traveling outbound.
- Route 1B – I-5 (from the south), south on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the south) for trucks traveling outbound.
- Route 2A – SR-133 (from the north), west on Irvine Boulevard, and north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue and east on Irvine Boulevard to SR-133 (to the north) for trucks traveling outbound.
- Route 2B – SR-133 (from the south), west on Irvine Boulevard, and north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue and east on Irvine Boulevard to SR-133 (to the south) for trucks traveling outbound.

As presented in Figure 2, the following intersections have been selected for study:

1. Sand Canyon Avenue & Portola Parkway
2. Sand Canyon Avenue & Irvine Boulevard
3. Sand Canyon Avenue & Trabuco Road
4. Sand Canyon Avenue & I-5 Northbound Ramps
5. Sand Canyon Avenue & Marine Way
6. Sand Canyon Avenue & I-5 Southbound Ramps
7. SR-133 Southbound Ramps & Irvine Boulevard
8. SR-133 Northbound Off-Ramp & Irvine Boulevard

Freeway links were not included in this study as less than 50 peak hour trips would be added to the freeway system.

Note: For the purpose of this study Sand Canyon Avenue is regarded as a north-south roadway

Analysis Methods

The *City of Irvine Traffic Study Guidelines* (City of Irvine, April 2020) were used to identify the analysis methodologies for the Vehicle Miles Traveled (VMT) and intersection Level of Service (LOS) analyses. Many jurisdictions in Southern California have regarded construction-related traffic as causing adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary.

Vehicle Miles Traveled Analysis

On September 27, 2013, Governor Jerry Brown signed Senate Bill (SB) 743 into law and started a process that has fundamentally changed transportation impact analyses conducted as part of California Environmental Quality Act (CEQA) compliance. The Governor's Office of Planning and Research (OPR) was charged with developing new guidelines for evaluating transportation impacts under CEQA using methods that no longer focus on measuring automobile delay and LOS.

OPR issued proposed updates to the CEQA guidelines in support of these goals in November 2017 and a supporting technical advisory in December 2018. The updates establish VMT as the metric for evaluating a project's environmental impacts on the transportation system. Lead agencies, including the City of Irvine, had until July 1, 2020 to implement these new requirements. On June 23, 2020, the City of Irvine adopted the *CEQA VMT Impact Analysis Guidelines* (City of Irvine, April 2020). These guidelines are included as an exhibit in the *City of Irvine Traffic Study Guidelines*.

Neither OPR nor the City of Irvine have provided guidance regarding VMT thresholds for construction related traffic. Nonetheless and per the approved scope of work, a VMT impact analysis was conducted for the Project that follows the adopted *CEQA VMT Impact Analysis Guidelines*.

Intersection Level of Service Analysis

For the signalized intersections within the study area, the transportation analysis was conducted in accordance with *City of Irvine Traffic Study Guidelines* requirements using the Intersection Capacity Utilization (ICU) methodology.

The ICU methodology is considered a standard approach for evaluating signalized intersection operations in Irvine. The ICU method of intersection capacity analysis determines the intersection volume-to-capacity (V/C) ratio and corresponding LOS for the turning movements and intersection characteristics at signalized intersections. "Capacity" represents the maximum volume of vehicles in the critical lanes that have a reasonable expectation of passing through an intersection in one hour under prevailing roadway and traffic

conditions. The ICU method calculates the V/C ratio for each critical movement by dividing volume by capacity. The V/C ratios for each critical movement are summed with an added lost time due to vehicle start-ups and stops to determine the total intersection V/C ratio. Traffic conditions for signalized intersections were evaluated using the Vistro Version 7.0 software.

After the quantitative V/C and delay estimates were completed, the methodologies assign a qualitative letter grade that represents the operations of the intersection. These grades range from level of service (LOS) A (minimal delay) to LOS F (excessive congestion). LOS E represents at-capacity operations. Descriptions of the LOS letter grades for intersections are provided in Table 1.

Analysis Scenarios

The proposed Project is assumed to be operational by end of 2026. The study was directed at analyzing the potential Project generated traffic effect on the local street system under both existing and future year traffic conditions. The following traffic scenarios were developed and analyzed as part of this study:

- Existing Conditions – Due to emergence of COVID-19 in southern California and the decision of local schools to end on-campus classes for the 2019-2020 academic year, existing intersection counts could not be collected in the study area. However, the City of Irvine provided intersection counts from 2018 that were used to estimate 2020 intersection volumes. Per the approved scope of work with the City of Irvine, a growth factor of 2% per year was applied to previously collected counts to develop 2020 intersection volumes for the AM and PM peak hours.
- Existing plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates was added to the Existing Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site was included.
- Short-Term Interim Year Approved Conditions – the future (Short-Term Interim Year Approved) conditions were developed using study area intersection volume growth rates on a per year basis. The per year growth rates were developed based on outputs from the latest versions of the Existing and Short-Term Interim Year Approved Irvine Traffic Analysis Model (ITAM) provided by the City of Irvine. The growth rate was applied to the Existing Conditions intersection volumes to reflect Existing Conditions growth to the Short-Term Interim Year Approved condition of ITAM.
- Short-Term Interim Year Approved plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates was added to the Short-Term Interim Year Approved Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site was included.

TABLE 1
INTERSECTION LEVEL OF SERVICE CRITERIA

Level of Service	Description	ICU Volume to Capacity (V/C) Ratio
A	<p><u>Signalized:</u> Operations with very low delay occurring with favorable progression and/or short cycle length.</p> <p><u>Unsignalized:</u> Little or no delay.</p>	0.000 - 0.600
B	<p><u>Signalized:</u> Operations with low delay occurring with good progression and/or short cycle lengths.</p> <p><u>Unsignalized:</u> Short traffic delays.</p>	0.601 - 0.700
C	<p><u>Signalized:</u> Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.</p> <p><u>Unsignalized:</u> Average traffic delays.</p>	0.701 - 0.800

Sources: *Transportation Research Circular No. 212, Interim Materials on Highway Capacity*, Transportation Research Board, 1980.

- Short-Term Interim Year Pending Conditions – the future (Short-Term Interim Year Pending) conditions were developed using study area intersection volume growth rates on a per year basis. The per year growth rates were developed based on outputs from the latest versions of the Existing and Short-Term Interim Year Pending ITAM provided by the City of Irvine. The growth rate was applied to the Existing Conditions intersection volumes to reflect Existing Conditions growth to the Short-Term Interim Year Pending condition of ITAM.
- Short-Term Interim Year Pending plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates was added to the Short-Term Interim Year Pending Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site was included.

Report Organization

This report is divided into eight chapters as described below:

- Chapter 1 – Executive summary summarizes the findings of the analysis.
- Chapter 2 – Introduction discusses the purpose and organization of the report.
- Chapter 3 – Existing Conditions describes the transportation system in the Project vicinity, including the surrounding roadway network, morning and evening peak period intersection turning movement volumes, existing bicycle, pedestrian, and transit facilities, and intersection operations.
- Chapter 4 – Performance criteria identify the thresholds for impacts and when traffic improvements would be required.
- Chapter 5 – Project characteristics identify the trip generation, distribution, and assignment of the Project traffic.
- Chapter 6 – Existing Plus Project Traffic Conditions addresses the Existing Conditions with the Project and discusses Project effect on intersections.
- Chapter 7 – Short-Term Interim Year Conditions addresses the Short-Term Interim Year without the Project.
- Chapter 8 – Short-Term Interim Year Plus Project Conditions addresses the Short-Term Interim Year Plus Project Conditions, with the Project, and discusses Project effect on intersections.
- Chapter 9 – Special Issues address site access analysis and VMT analysis.
- Chapter 10 – Required improvements address the improvements required of the Project.
- Chapter 11 – Conclusion summarizes the findings of the analysis.

3. Existing Conditions

This chapter describes transportation facilities in the study area including the surrounding roadway network, transit, pedestrian, and bicycle facilities. Existing intersection operations are also described.

Roadway System

The following discusses the roadways that would provide access to the site and are most likely to experience direct traffic effects, if any, from the Project (see Figure 1).

State Route 133 (SR-133) is a north-south freeway that runs between Laguna Beach, California, and Irvine. In the study area, SR-133 provides four general purpose travel lanes in both the northbound and southbound directions.

Interstate 5 (I-5) is a north-south freeway that runs between the Mexico border and the Oregon state line. In the study area, I-5 provides five general purpose travel lanes and one high occupancy vehicle lane in both the northbound and southbound directions.

Marine Way is an east-west roadway through Irvine. In the study area, the roadway generally provides one travel lane in each direction with turn pockets at intersections and driveways. The posted speed limit is 45 mph. No on-street parking is permitted on either side of the road.

Trabuco Road/Great Park Boulevard is an east-west roadway through Irvine. In the study area, the roadway generally provides three travel lanes in each direction with a raised median and turn pockets at intersections. The posted speed limit is 50 mph. No on-street parking is permitted on either side of the road.

Irvine Boulevard is an east-west roadway through Irvine that provides access to SR-133. In the study area, the roadway generally provides three travel lanes in each direction with a raised median and turn pockets at intersections. The posted speed limit is 55 mph. No on-street parking is permitted on either side of the road.

Portola Parkway is an east-west roadway through Irvine. In the study area, the roadway generally provides two travel lanes in each direction with a raised median and turn pockets at intersections. The posted speed limit is 55 mph. No on-street parking is permitted on either side of the road.

Sand Canyon Avenue is a north-south roadway through Irvine that provides access to I-5. In the study area, the roadway generally provides four travel lanes in each direction between Trabuco Road/Great Park

Boulevard and I-5, three travel lanes in each direction between Irvine Boulevard and Trabuco Road/Great Park Boulevard, and two travel lanes in each direction between Portola Parkway and Irvine Boulevard. A raised median and turn pockets are generally provided at intersections. The posted speed limit is 50 mph. No on-street parking is permitted on either side of the road.

Existing Pedestrian and Bicycle Facilities

Pedestrian facilities in the study area include sidewalks, crosswalks, and pedestrian signals. All the roadways in the study areas provide sidewalks or paths on both sides of the street. Sidewalks are not provided along SR-133 or I-5. At the signalized intersections in the study areas, crosswalks and pedestrian push-button actuated signals are provided. Figure 3 presents the following bicycle facilities in the study area, per the *California State Bicycle and Pedestrian Plan* (Caltrans, 2017) 3:

- **Bike paths (Class I)** – Bike paths provide a separate right-of-way and are designated for the exclusive use of people riding bicycles and walking with minimal crossflow traffic. Such paths can be well situated along creeks, canals, and rail lines. Class I Bikeways can also offer opportunities not provided by the road system by serving as both recreational areas and/or desirable commuter routes. Bike paths are provided along the following roadway segments.
 - Sand Canyon Avenue from Portola Parkway to I-5
 - Portola Parkway from Paragon to SR-133
 - Towngate from Hallmark to Crosspointe
 - Cypress Village Trail along I-5
- **Bike lanes (Class II)** – Bike lanes provide designated street space for bicyclists, typically adjacent to the outer vehicle travel lanes. Bike lanes include special lane markings, pavement legends, and signage. Bike lanes may be enhanced with painted buffers between vehicle lanes and/or parking, and green paint at conflict zones (such as driveways or intersections). The following roadway segments have Class II bike lanes.
 - Sand Canyon Avenue from Portola Parkway to I-5
 - Portola Parkway from Paragon to SR-133
 - Spring Meadows from Medallion to Coralwood
 - Irvine Boulevard from Groveland to SR-133
 - Towngate from Hallmark to Crosspointe
 - Trabuco Road/Great Park Boulevard from Keystone to SR-133
 - Roosevelt from Tulip to Sand Canyon Avenue
 - Nightmist from Tulip to Sand Canyon Avenue
 - Marine Way from Sand Canyon to SR-133

- **Bike routes (Class III)** – Bike routes provide enhanced mixed-traffic conditions for bicyclists through signage, striping, and/or traffic calming treatments, and to provide continuity to a bikeway network. Bike routes are typically designated along gaps between bike trails or bike lanes, or along low-volume, low-speed streets. There are no Class III facilities in the study areas.
- **Separated Bikeway (Class IV)** – Separated bikeways, also referred to as cycle tracks or protected bikeways, are bikeways for the exclusive use of bicycles which are physically separated from vehicle traffic. Separated Bikeways were recently adopted by Caltrans in 2015. Types of separation may include, but are not limited to, grade separation, flexible posts, physical barriers, or on-street parking. There are no Class IV facilities in the study areas.

Existing Transit Service

Transit service in the study areas is provided by Orange County Transit Authority (OCTA). OCTA operates Routes 83 and 206 along I-5 in the study area. These routes provide regional service but have no stops in the study area.

Existing Traffic Counts

Due to the COVID-19 pandemic in 2020, travel activity and traffic volumes in the existing year of analysis were substantially decreased throughout the study area and Southern California. It was not possible to collect counts that represented existing traffic conditions. A baseline condition that reflected travel activity and traffic volume prior to the COVID-19 pandemic was developed for the intersection analysis. Historical AM and PM peak hour turning movement counts collected at the study intersection in 2018 provided by the City of Irvine. Each of these counts were grown by 2% per year from their respective count year to the established baseline year of 2020. Peak hour intersection volumes are summarized on Figure 4 along with existing lane configurations and traffic controls. The traffic counts from 2018 are provided in Appendix B.

Existing Operations Analysis

Existing intersection operations were evaluated using the methods described in Chapter 1 for the weekday AM and PM peak hours at the study intersections. The analysis was based on the volumes, lane configurations, and traffic control presented on Figure 4. Detailed intersection LOS calculation worksheets are presented in Appendix C. As shown in Table 2, all signalized study intersections currently operate at LOS C or better in both the AM and PM peak hours.

4. Performance Criteria

The determination of significance for Project impacts is based on applicable policies, regulations, goals, and guidelines defined by the City of Irvine. The proposed impact criteria for this study are presented below.

Vehicle Miles Traveled Impact Thresholds

On June 23, 2020, the City of Irvine adopted the *CEQA VMT Impact Analysis Guidelines*. These guidelines identify the screening criteria, analysis requirements, thresholds, and mitigation options for VMT analysis associated with the operation of new projects in the City of Irvine. The City of Irvine has not provided guidance regarding VMT thresholds for construction related traffic. The screening opportunities and VMT thresholds identified below are documented in the *CEQA VMT Impact Analysis Guidelines* and were utilized as part of the analysis and performance criteria for the Project.

Construction-related traffic is typically considered to cause adverse but not lasting intersection deficiencies because, while sometimes inconvenient, construction-related traffic effects are temporary. However, in an effort to document potential impacts related to the Project, the City of Irvine VMT impact thresholds were applied to the Project.

Screening

If the analysis of environmental impacts related to transportation (i.e., VMT impact analysis) is required for a discretionary project, but if it can be demonstrated that the project meets any one of the following four screening criteria, then no further VMT impact analysis is required:

1. The project results in a net increase of 250 or fewer weekday daily trips.
2. The project is located in a Transit Priority Area¹
3. The project is 100-percent restricted affordable housing units
4. The project is locally serving such as 100,000 square feet or less of retail use, a daycare use or a locally serving public school

¹ A Transit Priority Area (TPA) is defined as within half-mile distance of existing rail transit station or located within half-mile of two or more existing bus routes with a frequency of service interval of 15 minutes or less during morning and evening peak hours.

Thresholds of Significance

The City's identified significance criteria is for the operation of new projects to generate 15 percent less VMT per capita (or per employee) compared to existing conditions, which is consistent with the OPR Technical Advisory recommendations. City staff will periodically update the VMT thresholds based on the latest calibrated and validated City VMT traffic model. Any technical updates to the VMT significance thresholds are subject to the approval of the Transportation Commission at the recommendation of the Director of Public Works and Transportation.

The table below identifies the existing residential VMT per capita and the non-residential VMT per employee, as well as the proposed residential VMT per capita and non-residential VMT per employee significance thresholds, as documented in the *CEQA VMT Impact Analysis Guidelines*. The residential significance threshold is based on the countywide residential VMT divided by the countywide population, while the non-residential significance threshold is based on the countywide commute and other (i.e., customer and client) VMT divided by the number of countywide employees.

Land Use Type	Existing	Significance Threshold* (15 percent reduction)
Residential (VMT per population)	17.5	14.9
Non-Residential (VMT per employee)	48.8	41.5

* Any technical updates to the VMT significance thresholds are subject to the approval of the Transportation Commission at the recommendation of the Director of Public Works and Transportation.

Source: *CEQA VMT Impact Analysis Guidelines* (City of Irvine, April 2020)

If the project VMT rate exceeds the respective threshold, then the project creates a significant impact. When a project results in a significant VMT impact, it must identify the mitigation measures to reduce the impact to a level that meets the City's adopted VMT threshold. All feasible mitigation measures must be incorporated into the project to substantially reduce the impact even if the project cannot meet the adopted VMT threshold.

Signalized Intersections Deficiencies

Construction-related traffic is typically considered to cause adverse but not lasting intersection deficiencies because, while sometimes inconvenient, construction-related traffic effects are temporary. However, in an effort to document potential intersection deficiencies related to the Project, City of Irvine intersection criteria was applied to all signalized intersections. A signalized intersection is considered to be deficient if one of the following criteria is met.

- A location is at acceptable LOS in the baseline condition and the project causes the location to become deficient; or
- A location at unacceptable LOS in the baseline condition and the project causes the location to further deteriorate by two percent or more (i.e. 0.02 v/c ratio change).

According to the *City of Irvine Traffic Study Guidelines*, LOS E shall be considered acceptable for links and intersections in accordance with the City's General Plan Objective B-1. LOS D shall be considered acceptable for all other areas of the City. Based on these criteria, all study intersections will be identified as operating acceptably if they are at or better than LOS D.

For intersection analysis, if an intersection is determined to be deficient based on the criteria above, then the project will be required to improve the intersection, at a minimum, back to the baseline condition.

5. Project Characteristics

Trip Generation

Construction of the Project is estimated to be approximately 41 months, depending on weather conditions and other variables. Construction is currently anticipated to begin in the Fall of 2022. Most construction activities would be limited to 7:00 AM to 7:00 PM Monday through Friday. Construction of the Project would include activities implemented in phases as outlined below.

- Access Routes/Intersection Improvements
- Excavation of Sediment/Existing Dam
- Construction of Dam/Spillway/Reservoir
- Construction of Filtration/Chlor/Dechlor Facilities
- Wetlands/Riparian Installation
- Installation of Recreation Facilities
- Demobilization

Construction Vehicle Type

Haul Trucks

Hauling hours are anticipated to be 7:00 AM to 3:00 PM on weekdays. During the peak trip period, approximately 52 material delivery trucks would enter and exit the site per workday for approximately twelve months. During other times of construction, material deliveries would be expected in the range of 5 to 10 material delivery trucks per day. These trucks are assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Equipment and Delivery Trucks

In addition to haul trucks, the site is also expected to generate equipment and delivery trucks during each phase of construction. These materials would be delivered to the site and stored on-site. These deliveries are expected to occur in a variety of vehicles including small delivery trucks to cement mixer trucks and 18-wheel trucks. Additionally, construction equipment would also have to be delivered to the site. This equipment could include bulldozers, excavators, and other large items of machinery. Most of the heavy equipment is expected to be transported to the site on large trucks such as 18-wheelers or other similar vehicles. These trucks are assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Employee Vehicles

The number of construction workers would vary throughout the construction period. Parking for all construction workers would be provided on-site. Construction workers are assumed to arrive in single occupant vehicles.

Construction Period Trip Generation

Based on the aforementioned information, a construction period trip generation analysis was conducted to estimate daily, morning, and evening peak hour trips of the phase with the highest trip generation potential. As seen in Table 3, the construction of Dam/Spillway/Reservoir phase represents the day with the highest trip generation potential with approximately 116 vehicles.

Construction workers often travel to and from a worksite outside of the typical peak commute hours. Construction hours are anticipated to occur from 7:00 AM to 7:00 PM, with most worker trips and truck trips anticipated to occur outside of the AM and PM peak hours. For the purpose of the analysis, it was assumed that up to 40% of the construction workers would arrive at the construction site during the peak morning commute hour and up to 40% would depart the construction site during the peak evening commute hour. Equipment trucks were assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Table 3 presents a summary of the construction trip generation on a peak day. As shown, on a peak construction activity day, approximately 232 daily trips are estimated, of which 36 trips (27 inbound/9 outbound) would occur during the AM peak hour and 18 trips (0 inbound/18 outbound) would occur during the PM peak hour. For the purpose of the intersection LOS analysis, the trip generation estimates were converted to Passenger Car Equivalent (PCE) trips. PCE reflects the additional effect larger vehicles have on intersection operations based on their larger size. A PCE factor of 1.0 was assumed for worker vehicles and a PCE factor of 3.0 was assumed for all construction trucks, based on the *Highway Capacity Manual 6th Edition (HCM)* (Transportation Research Board, 2017). As shown in Table 3, on a peak construction activity day, approximately 512 daily PCE trips are estimated, of which 72 PCE trips (45 inbound/27 outbound) would occur during the AM peak hour and 18 PCE trips (0 inbound/18 outbound) would occur during the PM peak hour.

This trip generation is anticipated to occur for approximately two to three months. Trip generation outside of this phase would be reduced with approximately 30 daily to 154 daily trips being generated.

Trip Distribution and Assignment

Four routes are proposed for the Project.

- Route 1A – I-5 (from the north), north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the north) for trucks traveling outbound.
- Route 1B – I-5 (from the south), north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue to I-5 (to the south) for trucks traveling outbound.
- Route 2A – SR-133 (from the north), west on Irvine Boulevard, and north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue and east on Irvine Boulevard to SR-133 (to the north) for trucks traveling outbound.
- Route 2B – SR-133 (from the south), west on Irvine Boulevard, and north on Sand Canyon Avenue for trucks traveling inbound and southbound on Sand Canyon Avenue and east on Irvine Boulevard to SR-133 (to the south) for trucks traveling outbound.

Figure 5 shows the distribution and assignment of the four routes studied. Figure 6a – Figure 6d shows the study intersection turning movement volumes of the Project trips for each route.

Timeline

The proposed Project is assumed to be operational by end of 2026.

**TABLE 3
CONSTRUCTION TRIP GENERATION**

Phase	Duration (Months)	Peak Day Activity Under Each Phase			Total Vehicles	Total Daily Vehicle Trips
		Haul Trucks	Equipment and Delivery Trucks	Employee Vehicles		
		Access Routes/Intersection Improvements	5	8		
Excavation of Sediment/ Existing Dam	6.6	0	6	31	37	74
Construction of Dam/Spillway/Reservoir	13.8	52	18	46	116	232
Construction of Filtration/Chlor/Dechlor Facility	12	0	29	48	77	154
Wetlands/Riparian Installation	12	0	5	20	25	50
Installation of Recreation Facilities	3	0	5	10	15	30
Demobilization	1	0	7	15	22	44

Construction of Dam/Spillway/Reservoir Trip Generation							
Trip Type	Daily Trips [a]	Morning Peak Hour Trips			Evening Peak Hour Trips		
		In	Out	Total	In	Out	Total
Haul Truck Trips [b]	104	7	7	14	0	0	0
Delivery and Equipment Truck Trips [b]	36	2	2	4	0	0	0
Construction Worker Trips [c]	92	18	0	18	0	18	18
Phase Total	232	27	9	36	0	18	18

Construction of Dam/Spillway/Reservoir Trip Generation							
Trip Type and Passenger Car Equivalency	Daily Trips [a]	Morning Peak Hour Trips			Evening Peak Hour Trips		
		In	Out	Total	In	Out	Total
Haul Truck Trips PCE: 3.0	312	21	21	42	0	0	0
Delivery and Equipment Truck Trips PCE: 3.0	108	6	6	12	0	0	0
Construction Worker Trips PCE: 1.0	92	18	0	18	0	18	18
PCE Phase Total	512	45	27	72	0	18	18

Notes:

[a] - Daily trips were calculated by counting two trips, one inbound and one outbound trip for each vehicle

[b] - Daily haul and delivery/equipment truck trips were assumed to occur evenly throughout an 8-hour construction day. Therefore, the daily truck trips were divided by 8 hours to calculate morning and evening peak hour truck trips.

[c] - Up to 40% of the construction workers were assumed to arrive during the morning peak hour of adjacent street traffic. A total of up to 40% worker were assumed to depart during the evening peak hour.

6. Existing Plus Project Conditions

This chapter evaluates potential off-site intersection deficiencies under Existing Plus Project conditions.

Traffic Volumes

The Project traffic volumes on Figure 6a through Figure 6d were added to the existing traffic volumes from Figure 4 to estimate the Existing Plus Project traffic volumes for each route, as shown on Figure 7a through Figure 7d.

Intersection Improvements

All Existing Plus Project scenarios intersection lane configurations are assumed to include buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site. This improvement assumes the northbound approach at Sand Canyon Avenue and Portola Parkway is modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach will be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal operation that gives a green phase for all vehicle movements of one direction followed by a green phase for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations.

Intersection Operations

Existing Plus Project intersection operations were evaluated using the methods described in Chapter 1. All the Existing Plus Project analysis results for each route are presented in Table 4, based on the traffic volumes presented on Figure 7a through Figure 7d. As shown, all routes would have each signalized study intersections operate at LOS C or better in both the AM and PM peak hours.

Intersection Deficiencies

As presented in Table 4, after applying the intersection deficiency criteria, it was determined none of the route options would have a deficient intersection under the Existing Plus Project condition.

Recommended Improvements

There are no intersection deficiencies under Existing Plus Project condition. No intersection improvements are required.

7. Short-Term Interim Year Conditions

This chapter evaluates the Short-Term Interim Year Conditions.

Future Traffic Forecasts

Per the approved scope of work, the Project is required to study the Short-Term Interim Year Approved and Short-Term Interim Year Pending scenarios from ITAM. ITAM forecasts for the base year and both short-term interim year scenarios were provided by the City of Irvine. These scenarios were used to determine growth rates on a per year basis that were applied to the 2020 existing intersection volumes to develop Short-Term Interim Year Approved and Pending intersection volumes. Study intersection volumes Short-Term Interim Year Approved are provided in Figure 8 and study intersection volumes Short-Term Interim Year Pending are provided in Figure 9.

Intersection Improvements

Both Short-Term Interim Year scenarios intersection lane configurations are assumed to include the same lane geometry as the Existing Conditions.

Intersection Operations

Short-Term Interim Year intersection operations were evaluated using the methods described in Chapter 1. The Short-Term Interim Year Approved analysis results are presented in Table 5. As shown, all signalized intersections operate at LOS D or better in both the AM and PM peak hours. The Short-Term Interim Year Pending analysis results are presented in Table 6. As shown, all signalized intersections operate at LOS D or better in both the AM and PM peak hours.

Note: For the purpose of this study Sand Canyon Avenue is regarded as a north-south roadway

8. Short-Term Interim Year Plus Project Conditions

This chapter evaluates the potential off-site intersection deficiencies under Short-Term Interim Year Plus Project conditions.

Future Traffic Forecasts

The Project traffic volumes from Figure 6a through Figure 6d were added to the Short-Term Interim Year Approved traffic volumes from Figure 8 to estimate the Short-Term Interim Year Approved plus Project traffic volumes, as shown on Figure 10a through Figure 10d.

The Project traffic volumes from Figure 6a through Figure 6d were added to the Short-Term Interim Year Pending traffic volumes from Figure 9 to estimate the Short-Term Interim Year Pending plus Project traffic volumes, as shown on Figure 11a through Figure 11d.

Intersection Improvements

All Short-Term Interim Year Approved plus Project and Short-Term Interim Year Pending plus Project scenarios intersection lane configurations are assumed to include buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site. This improvement assumes the northbound approach at Sand Canyon Avenue and Portola Parkway is modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach will be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal operation that gives a green phase for all vehicle movements of one direction followed by a green phase for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations.

Intersection Operations

Short-Term Interim Year Approved plus Project and Short-Term Interim Year Pending plus Project intersection operations were evaluated using the methods described in Chapter 1. All the Short-Term Interim Year Approved plus Project analysis results for each route are presented in Table 7, based on the traffic volumes presented on Figure 10a through Figure 10d. As shown, all routes would have each signalized study intersections operate at LOS D or better in both the AM and PM peak hours. All the Short-Term

Interim Year Pending plus Project analysis results for each route are presented in Table 8, based on the traffic volumes presented on Figure 11a through Figure 11d. As shown, all routes would have each signalized study intersections operate at LOS D or better in both the AM and PM peak hours.

Intersection Deficiencies

As presented in Table 7, after applying the intersection deficiency criteria, it was determined none of the route options would have a deficient intersection under the Short-Term Interim Year Approved plus Project condition. As presented in Table 8, after applying the intersection deficiency criteria, it was determined none of the route options would have a deficient intersection under the Short-Term Interim Year Pending plus Project condition.

Recommended Improvements

There are no intersection deficiencies under either the Short-Term Interim Year Approved plus Project condition or the Short-Term Interim Year Pending plus Project conditions. No intersection improvements are required.

9. Special Issues

This chapter addresses the site access analysis and VMT analysis for the Project.

Site Access Analysis

As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access during Project construction and maintenance/operations access during Project operation. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. Pedestrian and bicycle infrastructure at the intersection would be reconstructed to maintain access like the existing condition while following the City of Irvine requirements. This improvement assumes the northbound approach at Sand Canyon Avenue and Portola Parkway would be modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach would be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal operation that gives a green phase for all vehicle movements of one direction followed by a green phase for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations. During construction of the Project, this private roadway would be used by construction trips for ingress and egress of the construction site. Upon completion of the Project, this private roadway would be used by IRWD staff conducting maintenance and inspections as part of typical operations, similar to existing conditions. Trips by IRWD staff to the reservoir are not anticipated to increase as compared to the existing condition and are not considered to have a significant effect on the future intersection operations.

An analysis of the *City of Irvine Transportation Design Procedures* (City of Irvine, February 2007) [TDPs] was conducted to address primary access to the Project. The following TDPs were reviewed at request of the City of Irvine per the approved scope of work.

TDP – 1 Turn Lane Pocket Lengths

TDP – 1 identifies recommended lengths of left-turn pockets using a Nomograph for Left-Turn Storage, which uses inputs such as the number of left-turning vehicles, cycle length, and truck percentage. Eastbound left-turn pockets are not proposed at the intersection of Sand Canyon Avenue and Portola Parkway as the Project is planning to only modify the northbound and southbound approaches. Therefore TDP – 1 is not applicable to this Project.

TDP – 14 Driveway Lengths

TDP – 14 identifies recommended lengths for driveways to projects based on the number of peak hour trips entering a project site. The Project will construct a 2-lane private roadway from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site. While plans for this roadway have yet to be submitted, it is estimated that this private roadway will exceed 1,500 feet (ft) from the Sand Canyon Avenue and Portola Parkway intersection to the Project site. Signage indicating the use as a private road will be installed at the intersection and along the roadway. As a private road, access control will be maintained with a gate at least 500 ft away from the intersection. During the construction period this gate will remain open during hours of construction and closed when no construction is occurring. Following construction, the gate will remain closed and only IRWD staff conducting maintenance and inspections as part of typical operations will have access to open the gate. The gate location will provide an area for vehicles to turn around if they do not have access beyond the gate. As peak hour traffic into the Project site is estimated to be 27 vehicles, TDP – 14 recommends a driveway of at least 50 ft. The private road length (greater than 1,500 ft) and distance to the gate (at least 500 ft) exceed the recommendation of 50 feet based on TDP – 14.

TDP – 15 Gate Stacking

TDP – 15 identifies recommendations for vehicle stacking and gate-stacking at project sites. TDP-15 provides recommendations based on different types of land uses for vehicle stacking analysis. As a construction project, none of the examples provided in TDP-15 reflect the Projects' construction management operations or typical conditions of the reservoir following construction. The Project will construct a 2-lane private road with at least 500 ft of distance between the Sand Canyon Avenue and Portola Parkway intersection and a proposed gate. Signage indicating the use as a private road will be installed at the intersection and along the roadway. The proposed gate location will provide an area for vehicles to turn around if they do not have access beyond the gate.

During construction, the gate will remain open during hours of construction and closed when no construction is occurring. With an open gate, the private roadway and internal staging on-site can accommodate vehicle queuing that may be associated with a peak construction activity day.

Following construction, the gate will remain closed and only IRWD staff conducting maintenance and inspections as part of typical operations will have access to open the gate. The trips by IRWD staff will be nominal and are not considered to have a significant effect on the future intersection operations. The proposed gate location and gate operations during typical operations can meet the nominal inbound volume during future operations.

CEQA VMT Impact Analysis

The City of Irvine's *CEQA VMT Impact Analysis Guidelines* identify projects generating fewer than 250 weekday daily trips as requiring no further VMT impact analysis. As identified in Table 3, all phases of construction generate fewer than 250 daily weekday trips. Therefore, it can be determined that all the construction phases do not meet the daily trip screening threshold and require no further VMT impact analysis using the *CEQA VMT Impact Analysis Guidelines*. In addition, many jurisdictions in Southern California have regarded construction-related traffic as causing adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary.

Pedestrian Network Impact Analysis

Disruptions to Existing Facilities

Significance Criteria

The following significance criteria were applied:

A significant impact occurs if a project disrupts existing pedestrian facilities.

Project Impact

Pedestrian infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Interferes with Planned Pedestrian Facilities

Significance Criteria

The following significance criteria were applied to determine if the Project conflicts with planned facilities:

A significant impact occurs if a project interferes with planned pedestrian facilities.

Project Impact

Pedestrian infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. The Project will not affect any planned pedestrian facilities in the study area. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Conflicts with Adopted Pedestrian System Plans, Guidelines, Policies, or Standards

Significance Criteria

A significant impact occurs if a project conflicts or creates inconsistencies with adopted pedestrian system plans, guidelines, policies, or standards.

Project Impact

The Project is consistent with the policies identified in the City of Irvine General Plan Objective B-3: Pedestrian Circulation. The Project will reconstruct pedestrian infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway to maintain existing access while following the City of Irvine requirements. Therefore, it is concluded that the Project impact related to this item is less than significant.

Bicycle Network Impact Analysis

Disruptions to Existing Facilities

Significance Criteria

The following significance criteria were applied:

A significant impact occurs if a project disrupts existing bicycle facilities.

Project Impact

Bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. Minor improvements to facilitate bicycle circulation such as "BIKES MAY USE FULL LANE" signage, shared arrow advance warning signage,

and other suggested methods that provide advance warning to both vehicular drivers and bicyclists will be coordinated with the City of Irvine staff. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Interferes with Planned Bicycle Facilities

Significance Criteria

The following significance criteria were applied to determine if the Project conflicts with planned facilities:

A significant impact occurs if a project interferes with planned bicycle facilities.

Project Impact

Bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway will be reconstructed to maintain existing access while following the City of Irvine requirements. The Project will not affect any planned bicycle facilities in the study area. Minor improvements to facilitate bicycle circulation such as "BIKES MAY USE FULL LANE" signage, shared arrow advance warning signage, and other suggested methods that provide advance warning to both vehicular drivers and bicyclists will be coordinated with the City of Irvine staff. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Conflicts with Adopted Bicycle System Plans, Guidelines, Policies, or Standards

Significance Criteria

A significant impact occurs if a project conflicts or creates inconsistencies with adopted bicycle system plans, guidelines, policies, or standards.

Project Impact

The Project is consistent with the policies identified in the City of Irvine General Plan Objective B-4: Bicycle Circulation. The Project will reconstruct bicycle infrastructure at the intersection of Sand Canyon Avenue and Portola Parkway to maintain existing access while following the City of Irvine requirements. Minor improvements to facilitate bicycle circulation such as "BIKES MAY USE FULL LANE" signage, shared arrow advance warning signage, and other suggested methods that provide advance warning to both vehicular

drivers and bicyclists will be coordinated with the City of Irvine staff. Therefore, it is concluded that the Project impact related to this item is less than significant.

Transit System

Disruptions to Existing Transit Service

Significance Criteria

The following significance criteria were applied to determine if the Project is responsible for a disruption of existing transit services or facilities:

A significant impact occurs if a project disrupts existing transit services or facilities.

Project Impact

As noted in the review of existing transit routes, no transit routes currently run through the study area. Therefore, it is concluded that the Project impact related to this item is less than significant.

Interference with Planned Transit Services

Significance Criteria

The following significance criteria were applied:

A significant impact occurs if a project interferes with planned transit services or facilities.

Project Impact

As noted in the review of existing transit routes, no transit routes currently run through the study area. Furthermore, the Project does not propose any changes to existing bus pullout along any of the study roadways. Therefore, it is concluded that the Project impact related to this item is less than significant.

Project Conflicts or Creates Inconsistencies with Adopted Transit System Plans, Guidelines, Policies, or Standards

Significance Criteria

The following significance criteria regarding consistency with adopted transit plans, guidelines, policies, or standards were applied:

A significant impact occurs if a project conflicts or creates inconsistencies with adopted transit system plans, guidelines, policies, or standards.

Project Impact

Based on the review of the Project, it can be concluded that the Project does not conflict with these policies or other policies related to transit. The impact is therefore less than significant, and no mitigation is required.

Demand for Public Transit Services Above Capacity

Significance Criteria

The following significance criteria were applied:

A significant impact occurs if the project creates demand for public transit service above the capacity which is provided or planned.

Project Impact

The Project is consistent with the policies identified in the City of Irvine General Plan Objective B-6: Public Transit Circulation. Therefore, it is concluded that the Project impact related to this item is less than significant.

CMP Traffic Impact Analysis

The 2015 Orange County Congestion Management Program (Orange County Transportation Authority, November 2015) [CMP] guidelines require that projects with the potential to create an impact of more than 3% of LOS E capacity on the CMP highway system links should require a traffic impact analysis. All projects generating 2,400 or more daily trips should require evaluation. If a project will have direct access to a CMP link, the threshold is reduced to 1,600 or more daily trips. A traffic impact analysis is not required if one has already been performed for the Project as part of an earlier development approval which takes the impact on the CMP highway system into account.

The nearest OCTA CMP intersection is Irvine Boulevard and SR-133 Northbound ramps. As documented in Table 3, the Project generates less than 1,600 daily trips on a peak construction activity day. Therefore, a CMP traffic impact analysis is not required.

10. Improvements

As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access during Project construction and maintenance/operations access during Project operation. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. Pedestrian and bicycle infrastructure at the intersection would be reconstructed to maintain access like the existing condition while following the City of Irvine requirements. This improvement assumes the northbound approach at Sand Canyon Avenue and Portola Parkway would be modified from two left-turn lanes and two right-turn lanes to one left-turn lane, one shared through/left-turn lane, and two right-turn lanes. The southbound approach would be constructed with one shared left/through/right-turn lane. Split phasing (a traffic signal phasing that gives a green signal for all vehicle movements of one direction followed by a green signal for all movements of the opposite direction) would be incorporated for the northbound and new southbound approaches during construction and typical operations. During construction of the Project, this private roadway would be used by construction trips for ingress and egress of the construction site. Upon completion of the Project, this private roadway would be used by IRWD staff conducting maintenance and inspections as part of typical operations, similar to existing conditions. Trips by IRWD staff to the reservoir are not anticipated to increase as compared to the existing condition and are not considered to have a significant effect on the future intersection operations.

Based on the results of the analysis and in accordance with the adopted *Traffic Impact Analysis Guidelines*, no significant impacts or intersection deficiencies were identified as part of this Project and therefore no improvements are required.

While no significant impacts were identified as part of this study, the following measures are recommended to alleviate the potential effect of construction traffic:

- Off-site truck staging, if required, shall be provided in a legal area furnished by the contractor. Trucks shall not be permitted to travel along local residential streets.
- To the extent feasible, deliveries and pick-ups of construction materials should be scheduled during non-peak travel periods and coordinated to reduce the potential of trucks waiting to load or unload for protracted periods of time.
- Access shall remain unobstructed for land uses in proximity to the Project site during Project construction.
- Full-time lane or sidewalk closures are not anticipated for the Project. Temporary lane or sidewalk closures, when needed, shall be scheduled to avoid peak commute hours and peak school drop-off and pick-up hours to the extent possible. In the event of a lane or sidewalk closure, a worksite traffic control plan, approved by the City of Irvine, shall be implemented to route traffic or pedestrians around any such lane or sidewalk closures.

11. Conclusion

The purpose of this study is to evaluate the temporary transportation impacts associated with the Syphon Reservoir Improvement Project in Irvine, California. The following summarizes the results of this analysis:

- The Project proposes to increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The Project would be implemented within the IRWD service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and SR-133.
- As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access during Project construction and maintenance/operations access during Project operation.
- The scope of the traffic analysis, methodology assumptions, and selection of study intersections was developed in consultation with City of Irvine staff and documented in the Scope of Work for Irvine Ranch Water District (IRWD) Syphon Reservoir Construction Transportation Impact Analysis dated June 29, 2020.
- The study intersections selected represent the intersections where construction traffic is proposed to travel through. Four routes are proposed for the Project.
- On a peak construction activity day, approximately 232 daily trips are estimated, of which 36 trips (27 inbound/9 outbound) would occur during the AM peak hour and 18 trips (0 inbound/18 outbound) would occur during the PM peak hour. For the purpose of the intersection LOS analysis, the trip generation estimates were converted to PCE which resulted in approximately 512 daily PCE trips are estimated, of which 72 PCE trips (45 inbound/27 outbound) would occur during the AM peak hour and 18 PCE trips (0 inbound/18 outbound) would occur during the PM peak hour on the same peak construction activity day.
- The LOS analyses for all Existing Plus Project routes, Short-Term Interim Year Approved plus Project, and Short-Term Interim Year Pending plus Project that the Project would have no deficiencies at any study intersection. Therefore, no intersection improvements to address intersection deficiencies would be required.
- Based on the daily trip generation on a peak construction activity day, the Project does not meet the daily trip screening threshold and does not require further VMT impact analysis.
- The Project does not have a significant impact on the pedestrian, bicycle, or transit network.

District (IRWD) Syphon Reservoir
Construction Transportation Impact
Analysis**

MEMORANDUM

Date: June 29, 2020
To: Justin Equina, City of Irvine
CC: Jennifer Jacobus, PhD, ESA
Jo Ann Corey, Irvine Ranch Water District
From: Spencer Reed, PE and Ethan Yue Sun, PhD
Subject: **Scope of Work for Irvine Ranch Water District (IRWD) Syphon Reservoir Construction Transportation Impact Analysis**

OC18-0553

Fehr & Peers has been retained by ESA to assist with the transportation impact analysis for construction of the Irvine Ranch Water District (IRWD) Syphon Reservoir Project (Project) located near the intersection of Sand Canyon Avenue and Portola Parkway. Based on the City of Irvine's Traffic Study Guidelines (City of Irvine, August 2004, Updated 2020), this project is required to evaluate the impacts associated with construction of the Project. As the Project is anticipated to generate less than 50 peak hour trips (see trip generation section below), a Limited Scope Traffic Impact Analysis (TIA) will be prepared to evaluate short-term interim-year conditions and satisfy the City's analysis requirements.

The purpose of this memorandum is to document the methodologies and assumptions which will be used in the transportation impact analysis so there is an opportunity to approve the approach prior to preparing the traffic study. This Limited Scope TIA will include the following sections.

I. Executive Summary

This section will provide a summary of the project description and the analysis results. Any mitigations recommended as part of the project will also be included, if necessary.

Spencer Reed

Approved by Development Review

7/2/20

Date

II. Introduction

This section will describe the project, outline the Limited Scope TIA, and include the following sections:

Project Site

The Project proposes to increase the capacity of the existing Syphon Reservoir and replace the existing engineered dam with a new and larger engineered dam. The Project would allow the storage of additional recycled water produced at the Michelson WRP during periods of low demand (winter months) for use during periods of high demand (summer months). The Project would expand the reservoir's storage capacity from the current 500 Acre-Feet (AF) to approximately 5,000 AF and would help IRWD become more self-sufficient by reducing its dependence on costly and less-reliable imported water from both Northern California and the Colorado River. The Project would help IRWD to store more drought-proof recycled water during summer months and support the increased use of recycled water for public landscaping, agricultural, business and industrial uses. Every gallon of recycled water IRWD uses for non-drinking water purposes saves a gallon of drinking water, helping the region's existing and planned future development to better withstand future water shortages. By reducing IRWD's dependence on costly imported water, the Project would allow IRWD to replace an expensive source of water for one that is less expensive and a drought-resilient supply, which increases IRWD's water supply reliability.

The Project would be implemented within the IRWD service area at the location of the existing Syphon Reservoir, northeast of Portola Parkway between Bee Canyon Access Road and SR-133 in the County of Orange. The Crean Lutheran High School Athletic Complex is located between Portola Parkway and the toe of the existing dam. Residential neighborhoods are located on the southwest side of Portola Parkway.

As part of the Project, a private 2-lane roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site is proposed for construction vehicle access. This proposal will require reconstruction of the Sand Canyon Avenue and Portola Parkway intersection to accommodate the new northern leg and the associated traffic signals, lane striping, and signage changes. During the Project, this private roadway will be used by construction trips for ingress and egress of the construction site. Upon completion of the Project, this private roadway will be used by IRWD staff conducting maintenance and inspections as part of typical

Sun-Sun T. Murillo

Approved by Development Review

Date

operations. The trips by IRWD staff will be nominal and are not considered to have a significant effect on the future intersection operations.

Study Area Boundary

The study intersections selected represent the intersections where construction traffic is proposed to travel through. Two route options are proposed for the Project. Route Option 1 will be SR-133, north on Irvine Boulevard, and east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue and south on Irvine Boulevard to SR-133 for trucks traveling outbound. Route Option 2 will be I-5, east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue to I-5 for trucks traveling outbound. As presented in Figure 1, the following intersections have been selected for study:

1. Sand Canyon Avenue & Portola Parkway
2. Sand Canyon Avenue & Irvine Boulevard
3. Sand Canyon Avenue & Trabuco Rd
4. Sand Canyon Avenue & I-5 Northbound Ramps
5. Sand Canyon Avenue & Marine Way
6. Sand Canyon Avenue & I-5 Southbound Ramps
7. SR-133 Southbound Ramps & Irvine Boulevard
8. SR-133 Northbound Off-Ramp & Irvine Boulevard

Data Collection

Due to emergence of COVID-19 in southern California and the decision of local schools to end on-campus classes for the 2019-2020 academic year, it is not recommended to collect existing intersection counts in the study area. However, the City of Irvine has agreed to provide the most recent intersection counts available that can be used to estimate 2020 intersection volumes. As prescribed by the City of Irvine, a growth factor of 2% per year will be applied to previously counts collected to develop 2020 intersection volumes for the AM and PM peak hours.

III. Existing Conditions

Existing Lane Uses

Existing land uses on site will be identified. The existing site is the IRWD syphon reservoir.

Existing Roadways and Intersections

Fehr & Peers will collect the following information in a field visit to the study area:

- Lane & intersection configurations
- Traffic signal locations
- Signal phasing
- Land uses in the study area
- Existing pedestrian and bicycle facilities
- Transit service

IV. Performance Criteria

The performance criteria to determine potential impacts and mitigations will be consistent with the City's criteria, as outlined in the Traffic Study Guidelines. The City's Transportation Design Procedures (TDP) adopted February 2007 will be used as the performance criteria to evaluate the design features of the project access.

V. Proposed Project Impacts

Trip Generation

Construction of the Project is estimated to be approximately 41 months, depending on weather conditions and other variables. Construction is currently anticipated to begin in the Fall of 2022. Most construction activities would be limited to 7:00 AM to 4:00 PM Monday through Friday. Construction of the Project would include activities implemented in phases as outlined below.

- Access Routes/Intersection Improvements
- Excavation of Sediment/Existing Dam
- Construction of Dam/Spillway/Reservoir
- Construction of Filtration/Chlor/Dechlor Facilities
- Wetlands/Riparian Installation
- Installation of Recreation Facilities
- Demobilization

Sun-Sun T. Murillo

Approved by Development Review

7/2/20

Date

Construction Vehicle Type

Haul Trucks

Hauling hours are anticipated to be 7:00 AM to 3:00 PM on weekdays. During the peak trip period, approximately 52 material delivery trucks would enter and exit the site per workday for approximately twelve months. During other times of construction, material deliveries would be expected in the range of 5 to 10 material delivery trucks per day. These trucks are assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Equipment and Delivery Trucks

In addition to haul trucks, the site is also expected to generate equipment and delivery trucks during each phase of construction. These materials would be delivered to the site and stored on-site. These deliveries are expected to occur in a variety of vehicles including small delivery trucks to cement mixer trucks and 18-wheel trucks. Additionally, construction equipment would also have to be delivered to the site. This equipment could include bulldozers, excavators, and other large items of machinery. Most of the heavy equipment is expected to be transported to the site on large trucks such as 18-wheelers or other similar vehicles. These trucks are assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Employee Vehicles

The number of construction workers would vary throughout the construction period. Parking for all construction workers will be provided on-site. Construction workers are assumed to arrive in single occupant vehicles.

Construction Period Trip Generation

Based on the aforementioned information, a construction period trip generation analysis was conducted to estimate daily, morning, and evening peak hour trips of the phase with the highest trip generation potential. As seen in Table 1, the construction of Dam/Spillway/Reservoir phase represents the day with the highest trip generation potential with approximately 116 vehicles.

Construction workers often travel to and from a worksite outside of the typical peak commute hours. Construction hours are anticipated to occur from 7:00 AM to 4:00 PM, with most worker trips and truck trips anticipated to occur outside of the AM and PM peak hours. For the purpose of the analysis, it was assumed that up to 40% of the construction workers would arrive at the construction

Sun-Sun T. Murillo

7/2/20

Approved by Development Review

Date

site during the peak morning commute hour and up to 40% would depart the construction site during the peak evening commute hour. Equipment trucks were assumed to arrive and depart evenly between 7:00 AM and 3:00 PM during an 8-hour shift.

Table 1 presents a summary of the construction trip generation on a peak day. As shown, on a peak construction activity day, approximately 232 daily trips are estimated, of which 36 trips (27 inbound/9 outbound) would occur during the AM peak hour and 18 trips (0 inbound/18 outbound) would occur during the PM peak hour. This trip generation is anticipated to occur for approximately two to three months. Trip generation outside of this phase would be reduced with approximately 30 daily to 154 daily trips being generated.

Adjustments to Trip Generation

No adjustments to the trip generation shall be made without prior written approval from the City.

Trip Distribution and Assignment

Two route options are proposed for the Project. Route Option 1 will be SR-133, north on Irvine Boulevard, and east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue and south on Irvine Boulevard to SR-133 for trucks traveling outbound. Route Option 2 will be I-5, east on Sand Canyon Avenue for trucks traveling inbound and westbound on Sand Canyon Avenue to I-5 for trucks traveling outbound.

Phasing

The proposed project will be constructed in a single phase and is assumed to be operational by early 2026.

Vehicle Miles Traveled Methodology and Approach

On September 27, 2013, Governor Jerry Brown signed Senate Bill (SB) 743 into law and started a process that will fundamentally change transportation impact analysis conducted as part of California Environmental Quality Act (CEQA) compliance. The Governor's Office of Planning and Research (OPR) was charged with developing new guidelines for evaluating transportation impacts under CEQA using methods that no longer focus on measuring automobile delay and level of service (LOS).

Sun-Sun T. Murillo

7/2/20

Approved by Development Review

Date

OPR issued proposed updates to the CEQA guidelines in support of these goals in November 2017 and a supporting technical advisory in December 2018. The updates establish vehicle miles traveled (VMT) as the metric for evaluating a project's environmental impacts on the transportation system. Lead agencies, including the City of Irvine, have until July 1, 2020 to implement these new requirements. On June 23, 2020, the City of Irvine adopted the CEQA VMT Impact Analysis Guidelines. This project will include a VMT impact analysis section that follows the adopted CEQA VMT Impact Analysis Guidelines.

The City of Irvine's guidelines identify projects generating fewer than 250 daily trips as being screened out of VMT analysis. As identified in Table 1, all phases of construction have a daily trip generation less than 250 trips. Therefore, it can be assumed that all of the construction phases could be screened out of conducting a VMT analysis using the City of Irvine draft guidelines.

Many jurisdictions in Southern California have regarded construction-related traffic as causing adverse but not significant impacts because, while sometimes inconvenient, construction-related traffic effects are temporary. Therefore, due to all phases meeting the daily trip screening threshold of the City of Irvine and the temporary nature of the one phase that exceeds the threshold, this Project can be considered to be exempt from VMT and the traffic study will include a CEQA VMT Impact Analysis section and provide justification on how the project is exempt from VMT analysis.

Intersection Level of Service Analysis Methodology and Approach

The Intersection Capacity Utilization (ICU) methodology will be used to evaluate the intersection level of service (LOS) under the analysis scenarios identified below. The LOS will be reported at the study intersection for the AM and PM peak hours.

In addition, the Project's effect to non-automotive transportation will be evaluated based on the Project's consistency with existing or planned facilities in the study area

The following six scenarios will be analyzed:

- Existing Conditions – estimated intersection counts will be analyzed.
- Existing plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates will be added to the Existing Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site will be included.

Sun-Sun T. Murillo

7/2/20

Approved by Development Review

Date

- Short-Term Interim Year Approved Baseline Conditions – the future (Short-Term Interim Year) conditions will be developed based on the latest version of the Irvine Traffic Analysis Model (ITAM). Short-Term Interim Year Baseline Approved peak hour traffic volumes will be extracted for the study intersections.
- Short-Term Interim Year Approved Baseline plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates will be added to the Short-Term Interim Year Approved Baseline Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site will be included.
- Short-Term Interim Year Pending Baseline Conditions – the future (Short-Term Interim Year) conditions will be developed based on the latest version of ITAM. Short-Term Interim Year Baseline Pending peak hour traffic volumes will be extracted for the study intersections.
- Short-Term Interim Year Pending Baseline plus Project Conditions – the proposed construction trip generation (in passenger car equivalence) and route assignment estimates will be added to the Short-Term Interim Year Pending Baseline Conditions. Buildout of a private roadway connection from the northern side of the Sand Canyon Avenue and Portola Parkway intersection to the Project site will be included.

The following parameters will be used in our operations analysis:

- Manual assignment of project trips added to the estimated intersection count volumes.
- Vistro v7.0 software and ICU methodology to analyze signalized study intersections.
- Volume to capacity (V/C) ratios and the associated LOS will be reported for the signalized Irvine study intersections under the ICU methodology.
- A VMT analysis will be prepared in accordance with adopted Traffic Impact Analysis Guidelines in effect at the time of project approval.
- Per the City of Irvine Traffic Impact Analysis Guidelines, lane capacities of 1,700 per hour per lane for through and turn lanes will be used for all volume/capacity calculations.
- Per the City of Irvine Traffic Impact Analysis Guidelines, lost time of 0.05 added to ICU calculation. Lost time represents the time in which no vehicles can pass through the intersection despite having a green signal (i.e. the delay from the driver in moving the vehicle as the signal changes from red to green)
- Inclusion of proposed private roadway under Plus Project condition

VI. Special Analyses/Issues

Access Analysis

An analysis of the City's Transportation Design Procedures (TDPs) will be conducted for the primary access intersection (Sand Canyon Avenue/Portola) of the IRWD Syphon Reservoir. The TIA will identify the proposed lane geometry at this intersection to reflect this new access. The project is also responsible for restriping and other physical improvements necessary to implement the new access.

The specific TDPs to be evaluated include:

- TDP-1 (Turn lane pocket length) on eastbound Portola Parkway, if an eastbound left-turn lane is proposed
- TDP -14 (Driveway Lengths)
- TDP-15 (Gate Stacking), if applicable.

VII. Required Mitigation Measures

Based on the results and in accordance with the adopted Traffic Impact Analysis Guidelines, physical, operational, and alternative improvements required to mitigate unacceptable impacts due to the proposed project will be identified and analyzed.

VIII. Conclusions

A summary of the six analyzed scenarios, along with estimated effects of the mitigations, will be included in the TIA.

IX. Revisions to the Analysis

After a review and consolidated comments by city staff, Fehr & Peers will prepare one round of revisions to the TIA.

X. Signature

The TIA will be prepared under the supervision of, and signed, stamped, and dated by a registered traffic engineer or a registered professional civil engineer.

**TABLE 1
CONSTRUCTION PERIOD TRIP GENERATION**

Phase	Duration (Months)	Peak Day Activity Under Each Phase			Total Vehicles	Total Daily Vehicle Trips
		Haul Trucks	Equipment and Delivery Trucks	Employee Vehicles		
		Access Routes/Intersecction Improvements	5	8		
Excavation of Sediment/ Existing Dam	6.6	0	6	31	37	74
Construction of Dam/Spillway/Reservoir	13.8	52	18	46	116	232
Construction of Filtration/Chlor/Dechlor Facility	12	0	29	48	77	154
Wetlands/Riparian Installation	12	0	5	20	25	50
Installation of Recreation Facilities	3	0	5	10	15	30
Demobilization	1	0	7	15	22	44

Construction of Dam/Spillway/Reservoir Trip Generation							
Trip Type	Daily Trips [a]	Morning Peak Hour Trips			Evening Peak Hour Trips		
		In	Out	Total	In	Out	Total
Haul Truck Trips [b]	104	7	7	14	0	0	0
Delivery and Equipment Truck Trips [b]	36	2	2	4	0	0	0
Construction Worker Trips [c]	92	18	0	18	0	18	18
Phase Total	232	27	9	36	0	18	18

Notes:

[a] - Daily trips were calculated by counting two trips, one inbound and one outbound trip for each vehicle

[b] - Daily haul and delivery/equipment truck trips were assumed to occur evenly throughout an 8-hour construction day. Therefore, the daily truck trips were divided by 8 hours to calculate morning and evening peak hour truck trips.

[c] - Up to 40% of the construction workers were assumed to arrive during the morning peak hour of adjacent street traffic. A total of up to 40% worker were assumed to depart during the evening peak hour.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.366	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.580	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.496	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.538	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.596	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.600	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.556	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.465	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.396	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.588	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.505	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.538	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.596	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.600	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.556	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.465	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.429	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.541	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.520	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.396	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.588	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.505	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.556	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.602	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.608	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.556	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.465	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.429	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.541	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.525	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.396	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.580	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.496	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.538	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.596	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.600	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.569	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.465	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.429	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.546	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.520	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.396	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.580	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.496	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.538	-	A
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.596	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.600	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.569	-	A
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.491	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.429	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.546	-	A
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.519	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.622	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.547	-	A
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.520	-	A
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.738	-	C
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.625	-	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.426	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.681	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.580	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.630	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.700	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.704	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.652	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.544	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.456	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.689	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.589	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.630	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.700	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.704	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.652	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.544	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.499	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.635	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.731	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.641	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.610	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.869	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.735	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.456	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.689	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.589	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.648	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.705	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.712	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.652	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.544	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.499	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.635	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.731	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.641	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.615	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.869	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.735	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.456	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.681	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.580	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.630	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.700	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.704	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.665	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.544	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.499	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.640	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.731	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.641	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.610	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.869	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.735	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.456	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.681	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.580	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.630	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.700	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.704	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.665	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.569	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.499

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.439	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.704	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.600	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.651	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.723	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.728	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.674	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.562	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.470	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.711	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.651	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.723	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.728	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.674	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.562	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.506

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.470	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.711	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.609	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.670	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.728	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.736	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.674	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.562	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.506	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.644	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.618	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.743	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.651	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.625	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.883	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.746	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.506

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.470	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.704	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.600	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.651	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.723	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.728	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.687	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.562	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.506	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.650	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.618	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.743	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.651	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.619	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.883	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.746	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.506

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	WB Thru	0.470	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	SB Thru	0.704	-	C
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	WB Thru	0.600	-	A
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	SB Thru	0.651	-	B
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	SB Thru	0.723	-	C
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	SB Thru	0.728	-	C
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.687	-	B
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Right	0.587	-	A

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	Sand Canyon Ave and Portola Pkwy	Signalized	ICU 1	NB Left	0.506	-	A
2	Sand Canyon Ave and Irvine Blvd	Signalized	ICU 1	WB Thru	0.650	-	B
3	Sand Canyon Ave and Trabuco Rd	Signalized	ICU 1	EB Thru	0.618	-	B
4	Sand Canyon Ave and I-5 NB Ramps	Signalized	ICU 1	NB Thru	0.743	-	C
5	Sand Canyon Ave and Marine Way	Signalized	ICU 1	NB Thru	0.651	-	B
6	Sand Canyon Ave and I-5 SB Ramps	Signalized	ICU 1	NB Thru	0.619	-	B
7	SR-133 SB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.883	-	D
8	SR-133 NB Ramps and Irvine Blvd	Signalized	ICU 1	WB Thru	0.746	-	C

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report
Intersection 1: Sand Canyon Ave and Portola Pkwy

Control Type:	Signalized	Delay (sec / veh):	-
Analysis Method:	ICU 1	Level Of Service:	A
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.506

Appendix F
**Tribal Cultural Resources
Consultation (AB 52 Letters)**

May 24, 2019

Andrew Salas, Chairman
Gabrieleño Band of Mission Indians – Kizh Nation
P.O. Box 393
Covina, CA 91723

Subject: Assembly Bill 52 Consultation for Irvine Ranch Water District Syphon Reservoir Improvement Project, Orange County, California

Dear Mr. Salas:

Pursuant to the provisions of Assembly Bill (AB) 52 and Section 21080.3.1(d) of the Public Resources Code, this notification serves to extend an invitation to enter consultation for the Syphon Reservoir Improvement Project (project). Irvine Ranch Water District (IRWD) is the lead agency for the proposed project under the California Environmental Quality Act (CEQA, Public Resources Code 21000 et. seq.), and for Native American consultation per AB 52. IRWD seeks your input on tribal cultural resources that could be impacted by the project.

PROJECT DESCRIPTION

Syphon Reservoir is an existing recycled water storage reservoir located in Orange County, California (see Map 1, Project Location). IRWD acquired Syphon Reservoir in 2010 from the Irvine Company. In 2012, IRWD implemented the Syphon Reservoir Interim Facilities project, which made minor improvements to integrate the reservoir into IRWD's recycled water system. IRWD proposes to implement the Syphon Reservoir Improvement Project, which would increase the reservoir storage capacity by replacing the existing 59-foot high dam with a new embankment dam that would be up to approximately 136 feet high. By replacing the dam, the storage capacity at Syphon Reservoir would increase from 535 acre feet (AF) to approximately 5,000 AF. Existing onsite strainer and disinfection facilities would be replaced with larger facilities, and well as other supporting facilities to distribute water within IRWD's service area. The project location is shown on the attached project site map. Refer to Map 1, Project Location.

Please note that IRWD contacted you in November 2018 regarding the Syphon Reservoir Geotechnical Investigations Project, which led to the preparation of an Initial Study/Mitigated Negative Declaration. While the current project would be located at the same site as the geotechnical investigation, a separate CEQA document will be prepared, and IRWD is conducting separate AB 52 outreach.

PREVIOUS CULTURAL RESOURCES STUDY

As part of a geotechnical investigation, a Phase I Cultural Resources Technical Report for the full project area was prepared in January 2019, in accordance with both CEQA and Section 106 requirements. The report included a project description; regulatory and cultural/historical background contexts; methods and results of archival research and field studies; and recommendations for mitigation or any additional studies that might be required. Because both prehistoric and historic-period archaeological resources are

known to occur within the project site, archaeological and Native American monitoring are included as recommended mitigation. The report will be used as the basis for the cultural resources section of the CEQA environmental document, following Appendix G of the CEQA Guidelines.

Your participation in this local planning process is important. If you have any knowledge of tribal cultural resources, Native American Sacred Lands, or other cultural resources on or near the study area, or would like to consult on the project, please contact me **within 30 days** of receipt of this letter at (949) 453-5300 or via email at corey@irwd.com, with the subject line referencing the "Syphon Reservoir Improvement Project".

Sincerely,

Jo Ann Corey
